## Preface

The *Palgrave Handbook of Educational Leadership and Management Discourse* is designed to add a new dimension to the discourse in the field. Most handbooks are topical presentations and/or discussions of contemporary issues or problems. There is usually no deep probing or revealing interrogations of the foundations and assumptions upon which the topical presentations are made. There is rarely any tracing of where the ideas, concepts, or metaphors in use in topical discourse originated. For a field such as educational leadership and management, which is an applied body of practice, not knowing where ideas, concepts, or metaphors of practice originated leads to unintended consequences in an application, erroneous interpretations of alleged success or failure, or a dismal repetition of undiagnosed errors. One outcome is the complete lack of *reflexivity* in leadership practice. *Reflexivity* is different than reflection. Reflection of practice refers to asking such questions as, “Did we reach our goals, and if not, why not?” or “How could my leadership practice be improved?” *Reflexivity* asks instead, “How am I thinking about how I am thinking about leadership?”

For example, the word *accountability* is often applied to success or failure to produce specified learning outcomes. But the concept of *accountability* does not emanate from some theory of learning or theory of leadership that has anything to do with either teaching, learning, or leading. Rather, the root word *account* appears in about 1300 from the Middle English *acounten* or *acuten* which in turn was borrowed from Old French *aconter* or *acunter* which was derived from the Latin *computare* which means *compute* (Barnhart, 1995). When one is *accountable* for learning outcomes one is merely being responsible for counting or computing such results. It's not a failure to do anything but count or measure something. But in contemporary leadership jargon a failure to be accountable means an abrogation of “an obligation or willingness to accept responsibility or to account for one's actions” (Merriam-Webster, 2003, p. 8). Within this shifting meaning of 700 years of linguistic history lies the concept that being responsible or accountable is an indication that one is only responsible or accountable for measurement, that is, computation. That is the only action implicit in *accountability*. Yet placed within a context where the measurement involves student learning or achievement, there is an unwarranted assumption that being accountable means knowing how to do something different for attaining better results within a specific context of learning,

teaching, or leading. From this view, principals and superintendents have been fired for only computational accuracy. Yet they were fully accountable when they were expelled from their responsibilities. This is a case of the absence of *reflexivity* which would ask, “How am I thinking about how I am thinking about accountability?”

The *Palgrave Handbook of Educational Leadership and Management Discourse* is intended to be a historical trajectory of the multiple discourses (concepts, ideas, practices, theories) that comprise a field of knowledge. In this case, the field of educational leadership and management. In previous handbooks, trajectory histories consist of a search for continuities, patterns, or themes that can be presented as a sort of continuous progression of ideas thoughts, or practices that comprise a kind of conceptual or intellectual totality at any given moment in time. In his seminal book, *The Archaeology of Knowledge*, challenges this approach as a kind of sanctioned fiction. Such a history he avers translates, “. . .documents into monuments” (p. 7). To uncover a more complete and truthful account of the establishment of a field (something he calls an *enunciative field*), the perceptive observer must concentrate on the ruptures or discontinuities to show that “the history of a concept is not wholly and entirely that of its progressive refinement” (Foucault, 1971, p. 3).

To do this when presenting history or commentary about a field one must include those ruptures and discontinuities. These events “suspend the continuous accumulation of knowledge, interrupt its slow development, and force it to enter a new time, cut if off from its empirical origin and its original motivation, cleanse it of its imaginary complicities . . . towards a new type of rationality and its various effects” (Foucault, 1971, p. 4). These ruptures or discontinuities may serve as transformative events in the life of a discipline or field. They may signify a radical conceptual turning of the field itself.

This handbook attempted to identify such ruptures and discontinuities before presenting coherent chapter content. It also attempted to identify the critical assumptions involved in an overview of that content. To deal with the history of a field the handbook utilized Foucault’s three types of enunciative fields. They were:

*The field of memory* – those statements, ideas, or practices which are “no longer accepted or discussed, and which consequently no longer define either a body of truth or a domain of validity” (Foucault, 1971, p. 58), but may have left traces in the vocabulary or metaphors of that field (in a kind of memory). *The field of presence* – those statements, understandings, concepts, practices, or ideas which are considered to be truthful “involving exact description, well-founded reasoning, or necessary presuppositions” (Foucault, 1971, p. 57).

*The field of concomitance* – those statements, facts, ideas, or theories which have originated in other disciplines or areas and have been transferred to educational leadership or management. Strategic planning, for example, is not from business or educational management but originally from biology.

The purpose of including the discontinuities and ruptures in a field is to show the dynamic and fluid nature of knowledge development. To show that it is not always linear, not always progressive, and is filled with contradictions and anomalies. The key element is the presence of transformations in the concepts, ideas, theories, and/or practices. This inclusion underscores that the nature of knowledge in a field is rarely

static. It significantly challenges the idea of a static “knowledge base.” Rather the knowledge itself might be better characterized as a “knowledge dynamic” (English, 2006) which is a truer portrait of the nature of the field and the many areas and disciplines which form both the *field of presence* and the *field of concomitance*.

Closely nestled within a “knowledge dynamic” is Bourdieu’s concept of a field as a social space of play and struggle (Bourdieu & Wacquant, 1992). The competition of ideas, concepts, and theories is a never-ending battle within that social space, in this case with its attendant vocabulary and contrasting metaphors. It is usually the case that a “knowledge dynamic” is connected to individuals, groups, agencies, and/or institutions jousting for dominance. Since there is never a force which can attain complete hegemony over such a contested social space, these forces are in a constant effort to preserve and expand their influence and power. That means there cannot be one final, irrefutable, permanent model, solution, or theoretical definition or outlook that remains unchallenged for very long.

The chapter authors and their perspectives certainly point to the truth of a “knowledge dynamic.” There were 142 authors who wrote over a hundred chapters. They were from nine different countries: Australia, Canada, Israel, Japan, Malta, New Zealand, Turkey, the United Kingdom, and the United States. Eighteen percent were scholars of color and 58% were females.

As the reader traverses the handbook it is hoped that the exposition of the chapter content placed within its *field of memory, presence, and concomitance* will encourage future scholarship that is more reflexive, historical, and transparent in its claims and conclusions. Asking more probing questions about the conjectures, discontinuities, ruptures, and assumptions which undergird research and inquiry will hopefully produce more transparent and reflexive results as well as accelerate the development within the field.

## About the Editor-in-Chief

**Fenwick W. English** is Professor and Chairperson of the Department of Educational Leadership at Teachers College of Ball State University (2018 to present). Formerly he was the R. Wendell Eaves Senior Distinguished Professor of Educational Leadership in the School of Education at the University of North Carolina at Chapel Hill, a position he held since 2001. He has served at five other universities in the capacities of professor and department chair, dean, and vice-chancellor of academic affairs. As a practitioner, he has served as a middle school principal in California, assistant superintendent in Florida, and as superintendent of schools in New York State. He also has experience in the private sector where he worked as a manager/partner for 3 years at Peat, Marwick, Mitchell (now KPMG Peat Marwick) in Washington, D.C., and as an Associate Executive Director of the American Association of School Administrators in Arlington, Virginia. He was a member of the Curriculum Committee of the National Association of Secondary School Principals for over 10 years which published numerous position papers and pamphlets.

His record of publications includes over 42 books, 34 book chapters, 18 monographs and over 100 refereed journal articles. In addition, he has served as General Editor for the 2005 and 2011 *SAGE Handbook of Educational Leadership*; the 2006 *SAGE Encyclopedia of Educational Leadership and Administration* (2 volumes); and the 2009 *SAGE Major Works Series in Educational Leadership and Administration* (4 volumes). He is also the author of recent texts including *The Art of Educational Leadership* (2008) released by SAGE; *The Anatomy of Professional Practice* (2009)

released by Rowman and Littlefield Education; and with Rosemary Papa, *Restoring Human Agency to Educational Administration* (2010) published by ProActive of Lancaster, Pennsylvania. In 2016, he published *Leading Beautifully: Educational Leadership As Connoisseurship*, a co-authored book with Australian colleague Lisa Catherine Ehrich based on 3 years of research in Australia and America. He was named as an Adjunct Professor in 2015 for a 2-year term at the School of Cultural and Professional Learning, Queensland University of Technology, Brisbane, Australia. At the present time, he is also serving as an Associate Editor of the forthcoming Springer *Handbook for Promoting Social Justice in Education* (3 volumes) and Associate Editor of the Oxford University Press *Encyclopedia of Educational Leadership*.

Dr. English has presented his research at the University of Council for Educational Administration (UCEA); AERA (American Education Research Association) Divisions A and L; NCPEA (National Council of Professors of Educational Administration and now ICPEL), and BELMAS (British Educational Leadership Management Association Society) as well as the Australian Association of Research in Education (AARE). He was a member of the Executive Committee of UCEA for 7 years and served as President, 2006–07, and served two terms on the Executive Board of ICPEL (International Council of Professors of Educational Leadership) and former President 2011–2012. In 2013, he received the *Living Legend Award* from ICPEL. With Rosemary Papa he also assisted her in the founding of *Educational Leaders Without Borders*.

He received his B.S. and M.S. from the University of Southern California and his Ph.D. from Arizona State University.

# Educational Leadership in Uncertain Times: A Foreword

# 1

Peter McLaren

Ever since the recent pandemic and Black Lives Matter protests in over 2000 cities have helped to expose the grave inadequacies of neoliberal capitalism in meeting the basic needs of Americans, we have been living in a state of integrated madness, exacerbated by an attack on the Capitol building by conspiracy-minded insurrectionists attempting to overturn a legitimate election. Over recent decades our public square has been hewn into a divisiveness by mutant digital algorithms now defining our political culture and disguised as democracy. We know this political culture under the name “social media.” The algorithmic view that is the predominant paradigm of modern science can, I believe, be contested by the ontology of praxis – a philosophy of being and becoming that is exercised under the principle that we are unfinished beings in search of our humanity – who have an ontological vocation of becoming more fully human, as Paulo Freire would put it. If left unchained, however, these recombinant digital technologies operate by turning truth inside out, constantly revising reality for dangerously reactionary sectors of the public infected with conspiratorial paranoia and who fear the truth. Social networks prioritize which content a user sees in the likelihood that they will find it to be ideologically and often irresistibly compelling. Digital propaganda has raised concerns that news manufactured in online platforms that deliberately spread false information is undermining the legitimacy of the democratic process, and the authority of science, including the social sciences. These platforms now constitute an increasingly fractionalized media ecosystem where users can pluck elements from various websites that expressly conform to their strongest political inclinations. Conflicting positions

are not part of everyday digital information consumption in a world where the juggernaut of capitalism moves forward inexorably. Living at a time in which the governing episteme of our existence is in good measure that of mimetic rivalry and the root metaphor that of acquisition, the politics of moral agency is fading from everyday decision-making. Straddling the line between rightwing forces of fear and despair and the eliminationist discourse of cancel culture on the left, educational leaders walk a tightrope in institutions of higher learning that are filled with an overweening concern for optics and an obsession with rankings on the one hand and a preferential option for revealing truth and helping to exact accountability and justice, on the other. In such institutions, it appears that the inertial movement of critical studies is continuously backing up like matted hair in a kitchen faucet. The violent tendencies of acquisition culture is splaying its decadence across advertising websites, enabling dupery and filling the culture of predation with prosthetic sounds, panoptic space, and ethereal theories, precisely at the juncture where critical pedagogy and leadership studies need each other. Within our techno-galaxy of consumer fetishes and rust belt philosophies, ethical imperatives that accord with one's inner purpose have, tragically, become a forbidden pleasure. Attempts at insinuating a politics of truth within a culture of deception have so far left much to be desired.

Many look to our universities to bring some robust leadership and intellectual coherence and perspicacity to what has become a tinderbox democracy. However, by juggling inconvenient data, engaging in managerial code switching in the search for brand ascendancy, and avoiding administrative accountability, the inevitable ascent of neoliberal managerialism and metrics-based competition has proceeded apace. Universities have failed to live up to their promise. Lofty manifest objectives directed at educating for truth, equality, and enlightenment and redressing long-standing social inequities on campus have been unable to realize their own truth in practice because they reflect the racialized capitalist society in which they are situated. This is the unfortunate conundrum of what has been called the "hidden curriculum." Governed by their constitutive interest in the emancipation of the mind, universities make compulsory the language in which it is possible to state their principles and install the very language of democracy that makes their lofty goals unrealizable. In other words, they cannot carry out their aims and objectives and survive as an institution as long as they operate within the structure of capitalism and institutionalized racism and patriarchy. Thus, they are unable to abandon the promises that they cannot fulfill. The university becomes an institution parasitical upon itself. It becomes uniformly dependent upon self-deception. Saddling students with heavy loans and offering contingent faculty poor salaries with few, if any, benefits, universities make compulsory notions that it cannot make serviceable in a practical world.

Scholars and activists in leadership studies have often turned to social justice philosophers such as Paulo Freire to help redress the obstacles facing educators seeking advice in a society scarred by deep race, class, and gender divisions. Freire has always decried the fact that there exist social classes – that some live in opulence while others suffer. He opposed differentiating wealth – that some should be rich while others remain poor. During the Great Depression of 1929, Freire's family was forced into poverty, and Freire experienced the humiliation felt by his parents in their

attempts to feed the family. This was Freire's introduction into the culture of silence that helped to create the intergenerational social reproduction that condemned many Brazilians and their children to a lifetime of poverty. Yet over the decades, Freire was able to provide the poor with an ethical, ontological, epistemological, and pedagogical template from which to push forward in their fight for liberation, in their struggle for a right to live in dignity – a template for a partnership model of education that provides an important step in the direction of transforming a system of class exploitation that maintains privilege for a few at the expense of the many. The co-intentionality that pervaded Freire's pedagogy led to partnerships between teachers and students in which the teacher and student would co-construct their understanding of the world through dialogical encounters with the word and the world – and these acts of co-constitutive knowing are intended to calculate the curve of the arc of the moral universe in which we live. The arc of moral universe is not pre-bent toward justice. We need to bend it. That's the whole purpose of the critical pedagogy underlining Freire's leadership in the field of social justice education – to be able to divine the arc of our moral universe through our conscience and attempt to bend it toward justice through revolutionary praxis. Freire gives us a working conception of what justice could mean for the millions of people oppressed by ideologies, myths, lies, sociopolitical arrangements, social relations of capitalist production, and self-confirming rhetorical tropes. For some educational leaders Freire has been too militant. For other leaders, he has not been militant enough. Freire's work gains urgency, given the historical moment in which we live and the contextual specificity of our relationship to the world at that moment. And today, we are facing a global pandemic and a nation more divided politically than at any other time in recent history. But despite the various inflection points we encounter along history's tremulous path, Freire's work remains continually relevant to the larger struggle for human decency and dignity.

Leadership practice takes many forms, and the *Palgrave Handbook of Educational Leadership and Management Discourse* edited by Fenwick English is path-finding in its approach. This collection of articles by contemporary educational leaders is truly an archeology in the Foucauldian sense, covering the general history of leadership and management discourse, its enunciative field, folk mythology and heroic practice, its scientific standing, the hard fought social advancement of its women administrators and its various political discourses bridging race, class, gender, and sexuality. Under the broad umbrella of diversity, inclusion, and equality, a wide array of themes and topics such as STEM and technology are addressed, including online education in the age of the pandemic. Its contributors tackle the scourge of neoliberal policy, including the corporatization, financialization, and privatization of education and the courageous struggles of LGTB leaders and those who take up ethically robust critiques of class exploitation, white supremacy, and institutionalized racism. Educational struggles involving Asian American, African American, and indigenous educators are approached from critical perspectives that the authors, with formidable verve, attempt to make central features of educating today's educational leaders. Transdisciplinary contributions to the volume range from discussions of leadership styles to international perspectives on leadership

while broad theoretical discussions address topics such as social class, constructivism, postmodernism, postcolonial critique, democratic versus distributive leadership and mindfulness. To adopt a Freirean discourse for a moment, this volume presciently lays bare the limit situations that hinder the intentionality of contemporary educational leaders and their ability to fully engage history. Yet the contributors also bring to the discussion what Freire called “untested feasibility” – a catalyzing element in the construction of hope, of discovering new, creative solutions that can bring about substantive social change for the betterment of humanity. This is what makes the *Palgrave Handbook of Educational Leadership and Management Discourse* an essential volume for contemporary leadership studies in these uncertain times.

## Abstract

This chapter explores the notions of archaeology and discourse as central aspects of Michel Foucault's method and considers how these concepts can be used to explore educational leadership. The work of Foucault has been increasingly used to understand and interrogate a number of issues related to educational leadership. However, there has been less writing "using" his approaches rather than simply applying some of his concepts. This chapter considers how one might go about drawing on Foucault's methods to educational leadership so that a number of overlooked and hidden assumptions of leadership can be critically interrogated and new and genuinely different approaches can be developed for theory building in the field. The power of Foucault's discourse, it is argued, lies less in the application of his concepts but rather in the methodology to his archival writing and research that can provide new insights and understandings of knowledge formation in the field of educational leadership.

Educational leadership · Archaeology · Discourse · Michel Foucault

My books aren't treatises in philosophy or studies of history: at most, they are philosophical fragments put to work in a historical field of problems. (Foucault, 1991a, p. 74)

---

**Introduction**

The use of Foucault's work in the field of educational leadership has seen a range of incisive and complex tools and concepts with which to seek out new forms of knowledge. They can also provide different ways of interrogating this notion of educational leadership and how it has come into being. Numerous examples of this work exist, including analyses of principals' work and principals' subjectivities (Dolan, 2020; Gobby, 2013; Heffernan, 2019; Niesche, 2011, 2013), analyses of power and resistance (Anderson & Cohen, 2015; Anderson & Grinberg, 1998; Ball & Olmedo, 2013; Cohen, 2013; Longmuir, 2019; Niesche, 2013; Niesche & Keddie, 2016), development of discourse and discourse analyses of educational leadership (Gillies, 2013; Niesche & Gowlett, 2020; Niesche & Thomson, 2017), innovative genealogical methodologies and approaches (Mifsud, 2017), feminist approaches (Blackmore, 1999), leadership for learning (Lingard, Hayes, Mills, & Christie, 2003), and the intersection of education policy, Foucault, and implications for leadership (Ball, 1994, 2013). These examples of recent research are also only a fraction of the vast body of work in education generally from a Foucauldian perspective or drawing on Foucauldian ideas. There has clearly been substantial interest in the application of Foucault's work into education and educational leadership more specifically.

There is also a significant body of work in organizational studies drawing on Foucault that is relevant for educators looking at the nature of schools and schooling (e.g., McKinlay & Starkey, 1998; Mennicken & Miller, 2015). While this work has made a significant contribution to leadership and organization studies more broadly, given the extensive output of work from Foucault in the form of officially published books, collections of interviews and shorter works, and a comprehensive set of lecture series, there remains great potential in the exploration of ideas that have been given less attention and remain under-developed. Arguably, much of Foucault's early work prior to his specific and popular genealogical studies of prisons and punishment (Foucault, 1975) and sexuality (Foucault, 1976) remain a treasure trove of ideas that can further the field beyond the knowledge development already published. It is some of this earlier work that is taken up in this chapter as a way to move forward the field of those undertaking Foucauldian analysis of educational leadership.

One of the areas that have been less explored relates to Foucault's work on his methods of inquiry or his methodology works in *The Archaeology of Knowledge*

(Foucault, 2002a) and also various shorter pieces looking at the notion of discourse. *The Archaeology of Knowledge* is considered Foucault's "method book" (O'Farrell, 2005; Sheridan, 1980). As such, if one is interested in drawing on Foucault's ideas or to undertake genealogies themselves (Sawicki, 1991), then it makes sense to closely attend to how Foucault went about his investigations in his particular brand of historical and philosophical inquiry. That is the focus of this chapter.

In the first section of the chapter, I explain the methods and methodologies as discussed by Foucault in a number of shorter works (Foucault, 1991a, 2000, 2002b) and also the book, *The Archaeology of Knowledge*. Next is a brief discussion of his complex development of the notion of discourse that has so widely been adopted for a variety of means in education and educational leadership. Discourse is a term that has become ubiquitous and used to refer to almost anything, but Foucault did have a specific ensemble in mind when using this term. Also, importantly, he changed his views and usage of the term discourse between different books and chapters, thus making a clear and succinct definition more challenging. To understand and use Foucault's work requires an understanding of his methods, and hopefully this chapter will provide a basis upon which scholars, researchers, and thinkers in educational leadership can continue to draw on in order to further their own thinking and inquiries. This may be for the purposes of critically interrogating the often overlooked and sometimes hidden assumptions behind many of the models and theories developed for educational leadership – usually referred to in the form of adjectival models, leadership competencies, and standards, models of "best practice" and "what works" approaches that are so widespread in current thinking in the field.

---

## Foucault's "Methods"

Scholars often refer to taking a Foucauldian approach to their research or analysis. Usually this involves some Foucauldian concepts (e.g., disciplinary power and governmentality) and applying them to a particular issue, field, or problem. In fact, Foucault also wrote about the desire to see others use his books and ideas like "toolboxes" (O'Farrell, 2005). While there is no problem with doing so, as many of the scholars cited at the start of the chapter have done, but it may lead those unfamiliar with Foucault's work to infer there is a template to follow. This is certainly not the case and adds to the difficulty of using Foucault's work in an applied manner. The following are a number of "basic principles" as devised by Clare O'Farrell to think very carefully about when looking to apply Foucault's work:

1. *The first assumption that Foucault makes is that it is possible to produce and describe all human knowledge and culture in an orderly manner, but at the same time, human attempts to create order are always limited and crumbling at the edges. All forms of order should be challenged at every opportunity, so that people can understand why current orders exist and reflect on whether or not they should be changed.*

2. *The best tool to examine and dismantle existing orders is history. Every human action, idea, and arrangement exists in time: everything has a beginning and an end. No aspect of human existence escapes from history.*
3. *Foucault also consistently maintains that truth is a historical category. It is also a notion that has been of particular importance in Western history which has been marked, particularly since the Enlightenment, by a struggle between two mutually opposed methods of gaining access to the truth. On the one side there is the “intellectual” or “scientific” method which has gained ascendancy since Descartes and on the other hand an older method involving spiritual self-transformation and limit-experiences. Foucault deals with the opposition between these two approaches to truth in a variety of ways throughout his career, and consistently champions the non-Cartesian approach.*
4. *Foucault also holds that knowledge is always shaped by political, social, and historical factors – by “power” – in human societies. It is absolutely essential to examine the relationship between knowledge and the factors that produce and constrain it.*
5. *Finally, for Foucault, social justice is an essential ethical consideration that requires close and consistent attention, examination, and action (O’Farrell, 2005, p. 54).*

These assumptions have been inserted here in detail as they provide a much more useful way to “become” more Foucauldian rather than simply adding on his concepts for superficial analytic use. Therefore, what is important to note, in addition to this explicit recognizing of using particular theoretical concepts, is an implicit thinking and approach underlying Foucault’s work. Foucault did talk about this openly in a number of essays and interviews (Foucault, 1991a, 2000, 2002b; Lotringer, 1996; Pearson, 2001). That is, his approach to method and the notion of *problematization*. This is not a concept to be applied in the same way that disciplinary power might be but is more akin to a critical disposition of problem posing rather than problem solving. For instance, Foucault famously claimed that:

I have absolutely no desire to play the role of prescriber of solutions. I think that the role of the intellectual today is not to ordain, to recommend solutions, to prophesy, because in that function he [sic] can only contribute to the functioning of a particular power situation that, in my opinion, must be criticised. (Foucault, 2002b, p. 288)

It is in this way that Foucault worked to pose problems and to illustrate issues so that their complexity might be revealed and understood. The notion of *problematization* while reasonably self-explanatory is at the same time a little more of a complex balance than a simple questioning of what may be taken for granted. There is a fine line between posing problems, showing complex sets of power relations at work, and then allowing possible solutions to be devised. It was in historical analysis that Foucault avoided the need for prescribing solutions to the problems or issues he framed. Foucault explained that he was interested in a history of problems rather than providing solutions or in fact, writing a comprehensive history of any particular period or institution (see Foucault, 1991a; O’Farrell, 2005).

It was specifically the problem in its historical constitution that Foucault was interested in describing. Gillies (2013) writes about the use of Foucault's trident of scepticism, critique, and *problematization* that can provide powerful tools for examination of educational leadership as discourse. These elements are key components of Foucault's approach and his "method." This kind of approach leads one to examine questions of "how" rather than necessarily the "why" or "what" of issues and events. This is a key point of differentiation of Foucault's work from some others. Of course, this is not exclusive to Foucault but is more characteristic and stylistically what he was interested in through his research.

One of the other ideas Foucault referred to is that of the importance of events or *eventalization*. For Foucault, this term means "a breach of self-evidence" (Foucault, 1991a, p. 76) with reference to historical analyses whereby the temptation for many historians is to understand events within their continuity and historical constant and situation. However, Foucault is more interested in the pluralization of causes or understanding the event "according to the multiple processes which constitute it" (p. 76). This is an important element to Foucault's overall project and links in closely to the notions of *archaeology* and *discourse* which are discussed in the next sections. By way of brief summary, Foucault's approach is one that is more deeply rooted in the notion of *problematization* and this needs to be acknowledged through the adoption of his ideas rather than a simple adding on of his concepts.

---

## Archaeology

*The Archaeology of Knowledge* (Foucault, 2002a) is a challenging book but one that also unlocks much of Foucault's thought in terms of how he goes about his intellectual labor. Published after the hugely successful book, *The Order of Things* (Foucault, 1970), Foucault sought to clarify much of what he wrote in that book by detailing what Sheridan refers to as a "theoretical postscript to the earlier work" (Sheridan, 1980, p. 89). *The Order of Things* was a huge commercial and also critical success for Foucault and he became a household name in France, which is hard to imagine these days for such an intellectual providing a very difficult and complex look into the history of science and knowledge, or certainly Foucault's particular brand of historical inquiry. *The Archaeology of Knowledge* set out to clarify what were misunderstandings about Foucault's work as set out in *The Order of Things*, particularly in relation to his relationship with structuralism and also how he undertook his work. *The Archaeology of Knowledge* is a deeply theoretical elaboration of the approaches and concepts he used in *The Order of Things*, many of which were present in later works too. As such, it is important to engage with these ideas to understand what is entailed in a "Foucauldian approach" rather than simply applying decontextualized concepts of power, governmentality, and so on into other fields. Perhaps it is due to the book's complexity and perhaps even inaccessibility that few in education and certainly in educational leadership have deeply engaged with this

book and Foucault's methods therein, but there is much to be gained from a deep and ongoing reading of this important text.

In the beginning of the book, Foucault describes theoretical problems in relation to what he terms the history of ideas, of thought, science, or knowledge. Foucault writes of the continuities of historical inquiry and how he is shifting to one of a general history rather than a total history. For Foucault, more traditional historical approaches are interested in locating events and phenomena around a single center to provide meaning and context, establish periods and sequences that are "logical." However, a general history is more concerned with the displacement of the continuous, an investigation of the pluralification of elements, statements, discourses, and meanings to establish the emergence of a diversification of events. This is where it is possible to see Foucault shift away from structuralism (although he was sometimes charged with being a structuralist), although structuralism was more the object of Foucault's work and not the method to the work – a significant difference. With respect to this point, Foucault writes, "this book, like those that preceded it, does not belong—at least directly, or in the first instance—to the debate on structure. . .it belongs to that field in which the questions of the human being, consciousness, origin, and the subject emerge, intersect, mingle and separate off" (Foucault, 2002a, p. 18).

The bulk of the book then goes on to examine in great detail the notion of discourse, especially the statement and discursive formations which comprise the archive. Those are explored in the next section, but it is important to briefly outline this notion of archaeology that Foucault returns to in the later section of the book. For Foucault, the term archaeology refers to an historical way of ordering and analyzing discourses. It is his particular way of approaching a history of knowledge. The word archaeology itself invokes notions of digging away the sand or soil to uncover the history of the present. Like many of Foucault's terms he often shifts between various meanings of the term whereby he was less explicit about his interest in power and truth in his earlier works, although he has reflected back to say he was interested in these issues without explicitly referring to power, for example. Foucault claims archaeology was concerned with examining discourses themselves in their emergence, not for the purposes of arguing for a "better" one but rather how they come into being; what was said, how and under what rules they operated, and practices formed through them. Foucault talks of the notion of re-writing or "a transformation of what has already been written" (2002a, p. 156). As Foucault explains:

Archaeology – and this is one of its principal themes - may thus constitute the tree of a derivation of a discourse. . .it will place at the root, as **governing statements** (original emphasis) , those that concern the definition of observable structures and the field of possible objects, those that prescribe the forms of description and the perceptual codes that it can use, those that reveal the most general possibilities of characterization, and thus open up a whole domain of concepts to be constructed, and lastly, those that, while constituting a strategic choice, leave room for the greatest number of options. (Foucault, 2002a, p. 164)

Thus, Foucault's attempts to describe this history of ideas, of emergent discourse is not for the purpose of periodization or claiming a continuous line of history and development but rather for pluralizing events and of alternative questions and

discursive shifts; an alternate approach not a normative one that seeks to provide a better or truer account. To date there has been no real attempt to undertake this in educational leadership.

---

## Discourse

There are few more used terms in social theory than that of discourse. Even to the point where it has become ubiquitous and may mean almost anything. However, Foucault uses the term discourse in both specific and also quite different ways (even with himself using various definitions across books and essays) and thus eluding a fixed definition at times. Nevertheless, it is commonly accepted that Foucault uses the term discourse to designate “practices that systematically form the objects of which they speak” (Foucault, 2002a, p. 54). In other words, for Foucault, discourse refers to a certain way of speaking or a group of verbal performances, but more concisely is comprised of:

- That which was produced by groups of signs
- A group of acts of formulation, a series of sentences or propositions
- A group of sequences of signs, in so far as they can be assigned particular modalities of existence (Foucault, 2002a, pp. 120–121).

This is essentially what comprises a discursive formation for Foucault. These general comments regarding discourse and discursive formation indicate more than just language but are focused on practices and as a result it is what discourses do that becomes important. Discourses make certain truth claims that frame what is said, what can and cannot be said in relation to particular phenomena. How it is that certain statements are privileged over others and under what conditions they are uttered and linked to certain claims to truth. Of course, language is an important element of this, but it is the power effects that Foucault studied in prisons, health, sexuality, and madness among other areas. The term discursive practices is illustrative of trying to pin down more closely the workings of discourse in this sense rather than staying at a more abstract level. Foucault worked at length on these historical manifestations of discourse, indicating that they must be studied, historically rather than to make them prescriptive. It is in this sense that Foucault referred to discourses also as “verbal traces left behind by history” (O’Farrell, 2005, p. 78). Taking the notion of educational leadership as a form of discourse (Gillies, 2013) or multiple discourses (Niesche, 2011) would introduce instability and discontinuity into the notion and its general propositions and understandings. As such, to do this kind of historical tracing reveals the formation of certain truths and power effects in the field and would establish how certain ideas, concepts, and approaches have come to be privileged over others at different times. Different from a form of continuous history making, this sheds light on leadership as an effect of discourse (Lingard et al., 2003), to show the constitution and effects of educational leadership discourse or discursive field.

Educational leadership discourse exists through certain conditions rather than the changing object of discourse itself. Its existence depends on conditions in which complex sets of relations occur at a particular time and place. It is the revealing of these relations that becomes important for an analysis of discourse. It is not so much the “truth” of discourse or the identification of a fixed object itself that is important, rather it is:

To define these objects without reference to the ground, the foundation of things, but by relating them to the body of rules that enable them to form as objects of discourse and thus constitute the conditions of their historical appearance. (Foucault, 2002a, p. 53)

Bringing this back to the notion of educational leadership, then it is not the aim to find out what leadership is, to define it, to find the ultimate truth of it, but to examine its constitution, the rules of its formation as a discourse, what is said, when it is said, and what its intended and unintended effects have been. This then links back into the notions of *eventalization* and *problematization* and also the key themes or methods of Foucault’s investigations that are different from other forms of inquiry. **A Foucauldian approach to analysing educational leadership is not to define it, to develop a new model, or to provide (reduce) it to a solution for education (usually as a form of best practice), but to investigate its formation as discourse.**

Some key questions are required to do this type of analysis. For Foucault, these are in the *formation of enunciative modalities*. By this Foucault refers to the role of statements in discourse that imply complex sets of relations, or those that multiply, diversify, and form pluralities of discourse rather than working toward a unifying theme or whole. Foucault offers a range of questions in getting to the formation of these enunciative modalities:

- Who is speaking? Who is accorded the right to use this sort of language? Who is qualified to do so?
- What is the institutional site from which this discourse derives?
- What is the position of the subject in relation to the various groups of objects? (Foucault, 2002a, pp. 55–58).

These questions are examples of how Foucault interrogates discourse and discursive formations. While these questions and ideas have been used specifically in educational leadership elsewhere to form particular lines of inquiry (see Niesche & Gowlett, 2020; Niesche & Thomson, 2017), there is broader utility and purpose to consider these across many domains and fields. Considering these questions is important in the formation of discourse. For example, Foucault uses the example of the doctor in the formation of medical discourse. Clearly the doctor has a special place and status in the formation and enunciating of medical statements and claims. The doctor has a privileged status – one need only look the recent example of Covid-19 and the importance of expert opinion of epidemiologists in policy and strategy formation tackling the pandemic. Who is speaking is clearly of importance to the formation of discourse. Further, the institutional site from which the individual makes their

discourse is also relevant. This is particularly apparent for the academic in terms of their institutional status accorded to a particular university or research organization. There are a whole range of hierarchies, qualifications, registrations, accountabilities, and sources of verification that lie behind the individual speaking from an institution. The third question Foucault lists above relates to the distance or relationship the individual has between themselves as speaking subject and the domain or group of objects. As a questioning, listening, observing, and seeing subject there is some maintenance of “impartiality” to the topics or issue that needs to be maintained or seen to be maintained for their views to be respected and valued.

Following on from the above questioning in *The Archaeology of Knowledge*, Foucault then moves to explaining the formation of concepts and strategies as key elements in the historical formation of discourse. He does this by further refining down the scope of analysis to the statement, of which he defines as “the atom of discourse” (Foucault, 2002a, p. 90), or “that which enables groups of signs to exist, and enables these rules or forms to become manifest” (p. 99). Without delving into detailed structural linguistics here, it is important for Foucault to delineate, at the level of the statement, how discourse is formed and also its rules of formation. This then is the level at which discourse functions, and needs to be analyzed, to provide the critical tools for archaeological investigations that Foucault is most well-known for. This seems to be the element that is missing from detailed use of Foucault’s work, or to actually **do** archaeology or genealogical investigations. There are many studies drawing on Foucault’s concepts but few that actually undertake his approach into other fields or disciplines. It is less the point about more studies or research needing to draw on Foucault that is being advocated here, but those that do use Foucault should be “more Foucauldian” in approach and not simply adding on Foucauldian concepts.

---

## Educational Leadership as Discourse

So, what is this all got to do with educational leadership? Well arguably not very much if, by educational leadership, one is only interested in school effectiveness and improvement and more instrumentalist accounts of educational leadership. However, as explained in Foucault’s approach and methods, if the interest is in how knowledge domains such as school effectiveness and improvement have come about, historically and in terms of the formation of particular discourses, discursive formations, and enunciative fields that use particular statements, then Foucault’s ideas may have something substantive to offer in terms of interrogating how these knowledge domains and formations have come to be the way that they are. This may be for the purposes of understanding or problematization. The same could be said for any of the knowledge domains or traditions – for example, Helen Gunter (2016) has undertaken an excellent analysis of intellectual histories of school leadership and research using the categories of:

- Educational administration
- Educational effectiveness and improvement

- Entrepreneurs and popularizers
- Critical educational policy and leadership studies

While there are numerous other useful categorizations of the “field” of educational leadership (e.g., Culbertson, 1988; Donmoyer, Imber, & Scheurich, 1995; Eacott, 2018; Evers & Lakomski, 1991; Gunter & Ribbins, 2003; Willower & Forsyth, 1999), one could undertake Foucauldian analyses of any of these intellectual histories to examine how the associated discourses have emerged, under what rules and conditions, and how they have formed and changed to the point that we are today. In other words, a history of the present of educational leadership. However, what is less studied is the broader conditions or environment in which educational leadership discourses manifests. Rather than analyzing the objects of leadership themselves, one could analyze the formation of leadership discourse within the recent movement of neoliberalism into education and educational leadership.

As was stated at the start, there are numerous scholars who have employed both Foucault’s methods and his concepts in the field of educational leadership. However, it seems that at the present moment there are particular tensions for educational leadership in a time where neoliberal influences on education policy and reforms (as they have been for a few decades now) are still a persuasive force. If discourse formation needs to be studied if and when it occurs and is influenced by their social cultural and political contexts (Blackmore, 1999), then to understand educational leadership discourse, one must examine the contexts with which it is not only intersecting but also that helps constitute it as a particular kind of discourse. In addition to approaching an analysis of educational leadership as discourse during neoliberal influences, one must also seek to understand the history of neoliberalism, the history of educational leadership, study their discursive formations, policy context and reform (e.g., Brown, 2015; Dardot & Laval, 2013). This is important work that underpins much of what counts as educational leadership today in terms of those exercising educational leadership in all education settings and also those researching educational leadership – not that they are necessarily two distinct entities, as they certainly are not.

Scholars in educational leadership are prone to emphasizing the importance of context in defining leadership practice, and yet then make a shift to prescribing how things should be or done accordingly. While this is problematic on a number of levels, it also indicates a narrow approach to that of context, usually described as a school or school system. What is much less analyzed and understood within educational leadership (it is much better understood and theorized in education policy, education sociology, and other disciplines) is how leadership is constituted through particular neoliberal discourse. Some exceptions tend to be in the more socially critical approaches to educational leadership but is vastly absent from other domains. A closer inspection of neoliberalism and its role in crafting particular approaches to leadership would help illuminate how and under what conditions or circumstances these particular versions of educational leadership become privileged and others constrained.

An example might be the role of school autonomy and leadership whereby shifts to more autonomous schools have had profound effects on what educational leadership is and how it is positioned and constructed in policy documents and academic discourse. The early days of school-based management (Caldwell & Spinks, 1988)

were more about transformational leadership whereas more recently there has been a focus on distributed leadership (with the acceptance that the job is too big for one person at the top, e.g., school principals) and also instructional leadership. Even more recently is the notion of “system leadership” as being key across more autonomous schooling systems (e.g., see NSW Department of Education, 2020). However, underlying these leadership discourses are pressures of workload, health and well-being and work/life balance issues, restrictive accountabilities, school choice policies and competition and large administrative burdens (Heffernan & Pierpoint, 2020; Ontario Principals Council, 2017; Riley, See, Marsh, & Dicke, 2020). These factors are shaping educational leadership in ways that are in tension with formal academic discourse and the desires of school leaders about what the role should or should not be. It is these spaces, where discourses form that of which it speaks, that there needs to be more interrogation and analysis. The chapters in this handbook, while not necessarily using Foucault’s ideas explicitly (or at all for some), are interested in at least probing into some of these issues and questions in different domains within the field. These are just a few possible lines of inquiry or critique that do need to be undertaken, with less attention given to capturing fads, fashions, and finding quick and marketable solutions under the guise of leadership.

---

## Conclusion and Reflections

The aim of this chapter was to introduce a number of Foucault’s methods and ideas that have been less explored and used in educational leadership research. These approaches are also key elements to the formation of this edited collection and so it has been necessary to briefly discuss the importance of the ideas and approaches behind Foucault’s more commonly understood and utilized concepts so that readers and users of this collection can better understand and target their approaches to their respective disciplines and fields. Keys to this work include notions of *problematization* and *eventalization* along with *archaeology* and the commonly used notion of *discourse*. In the final section of the chapter, there was a brief discussion of how these approaches might be put to work in looking at the role of neoliberalism and its relationship and intersection with various educational leadership discourses drawing on the mapping from Helen Gunter. The power of Foucault’s discourse lies not so much in the application of his concepts or tools, although this is still a useful appropriation to understanding many issues, but rather in his broader approach or methodology that can provide others with new insights and understandings of knowledge formation in the field of educational leadership.

## Abstract

While leadership is the contemporary focus of what is known as educational leadership, this has not always been the case. In the past educational administration and educational management have been the orthodoxy. In trying to capture the history of this field, it is commonplace to chronologically lay out the changes in labels and discuss the many different iterations of leadership (e.g., instructional, transformational, servant). While this can be a useful introduction to the field, it does require an uncritical acceptance of the idea that leadership, management, and administration are distinct analytical categories. To offer a distinctive account of the history of leadership thought in education, this chapter focuses not on the content of research (e.g., types of leadership) or a chronological account of themes but instead on the underlying generative assumptions of knowledge claims. The choice of labels from administration through to management and now the contemporarily popular title of leadership is not as distinct as many would argue or are led to believe. The choice of labels says more about the temporal conditions of claims and the pre-existing normative assumptions of authors than anything else. To that end, this chapter illuminates the assumptions of major approaches (adjectival,

**The Field of Memory**

Earlier labels for the field such as “educational administration” and “educational management” have been relegated to history or are now viewed as deficit or less than the contemporarily popular label of “educational leadership”. Despite this, many of the underlying assumptions of administration and management prevail.

**The Field of Presence**

Educational ‘leadership’ is the dominant label for the contemporary field. Not only is it contemporary, but for many it is seen as necessary for organizational improvement and/or high performance. Irrespective of what are considered the desired outcomes of education, there is a form, type, descriptor for leadership that meets that requirement.

**The Field of Concomitance**

From its very inception, educational administration and leadership have borrowed explanatory resources from other fields. Even the contemporary focus on leadership has its roots outside of education. Almost all major concepts in educational leadership thought originate in other fields and are at best appropriated into educational leadership and at worst simply borrowed and applied.

**Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field**

Leadership thought in education has experienced many ruptures in shifting from great man/heroic approaches through to trait, behavioral, practice orientations, the pursuit of a science of educational administration though the Theory Movement, Greenfield’s humanistic intervention and then the broader social critical critiques. Each of these ruptures have accompanying assumptions that germinate new lines of inquiry but not necessarily within field dialogue and debate.

**Critical Assumptions or Presupposition**

Rather than provide a chronological snapshot of the history of leadership thought in education, this chapter focuses on the underlying generative assumptions of different positions on leadership. The key argument being that rather than focus on labels – those which change with the times – there is greater explanatory value in illuminating the assumptions of different positions and the implications of those assumptions for understanding leadership in education.

## Introduction

The first Departments of Educational Administration were established at universities in the USA during the early decades of the twentieth century (Callahan, 1962; Tyack & Hansot, 1982), with Commonwealth nations a few decades later (Baron & Taylor, 1969). This creates a lengthy history on a global scale. However, despite this presence in universities, research has not necessarily been a high priority for educational administration and leadership professors (Hills, 1965; Immegart, 1975), with William (Bill) Walker (1964) – the pioneering Australian scholar of educational administration – noting “[I]n some quarters, the necessity for any formal study of administration on the part of educators is seriously questioned” (p. 12). While in recent decades, the generation of knowledge through research has taken on greater importance for those employed in universities (Tschannen-Moran, Firestone, Hoy, & Moore Johnson, 2000), the enduring tension between research and experiential based knowledge claims – often pitched as theory and practice (although that is an inaccurate label) remains strong in educational leadership (Eacott, 2021). The field has been prone to following fads and fashions (► Chap. 9, “‘The Next Big Thing’: A Delineation of ‘Fads’ and ‘Fashions’”), many from outside educational leadership (Peck & Reitzug, 2012). Taken together, these factors have a significant influence on the history of leadership thought in education.

There have been many attempts to capture the history of research on educational administration and leadership (Burgess & Newton, 2014; Culbertson, 1988; Leithwood & Duke, 1999), including its epistemological assumptions and knowledge claims (Eacott, 2017; Evers & Lakomski, 1991; Oplatka, 2010) and the field in general (Boyan, 1988; Leithwood et al., 2002; Leithwood, Chapman, Corson, Hallinger, & Hart, 1996; Murphy & Louis, 1999). As with all domains of knowledge production, particularly in the social sciences, educational administration and leadership have not been immune to issues of credibility within the academy. In pursuit of scientific status, the field experienced what has come to be known as the Theory Movement, a US-centric movement in the 1950s influenced by (Vienna Circle) logical positivism where knowledge claims were based on hypothetico-deductive structures derived from observational statements based on (natural or curated) experiments. This served the field well in seeking to establish credibility but also raised many questions about what constitutes useful knowledge in educational administration and leadership.

The paradigm wars of the late twentieth century did not exclude educational administration and leadership (Waite, 2002). Impact on the field is best captured in the germinal work of Thomas Barr Greenfield (1973, 1974), a pioneering Canadian scholar who opposed logical positivism and argued for an humane science of educational administration (e.g., Greenfield & Ribbins, 1993). Subsequent disruptions, although to differing degrees of impact, include a Critical Theory of educational administration from the likes of Richard Bates (1980) and William Foster (1986), Colin Evers and Gabriele Lakomski’s (1991, 1996, 2000) naturalistic coherentism, and various forms of post-modernism (English, 2003; Maxcy, 1993), post-structuralism (Niesche, 2014; Niesche & Gowlett, 2019), feminism (Blackmore, 1999; Fuller, 2022),

anti-racism (Diem & Welton, 2020; Lopez, 2021; Miller & Callendar, 2019), post-colonialism (Samier, 2021), and relationality (Eacott, 2018). In short, since the 1970s there has been great diversity in educational administration and leadership thought.

More than just diversity of thought, the last 40 years has witnessed the further partitioning of school effectiveness and school improvement, and educational change away from educational administration (e.g., Chapman et al., 2016; Hargreaves, Lieberman, Fullan, & Hopkins, 2009) and the seemingly uncontested rise of leadership as the core focus of the field (Thomas, 2006). The shift, almost exclusively, to leadership in the field has been met with some critique (e.g., Eacott, 2018; Lakomski, 2005; Lakomski, Eacott, & Evers, 2017), but questioning or querying of leadership remains not just peripheral but marginalized in the field as the core continues to proliferate literatures.

To offer a distinctive account of the history of leadership thought in education, this chapter focuses not on the content of research or a chronological account of themes but instead on the underlying generative assumptions of knowledge claims. The choice of labels from administration through to management and now the contemporarily popular title of leadership is not as distinct as many would argue or are led to believe. The choice of labels says more about the temporal conditions of claims and the pre-existing normative assumptions of authors than anything else. To that end, this chapter illuminates the assumptions of major approaches to educational administration and leadership thought and the impact of those assumptions.

---

## Complicity with the Label of the Day

Pointed out by John Dewey (1902) and then later by Richard Bates (2010), it is easy to separate the administration of schooling from education. As schooling moved from the single room schoolhouse to larger sites and ultimately systems with the spread of mass schooling in the twentieth century, educators were forced to grapple with the need for administrative oversight. The uncomfortable marriage of education and a potentially bureaucratic administration was and continues to be an uneasy one. For a fledging field without any core disciplinary specific knowledge base, it meant that the key actors and policy makers of the time were somewhat forced to look elsewhere for insights. At the same time, Frederick Winslow Taylor (1911) was advocating his principles of scientific management developed in the pig iron factories of Bethlehem Steel Mill, and they proved popular with the early professors of educational administration (many who had backgrounds outside of education themselves) and carried on throughout the first half of the twentieth century (Callahan, 1962).

Looking outside of a core disciplinary knowledge base or what Fenwick English (2006) labels a “knowledge dynamic,” contemporary educational leadership faculty and professional associations have sought less the counsel of other fields but instead the reformers (Waite, 2016), consultants (Gunter & Mills, 2017), gurus, and social media influencers (Eacott, 2020) promoting their version of educational change and reform. There has become a lucrative – professionally and personally – career path for the players on the international keynote circuit

who travel the world outlining their solutions to solve enduring problems (e.g., structural inequities) as though no-one has ever thought of the problem or been working on it previously. In doing so they promote the latest buzzwords for what it takes to be a thought leader, agile, influencer with little regard for what such labels mean or their relationship with expertise.

The importance of labels and language comes to the fore when discussing the history of leadership thought in education. There is little doubt that leadership is the core focus of the contemporary field. The shift from educational administration through to management and now leadership confirms its primacy. Academic journals, as a key artefact of a field's knowledge production and core claims, are a useful site to look at changes in a field (Thomas, 2010). Table 1 displays the major journals in educational leadership, management, and administration with particular attention to the titles and year of establishment (including changes in titles).

While administration remains in the titles of the five longest serving journals in the field, by the 1980s management (and even organization) crept into titles or was even used instead of administration. The 1990s onwards has seen the rise of leadership and it would be difficult to see any publisher supporting a journal or book series that does that use the contemporarily popular label – educational leadership. The most overt example of a journal seeking to match the titles of the times is the British Educational Leadership, Management and Administration Society's flagship journal – *Educational Management, Administration and Leadership* published by SAGE and currently edited by Tony Bush, who himself has published many textbooks in the field (e.g., Bush, 2011). After launching under

**Table 1** Major journal titles (and changes) over time in educational leadership

Journal title (previous titles)	Establishment decade				
	1960s	1970s	1980s	1990s	2000s
Journal of educational administration	1963				
Educational administration quarterly	1965				
Journal of educational administration and history	1968				
International studies in educational administration		1970			
Educational management, administration & leadership					
Educational administration		1972			
Educational management and administration			1982		
Educational management, administration and leadership					2004
School leadership and management					
School organization			1981		
School leadership and management				1997	
International journal of educational management			1987		
Journal of school leadership				1991	
International journal of leadership in education				1998	
Leadership and policy in schools					2002

the title “Educational Administration” in 1972, the journal added “management” in 1982 and then “leadership” in 2004. In explaining the latter decision, Bush (2004) notes, that while leadership had been garnering increasing attention in the previous 15 years, and the choice of label was related to geo-spatial location (e.g., management being preferred in Britain, Europe and Africa, and administration in the USA, Canada, Australia and New Zealand), there is “little evidence of any substantive differences in the meaning of these concepts; it is simply a question of national custom and practice” (p. 6).

What remains is a challenge to explore the underlying generative assumptions rather than necessarily engage in countless debate over the definitions. This is particularly the case given there is no empirical referent for leadership, yet its centrality in the social world creates an ontological complicity in researchers (and others) that makes it difficult to epistemologically break ordinary language. The uncritical acceptance of leadership as not just a thing, but a thing worthy of study grants it ontological status. Despite the absence of an empirical referent, there is a belief that leadership exists, and researchers draw on socially constructed resources such as categories of leadership to then correlate and coordinate their accounts with the accounts of other researchers and practitioners in a constantly emerging narrative of the importance of leadership based on original constitutive beliefs in its own importance.

Gaston Bachelard (1984 [1934]) denies science the certainties of a definitive heritage and reminds us that it (science) can only progress by perpetually calling into question the very principles of its own constructs. Therefore, to understand something (e.g., educational leadership), not just uncritically accept the categories and constructs of the ordinary language of the everyday, one must pay attention to the underlying generative assumptions. Educational leadership (although no more than any other domain of social scientific inquiry) functions only in so far as it produces a belief in the value of its product (e.g., organization). As Simon Kelly (2008) argues, debates around the definitions or categories of leadership are futile as they are the product of a design problem. Leadership owes its existence to the currency of public concern over particular social issues (e.g., improving student outcomes) and the belief that leadership – not administration or management – is the solution.

---

## Leading as Organizing

Peter Gronn (2010) argues that leadership is part of the equation because above a certain numerical threshold, the self-organization by small collaborating groups/individuals proves difficult. Although using a different language, and resulting in a more structural narrative, Max Weber’s (1978 [1922]) pays particular attention to how groups organize at scale leading to his description of the bureaucracy. Focusing on leadership, Brian Caldwell (2007) makes the claim that ‘leadership must result in change. If no change occurred then either leadership failed or leadership was not needed’ (p. 225). Working with Caldwell, Gronn, among

others, Eacott (2018) proposes two core underlying assumptions guiding educational leadership research:

- i) A group (i.e.,  $n \geq 2$ ) requires some form of organizing.
- ii) If there is leadership, there is change

The genesis of leadership is found in a social group (of two or more individuals) undertaking some activity that requires a form of organizing. In the absence of such organizing there are just disparate groups or individuals working in parallel. Distinctions in this organizing, beyond individual preference, between leadership, management, and administration have no definitive resolution or analytical criteria unless a desirable outcome or criterion is imposed upon them. Leadership is not a self-contained idea. Put simply, leadership is the advocacy of a particular form of organizing.

The linking, or conflating, of leadership with change is common. However, once again there are issues of advocacy for a particular version being granted status. In other words, leadership researchers go out observe empirical evidence to support their pre-existing normative assumptions about what is leadership. When the change that is desired is evident, these data confirm and validates the original assumptions. Alternatively, if there is no evidence to support the original assumption, then it can be dismissed as non-leadership. In doing so, leadership is conflated with positive or desired change as defined by the observer. The difficulty with such a position, paraphrasing Eacott (2018), is that while change is a requirement or essential property of leadership, leadership is not necessarily a requirement for change.

To avoid defaulting to advocating for a particular outcome or a form of organizing, it is possible to shift the focus of inquiry to the underlying assumptions of organizing embedded in claims of leadership. In centering organizing the key assumption of interest becomes how do different positions conceptualize social relations. These relations may be between, among or even constitutive of and emergent from what we come to know as things or organizing itself.

Table 2 provides a transition between the chronological account of the history of leadership thought in education to categories of assumptions of organizing. The somewhat timeless accounts of great men/heroic leaders, captured in at least the work of Thomas Carlyle (1841), and arguably many others before him, have been central to historical accounts of just about every civilization. History is very much a biography of great men and the decisions they made. While to some extent an outlier in its assumptions around organizing – as they remain very much grounded in the work of an exceptional individual – these great man/heroic leader accounts are just as common in the contemporary educational leadership thought as they were 100 + years ago. Ross Thomas (1998), long-time editor of *Journal of Educational Administration*, used movies with his classes to demonstrate how this was one of the common ways in which school principals were portrayed in popular culture. The study of turnaround leaders or those leaders generating better than expected outcomes, without attention to the various social, cultural, political, spatial, and historical relations impacting on organizational outcomes continues this line of inquiry.

**Table 2** Major developments in the field

Leadership thought	Time period	Description	Assumptions of relations	Analytical category
Great man/heroic	Late nineteenth century (timeless)	Concerned with advocacy for a particular version of how things ought to be	Adjectival	Adjectival
Trait theory	Early twentieth century	Concerned with identifying the traits of effective leaders	Co-determinist	Scientific
Structural	Early twentieth century	Concerned with identifying the structural arrangements of effective organizations	Co-determinist	Scientific
Human relations	Early-mid twentieth century	Concerned with identifying the behaviors of effective leaders	Co-determinist	Scientific
Humanistic	Mid-late twentieth century	Concerned with the generation of organizational reality through subjective perception	Conflation	Conflationary
Social critical	Mid-late twentieth century	Concerned with the simultaneous constitution and emergence of organizing activity	Relational	Relational

Borne out of these great man/heroic leader narratives is a focus on traits shared by leaders. The shift is subtle but significant. Whereas the great man/heroic leader focuses on the individual and seeks to advocate for a normative version for others, trait-based approaches sought to identify the elemental traits shared by effective leaders. Such an approach was designed to enable the timely identification of leaders and potentially as a basis for improving or harnessing those pre-disposed gifts. Optimizing these traits would be through recognizing the co-determination of desirable outcomes courtesy of the collection of traits.

Alternate approaches around the same time focused less on the individual and instead on the structural arrangements (e.g., Taylor, 1911) or behaviors of leaders (e.g., Mayo, 1933; Stogdill & Coons, 1957) later including context through contingency approaches (e.g., Fiedler, 1967) or situational leadership (e.g., Hersey & Blanchard, 1969) and often linked with Douglas MacGregor's (1960) Theory X and Y for motivation. It is worth noting that Elton Mayo and colleagues' work, particular the Hawthorne Studies (which focused on the behavior of workplace groups), is considered as a counter argument to Taylor's structural arguments. The former focused on the management of employees and seeking to maximize profits for both employer and employee, the former focused on the workers as individuals. That said, as with trait-based approaches, structural and behavioral approaches assume a co-determination of factors leading to outcomes. Optimizing organizations is made possible through manipulation of organizational components (e.g., structural) or behaviors (e.g., behavioral) to achieve the desired outcome. Nowhere is this more evident than in the work that aligns with, follows, or builds upon William

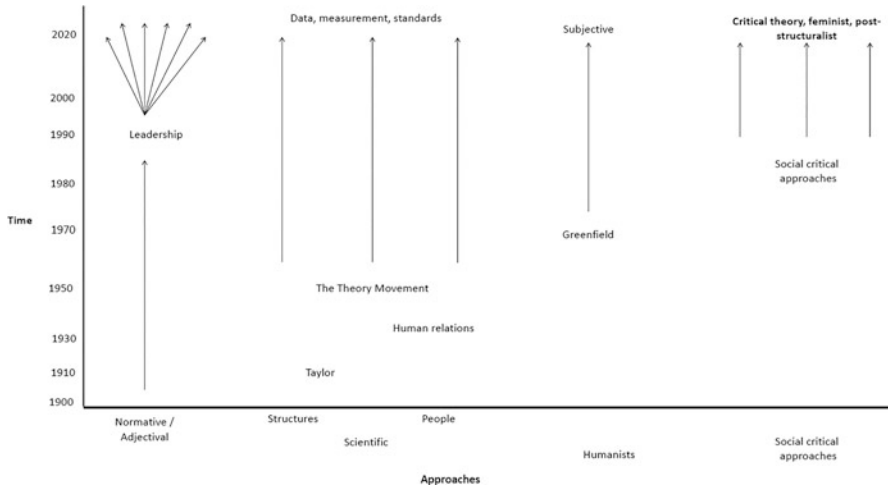

E. Deming (1982, which built on the work of Walter Shewhart of Bell Laboratories in New York) and his Plan-Do-Study-Act which focuses on the role of data to inform decision making.

To this point, the origins of explanatory approaches (great man/heroic leaders; trait; behavioral) have been from outside of education. Even if we take the Theory Movement to be the field specific appropriation of broader scientific approaches to understanding organizing and organizations, it does not find its genesis in educational administration and leadership. Despite pursuing a science of educational administration, as espoused by key figures at the time such as Andrew Halpin (1966), Daniel Griffiths (1959), and Jack Culbertson (1981), it was unable to deliver on the promise. Put simply, there were too many variables to capture the nuance of educational organizations. Evers and Lakomski (1991, 1996, 2000) have, however, consistently argued that it is not science that is the problem, but the kind of science (e.g., logical empiricism) taken up in educational administration.

Thomas Barr Greenfield's work was an intervention for the field that was grounded within the field. Influenced by the work of Max Weber, Greenfield brought a philosophical position to educational administration and leadership that blurred the boundaries between structures and individuals. He argued that human will, and values were fundamental to educational organizations and that such organizations were generated by organizational members rather than separate to them. This conflating of entities previously thought of as separate (e.g., the organization, organizational members) by denying their original separation was a major explanatory disruption to the field – one more welcomed by Commonwealth nations and by USA based researchers. Australian, New Zealand, Canadian, and to lesser extent British researchers were more comfortable with the subjective and interpretivist approaches than USA-based colleagues you were still deeply influenced, even if second generation, by the Theory Movement and its pursuit of an objective science.

Blurring the boundaries between organizing activity and broader contextual matters, including issues of race, gender, place, colonialism, history, among others are relational approaches. This array of approaches is concerned with the unfolding societal relations that are shaped by and shaping of the work of education. Working within and beyond educational administration and leadership, these approaches make the unfolding relations of the social world their focus and educational organizations an empirical example of broader issues. These approaches see education and educational organizations as both embedded in and embodying society. In doing so, they add a messiness to discussions as discrete things are not possible and instead the key message systems of education (teaching, curriculum, and assessment) and issues impacting upon staff, students and communities are all part of wider discourses and not bounded to the organization. Taking various forms, these relational approaches have long been marginalized in educational administration and leadership as they infrequently offer concrete actions to be implemented or applied. Rather than problem solving, they are more likely to problem pose, inviting questions and reflections on what is done and what could be done.

Although the various analytical categories provided in Table 2 (adjectival, scientific, humanist, relational) came into conversation with educational administration and leadership at different times over the past 120+ years, they all remain active – to

**Fig. 1** Historical mapping of explanatory approaches to organizing in educational leadership

varying degrees – in contemporary thought and analysis. As Fig. 1 shows, the normative/adjectival approach that underlies the great man or heroic leader narratives is the basis for much of the leadership discourse of the field. The proliferation of books on how to be a certain type of leader – with fast evolving adjectives is commonplace. Structural, behavioral, and trait-based approaches which sought to bring a scientific approach to the identification, leveraging, and optimizing of organizational assets to maximize outcomes is evident in the continued attention to or rise of data, evidence informed practice, measurement and dashboards, and professional standards for leaders and educators. A humane science remains a marginalized pursuit but has reached become a viable alternative in the field, even if not employed in the way Greenfield may have intended. Social critical approaches in all forms similarly remain marginalized as they ask many questions of accepted norms and behaviors, yet they have reached enough of a critical mass internationally that an increasing number of outlets have provided a network for researchers even if their collective impact is not as great as desired.

## Implications for Leadership Thought

The diversity of underlying assumptions has implications for scholarship in the field. Distinctions in the ontological, epistemological, normative, and ethical assumptions of the adjectival, scientific, conflationary, and relational approaches shapes the empirical and explanatory problems they conceive, the solutions they seek and the ideas they reject.

Adjectival approaches are concerned with advocacy for a particular version of how leadership ought to be. There is a belief that leadership is an external knowable

reality and that knowledge claims can be either empirically verified or simply linked to an aspirational goal. The normative appeal is that leadership is good, a path to something better for both the individual and society and that it would be unethical to not pursue such an endeavor. To achieve this, the author or presenter has not only a vision but the superior vision of how to deliver on the promise. Adjectival positions consider educational organizations as not performing as well as they could be. The proposed solution is to copy the path outlined by the author or presenter. There is frequently an appeal to the moral obligation to either copy what great leaders have done or follow the outlined path towards a utopian version of the future.

Scientific approaches assume that organizational outcomes are the product of the relationships between two or more entities (variables) within or beyond the organization. These relationships and entities are considered to part of an external knowable reality where objective knowledge claims can be empirically verified through inquiry. The normative assumption is that improvements can be achieved through objective knowledge of what works, and it would be unethical to not do so. These approaches can work across ideas of structure and agency through co-determination of outcomes. Co-determinist assumptions means that these scientific approaches consider educational organizations to not be performing optimally. The underlying belief being that through systemic understanding of the components of organizational performance, educational organizations can be more effective, efficient, or whatever marker is desired. Ideas that are rejected include the idea that high performance is not universally possible, that explanation cannot be empirically verified, and the subjective or context-specific insights are of lesser value as they cannot be scaled. Approaches and then the problems seen, the possible solutions and what is rejected.

Conflationary approaches grant a single identity (if such a thing is even possible) to two or more concepts or constructs that have previously been thought of as separate. For example, the educational organization not as an external knowable entity but as something constantly constructed through the thoughts and actions of individuals. Knowledge claims can be supported by many forms of data or evidence, depending on the nature of the claim. Put simply, conflationary approaches are based on the belief that you cannot break the social world into smaller parts and that multiple interpretation of events is not just possible but the norm. As an approach it is concerned with the conflict between individual and collective values and whose values become dominant and why. Ideas rejected include the prospect of understanding anything through data or objective social structures as organizations are not a thing external to individuals. A significant difficulty of conflation is that it reaches a point where almost anything goes and that reduces its utility and perceived value for researchers, practitioners, and policy makers.

Relational approaches, at their broadest, are concerned with the constitution and emergence of organizing activity through social relations (e.g., race, class, gender, among others). These relations are considered to have a reality of their own, not simply derived from something else (e.g., co-determinism), nor psychic or merely in the minds of observers (e.g., conflationary). There is less concern for right and wrong and greater attention to describing unfolding activity and why it took place in particular social conditions. This is not to say there is not an ethical or emancipatory

goal but advocacy is not the primary purpose. Instead, the key problem they seek to address is how existing explanations of organizing activity are limiting the possibility of alternatives. In other words, contemporary attempts to move beyond orthodoxy (e.g., the sole focus on leadership as the solution) do not provide alternatives but iterations of existing theories (e.g., administration and management). In doing so, relational approaches reject the uncritical acceptance of the ordinary language of the everyday, static and forevermore conceptualization based on entities, the separation of activity from time and space, analytical dualism (e.g., structure and agency, universal and particular, and individual and whole), and most importantly, critique without the provision of alternatives (Table 3).

The intellectual history of leadership thought has led to a diversity of positions. However, these positions are not necessarily developed in dialogue with one another and are more likely to actually advance as parallel monologues (Eacott, 2017).

**Table 3** Underlying assumptions of different analytical categories

Analytical category	Ontological assumptions	Epistemological assumptions	Normative/ethical assumptions	Theory of subject
Adjectival	Social relations/organizing is an external knowable reality.	Knowledge claims can be justified through empirical evidence or an aspirational goal.	Leadership is good. Organizations can be better, and I/we have a path to achieve that.	Leadership is a positive and I/we have a superior version
Scientific	The world is an external knowable reality.	Objective knowledge is empirically verifiable.	Improvements can be achieved through objective knowledge of what works.	Leadership is real and organizational outcomes are a mix of individual agency and structural arrangements.
Conflationary	There is no separation of inner and outer worlds.	Knowledge claims are justified in relation to the perceptions of the observer.	It is difficult, if not impossible, to impose a single version of reality.	The social world can take many forms based on perception.
Relational	Relations have a reality of their own, not simply derived from something else (e.g., interaction) nor psychic or merely in the minds of the observer.	Knowledge claims are generated through relations with the social.	Less concern for right/wrong and instead with describing unfolding activity and why it took place in spatiotemporal conditions.	Activities are generated and not separate to assumptions (individual and shared)

Anthony Riffel (1986) argues that if debate in educational administration and leadership is to ultimately become fruitful, it must extend to include critical attention to the assumptions of others. English (2006) claims that advancing scholarship of educational leadership requires criticism of it philosophically, empirically, and logically. Despite attempts to understand the variety of traditions within the field (e.g., Gunter, 2016), making sense of the heterogenous contributions of the various approaches to educational administration and leadership research is a complex task. Competing theories of leadership in education are frequently incommensurate ontologically and epistemologically and the possibility of any form of equivalence is limited to artificially merging or conflating positions without due attention to the distinctions in their underlying generative assumptions.

Throughout the history of leadership thought in education, the lack of meaningful engagement across traditions (Blackmore, 2010) has led to a situation where researchers or research communities ignore (rather than critique) those with whom they disagree creating an insular and self-confirming knowledge base (Donmoyer, 2001; Thrupp & Willmott, 2003). Not only does this thwart the development of critical dialogue and debate, as Don Willower (1981) warns, the absence of constructive controversies means a field loses its vitality.

---

## Conclusion and Reflections

The genesis of educational administration and leadership as a field of inquiry was grounded in the practical problem of how to organize education at scale. In doing so, it was easy to de-couple the organizing of education from the act of educating. Since its establishment, this decoupling has created many problems and possibilities for the field.

Historically, major contributions and disruptions to leadership thought have come from outside of the field. Many of the original professors had backgrounds well outside of education (see: Bates, 2010), the Theory Movement was arguably a response to issue of credibility in the broader academy, and even Greenfield's intervention aligned with broader discussions within the paradigm wars. Even calls to put the 'education' back in educational leadership have often been little more than appropriations of ideas, concepts, and explanatory resources from outside the field. The difficulty of establishing a distinctive knowledge dynamic has been conceived as a negative it need not be. Education is an interdisciplinary space, sitting at the intersection of many fields. As education has become increasingly complex with a wider array of actors influencing decisions a fruitful endeavor is to explore the myriad of explanatory resources and analytical techniques from across the social sciences. If education is embedded in and embodying of society, then it only makes sense to draw on the widest range of explanatory and empirical resources to better understand its leadership.

Education is ubiquitous to contemporary society. This creates a need for educational administration and leadership thought at scale. At the same time, global discourses of leadership in education remain dominated by major powerhouses such as the USA, UK, Canada, and to a lesser extent Australia, and New Zealand. Voices

from Africa, Asia, Latin America are often crowded out, excluded entirely, or used in a tokenistic way. This can play out in several ways, but two common ways are: (i) the silencing or exclusion of alternate voices through systemic structures of the field and its processes of knowledge generation; and (ii) in the imposition of the intellectual resources of the dominant anglophone/Western culture (e.g., the focus on leadership) in different contexts. This latter phenomenon, a form of epistemic imperialism means theoretical, conceptual, or empirical arguments may not be reflective of different values and culture or even sensitive to the local contexts and needs of groups they are imposed on (Asuga, Scevak, & Eacott, 2016). In doing so, the potential diversity of ideas is lost to the field in its attempt to achieve global reach.

Attempts to curate a distinctive knowledge field of leadership thought in education requires an uncritical acceptance of the importance of leadership and an at scale commitment to advancing that cause. While advocacy is built into all forms of social scientific research, this poses both a problem and a possibility. The imposition of a master narrative means the field loses its sense of reflexivity, expanding through a never-ending array of adjectival leaderships to meet different needs without ever calling into the question the underlying assumptions of knowledge claims. The potential loss of a diverse range of voices makes the possibility of critical engagement with the core assumptions of the field less likely. The marginalization of critical dialogue and debate, at least that which seeks to generate possibilities not just critique, is a major challenge for leadership thought in education. The enduring value and contribution of the field will be dependent on its ability to provide useful resources to describe and explain the organization of education. Paying attention to the underlying assumptions of knowledge claims is the path to renewal as it is a basis for understanding how things are now and how they can be different. If leadership is to offer hope of something different, then the scholarship of leadership should enable not constrain the possibilities of alternatives.

### Abstract

This chapter critiques leadership as both a discourse and practice. The core of this critique is focused on leadership as a set of organizational practices and the presumed division of labor between leadership and those that are led. Preoccupations with leadership as the antidote to address organizational shortcomings and leaders under the gaze of the educational bureaucracy of the state contribute to the disciplining of the act, actions, as well as individual actors. Accordingly, leadership has become codified and mandated that render leaders as little more than organizational technicians, or indeed servants of the polity.

### Keywords

Leadership · Leaderships · Structure · Individual · Practices · Myths · Metaphors · Disruption · Discourses · Configurations · Assumptions · Seductions · Decolonization

**The field of memory**

Notions of a stable and heterogeneous understanding of concepts such as “leadership” and “leadership practices” are redundant. Scholars and practitioners continue to use terms such as “leadership” and “practice” in both conservative and hegemonic ways. Hence, leadership discourses and practices are legitimated through the convergence and reinforcement of these ideas, concepts, and constructs. What has occurred therefore is a reinforcement of what is known rather than sustained attention to what is not known.

**The field of presence**

All fields and forms of practice and knowledge are open to scrutiny and debate. There is an almost hegemonic insistence on evidence-based practices that are underpinned by an adherence to theoretical concepts and constructs that are relatively static. Central to this is the absence of the complex interplay of leadership and management, as well as knowledge, knowing, and professional practice.

**The field of concomitance**

Histories of the field point to its provenance and the shifting emphasis on administration, management, and leadership. Initially linked with the science of administration and subsequently drawing on the business management literatures, leadership has taken on a new ascendancy and positioned as the antidote for educational reform and the repositioning of principals, head teachers, or superintendents as policy servants.

**Discontinuities and ruptures which form the different viewpoints of this area or field**

There have been significant debates on the origins, development, and contested nature of leadership. In the main, leadership has been constructed as if it were a singular word or action. Although leadership might be conceptualized as a set of practices, it is timely to reconsider how leaderships (plural) might be theorized, deconstructed, and decolonized.

**Critical assumptions or presupposition**

This chapter offers a critique of the leadership literatures and the assumed connection between discourses of leadership and organizational practices. An immediate inadequacy of this standpoint is that lexical confusion exists between leadership and management and a presumption of a division of labor between those who lead, and those who are led. As noted, the concept and construct of leadership is part of a well-used vocabulary that seeks to create an almost apostolic myopia about the role and impact of individuals who bear the title “leader,” the impact of their work or “leadership,” and connections between the “led” and “leaders.” The term leader and the act of leading, leadership, is deeply seductive. It suggests that an individual can exercise a level of agency and working through others (labeled at times “followers” or in other words, the “led”), and “distributing” leadership as if it were a good or service, can bring about organizational change. The paradox is that leadership cannot operate in a vacuum, and while there might be a single word to describe

actions and activities – leadership – ultimately *leaderships*, the work of more than one individual, is discursively more accurate.

---

## Introduction

Implicit in the abundant educational leadership, management, and administration literatures is that concepts such as “leaders” and “leadership” are relatively uniform and stable. In the main, terms such as leaders and leadership have been used to signify formal organization-wide roles, structures, and practices. More recently, sociologically informed scholarship has offered rejoinders to these debates and pointed to the need for more nuanced understandings of leadership as theory and leadership as practice (Eacott, 2013). Leadership, leaders, and leading have become terms linked with a single set of activities, actions, or a term ascribed to an individual (Gunter, 2001). Indeed, in the past three decades labels such as educational administration and educational management have been replaced with the term leadership. The net effect has been that administration and management are now relegated to the dialogic periphery and leadership now the canonical center. As Gunter (2001, 2013) points out, “leader,” “leading,” and “leadership” are now the discursive reality to describe what occurs at the apex of a school organization. Is an alternative or set of alternatives possible? How might we conceptualize moving away from the reverence that leadership is frequently afforded? And importantly, why has leadership become no more than a metaphorical legend to what describe what an individual might do and how s/he/they might act? I am therefore troubled by the ascendancy of leadership studies that appear to reinforce the notion of the leader as an individual, that there are followers to be led, and that leadership is ultimately beneficial for an organization. Leaders and leadership are not a set of neutral identities, actions, or activities.

The potential exists to set aside these orthodoxies and to recognize leaderships; the accumulation and convergence of the diversity of individuals, identities, perspectives, activities, and actions (Fitzgerald, 2003). This chapter begins with an overview of the leadership literatures and suggests that there is a level of folklore and mythology embedded in both the concept of leadership and leadership practices. I suggest that there is a hegemonic adherence to key texts and concepts and that it might well be timely to reconsider the complex interplay between leadership, leading, and leaders and that in order to connect theory and practice that leaderships might usefully be considered. The plural use of this term implies an overlap in terms and terminology, and that *within* the act or exercise of leadership, there are acknowledged axes of power, authority, influence, and coercion.

---

## Content

Vital to contemporary understandings of educational leadership, management, and administration as a field of knowledge and a field of practice is an intellectual archaeology of core terms. In essence, leaders, leading, and leadership have become

part of the standardized knowledge base in the field and integral to professional practices (Gunter, 2010). This chapter considers ways in which descriptions of “leadership” that denotes an activity, “leading” as a technique of practice, and “leader” as a form of positioning have occupied a level of ascendancy in the literatures. Leadership, leaders, and leading have been discursively co-opted to describe, if not prescribe, the work of some individuals within an organization. Thus, it occupies an explanatory, descriptive as well as conceptual space to explain, if not cajole, individuals to act in certain ways, that is, exercise “leadership.” How might this contested space be opened up further and new conceptualizations emerge? Would it indeed be a heresy if “leadership” as a set of presumed actions, activities, and conceptual strategy were scaled down or dispensed with? What might be possible if the mythologies of leadership, leading, and leader were viewed through new lenses.

---

## Myths as Metaphors and Metaphors as Myths

Metaphors are discursive devices that serve as a means to connect ideas and offer a broader understanding of a phenomena (Alvesson & Spicer, 2010). Although this might suggest that metaphors act as neutral descriptors, the reality is that in the field of education, metaphors offer a persuasive image that draw heavily on one type of concept or construct (Guilherme & Souza de Freitas, 2018). A myth is a symbolic conceptual image to draw in our imagination and which further offers a narrative that creates a mythology of an individual or event (Alvesson & Spicer, 2010). Myths and the mythologies that are created can be appealing as they work to offer an explanation of an event, phenomena, or individual act. In similar ways, metaphors can render unfamiliar ideas, terms, or constructs as familiar and in doing so provide a frame of reference that connects experiences and knowledge. Certainly, as Guilherme and Souza de Freitas (2018) illustrate, metaphors abound in education and condense complex ideas into familiar ones. Educational leadership and management research have long drawn on metaphors as an analytical tool to explore and explain leadership attributes, behaviors, and practices (Eacott, 2013). Metaphors can advance thinking about leaders and leadership in education and can offer a level of sense-making about how leaders perceive their work and identities. Long used across the field of educational leadership, management, and administration, metaphors such as the heroic leader and the heroism of leadership have resulted in a level of myopia around these dominant concepts. Just as metaphors might open up our thinking as Alvesson and Spicer (2010) suggest, it is equally important that these metaphors do not become orthodoxies.

There is a long history of the evolution of theories of educational leadership, management, and administration. In its first stages, the term “educational administration” was connected with the work of Taylor (1911) and the principles of scientific management. The science of educational administration was the focus of the work of Simon (1945) who introduced scientific inquiry to the study of administration. Accordingly, terms such as objectivity and reliability were used and fundamentally suggested that a more rational technique of inquiry was required. Simon’s work was

extended further by the *Theory Movement* (Culbertson, 1981) that sought to define the underlying generative principles of the field as well as the formalization of educational administration as a field of study (Walker, 1964). In the 1970s Greenfield fundamentally challenged the origins of the field and argued for the rejection of objectivity (Greenfield & Ribbins, 1993). And while Evers and Lakomski (1991, 1996) have consistently argued that the narrow conceptualization of educational administration as a science is problematic, Bates (1980, 1983) and Gunter (2013), on the other hand, have maintained that sociological approaches should be deployed. Importantly, English (2006) suggested that it was critical to contest the epistemological and ontological claims of the field itself. In other words, the defining myths and metaphors.

In the nineteenth and twentieth centuries, leadership was linked with meritocratic principles. Rather than birth and heritage being markers of a leader, individual skills, knowledge, and professional mastery were the hallmarks of leadership in the professions (Perkin, 1990). In the later decades of the twentieth century, it was the (sole) leader in an organization who was both responsible and accountable for its effectiveness, financial stability, quality, performance, and attractiveness in the educational marketplace (Fitzgerald, 2008). That is, leadership was vested in a single and identified individual whose task it was to refocus and improve the organization via their transformational style of leadership. From this discourse emerged the idea/ideal of the heroic leader; the leader who turned around poorly performing or failing schools, and by inference poorly performing teachers and students as evidenced by national and international league tables. As a metaphor to describe what may have initially occurred in schools, the notion of heroic leader developed a level of policy ascendancy. This was the leader who could, it was assumed, deliver on the objectives of school self-management and whose work was tangential to the changed policy environment of accountability (Gronn, 1996, 2003; Gunter, 2010; Gunter & Fitzgerald, 2017).

The term “leadership” has been and continues to be used to denote a strategic role at the apex of an educational hierarchy (in schools, colleges, or universities). The label “leader” signifies the identified and identifiable individual at the helm of an educational organization. Consequently, leader and leadership have been assumed to be one and the same in both definition and practice. It is their presumed superior knowledge and access to information sets leaders apart from their followers, and potentially places followers in a subordinate if not co-dependent relationship with their leader (Eicher, 2006). Those with the necessary qualities, dispositions, skills, and understandings are looked to as leaders and leadership assumed to be the solution to organizational problems (Day & Leithwood, 2007; Gunter, 2005; Robinson, 2002). A powerful imagery that emerged from these timeworn assumptions is the myth of the strong, heroic, or charismatic leader as the antidote to organizational problems (Brown, 2014; Burns, 1978; Gosling & Mintzberg, 2003; Hunt, 1999).

The leader-as-hero myth and mythologies of heroism that draw individuals into a leadership orbit; an orbit in which change is normalized and leadership is connected with vision, purpose, and mission. This leadership paradigm solidifies the construct and conceptualization of the leader as an individual and connects the act of leading and exercising leadership with one source of influence (Alix, 2000; Gronn, 2010). In essence,

and in a conventional sense, leadership and leading ostensibly differentiate the actions and activities of the leader from the non-leader (or follower). The leader as the central figure in leadership narratives is simultaneously projected as a hero destined to undertake heroic tasks. Hence, heroic leadership is positioned as transformational for both the individual and the organization (Bush, 2020; Gronn, 2010; Leithwood & Day, 2007).

The metaphor of the heroic leader and the presumed heroism of leadership is deeply seductive. An individual with exceptional qualities (of leadership and as a leader), who acts in heroic and mythical ways to transform (read: save) an underperforming school, and whose visionary and charismatic style draws in followers and adherents (see here Bennis & Nanus, 1985; Gabriel, 1997). Narratives that support the leader-as-hero model identified “best practice”; a somewhat reductionist term that was used by policymakers to cajole leaders into imitating each other thereby reinforcing further the heroic myth. The official assumption is that the heroic leader, the superman or superwoman of the organization, can transform, can disrupt any rhetoric or metric that points to failure or under performance and can succeed where others have not. As Dutro (2011) humorously points out:

An individual with the capacity to step in to save the day, . . . the opposite of a social movement for change; . . . the ultimate rugged individual, standing tall with cape flying, fists on hips, wearing the confident half-smile of a job well done. No problem is very complex for Superman . . . arrives out of nowhere, quickly disposes of the fiercest of obstacles, and leaves with the unfailing gratitude of the people. (p. 1)

The language, power, and imagery of the super-heroic leader suggests a level of adventure, challenge, temptation, response to adversity, transformation, and, ultimately, a level of heroism. Canonizing heroic leadership renders any form of debate or counter-narrative difficult, if not impossible (Haslam, Reicher, & Platow, 2011; Sinclair, 2007). In effect discourses of power and control are normalized as a result of the inculcation of the myth of the hero-leader and heroic leadership. Missing from the imaginary of the heroic leader is the social and relational contract between leader and his/her/their constituents; those whom s/he/they leads. The question to raise at this point is – for what reasons has a normative assumption emerged that leadership is the remit of an individual? With emergence of neoliberalism and managerialism in the 1980s, heroic leadership became somewhat redundant, although the canon of the individual leader has remained.

Leadership as a contemporary term has metamorphized further with the inclusion of a number of adjectives such as transactional, transformational, servant, teacher, instructional, distributed that appear, on the surface, to suggest a spectrum of possibilities about how leadership might be conceptualized and enacted (see, e.g., Alix, 2000; Gronn, 1996; Hunt, 1999; Lambert, 2003; Meindl, 1995; Spillane, 2006; Youngs, 2009; Yukl, 1999). While these terms might signal a shift toward collective leadership and more inclusive practices, the realities of managerial pressures and constraints continued to place both organizational accountability and responsibility in a single individual (Bush & Glover, 2012).

These are no more than metaphors that have served to popularize both leaders and leadership as a necessary ingredient within an organization. These metaphors have

given rise to normative and conceptual assumptions about how leadership might be configured, structured, and operationalized. That is, the individual head of an organizational entity such as a school, unit, and department is its leader with authority to act, to exercise leadership (Robinson, 2002). There is a discursive grip here whereby leaders and leadership are standard linguistic categories that describe a division of labor (leader/follower) as well as a category of activity (leadership/led). A fundamental difficulty here is that being a leader is connected with a specific and formal organizational role, and leadership ascribed to a set of dispositions, behaviors, or actions enacted by an individual (Gunter, 2005). Leaders and leadership are part of a binary; it is either one metaphor or another, one person or another. The role and importance of leadership, leading and the leader are further amplified in texts that work to suggest that these are neither mundane nor ordinary roles and activities (Fitzgerald & Savage, 2013).

Descriptive terms and metaphors are seductive insofar as they persuade leaders, practitioners, scholars, and the wider public that there exists a set of rules, a recipe, to follow that will inevitably bring about success (Day & Leithwood, 2007; Kellerman, 2012; Robinson, 2002). But leadership ought to be more than heroic tasks, capes, images, and costumes. Perhaps these images, imagery, and props are taken up as both discursive and persuasive tools to attract, or even lull, individuals into being a leader. A sobering reality is that leadership, leading, and being a leader is predominantly depicted and theorized as a positive set of practices. Myths and metaphors might well be counterproductive as they do not necessarily offer a view of the reality of being a leader in the twenty-first century. What would be helpful would be to invoke new concepts and practices to assist with understanding new knowledges and experiences.

While there are critiques of each of these terms and interrogations of the epistemological underpinnings, less attention has been paid to critiques of “leadership” itself. The canon of leadership has remained uninterrupted as too has its intellectual origins. In many ways, leadership, leading, and leaders have provoked a level of nostalgia about what it means to be a leader, to lead, and to enact leadership. Discursively at least these terms are used interchangeably to describe a set of practices. Adjectives such as “distributed,” “transformational,” and “instructional” appear to suggest that from the outset a descriptor is required to signify a performative aspect of the role (Gronn, 2003). That is, as a leader I am going to be “transformational” in the way I act (lead) and interact with those I lead (followers). It is conceivable that these adjectival descriptors do no more than position a leader as an influencer who, for example, does little more than “distribute” and “transform” presumably based on a level of charismatic inspiration.

An observation to be made at this point is that while adjectives have been inserted into leadership discourses, there appears to be little attention to the word “leadership” itself. And while terms such as “administration” and “management” have been replaced with “leadership,” leadership as a sociocultural activity (Bates, 2010) remains linked with administrative goals and managerial pursuits (Fitzgerald, 2008). Perhaps it is timely to consider a hybridity of approaches that recognize situational practices as well as differing ways in which leaders and leadership might be configured (Gronn, 2003, 2010). This opens up the possibility of leadership, leaders, and leading being less about the privileging of certain practices and labels, and more about emerging patterns of enactment.

Less recognized is that leadership and power are inextricably linked. Being a leader and exercising leadership in an institutional context is embedded within a configuration of power relationships (Haslam et al., 2011; O'Reilly & Reed, 2010). Perhaps what is needed is a re-framing, a re-thinking about leadership, or even a theoretical disruption.

## Disruptions

A study conducted by Henry and Pringle (1996) with Māori and non-Māori women-run organizations concluded that Māori women in leadership roles predominantly correlated their understanding and descriptions of their leadership practices within a Māori-centered framework. This framework moved beyond thinking about leadership by an individual, to thinking about leadership as a set of relational activities that are culturally responsive. As the framework below shows, *connection* in terms of their leadership identity is critical to understanding “women” and “leadership.” That is, circumstances of family, genealogy, and connection with the land matter, particularly for Indigenous peoples.

Term	Leadership
Kuia (elder grandmother)	Wise leader; authoritarian
Whaea (mother)	Guiding and leading from behind
Rangatira (tribal leader)	Autocratic and confident leader
Tohunga (expert)	Analytical and leading by expertise
Tuakana (eldest sibling)	Directive; leader-in-waiting
Wahine toa (warrior woman)	Leading by example and power of convictions
Teina (younger sibling)	Tentative; leading through friendship
Potiki (youngest sibling)	Daring; leading by force of personality
Tauwiwi (foreigner)	Tentative leadership exhibiting a lack of confidence

Source: Henry and Pringle (1996)

Within this Māori-centered framework leadership for/by Māori women is relational as well as generational; that is, as a female grows older and as her life experiences expand, she adopts different roles at different times. Here, leadership is derived from within the whanau (family) and hapu (tribal group) and related back to that structure. Becoming a leader and leading are therefore conceptualized according to age, experience, skills, knowledge, and status. Affiliation, the connection between the individual, her past and her present determines how leadership is enacted. As Bhabha eloquently outlines:

The question of identification is never the affirmation of a pre-given identity, never a *self-fulfilling* prophecy – it is always the production of an image of identity and the transformation of the subject in assuming that image. (1994, p. 45)

Broadly what is being suggested is that connections that are familial and linked with physical, spiritual, and geographic space and place offer more embodied

ways of looking at leaders and leadership. Connecting leadership with self and the identities that are carried merges past, present, and future; histories and memories. It is not about self-importance, self-reference, or perfecting self. Crucially, leadership occurs within a framework of identity and culture that emphasizes connectedness and generational survival. What becomes important then is not leadership traits, characteristics, and behaviors but how leaders connect with community and exercise leadership in terms of their relationship with that community. In essence, it is about recognizing the distinctiveness each leader brings to the role and contesting myths of “sameness” that *naturally* assign the leader a gender, class, ethnicity, and race. What is being called for here is thinking about leaderships; that a leader might inhabit one of more roles based on their influence and agency and that leadership is not a singular activity exercised by a single individual. Crucially, Henry and Pringle’s (1996) theorization poses a challenge to think about leadership as a construction of Whiteness (see also Fitzgerald, 2006, 2010) and to now contest metanarratives of leadership that reinforce dominant narratives and uncontested norms of White privilege. Debates have surfaced that examine schools (e.g., Christie, 2020; Molepo, 2017), schooling (e.g., Bishop, Vass, & Thompson, 2019), curriculum (e.g., Arday, Belluigi, & Thomas, 2020), professional practice (McNabb, 2017), and the field itself (Samier, 2017). Less attention has been paid to how leadership and leading might be deconstructed and decolonized. It is timely that the theorizing and practices in the field is disrupted and that we collectively begin to discuss how leadership can be decolonized and new leaderships emerge. Simply put, moving away from the myopias that have long dominated the field.

---

## Conclusion and Reflections

The core purpose of this chapter is to shift the gaze away from some of the myths and myopias that have long shaped the history of the field and to look for ways in which theorizing can be “grounded” (Eacott, 2015). That is, that leaders, leadership, and leading are connected with the social and familial world and that there is recognition of this interconnectedness in the way that leadership is theorized and enacted. This is no less than a call to researchers and practitioners in the field to continue to problematize the field of educational administration, management, and leadership, look beyond their own epistemic boundaries and decolonize our theorizations and practices.

One of the immediate consequences of shifting our thinking is that the myths and metaphors of leadership that have been perpetuated can be abandoned and new ways of thinking about leaders, leadership, and leading can be re-imagined. It is hoped that this will bring a vibrancy to the field and that new theorizations that emerge speak to ways in which leaderships might occur in the twenty-first century. Thus, this chapter advocates for new beginnings and new imaginaries, and that the myths and myopias of the past are part of the history of the field, not its present or future.

## Abstract

This chapter aims to describe and explain the unprecedented levels and global reach of private interests in school education. Using Foucault's theoretical work on power/knowledge, a discursive account unfolds from the neoliberal logics of governance, human capital, and the enterprise form. Each of these logics is shown to orient power relations towards certain truths about the private provision of educational services, thus bringing a type of discursive patterning to the relations of free enterprise and schools. Foucault's notion of the apparatus (*dispositif*) is subsequently used in analysis of more tangible relations and affects. The apparatuses of marketization, economization, and commercialization are identified and explicated, with Deleuze's (What is a *dispositif*? In *Michel Foucault: Philosopher*, pp. 159–168, 1992) “map” of Foucault's apparatus used to orient conceptual possibilities towards a method of analysis. The chapter concludes with a discussion of whether the apparatus as a tool of analysis includes disruptive

### Keywords

Global education industry · Power/knowledge · Neoliberalism · Dispositif · Apparatus · Foucault · Deleuze · Educational leadership · Neoliberal governance · Human capital · The enterprise form · Marketization · Economization · Commercialization

### The Field of Memory

The ideal of education as a public good rendered schools as democratizing civic institutions and established a broad entitlement to a liberal public education that sought to induct students into active citizenry and to promote fairness and equal opportunity. This idealized formulation has, for a long time, been conjoined with various private interests in education. Practices such as fee-paying, fundraising, using private tutors, and choosing a “better” school, all became strongly established in western democracies during the twentieth century as parents and students sought individual advantage through education.

### The Field of Presence

Neoliberalism, as a political project, is grounded in an understanding of all aspects of society in economic terms. As such, it problematizes public institutions as ineffective, inefficient, and inept and shapes and supports various forms of private investment and business involvement, even in traditionally non-business activities such as education. The neoliberal logics of governance, human capital, and the enterprise form make school education more susceptible to the various entreaties of free enterprise by favoring the privatizing and directing of state institutions and policy in ways that promote competition in the market, privilege the economic functions of schools, and encourage profit-oriented private actors to make their investments in education.

### The Field of Concomitance

The neoliberal political project imposes on education the values, concepts, and processes of the business and corporate world. Foucault’s theory of power/knowledge can be deployed to show how these impositions, when interpreted through market-infused neoliberal logics, become established as regimes of truth that pattern the relations of private interests and schooling and constitute the subjectivities and direct the conduct of leaders, teachers, and students.

### Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field

Theoretically, the tendency to aggregation and uniformity in the various apparatuses of privatization may be disrupted by turning the heterogenous and contingent qualities of the apparatuses to processes of problematization and critique and to

practices of opposition and resistance. Historically, these theoretical possibilities have not translated smoothly or easily into practice.

### Critical Assumptions or Presupposition

A critically oriented exploration of the incursions of various private interests into school education presupposes the continued existence and influence of the intentionality, will, and freedom of the individual. Such an exploration also recognizes the potential for dissonance between centralized directives and local action, the ongoing possibility of non-conforming and dissenting subjectivities, and a continued capacity for groups of like-minded people to organize and caucus around issues in common.

---

## Introduction

A primary aim of this chapter is to contribute to the existing library of critical texts about an escalation and intensification of the involvement of multiple private interests in school education in what is popularly termed *the global education industry* (see Ball, 2012; Lingard & Sellar, 2013; Thompson & Parreira do Amaral, 2019; Verger, Steiner-Khamsi, & Lubienski, 2017). Now operating at unprecedented levels, the privatization of schools and schooling exceeds nation-based designs for dividing private schools away from public education, to focus on “the transnational dimension of education marketisation and on the emergence of new global businesses specialising on education services and products” (Verger et al., 2017, p. 326). In the first section of the chapter, the various intrusions of the market and businesses into schools are analyzed through the broadly framed logics of neoliberalism. Called *Seeing the patterns*, this section takes these logics as functioning strategically to make certain truths visible – by shining a light on an array of favored practices, discourses, and knowledges – while confining others to the dark. Working from Foucault’s (1977) treatise on power/knowledge relations, this strategic function relies on market-infused neoliberal logics promulgating ways of knowing that advance their claims to truth and deploying the various power techniques of discipline, subjectification, and surveillance to inscribe these claims in reality. In simultaneous operation, these knowledges bring an epistemic context to the lines of force on which the escalation of industry and business involvement relies while depending on these lines for their production, necessity, and standing.

Against a tendency to universal and fixed categories, these power/knowledge arrangements are taken as creating “spaces and locations where policy is performed and disposed in particular ways” (Bailey, 2013, p. 807), thus creating a patterning effect in the relations of business and school education. In discerning new patterns and regularities, neoliberal logics of *governance*, *human capital*, and *the enterprise form* are taken as orienting power relations into a certain configuration while doing the normative work of (re)shaping the institutions and subjectivities in which they are embedded.

Shifting the emphasis of analysis from the idea of marketization and globalized business involvement contained in neoliberal logics to actual existing practice, the

second section of the chapter identifies three *apparatuses of privatization* and argues that each helps define, shape, and promote what Thompson and Parreira do Amaral (2019) call “the penetration of economic rationales into the education sector” (p. 8). In this section, titled *Untangling the lines*, apparatuses of *marketization*, *economization*, and *commercialization* are explicated by using the work of Deleuze (1992) to turn the conceptual possibilities of Foucault’s *dispositif* (or *apparatus* as its close English equivalent) to methodological and analytical purposes. The explanatory focus remains on a pairing of power/knowledge “that effectively marks out in reality that which does not exist and legitimately submits it to the division between true and false” (Foucault, 2008, p. 19). However, this section pursues the more tangible and “instrumental” (Bussolini, 2010, p. 93) componentry of the global education industry while also tracing the emergence of what Brenner (1994) terms “a cluster of functions” or “tactics” aimed “towards the same set of targets” (p. 691).

As part of the chapter’s orientation to leadership in the schooling context, the constitutive influences of policy on school leaders and their work is an area of specific interest. To this end, an understanding of the apparatuses of privatization also involves linking the “policy discourses of neoliberalism” (Dolan, 2020) to power/knowledge effects that make school leaders, and often teachers and students, a target of their tactics. Foucault’s (1972) conception of discourses as “practices that systematically form the objects of which they speak” (p. 54) is used to focus on the constitutive effects of policy discourses of *choice*, *excellence*, and *entrepreneurship*. Each of the discourses is shown to illuminate the language, principles, and thinking of privatization that inform and permeate them and, by extension, to reveal and produce certain power effects, policy emphases, and favored subjectivities.

The chapter concludes by testing the value of the apparatus as a tool of analysis in terms of the possibilities it facilitates for the detection of weaknesses and fractures in the current order and for disrupting established certainties and continuities. While this conclusion works in part as a corrective to earlier forceful representations of private enterprise involvement, it stops short of advocating reactive forms of critique or providing instrumentalized versions of resistance. Rather, it diagnoses possibilities at the break “that separates us from what we can no longer say and what falls outside our discursive practices” (Foucault, 1972, p. 147) and uses Deleuze’s (1992) interpretive work, to plot new orientations and new lines of flight that emanate from reworking “the map of apparatuses” (p. 161).

The task of theorizing a fluid, ever-changing and polymorphous set of ideas, processes, and practices is, by definition, always partial and incomplete. In response, in this chapter, depictions of variegated and contingent processes are generally preferred over normative truth claims, with illustrative examples, leading questions and generalized observations variously used to concede the impossibility of a full and detailed coverage. The reader is thus invited to build a picture of their own in the spaces created and to recognize, following Bailey (2013), that education is “always in a process of becoming, constituted in different ways at different times” (p. 812).

## Seeing the Patterns

The historically specific logics of neoliberalism bring both meaning and materiality to the relations of private interests and school education. An inclination towards neoliberal logics and their effects in contemporary schooling is here interpreted as *patterning* the composition of private involvement. Emphasis is not sought in the representation and reification of neoliberalism as an all-embracing societal shift (Raffnsøe, Gudmand-Høyer, & Thaning, 2016, p. 276) but rather in the visible regularity that emerges from an arrangement and connection of logics directed to certain unified purposes. Three neoliberal logics are now described – *governance*, *human capital*, and *the enterprise form* – with references made not only to their patterning effects as they fit together as part of a broader ensemble but also to the conceptual support they lend the balance of the chapter.

## Governance

Brown (2016) describes governance, as “the key administrative form of neoliberalism,” and claims that it “indexes a specific fusion of political and business practices” (p. 5). In neoliberal times, this fusion is a joining of the public good with private interests, invoking circumstances of decentered government and reconfigured relations between the state and the market. The concept of *contemporary neoliberal governance* provides a resource that connects the incursions of business with governmental aspirations for schools to make themselves more competitive in the market, to orient their capability and function to economic ends, and to become a more receptive market for the profit-oriented businesses waiting at their doors. Amos (2010) in accounting for the rise to prominence of governance in educational policy and research alludes to some of the central concerns of this chapter. She points to “profound changes in education” noting specifically, “the instruments and ways of steering . . . that bring order to a population of actors” and “new forms of providing and organizing educational services, and the emergence of new actors in educational policy” (p. 24).

As a mentality of rule, this form of governance aligns with Foucault’s concept of *neoliberal governmentality* in inciting people to govern themselves inside of confected freedoms and in answer to individuated and incentivized calls to become autonomous, entrepreneurial, and self-monitoring and self-possessed. Applied to practice, this summoning of the active involvement of “auto-regulated or auto-correcting selves” (Springer, 2012, p. 137) includes the necessity for individuals to enthusiastically embrace policy preferences for parental choice and competition between schools, to actively participate in seemingly apolitical steering processes of measurement, appraisal, and comparison and to adopt preferred subject positions and commensurate priorities and practices. Furthermore, the individual freedom attached to self-government and to the entrepreneurial and competitive instincts of the school marketplace, under these conditions of governance, are not taken as being opposed to government but rather become a *strategy of governing*.

Understood in this way, the formulation of subjects involves a requirement and obligation to adopt a certain set of freedoms that are made possible and shaped within government.

Both the take-up of business-oriented practices *by* schools and the incursions of private interests *into* schools exemplify the benign and rational qualities of neoliberal governance. De Lissovoy (2015) claims “this new logic of governance internalizes the market and competition as its inner matrixes of intelligibility in place of government as old-fashioned statecraft” (pp. 16–17). Such a makeover is not shaped out of hostile transformation or an attack on the state, but rather follows the normative reason of neoliberalism, with government configured as a commonsense political rationality favoring business principles and metrics and rendering older versions unsuitable and outdated. The active participation of schools in the marketplace can thus proceed as natural and taken-for-granted, with increased corporate involvement in schools and schooling occurring as a logical extension of broader guiding principles of marketization and competition. Brown (2016) likens the state to a firm that can elicit required conducts and subjectivities:

as neoliberal rationality remakes the human subject as a speck of capital, there is a shift from a crude earlier rendering of the human being as an interest maximizer to a formulation of the subject as both a member of a firm and as itself a firm, and in both cases appropriately conducted by the “governance” strategies relevant to firms. (p. 3)

The patterning that neoliberal governance brings to relations between businesses and schools includes consideration of knowledges propagated by government and their imbrication with governmental power. Governmental knowledge can be taken to reside in broad policy discourses such as choice, excellence, entrepreneurship, and managerialism and in the policy technologies on which they rely such as standardization, efficiency, data-driven improvement, and external accountability. Importantly, this ensemble of governmental knowledge production works to obscure ruler aspirations and power plays so that neoliberalism “is not seen as a dangerous form of governance” (de Saxe, 2015, p. 7), but rather as a commonsense truth based in the rationality of the market. Foregrounding the crisp and reliable metrics of business, fashioning freedom and autonomy as unencumbered and emancipatory, and prizing the entrepreneurial and competitive spirit in individuals, all work to hide *governance at a distance* as a very complex and specific form of power.

## Human Capital

In neoliberal times, individuals in schools are summoned to market with the expectation that they will inculcate market-based values into their decisions and practices. The notion of *human capital* surfaces as these values are enacted, for example, by reframing schools as sites where knowledge production is directed to economic growth and in expecting schools to respond to the needs of the workplace by developing a clearer view of how to transform young people “into useful,

employable human assets” (Kim, 2019, p. 89). After De Lissovoy (2015), human capital “seeks to comprehend the range of human capacities within the context of economic processes of investment, production, and competition” (p. 3). A patterning effect can be discerned in De Lissovoy’s insight, marked out by a neoliberal rationality that posits a pure connection between capital and people and that values amassing of human capital in the interests of the economy.

As a conceptual resource, human capital brings new emphases to an understanding of the globally scaled privatization of schools and schooling. In consideration of the analytic interests of this chapter, it most obviously supports a line of inquiry into “the economization of education” (Spring, 2015) and, more exactly, the privileging of the economic purposes of schooling. De Lissovoy’s (2015) describes how human capital is given expression in schools:

privatization and chartering of schools at the system level, as well as scripted curricula and test-based pedagogies at the classroom level, seek to eliminate the noise in this market, to clear away the interference of the public and its commitments, and to create the possibility for the pure expression of teaching as private investment in human capital and learning as the pure expression of that capital’s valorization’. (pp. 18–19)

The effect of this valorization of human capital is to commodify school education according to purposes associated with preparing students to be productive members of society and providing individuals with competitive advantage in the workforce. Accordingly, this commodification of the learner as knowledge worker ushers in seemingly inarguable neoliberal refrains about *data-led reform*, *continuous improvement*, and *excellence for all* while, at the same time, only privileging the knowledge that inheres to the capacity of each individual to capitalize on themselves.

The drive of individuals to take responsibility for accruing and investing their human capital also reveals what is subjugated and left out when schooling is turned over to market forces. Holding a mirror to this intrusion of market rationality shows how the socio-moral concerns of schooling are reframed inside of a neoliberal imaginary about meritocracy. Shamir’s (2008) “neo-liberal epistemology” can be applied here to the way the practices of market actors in schools are pushed into the gap created by the neoliberal retreat from social justice responsibilities. These practices, as part of “a general neo-liberal drive to ground social relations in the economic rationality of the market” (Shamir, 2008, p. 3) are authorized inside of an assumption that the socioeconomic circumstances of individuals can be folded into a *success for all* mantra. In this reading, students from disadvantaged backgrounds are not taken as penalized by their circumstances, but rather suffering a reduced ability to be competitive because of a lack of credentials, knowledge, and skills – a failure to accumulate the required human capital.

Bound up with contemporary applications of governance, and further illuminating lines of power and subjectivity, is the connection Foucault makes in *The Birth of Biopolitics* (2008) between the production of human capital and the scarcity of educational investments. Foucault notes that “human capital only becomes relevant for economists inasmuch as this capital is formed thanks to . . . the alternative use of

scarce means for a given end” (p. 229). In neoliberal times, the need for austerity in education is created and fed from an extensive discursive field of claims about scarcity. Knowledge claims that allege wasteful and excessive bureaucracy, profligate spending and ruinous national debt, fuel popular narratives about governmental failure, a paucity of enterprising solutions and the necessity for cutbacks and efficiencies.

In different and intersecting ways, these various claims and stories assert that educational resources must be considered as scarce and, by extension, that it is incumbent upon government to find different and more efficient ways of using them. For schools, operating under burdensome conditions of scarcity and austerity, following economic principles about efficiency, economic accountability, and return on investment becomes a necessity as “they adhere to standards of performance that are adjusted to the reality of an all-encompassing market environment” (Shamir, 2008, p. 6). In economic terms, the joined-up ideas of scarcity and austerity not only foreground concerns about returns on educational spending but also, after Foucault (2008), make it “possible to calculate, and to a certain extent quantify, or at any rate measure . . . the possibilities of investment in human capital” (p. 230). The ushering in of elements of quantification presupposes that *being* can now be measured as capital and, by extension, that freedom, against the *laissez-faire* economics of traditional liberalism, can be turned into a calculative power of government that conducts the conduct of individuals as it invites and binds them to imperatives of enterprise, competition, and survival.

This reading of the measurement and accumulation of human capital not only applies to servicing of outside interests of employers and the economy but also to the ways that individuals’ position and exalt themselves inside of a marketized school environment. In reaching into “the most intimate levels of the self” (De Lissovoy & Cedillo, 2017, p. 3), individuals are drawn to seeing and judging themselves as human capital and all that they do as in the cause of its accumulation.

## The Enterprise Form

Closely tied to governance and human capital, the neoliberal logic of *enterprise* helps to pattern the global education industry in more productive and material terms. Foucault (2008) claims that “the multiplication of the ‘enterprise’ form within the social body is what is at stake in neo-liberal policy” and that “it is a matter of making the market, competition, and so the enterprise, the formative power of society” (p. 148). Leveraging from this expansive claim, the enterprise form emerges as a pre-eminent discursive logic shaping schools and school leaders, not only by dint of its prominence in the material landscape of neoliberal languages and practices but also in the constitutive force it exerts to make the individual into “a self-maximising productive unit operating in a market of performances” (Ball, 2010, p. 126). This enterprise logic permeates the school market. At the nexus of competition and school choice, it ensures that the work of competing to be chosen is sheeted home to the effective execution of enterprising practices and policies in

schools. In this, the enterprise form shifts from logic to operating principle by suggesting that schools themselves must become small enterprises bent on raising their own productivity as a matter of survival.

Arguably the most telling effects of this logic of enterprise are in its shaping of individual subjects. Dardot and Laval (2017) describe “the set of enterprises of the people” that demand that “individuals must no longer regard themselves as workers, but as enterprises that sell a service in the market” (p. 266). In schools, the discursive call to leaders and teachers is one with “individualising, economic and responsabilising tones and effects” (Bailey, 2013, p. 817). Recalling aforementioned logics of governance and human capital, this call carries requirements to govern their own conduct and to continually enhance the measured value of their work. In the non-discursive realm, the enterprising subject is appraised, valued, and compared in an accountability regime that claims data-driven objectivity and a rationale of verifiable improvement. Dardot and Laval (2017) describe, in these arrangements, the emergence of new contract where “the individual’s activity in its entirety is conceived as a *process of self-valorization*” (p. 266 italics in original).

The individual is bound to the enterprise form by the power/knowledge arrangement emerging in these discursive and non-discursive elements. Matters of self-maximization and personal productivity are rendered both transformative and essential, with the privileges and seductions of membership ensuring alignment of the practices of individuals with the requirements of neoliberal policy and the aspirations of its makers. The related technologies of *responsibilization* and *performativity* appear prominent in this shaping of individual conduct to the enterprise form.

*Responsibilization* folds the capacity of individuals to take responsibility into a governance regime based on compliance and obedience. Brown (2015) claims that responsabilization uses responsibility as a tool “to constitute and govern subjects” and to organize and measure their conduct so that they are remade and reoriented “for a neoliberal order” (p. 133). Through responsabilization, the enterprise form becomes another iteration of human capitalization – a “bundling of agency and blame” (Brown, 2015, p. 134) that urges individuals to fend for themselves and realize their potential as capital while continuing to submit to outside judgments of their economic contribution and worth. Following Davies (2005), the technology of responsabilization renders the enterprise form that shapes the neoliberal subject as “both vulnerable and necessarily competitive” and is inclusive of the responsibility to survive. Concomitantly, it also marks the dawn of a “new disposability” for the irresponsible (p. 9).

*Performativity* equates success to the recognition and relevance that can be detected in public displays of performance. Contributing to the idea that the enterprise form targets and values the agile individual, performativity renders the neoliberal subject, according to Ball (2010), as “malleable rather than committed, flexible rather than principled – essentially depthless” (p. 126). Performativity also detaches the enterprise form from the notions of freedom and agency that it promulgates by making clear to the individual the results that are anticipated and required and the neoliberal values and conducts that must be embodied to get those results. Fielding

(2006) references this detachment in performative acts as a type of “emotional assent” where “contributions are enhanced through your carefully managed ‘ownership’ of what others desire for you” (p. 357). Ball and Olmedo (2013) affirm Fielding’s position and add a seductive element in noting that “performativity works best when we come to want for ourselves what is wanted from us; when our sense of purpose is aligned with its pleasures” (p. 89).

The enterprise form and the technologies that give it momentum and shape are not static and fixed, but rather have a processual quality that is transformative and emergent. In neoliberal times, this quality is seen, for example, in the rise and refinement of business-like practices of school marketization and in the shift of emphasis in learning, within and beyond school, to that which is directed to internalizing the entrepreneurial spirit. In the process, the enterprise form has become essentialized, so what once may have “seemed radical, even unthinkable” has “become more and more possible, then normal and then necessary” (Ball, 2010, p. 129).

---

## Untangling the Lines

In responding to a question about the meaning and methodological function of the *dispositif* (apparatus), Foucault (1980) says:

What I’m trying to pick out with this term is, firstly, a thoroughly heterogeneous ensemble consisting of discourses, institutions, architectural forms, regulatory decisions, laws, administrative measures, scientific statements, philosophical, moral and philanthropic propositions – in short, the said as much as the unsaid. (p. 194)

While Foucault’s formulation of the *dispositif* is typically arcane in terms of any actual methodology, he does note that the work of trying to identify a *dispositif* becomes one of “looking for the elements which participate in a rationality, a given form of co-ordination” (Foucault, 1980, p. 197). In the previous section, some rational and coordinated qualities of the globally scaled involvement of private interests in school education were suggested in the patterning work done by various neoliberal logics and their effects. In this section, these qualities are applied more pragmatically as an untangling of the lines in three apparatuses of privatization – the apparatuses of *marketization*, *economization*, and *commercialization*.

Towards a more schematic rendition, the three apparatuses are analyzed using what Deleuze (1992) calls a Foucauldian version of “fieldwork” involving “preparing a map, a cartography, a survey of unexplored lands.” He claims for this method of analysis a depiction of the many and various lines in each apparatus that “follow directions (and) trace processes that are always out of balance, that sometimes move closer together and sometimes farther away” (p. 159). In this section, this array of lines and their “curves,” “tensors,” and “vectors” are taken as a metaphorical opening for inquiry into the technologies and practices of policy and the way they are realized (and contested) in local school settings. In keeping with the contingent and diffuse qualities of the apparatus, *policy* is taken, after Ball (1994), to include a multiplicity of “action,

words and deeds” that functions as “an economy of power” even as it is rendered incomplete by a “wild profusion of local practices” (pp. 10–11).

Deleuze’s (1992) “untangling the lines” (p. 159) is therefore oriented to tracking the discursive work that policy does in laying down versions of schooling that are business-like, that respond to the calls of private actors, and that smooth the way for their inculcations and intrusions. Gridded over this map, and helping to deploy the concept of an apparatus more heuristically, are possibilities for new exploration held in Deleuze’s (1992) references to “curves of visibility and curves of utterance,” “lines of force,” and “lines of subjectivation” in an apparatus (pp. 159–60). Against the impression of a schematic organization and formulaic analysis, the desired effect is not a reductive and clipped account of each apparatus, but rather a holding open of complex and multidimensional dynamics both in the way each is composed and in how its lines pass through it and transform it and how it perpetuates and is permeated by “innumerable points of resistance and strategy” (Bailey, 2013, p. 811).

## **The Apparatus of Marketization: Buying and Selling School Education**

The apparatus of *marketization* recognizes a policy shift towards making schools into businesses and, more pointedly, an orientation of policy towards the buying and selling of school education. The origins of this shift can be detected in Foucault’s (2008) account of American neoliberalism when he observes that the “supply and demand” of the market has come to function as “a schema which is applicable to non-economic domains” (p. 243). Working from Deleuze’s (1992) map of the apparatus, this schema of the market can be construed as the “regimen of light” that works to make the marketization of schools visible, truthful, and necessary. Deleuze describes “curves of visibility” illuminated by a light “that falls, softens and spreads, distributing the visible and the invisible, generating or eliminating an object, which cannot exist without it” (p. 159). The task is not, therefore, to highlight the marketization of schools as a pre-existing object, but rather to show that it shines a light on truths that may previously have gone unseen and un contemplated.

The visibility of marketization, as one of the apparatuses of privatization, is joined with what Deleuze (1992) calls the “lines of enunciation” and the “regimes of utterance” (p. 159). Deleuze describes how articulable utterances are distributed along lines of enunciation and how their differential positioning provides theoretical support to Foucault’s interest in the relations of discourse, the emergence of new regimes of truth and the governing of meaningful conduct and practice. The enunciations in the marketization apparatus include the joining of attendant neoliberal logics of competition, excellence, and accountability to purported truths, for example, about improved efficiency (Springer, 2012, p. 136), greater responsiveness of schools to their communities (Buras & Apple, 2005, p. 556), higher standards and strengthen accountabilities (Lingard, 2010, p. 132), and more enterprising approaches that anticipate and satisfy the expectations of education consumers

(Angus, 2015, p. 396). In the non-discursive realm, “patterns of action” (Bühmann & Schneider, 2007, p. 5) are enunciated, for example, in documents specifying certain processes and priorities, in measures and artifacts that assume importance, in the problems to which policy responds, and in favored routines for administration and decision-making. Under the spreading light of the apparatus, these non-discursive practices become “symbolically charged actions or gestures within a discourse” (Bühmann & Schneider, 2007, p. 6) that add and support the visibility of certain truths about the relations of schooling and business and work to subjugate, hide, and ignore conflicting truths the alternative practices they suggest.

Arguably the most prominent of the neoliberal policy discourses that enunciate and mark out the terrain of school marketization is the discourse of *school choice*. As a discourse of neoliberal policy, school choice surfaces and speaks the market logic that parents and students, as consumers of schooling, should be free to choose the school they think is best for them. Buras and Apple (2005) add a corollary to this logic founded on the assumption that schools work better when they “are motivated and disciplined by market forces” (p. 551). The discourse of choice presupposes a standardized and apolitical field of judgment that all consumers are equally free to access. Regularity of this field is assured by the production of a competitive environment in which all schools must develop and continuously improve their educational product in ways that attract the best possible share of parents and students.

In terms of Deleuze’s (1992) enunciations and utterances, the discourse of school choice focuses attention not just on market vernacular and the concepts and language of business but also on the discursive production of domains of knowledge, fields of operation, and the modalities of various subjects, such as teachers and principals. The suggestion is not that these discursive practices and available subjectivities coalesce around school choice as a new idea, but rather that various utterances – as acts of speaking, writing, thinking and doing – become possible and permissible as they intersect with and organize themselves along lines of enunciation and create the possibility of a break from what has gone before. This discursive field includes the outside construction of the schooling “problem” in a way that serves a governmental preference for school choice and competition between schools, with choice posited as a solution to perceived problems of underachievement, lack of initiative, complacency, and ambivalence. In turn, solutions held in promises of greater efficiency, improved community responsiveness, higher standards, and strengthened accountability create the important precept that there is nothing political about school choosing. As Angus (2015) notes, school choice is constructed as “just atomized, self-interested, rational choosers dispassionately acting to maximize their individual advantage in ways that are ostensibly equally open to all right-thinking and conscientious people” (p. 404).

Certain practices emerge as “discursive regularities” (Foucault, 1972) from the lines of enunciation and regimes of utterance that form in the interactions of marketization and school choice. For example, in the:

- *Multilevel inculcation of the language of business into schooling* – in the processes and documents that support systemic and local efforts at visioning,

strategic planning and managing performance, the setting of targets and key performance indicators, and references to school principals as CEOs, learning as a quantifiable product, schools as businesses, and parents as clients

- *Interactions with various third-party educational services and providers* – local, national, and global interactions that further elicit the practices and language of private enterprise as well as allowing in new solutions (often to previously unrecognised problems), rendering existing educational practices and structures as outdated and uncompetitive, and normalizing the “for-profit” motive of private actors, mostly inside of publicly funded institutions
- *Aping of business models in schools* – in systemic moves towards cost-effective privatization and chartering of schools, local emphases on managerially oriented ways of leading and classroom teaching that must submit to technologies of standardization (e.g., in curriculum and pedagogy) and new accountabilities based on students’ performance in standardized tests

These practical expressions and manifestations of the marketization of schooling dotted along lines of enunciation are made more distinct and secure by a “discursive power apparatus” (Maesse, 2017, p. 909), or what Deleuze (1992) refers to as “the lines of force,” circulating in an apparatus. Deleuze says these lines, as a “dimension of power” are “ubiquitous, variable, invisible, unspeakable and ‘composed with knowledge’” (p. 160). Following the argument developed in Foucault (1978), the dimension of power is enabled by the simultaneous investments that “techniques of knowledge and procedures of discourse” make in it (p. 98). In the marketization apparatus, these restructured power/knowledge arrangements allow for new “matrices of transformation” to emerge (Foucault, 1978, p. 99) that normalize and catalyze the fitting of schooling to the market and impose business-like models of schooling whose power is composed in conjunction with the very mode of knowledge these models naturalize and privilege.

Applied to the visible and enunciated lines of marketization described above, these power/knowledge effects are located in the way the neoliberal logic of governance ushers in decentered and dispersed lines of force. The technologies and institutions of governmental power now develop, conjoin, and operate in the guise of the more benign and apolitical processes. They steer the performance of individuals and groups by processes of measurement, appraisal, and comparison and incite people to govern themselves and posit an “artificially arranged” liberty (Lemke, 2012, p. 45) by championing entrepreneurial and competitive instincts. This type of governmental power is not marked by a withdrawal or retreat from state control and intervention, but rather by new acts of subterfuge, incentive, and “steering at a distance” (Kickert, 1991 in Ball, 2006, p. 10).

In competing to be chosen the school marketplace becomes a “quasi-market” (see Ball & Youdell, 2007) in which educational governance is directed to the operationalization of market principles. As Dardot and Laval (2017) note of competition under neoliberal conditions, “(i)t is no longer a question of postulating a spontaneous agreement between individual interests, but of creating the optimal conditions for the interplay of their rivalry” (p. 47). Against any notion of a free

market environment, the school market is mediated, controlled, and manipulated by government with competition central to its mercantile policy interests. Accordingly, one of the important pre-conditions of marketization and school choice is that schools are expected to willingly submit to various inducements, inspections, and accountabilities, imposed by the state through its legislation, policy, and funding arrangements.

At the nexus of the specific knowledges produced, and the particular relations of power in which they are enmeshed, technologies such as impression management, performativity, and standardization operate to hold these discursive arrangements in place. Such technologies manifest in the workings of business plans, advertising campaigns, and promotional signage. They are found in formally allocated responsibilities for marketing and publicity, in efforts to use data to put the most positive spin on student achievement, and in activating communications directed to improved productivity and comparative advantage. The effect of these technologies, as “moves in a power game” (Maesse, 2017, p. 913), is to render participation in the school market as necessary obvious and natural and to hide the power relations that reside within its discursive and non-discursive workings.

While these power/knowledge arrangements evoke governance, the instrumental forces circulating in and across the marketization apparatus – and the enunciations it draws from the neoliberal policy discourse of school choice – also require adherence to an order of discursive practices that sort symbolic differences into material hierarchies and inequalities. As *symbolic capital*, these practices work to change and restructure power and knowledge (see Maesse, 2017), for example, by turning test scores into favorable rankings and classifications, by treating the attainment of excellence as a triumph over other competitors and by spruiking high achievement for all as an antidote to persistent obstacles of equity and social justice. These are “excellence myths” (Maesse, 2017) transformed into material reality and used for social, economic, and political ends. As symbolic capital, they yield legitimacy and, in turning back on themselves, affirm the neoliberal status quo and fix the discursive as living proof of its truthful existence. These myths also work from a premise that while every system and every site can be induced to want to construct valuable symbolic goods, not every system or site can do so. Accumulation of symbolic capital thus involves a bifurcating and hierarchizing set of sorting processes that plays to the aspirations of all – whether they can be realized or not. This sorting function is tethered to the truth of the broader neoliberal project through processes of ranking and comparison and, in a school market driven by competition, the need for winners and losers. As such, it is an exercise of power that favors systematic processes of division and difference and interpolates broader societal patterns of privilege and poverty into schools.

As this brief analysis shows, dimensions of power are connected quite directly to Deleuze’s fourth dimension of the apparatus concerned with “a process, a production of subjectivity” (p. 161). The marketization of schools and associated policy discourses of choice, competition, and excellence brings individuals under the constant influence of a power/knowledge arrangement that confers them with particular freedoms and imbues them with certain knowledge and expertise while hiding the

impositions it makes on what can be thought, said, and done. Furthermore, the apparatus mobilizes the technology of responsabilization, so that individuals assume responsibility for their own subjectivity and enact it as if an obvious and conscious choice and a matter of their own free will. Responsibilization describes a requirement for school actors in a marketized schooling system (e.g., principals, leaders, and teachers) to do business and to accept the commodification of schooling and take responsibility for improving the value of their school as an education commodity. Moreover, it assumes a willingness to become business savvy – to develop and adopt the traits, behaviors, processes and dispositions associated with success in a competitive marketplace.

### **The Apparatus of Economization: Privileging the Economic Purposes of Education**

The second of the privatization apparatuses draws from Hirtt's (2008) claim that "the neoliberal offensive" now configures the school as "a machine serving global and international economic competition" (p. 214). The idea of schools "adapting to the expectations of the business community" (Hirtt, 2008, p. 220) is used as a macro-interpretive for looking into how school education has become increasingly *economized* by its privileging of economic purposes associated with meeting workforce needs, maximizing the economic participation of students, responding to "economically fruitful policies" (de Saxe, 2015, p. 2), and driving wealth production and economic growth.

The economization apparatus is illuminated by the popular notion of the knowledge economy – the idea that "countries and continents that invest heavily in education and skills benefit economically and socially from that choice" (Schleicher, 2006, p. 2). The knowledge economy lights up a range of intersecting ideas and practices that feed the assumption that schools should function as drivers of economic growth and, therefore, are productively configured as merchant organizations who make education into a commodity to serve the outside interests of business.

Historically, linking the knowledge economy to schooling emerges from a broad critique of education as failing to satisfy the needs of the labor market in a changing economy. A new educational imperative accompanies this critique, directing attention to maximizing economic participation by promoting schools as sites for the acquisition of utilitarian knowledge and the accumulation of human capital. The notion of the knowledge economy lends a certain inevitability to a tightened connection between schooling, employment, and profitable business. Schools are enticed away from concerns about their narrowed purposes in neoliberal times and towards becoming more "economized" (Shamir, 2008) through effective tailoring of their offerings to better meet the demands of outside interests.

Continuing with Deleuze's map, it is the various lines of enunciation and curves of utterance in this part of the business apparatus that work to normalize the idea of an economized school and consolidate this idea in an array of discursive and non-

discursive practices. Among the differently positioned utterances, the following help to more precisely define and clearly enunciate the economization apparatus:

- A shift in valued knowledge emphasis to that which connects more directly with post-school options, for example, in the teaching and certification of specific industry skills and in the privileging of the math/science/technology curriculum and work-related ICT skill acquisition
- Positioning of students as consumers of knowledge, thus reducing learning “to a series of teaching inputs designed to meet prespecified outcomes” and directing the ends of schooling to the “creation of the knowledge worker” (Patrick, 2013, p. 4)
- A homogenizing effect emerging from an emphasis on employer-valued knowledge, scripted curriculum and standardized assessment, and a tendency to a means/end teaching model based on “the assumption that learning can be *caused* as an *effect* of teaching” (Webster, 2017, p. 62).
- Outside voices of business, the media and employers become more audible and influential in schools so that much of what is taught is surrendered to the control of non-educators, with schools, communities, and systems handed responsibility for value judgments about which information and knowledge are most useful in maximizing students’ economic participation
- The marketable individual is separated from and exalted over others by converting their measured outputs into specific qualifications in the form of certificates, diplomas, degrees, etc. This inherent and systemic credentialism ties the learner to “an economic empirical base” (Patrick, 2013, p. 3) and, quite possibly, to a “false sense of accomplishment” founded in the premium placed on a neoliberal version of self-meritocracy (de Saxe, 2015, p. 2)

While the above list brings some clarity to the visible and the utterable, it provides largely descriptive and apolitical insights into the economization of schools. To move beyond this semantic space, and towards the lines of force and lines of subjectivation, it is necessary to engage with the constitutive power of discourse and the “will to truth” – the desire to speak “inside” of the discourse that is attached to power by its truth claims (Foucault, 1981, p. 56) – it engenders. Under “steering at a distance” requirements of neoliberal governance, this power forms a set of instrumental logics – the rules and conditions of possibility – that enable prevailing discourses to govern meaningful practice through claims to truth and the assumption of a natural and taken-for-granted status. As the list of enunciations above suggests, the governing and enacting of the rules and conditions of economization makes intersecting discourses of marketization, school choice, and entrepreneurialism more prominent. However, in championing the economic function of schooling and in maximizing the economic potential of students, the discourse of “excellence” is arguably most pertinent.

As a policy discourse of neoliberalism, excellence responds to negative perceptions of a school-based workforce that is accepting underachievement and mediocrity and where the entrepreneurial qualities of the individual are thought to be driven out by “bureaucratization” and “rigid hierarchies” (Peter, 2018, p. 39). Gillies (2007)

account of the historical emergence of excellence as a “crisis narrative” aligns this problematization more closely with the creep of corporate influences and the privileging of the economic functions of schools. Using historical examples from various times and locations, Gillies describes “the periodic emergence of excellence” as “a corrective solution” to the perceived risk that education systems as not properly geared “to continued economic success” (p. 24).

Relatedly, the discourse of excellence also connects directly with the economization of schooling through a “social mobility approach” that presupposes “the better one does at school, the more possibilities become available’ in higher education and in the workforce” (de Saxe, 2015, p. 3). In neoliberal times, such an approach chimes with more pressing and urgent concerns for schools and school personnel as it shifts excellence away from traditional notions of “striving for success” and “everyone can do it” and towards a powerful and discerning discourse coordinated by the market on behalf of the state. “Unmistakably shaped by the semantics of neoliberalism” (Peter, 2018, p. 38), striving for excellence is now transformed from an egalitarian value of the masses to the responsibility of self-governing individuals as they harness their personal creativity and enterprise in pursuit of economic success.

The shifting of excellence from rhetorical marker of high achievement or grand aspirations to a regime of truth that works as a constitutively powerful neoliberal discourse relies on processes of *quantification*. Bansel (2015) describes a policy preoccupation “with an empiricism that fetishes numbers” and a concomitant insistence that the measurable indicators of excellence are the only ones that count, matter, and have meaning (p. 6). Extrapolated further, the power *effects* of excellence as a policy discourse are derived from its capacity to elicit knowledge about schools and, concomitantly, for experts to institutionalize that knowledge into an accredited and “truthful” system of measurement, appraisal, and accountability. In the economization apparatus, the discourse of excellence not only ties the functions of schooling to metrics of economic success and improved workforce participation but also links these functions directly to the successful performance of schools in the marketplace. Measures of excellence – most often relying on student achievement data from high stakes testing – become de facto indicators of school quality and the grist of competition and comparison, of success and failure.

The forces that “move through every place in an apparatus” (Deleuze, 1992, p. 160) are also subject to an immanent ordering in the practices, strategies, and interventions of government. Governmental intrusions into a quasi-marketized school environment produce their own truth claims against which efforts to be and become excellent can be judged. Institutional policies, directives, processes, and technologies, conjoined with the self-governance requirements of the neoliberal subject, work to ensure that individuals pursue particular subjectivities that signal excellence and that they measure, order, and articulate their efforts to be excellent.

Out of these tangled lines of force that seem to produce an overdetermined politics of excellence, a certain “process” or “production of subjectivity” (Deleuze, 1992, p. 160) can be discerned. The discourse of excellence shapes available subjectivities by aligning with neoliberal tenets of individuality and self-interest. The subject, as policy

actor, is made more vulnerable to incitations to perform in the market and to willingly pursue the economic ends of schooling. In particular, excellence puts a premium on self-meritocracy, rendering the individual subject as knowledgeable, market-savvy, and entrepreneurial, while binding them to the precarity of market forces and to the accumulation of their own human capital and quantification of their economic contribution. For leaders and teachers in schools, the aspiration to become excellent in the marketplace brings a vigilant and suspicious gaze to their everyday encounters. It asks that they become endlessly adaptable to levels of change and insecurity and renders, as necessary for survival, less savory tendencies to self-aggrandizement, exaggeration of achievements, and disparaging of rivals.

However, the lines of subjection in this segment of the business apparatus extend beyond the efforts of leaders and teachers to become excellent by shaping themselves as meritorious, agile, and marketable policy subjects. Privileging the economic purposes of schooling also repositions *learner excellence* within a framework of economic utility. Student subjectivities are located inside of functional aspirations about creating successful knowledge workers and “shaping the individual as economically responsible and entrepreneurial” (Patrick, 2013, p. 3). Students, as subjects of the knowledge economy, come to embody a conceptualization of knowledge as skills for knowledge intensive work. Thus, as a measurable commodity, excellence is evidenced in the performance of individuals in those subjects best fitted to their future economic participation and in the credentials they accumulate as proof of their marketability.

## **The Apparatus of Commercialization: Schools as Markets**

The apparatus of commercialization creates conditions for making schools into profitable markets for outside interests. Importantly, previous enunciations in the marketization and economization apparatuses remain in play, with the corporate form that private involvement brings to education transfiguring schools “to act as if embedded in a competitive environment where the laws of economics reign” (Shamir, 2008, p. 2). In striving to become a school of choice in a broader marketplace, key actors look to private enterprise and its products for a new narrative (e.g., see Anderson, Cohen, & Seraus, 2015) and new solutions that will differentiate them and make them more competitive. A more ubiquitous commercial presence may, for example, tempt school leaders to fold long standing interests in equity and social justice into broader concerns about favorable comparisons with market rivals, with the needs of disadvantaged individuals and cohorts “perceived as *non-economic*” (Manteaw, 2008, p. 124 italics in original) and outside of the current purview. The commercialization of schools also connects directly with the previous discussion about schooling as an asset in economic growth. Foregrounding the economic function of schooling creates the conditions and confidences that businesses need to make their investments. Along these lines, Manteaw (2008) claims that the emphasis on math, science, and technological innovation in the partnerships that big corporations form with schools points to their desire to “enhance market advantage” by having a say in the skill development of a future workforce (p. 123).

In shifting emphasis directly to possibilities for making money out of schools, Verger, Lubienski, and Steiner-Khamsi (2016) note the broad terrain of business interests in “the emergence of the idea of education as a sector for investment and profit making, where organizations, practices and networks engaged in these endeavors take on an increasingly global scale” (p. 3). Commonly gathered under the portmanteau “edubusiness,” profit-making interests in schools can be considered as three sets of commercial practices – selling *to* schools, selling *in* schools, and selling *of* schools. As Molnar (2013) observes, schools have been transformed by commercialization into “centers of profit benefitting private interests . . . as markets for vendors, venues for advertising and marketing, and commodities to be bought and sold” (p. 16). As arguably the most visible segment of business involvement in schools and schooling systems, the globally influential process of commercialization directs a concerted effort by various outside enterprises to own and control education in ways that yield a handsome financial return.

Returning to Deleuze’s (1992) map, in consideration of businesses looking to capitalize in schools, it is the sway of market logic that continues to provide the apparatus with its curves of visibility. However, the spotlight now shifts away from the marketing *of* education and education *for* the market to illuminate education *as* a market. The rhetoric and discourses of neoliberalism remain influential. In describing scarce resources and depicting bureaucratic spending as wasteful and ineffective they light a path that leads away from welfare and state reason to new and promising destinations built from business ideas about profit, efficiency, individualism, and agility. In this vein, Cassell and Nelson (2013) claim that “perhaps the central effect of neoliberalism” is:

To open key public services to various forms of private involvement and the influences associated with it. This invariably involves a preference for and promotion of the values and imperatives associated with business activity and corporate culture as well as the character markers associated with them. (p. 249)

In moving from the visible to the enunciated and the utterable in the commercialization apparatus, many more “derivations, transformations, mutations” (Deleuze, 1992, p. 160) are revealed. The multiple and complex lines crisscrossing the apparatus are not confined to enunciations of commercial presence or utterances about the economic importance of free enterprise involvement. Nor are they fully understood in a list of services and goods that are produced, exchanged, and consumed or in numerical representations of profits gained or value added. Supporting a more complex reading, Au and Lubienski (2016) acknowledge the significance of “profit seeking corporations . . . in the rise of the global education industry” but also note, along a different but intersecting enunciative line, that “non-profit entities” such as philanthropies, foundations, and advocacy organizations have also “played a substantial role in shaping emerging education markets” (p. 27). Further enunciative possibilities are found at various intersections, for example, as schools and outside providers of standardized testing notice a mutual benefit in a more comprehensive approach to test preparation and readiness, as technology companies mine the

“inevitability” discourse about ICT take-up in schools in order to capitalize on community and school priorities about twenty-first century learning, and as schools configure teaching and learning as their core purpose, thus creating a rationale for outsourcing the organization of extraneous activities and events.

The breadth, complexity, and contingency of “the multiple privatizations” of schools (Ball, 2007) makes a full depiction of the field extremely difficult. While avoiding any claims to completeness, this enunciative field is here represented in a summary version of the main players and some of the categories of their involvement.

**Edu-philanthropists:** While edu-philanthropy is traditionally associated with charitable contributions to educational needs and services that cannot be met by the state, commercialization ushers in a *new* philanthropy that incorporates business logic and is directed to reshaping and supplanting state policies and practices. Avelar and Patil (2020) describe a philanthropy that operates on a global scale, adopting innovative and disruptive practices, using technology to further its purposes, and “blurring the lines between profit and social purposes” (p. 9). The new edu-philanthropists not only carry business and investment techniques into schools but also become new and influential voices that invoke a “money is power” principle to shift the purposes of schooling into tighter alignment with their own educational vision and values. For example, Au and Lubienski (2016) speculate that the significant money provided by the philanthropic Gates Foundation to publicly funded but privately managed charter schools in the United States is “because they represented a relatively easy, politically palatable route for introducing market mechanisms such as choice and competition to public education” (p. 31).

**For profit schools:** In “a lively market in private educational organizations” (Ball, 2012, p. 24), a diverse group of private and quasi-private schools operating for profit is emerging across the globe. Verger et al. (2016) describe “chains of private schools, such as GEMS, ARK, Bridge International Academies, and the Omega schools,” that bring a new diversity to schooling in their countries of operations (p. 12). The philosophies and practices of these global chains are directed to reforms that make money. As Molnar (2013) observes, “the selling of schools – privatization – transforms public education into a segmented collection of private products and services sold for the profit of investors” (p. 122). Evidence of the profit motive is found, for example, in student selection processes that widen the disparities between rich and poor, in transforming and homogenizing curriculum and assessment to suggest a match to global economic aspirations, and in forming networks of “influential connections” to “convey and maintain credibility” as part of a sophisticated marketing approach (Ridge, Kippels, & Shami, 2016, p. 268).

**Product and service providers:** Under the edu-business banner, this diverse group of vendors gains new prominence inside of neoliberal logics about the school marketplace as they penetrate traditionally public spheres with new ideas, services, and products and an accompanying evidence-based case for their necessity. Anderson et al. (2015) describes “cafeteria services, data management and warehousing, educational software, tutorial services, educational design and management, professional development, and transportation services” (p. 353) as among the wares being

sold into schools. Including the big educational corporations and conglomerates such as Pearsons, Microsoft, and Hewlett Packard in this category adds a broad range of texts and learning materials, curriculum and assessment resources, and ICT hardware and software to the products and services on sale. Additionally, the size, wealth, and global reach of these companies also hints at the considerable capacity for their business to penetrate public spheres of influence and for their solutions to supplant those typically provided through the knowledge and resourcefulness of educators in schools.

**Edu-consultants:** Most conspicuously represented by the large consultancy firms such as McKinsey and Price Waterhouse, but also including a “wide but disparate constellation of individuals” (Verger et al., 2016, p. 12), edu-consultants are in the business of marketing expert knowledge – of defining and epitomizing the importance of knowledge, acquiring, and imparting their expertise, and convincing clients and customers of the need for their know-how and its suitability as a legitimized solution to their perceived problems. Governments are a major client. Ball (2010) describes a new generation of consultants “for whom policy is a business opportunity and from whom governments are increasingly purchasing ‘policy knowledge’” (p. 127). The proliferation of companies and individuals dealing in knowledge coupled with the ubiquity of expert knowledge means that the success of edu-consultants is now more tenuously linked to matters of knowledge, expertise, and problem-solving and increasingly influenced by image and impression management, building international reputation, and the capacity to convince clients that large fees are to be expected when professional knowledge is utilized (see Alvesson & Sveningsson, 2011; Brown & Lauder, 2012).

**Policy influencers:** While privatization reforms in education are most typically and visibly displayed in the various involvement of the private sector in provision of money and resources, following Fontdevila and Verger (2019), this sector “increasingly plays a diverse range of roles in the policy field” (p. 67). Members of this broad category of corporate actors and organizations, including advocacy groups, lobbyists, consultants, philanthropists, and business corporations, are interested in exerting “a growing power in the politics of education as agenda-setters” (Fontdevila & Verger, 2019, p. 67). While not having direct involvement in the provision of education, they work to smooth the policy path – or to get policy out of the way – so that the interests of businesses are less encumbered and can be advanced from a more powerful position.

**Agents of technological change:** Linked to the global growth of various categories of free enterprise involvement, private actors and businesses driving technological change have become central in servicing and supporting schools as profitable markets. In terms of the products and services sold to schools, provision and replacement of computer hardware, software, and peripherals have emerged as a burgeoning market and a major financial consideration for schools and schooling systems. More expansively, Thompson and Parreira do Amaral (2019) claim digitalization as “a key driver of the global market in education” and go on to describe the capacity of digital technologies to open new markets and new customers in the education sector by using “powerful imaginaries and objectives” (p. 7). The

transformative potential of technology and the apparent inevitability of its take-up work to naturalize the intrusion of outside commercial interests into schools and make schools susceptible to their ardent and inviting claims, for example, about new environments for learning, improved social participation and knowledge management, and a greater capacity to store, analyze, and evaluate learning data in ways that contribute to measuring school effectiveness and competitiveness.

Given these various and intersecting lines of enunciation depict an array of subject positions and the global incursions of businesses into the local operations of schools, an explanation of lines of power and lines of subjection might usefully proceed, in the tradition of policy sociology, as a bringing together of macro- and micro-political interests. Translated to the apparatus of commercialization, one iteration of a macro-/micro-explanation emerges from an analysis of the power/knowledge effects of policy discourses on the triumvirate formed by business, government, and education.

While a hybrid set of intersecting discourses are in play, the policy discourse of *entrepreneurship* is one which both provides explanatory possibilities in this three-dimensional analysis as well as certain preferred subject positions for key actors. Harvey (2007) alludes to the present-day centrality of entrepreneurship in describing neoliberalism as “a theory of political economic practices that proposes that human well-being can best be advanced by liberating individual entrepreneurial freedoms and skills within an institutional framework” (p. 2). The discourse of entrepreneurship provides claims about the truth that divide the innovative, agile, and enterprising practices of the entrepreneur away from older depictions of stolid and sedimented bureaucratic solutions.

The discourse of entrepreneurship smooths the way for what Ball (1998) calls the “policy entrepreneurs . . . who ‘sell’ their solutions in the academic and political market-place” (p. 124). While knowledge companies may shine the light of commercialism ever more brightly on schools, Verger et al. (2016) point out that the global education industry “is not simply an organic phenomenon in the economic sphere” but is also shaped by political actors and “enabled by public policy making” (p. 4). Drawing close to Mazzucato’s (2018) notion of “the entrepreneurial state,” the commercialization of schools does not happen in an unregulated market or entirely at the behest of private interests, but rather, relies on a type of state involvement that invites, shapes, and directs private interests and investments.

In a “complex interweaving of the public and private” (Lingard & Sellar, 2013, p. 272), policy reforms aimed at making educational activities more saleable in the market rely on a conception of the state as the institutional framework which nurtures and enables entrepreneurial freedoms while also creating the bounded and structured social space in which these freedoms are exercised. However, policy reforms sanctioning an expanded role for outside providers effect a shift in power relations – with an array of constitutive effects – as policy making itself is subject to private interests and incentives and pressures are exerted on public sector providers to use private sector services. For example, the state enamored with promoting entrepreneurial freedom becomes more susceptible to the strategic involvement of nongovernment think tanks, advocates, and financiers in processes

of policy reform. Verger et al. (2016) describe various “individual policy entrepreneurs and boundary spanners” (p. 12) dotted over the policy-making terrain that operate and mobilize the “cognitive frames” (p. 14) that constitute schooling in terms of commercially oriented and business friendly ideas and solutions.

In terms of macro-/micro-political interests, the flow-on effect into schools of injecting nongovernment expertise into policy making are expansive as new knowledges and discourses about education that follow neoliberal tenets of commercialization and entrepreneurialism are generated, popularized, and bedded down. This new orthodoxy is both transformative and seductive, invoking Ball’s (2006) chronotype of the “fast, adventurous, carefree, gung-ho, open-plan, computerized, individualism of choice, autonomous ‘enterprises’ and sudden opportunity” (p. 72). Along lines of power in the apparatus of commercialization, just as the discursive realm shapes the willing acceptance of a new commercial presence and new ideas about the purposes and practices of schooling, it is also articulated within the concrete enactments of non-discursive practices. For example, schooling practices traditionally under public control, such as school structures and funding, teacher training, school leadership/administration, professional development, classroom pedagogy and intervention, and curriculum development are, in varying degrees, facilitated by outside experts, infiltrated by business interests, or outsourced to private providers.

Along lines of subjection, the influence of the discourse of entrepreneurship relies on the quality of neoliberal governance that takes individuals as mobile policy actors interested in working on themselves and “facilitating ‘private’ forms of authority” (Shamir, 2008, p. 6). In connecting “mechanisms of coercion and contents of knowledge” (Foucault, 1997, p. 59), entrepreneurialism constitutes educators, and often those being educated, as subjects that identify with being entrepreneurial and who are thereby drawn to reproducing the entrepreneurial practices that define them. Personal qualities are configured as entrepreneurial potentialities to be instrumentalized and applied to better results in the school marketplace. To support its normalization, the discourse of entrepreneurialism harnesses various technologies of responsabilization and (self-)surveillance, third-party renditions of required standards of professionalism, and the rewards of recognition and performance embodied in a multiplicity of ceremonies, awards, and professional opportunities.

## Conclusion and Reflections

The mapping of apparatuses in the previous section, while necessarily partial and selective in its coverage, worked to convey a shift in emphasis towards deeper intrusions and more comprehensive involvement of private interests in school education. In keeping open a non-reductive characterization of this involvement (while trying to avoid portraying an inexorable invasion and take-over), the aim was to depict processes of aggregation and tendencies to uniformity in each of the apparatuses while steering away from representations of pervasive and categorical truths fixed in the current epoch.

In such a depiction, one question not fully addressed is whether it remains possible to oppose, ignore, or look away from the disciplining tendencies in neoliberal policy effects. This question of disruptive possibilities further tests the analytical potential of the apparatus by asking after its non-essential qualities and its functionality as a tool of problematization and critique. Certainly, the potential for resistance, non-conformance, and contingency seems to reside in Foucault's (1980) attribution of heterogeneous, relational, and modifiable qualities in the *dispositif* (apparatus) and his explicit references to its various functions of "justifying," "masking," and "re-interpretation" (pp. 194–195). Further references to this expanded functionality and non-essential qualities can be detected in Deleuze's (1992) apparatus map, where he describes the subject as eluding lines of force and taking "a line of flight" that "escapes the previous lines" (p. 161).

In applying these theoretical references from Foucault and Deleuze to the apparatuses of privatization, as well as ideas from a body of related secondary literature, three insights into possibilities for disruption emerge. Firstly, while the apparatuses may indeed "produce submission and compliance to the demands of governance" (Jackson & Carter, 1998, p. 60) their interconnected, dynamic, and expansive qualities open possibilities for a more "controversial dialectic" (Maesse, 2017, p. 910) between discursive calls for compliance and local action. Legg (2011) maps the general terrain of these possibilities in noting that apparatuses in "their very multiplicity necessarily opens spaces of misunderstanding, resistance and flight" (p. 131), while de Goede (2017), in mobilizing the discursive and material parts of the apparatus, claims there are "likely to be many stumbling blocks, non-conformities and changes between the plan and the eventual building" (p. 360). By introducing the dialectic of "central input and local inflections" (Clarke, Bainton, Lendvai, & Stubbs, 2015, p. 15) assumptions about the linear flow of policy knowledge and the smooth and untroubled entreaties and intrusions of private interests into schools are interrupted. In the space that opens, the apparatuses of privatization may appear as more contingent and contestable as "lively materialities" emerge that do not conform (de Goede, 2017, p. 360) and the more critical and discerning work of local evaluation and decision-making gains a greater hold.

Secondly, subjectivity emerges as a key site of disruption and resistance in an apparatus. This interpretation relies on understanding subjectivity not as emerging as an after-effect of the power arrangements and tactics of the apparatus, but rather being active in their shaping. Such an understanding opens the possibility of non-conforming and dissenting subjectivities, for, as Raffnsøe et al. (2016) note, the apparatus does not rule out, but indeed presumes, the existence and influence of intentionality, will, and freedom (p. 286). In consideration of the apparatuses of privatization, the revitalizing of more agentic possibilities for leaders, teachers, and students in schools helps conceive a different set of power arrangements and new subjectivities that fall outside of the neoliberal order. Binkley (2009) provides a relevant insight in his claim that "top-down" readings of neoliberal governance that "consider how neoliberal subjects work to optimize, individualize and entrepreneurialize themselves and their conduct" are also "shadowed by a certain

ambivalence and instability, a technique of subjectification that remains open to the potential for being otherwise practiced” (pp. 63–64).

Thirdly, the apparatus in revealing a strategic intent and a set of tactics oriented to particular targets simultaneously maps a field of resistance in which different strategies and tactics might be organized. Here, the possibilities of critique, counter-conduct, and agonistic resistance merge in the collective actions of the like-minded. When applied to the apparatuses of privatization, a process of liberating individuals such as school leaders and teachers from the constraints of neoliberal policy discourses is suggested. In practice, the possibilities for action span a broad field which includes:

- Working against the forces of economization by emphasizing and privileging the broader purposes of schooling and recasting excellence as an egalitarian value that includes an understanding of the school’s social justice responsibilities beyond economic utility
- Resisting market forces and measures by creating new coalitions as an antidote to damaging rivalry and competition, critiquing centralized processes that rank and compare schools, and replacing the metrics of the market with broader and more inclusive measures of school success
- Privileging the professionalism of leaders and teachers in ongoing critical assessment of the value, impact, and sustainability of private enterprise involvement in curriculum, pedagogy, and assessment.

Notwithstanding the many merits and seductions of a diverse and powerful group of privatization apparatuses, the need to test, critically evaluate, and sometimes oppose their strategies and tactics remains important and urgent work. Of course, matters of disruption do not proceed easily, especially against such a formidable machinery operating at unprecedented levels. Anderson et al. (2015) describe an array of “increasingly contested” neoliberal and managerialist reforms, many of which fall squarely inside of business interests in schooling, but they also note the “uncomfortable necessity” of resistance is, in its organisation, “largely diffuse and inchoate” (p. 350–351). For scholars and researchers interested in this work of disruption (see also Anderson & Cohen, 2015; De Lissovoy, 2015; Longmuir, 2019), the apparatus, as a tool of analysis, holds open a theoretical space in which to propose new ideas and practices, not necessarily in the tight and reactive dichotomous relations of power and resistance, but as a contribution to shifting, modifying, and redistributing current arrangements.

### Abstract

By the end of the twentieth century, many universities worldwide were describing themselves as international or global in vision, mission, and reputation. In doing so, they came to be represented in normative discourse as instruments of progressive cosmopolitanism. Under the guise of establishing “world class” status, university leaders have drawn on international benchmarks and models of good practice without sufficient regard to the persistence of colonial imaginaries of empire and nation in their revisionings. The chapter interrogates the global reach of governing rationalities such as “corporatization,” and “world class” reputation-making and the ethical and intellectual challenges they have presented for universities. Michel Foucault’s ideas of critique provides the analytical lens from which to interrogate normative understandings of the international university in Japan and Australia. Lessons learnt from two sets of crises, a natural disaster and a health pandemic, guide the discussions on using Foucault’s conceptualization of critique to consider university leadership anew.

**Keywords**

International university · Globalization · Techno-nationalism · Critical leadership studies · Problematization · Voluntary insubordination

**Fields of Memory**

Universities have been crucibles of paradox, simultaneously reinforcing and interrogating colonial approaches to knowledge discovery and application. Large-scale, epistemological projects instituted by Euro-American hegemony have cast a shadow over the modern university through a complex blend of mimicry, accommodation, and creative adaptation. Modern scientific expertise produced in colonial centers of knowledge has traveled elsewhere providing the intellectual and ethical grounds for dispossession, oppression, and domination of people and places. Universities and their leaders have been unable to break free from the legacies and effects of colonial conquest, empire, war, and nation-building.

**The Field of Presence**

With the end of formal colonialism, many universities were enlisted into capitalist or socialist-driven modernization projects. Confronted by the contingencies of postwar development, national universities were called on to foster a nationalist sense of purpose and to contribute to addressing complex societal problems. The USA was regarded as an exemplar of a superior scientifically driven modernization process. Inspired by social psychology research and the support of US defense funding, centers like Harvard University's Social Relations Unit produced various leadership theories. Bales and Slater's (1955) leader behavior theory is a case in point. Leadership theories helped legitimize putative liberal virtues such as individualism and meritocracy, leaving the structural antagonisms from colonial and imperial projects uninterrogated. The circulation of theories and knowledge practices was helped along by scholars and students traveling to the centers of knowledge in eminent universities. Local norms and contingencies mediated the uptake of these practices producing converging and diverging patterns. Confronted by policy-driven demands in the name of postwar reconstruction and development, university leaders presided over a series of distorting (as well as productive) effects from their emulations of scientific modernization and techno-nationalism.

**The Field of Concomitance**

For close to four decades now, universities have embarked on cycles of change, in response to ideologically driven policies. Ideas and imaginaries from the corporate world have been increasingly influential in shaping university administration and governance. Market rationalities have informed university teaching, research, and service. At the same time, in a series of parallel and paradoxical developments, public universities have been subjected to increased state scrutiny. From the competitive allocation of research funds to persistent evaluations into the performance

and quality of institutions, practices of surveillance and benchmarking have become a feature of university administration. University leaders both in Japan and Australia have presided over audit architectures and “new public management.” Leaders have (unwittingly) endorsed isomorphic mimicry. Leadership theories in this era of audit have remained wedded to social psychology, based on the assumption that leadership – the conduct of individual leaders, is crucial for system-level change. The emergence of new fields such as critical leadership studies have focused on analyzing the power relations inspired by various leadership theories. Drawing on sociological, historical, and philosophical insights, contributors have attempted to interrogate agenda-conforming reforms in organizations such as universities and through these forms of inquiry, the ontologies of leadership have been broadened.

### **Discontinuities and Ruptures**

The field’s ruptures can be traced to various developments to sharpen the analysis of power relations in organizations and societies. Investments of excessive hope in transformative leadership at the hands of individual leaders are subjected to scrutiny and immanent critique is foregrounded. The thrust of this work, as exemplified in critical leadership studies, is to unsettle the “tripod” ontology of leadership theories which focuses on “leaders,” “followers,” and “shared purpose.” Critical leadership studies, put simply, seeks to de-essentialize leader-driven theories and practices and the forms of normativity they inspire. For example, the critical school of leadership draws on feminist and postcolonial theories to show the enduring connections of capitalist, colonial, and masculinist logics in contemporary organizations. Leader-based theories are subsequently reread as discursive resources that normalize individualism, elitism, and widening inequality within organizations and beyond.

### **Critical Assumptions or Presuppositions**

Current developments are paving the way to recognize leadership as a political project. This approach to leadership restores an analytic of power into understanding roles and relationships within organizations and in the wider social and geopolitical domains. Structural and historical antagonisms are brought to the fore. New lines of inquiry are embarked on including how and why it is that some countries/cultures lead and others follow? Why are the countries deemed to be worthy of emulation concentrated in the West/Global North?

---

## **Introduction**

Governments routinely produce and circulate certain truths about their internationalized universities. For example, by portraying their institutions as instruments of progressive cosmopolitanism, where students learn about “global citizenship.” Using insights inspired by the work of Michel Foucault, this chapter explores the normative understandings of the international university in two national settings, Japan and Australia. In both contexts, universities have performed internationalization through specific histories that speak to narratives of conquest, empire, and nation.

Notably, these fields of memory rarely find a place in the deliberations undertaken by university leadership. Yet, this historical background is vitally important if universities are to be creative forces for the public good in the future. The chapter examines the global reach of governing rationalities such as “‘corporatization,’ new public management” and “world class” reputation-making, paying particular attention to the ethical and intellectual challenges presented by these developments. Foucault’s conceptualization of critique is then used to consider university leadership anew, drawing on the lessons learnt by two sets of crises, a natural disaster and a health pandemic.

The chapter begins with historical snapshots of university internationalization – loosely defined as institutional processes of incorporating international influences – in Japan and Australia. Interspersed with this snapshot are outlines of two events: the Fukushima Daichii Incident and the effects of the COVID 19 pandemic on Australia’s education industry. Both crises provide a moment to examine the limits of existing leadership practices. In the final section, the Foucauldian concept of critique is introduced as a vital component of ethical leadership. Problematization, refusal, and the courage to unveil one’s complicity in the exercises of power are discussed as vital elements of ethical leaderships.

---

## **Problematizing International Education in Japan**

Japan first embarked on internationalizing its universities at a time of drastic social and political transformation as the nation faced contact with, and mounting pressure from, the West. The arrival in 1853 of a US naval contingent demanding access to Japanese ports by American merchant ships was followed by incursions by other Western powers – Russia, Britain, France, and Holland – to pressure Japan into “free” trade treaties.

Japan was prompted to modernize itself in order to retain its sovereignty and stave off the imminent threat of Western dominance. Necessitated by external and internal forces, a new system of governance emerged in the wake of the Meiji Restoration (in 1868). Japan’s leaders opted for open-door, vigorous, and proactive Westernised “scientific” modernization to establish a full-fledged nation-state to join the European “family of nations” (Yamamuro, 2017, pp. 279–281). The country would be the first to do so in East Asia. Part of the pull was a desire to reconfigure Japan’s peripheral position in what was then a Sinocentric Confucian order (Yamamuro, 2001). Wholesale internationalization efforts were embraced to emulate Western political, economic, technological, and military systems and social norms. In short, a comprehensive adoption of the ways of European “civilisation” was embarked on. Everything “from railways to parliaments, from hair style to philosophy” was adopted, including a Western system of education (Beazley, 1972, p. 311; Yamamuro, 2017).

The country’s first university, Tokyo University, was established in 1877 and renamed “Imperial University” in 1886. In the period immediately following its establishment, Tokyo University adopted a radically “global” approach. Most classes were taught in foreign languages, with English occupying a prominent position. Only nine out of 32 professors were Japanese, though the balance was reversed in

1881 (Amano, 2017, p. 150). The experience of studying abroad in an approved Western university was a prerequisite to obtain professorship. The primary mission of modern Japanese universities during the Meiji period (1868–1912), led by the University of Tokyo, was to “go global” and import advanced Western knowledge (Sato, 2017, pp. 173–174; Amano, 2017). Returning academics and their colleagues were expected to translate imported knowledges into the Japanese language, and thereafter recontextualize or “localise” ideas for adoption.

These first moments of internationalization drove profound domestic social transformations and geopolitical changes. Domestically, opportunities were opened up for nonhereditary leaders from all walks of life (cf. Beasley, 1972). Japan established itself as an exemplar in Asia, a modern state that succeeded in resisting formal colonization. By the start of the twentieth century, it would become a major study destination for students from the East and Southeast Asia. Threatened by European imperialism, Japan had responded with an aggressive engagement with science and modernization to internationalize its governance and very identity. It harnessed science and technology toward industrialization and militarization, altering the balance of power vis-à-vis the West and the politics of the Asian region. The recalibration of geopolitical power brought with it a series of unresolved consequences which continues to confront the region.

Postwar internationalization of Japanese universities was largely a matter of outbound mobility of students and scholars. In-bound international student mobility started to take hold with Japan’s increased prosperity and global presence. The first major internationalization initiative (*kokusaika*) was *The Project on Welcoming 100,000 International Students* introduced in 1983 by the Nakasone government during a period of economic prosperity. Its official goal was to raise Japan’s prestige, promote national security, and facilitate its integration into the emerging international society (Ota, 2003, p. 36). In the context of rampant international trade disputes and frictions with its economic partners, cultural diplomacy and “capacity building” through human resource development in developing countries were adopted as policy priorities (Ninomiya et al., 2009). Subsequent policies such as the *Global 30* (FY2009–2013), *Go Global* (FY2012–2016), *Reinventing Japan* (FY2011–), and *Top Global University* (FY2014–2023) were all introduced during periods of economic and national tumult (Ishikawa, 2014; Rose and McKinley, 2018).

For the *Global 30* project *kokusaika* meant opening up Japan through inbound mobility of international students and scholars. A target of hosting 300,000 international students was announced, and university overseas centers were opened to aid recruitment. An aggressive policy of English medium instruction in undergraduate and graduate courses was initiated to make Japanese higher education attractive to international students and international scholars.

*Go Global*, which succeeded *Global 30*, saw a slight shift in emphasis, by also including outbound mobility of Japanese students. This was part of a national goal to “re-invent Japan” by fostering the development of “globally active” citizens. Universities were exhorted to “upgrade the quality” of education through strategic alliance with overseas institutions (MEXT, n.d.).

Importantly, policy platforms to internationalize universities coincided with other policy reforms which increased their surveillance. In 2004, all national universities were “incorporated,” ostensibly to increase autonomy (Amano, 2008). They were also subjected to rigorous evaluation regimes on goals achieved over a six-year period by the Ministry of Education, Culture, Sports, Science, and Technology (MEXT). Even universities with impressive performance records experienced reduced financial support in a policy context of national fiscal austerity (Kaneko, 2013, pp. 177–180). Reflecting on these changes, a former president of a national university lamented:

The corporatisation of national universities was first celebrated as an educational reform. Then it started looking more like an administrative reform. As time went by, it became apparent that it was nothing but a ‘fiscal reform’, which is the way it was really intended. [When] our budget is controlled, all is controlled (Kuroki, 2009, p. 125).

Status competition soon became a driving force, steering Japanese universities to internationalize or “perish.” At the University of Tokyo, the leadership team announced to alter its academic calendar to “go with the world” but after protests fell short of implementing the change. The University’s actions, however, ignited a national debate, marked by concerns about the “vulnerability” of Japan’s institutions. Its most esteemed institution had been driven to consider administrative mimicry, aligning its academic calendar with the “international standard.” Teaching in English, another internationalization initiative, saw a marginal increase in inbound international graduate students, but other problems arose, most notably, the segregation of international students into Anglophone bubbles, reducing opportunities for intercultural relationships with Japanese students (Rose and McKinley, 2018, p. 118; Ota and Horiuchi, 2018). Requirements to teach in English were also unpopular with the professoriate. All in all, these extravagantly symbolic gestures insisted on by the education ministry and university management were not well received.

Summing up, contemporary cycles of internationalization that have followed have been rationalized as necessary to help “solve” the country’s economic and demographic challenges. Restoring the reputation of Japanese universities has been narrowly interpreted as improving rankings in the Times Higher Education and QS league tables, which since 2010 has become an explicit national policy objective (Ishikawa & Sun, 2016, Ishikawa, 2014, Morita, 2015).

## **Fukushima: A Loss of Faith**

On 11 March 2011, Northeast Japan experienced an earthquake and a tsunami which led to the explosion of nuclear reactors in Fukushima prefecture. The series of catastrophic events which followed left deep scars in Japan’s topography, shaking citizens’ faith in its political leadership, its business community, media professionals, and its science and technology experts, many of whom were located in the nation’s premier universities.

Business and political leaders and university experts had over the years articulated a narrative of absolute safety to neutralize public wariness of nuclear

power (Low, 2015; Friedman, 2011). The use of atomic weapons against Japan to hasten the end of the Second World War killed close to a quarter of a million citizens and exposed generations to fatal radiation-related illnesses (Southard, 2015). This destructive history and its related moral and existential failures were replaced by a vastly different set of social imaginaries: Nuclear power would enable national reconstruction. Universities joined state and market actors to reset the calculus of power and scientific knowledge through which nuclear energy came to be seen as inevitable for furthering Japanese industrialization (Kinefushi, 2015; Low, 2020).

A broad umbrella of protective legislation, introduced over time, enabled companies to use academic assessments to neutralize and deflect their management of risk analysis (Friedman, 2011; Kinefushi, 2015). TEPCO, the company in charge of the Fukushima nuclear facility, enjoyed these legal protections to limit liability. The company was one of many companies that embarked on building nuclear reactors in areas deemed to be dangerously vulnerable. In the case of Fukushima, long-held local knowledge about the risks of earthquakes and tsunamis was forgotten or ignored.

In the wake of the 2011 disaster, experts including university-based scientists appeared untrustworthy, evasive, and defensive (Kinefushi, 2015). This was a key moment in which public confidence in the universities might have been boosted had they been seen to provide frank and fearless scientific leadership. Initial briefings by TEPCO and government officials appeared to minimize the scale of the disaster. The Internet enabled the rapid circulation of (mis)information and journalists were left scrambling to vet expertise and manage the large quantities of information (Friedman, 2011).

The Fukushima crisis revealed the downside of close links between the energy industry, the state, and Japan's most prestigious institutions of higher education. The disaster raised questions about the integrity of science and engineering experts at leading research universities such as the University of Tokyo. Professors were labeled *goyo gakusha* or scholars who serve the interest of the government and industry by "uncritically singing their tune" (Chronicle of Higher Education, 2011, July 24). They had proliferated *gempatsu anzen shinwa* – the myth about unconditional nuclear safety (Brasor, 2011). By adopting a pro-industry stance in their analysis of risk, researchers compromised their responsibilities to support the regulatory roles of governments, and to uphold the public good (Kinefushi, 2015).

A broader failure of leadership can be said to have occurred with universities, media organizations, and the business sector cooperating to effectively censor experts who held opposing views. Pronuclear experts were courted by the powerful Ministry of Economy, Trade, and Industry and the nation's media organizations. Scientists opposing nuclear energy were consistently denied a public profile by media and the state. Many were also refused recognition by their institutions, sidelined in promotion opportunities and locked out of lucrative grants. One such group was the "Kumatori Six" – six nuclear scientists at Kyoto University's Research Reactor in Kumatori, Osaka. All remained in junior faculty positions until retirement, denied public and corporate research funding for the duration of their careers (Hosomi, 2013).

Nuclear power technology became a national project in Japan's postwar reconstruction and effort was "re-branded" through a range of practices. Public acceptance of "safe atoms" was helped along by the combined influence of business, political, and media actors. Japanese department stores hosted exhibitions that were directed at housewives on the utility of atomic power in everyday lives, "women were seen as important to achieving a national consensus about the need for atomic energy" (Low, 2003, p. 204). Even children were socialized into a pronuclear stance through formal curricula in schooling, popular children's TV shows, and through poster competitions and science museum exhibits. Japan's seven former imperial universities played their part. Dubbed "nurseries for nuclear power," they were responsible for producing a stable of pronuclear experts and expertise, invested in assuring a public that nuclear power was safe. The safety myth was also supported through suppression of oppositional voices. Techno-nationalism – the tying of national identity to technological prowess – also helped to consolidate state and popular support for nuclear energy (Low, 2020).

The crisis was a critical moment of questioning the politico-economic-intellectual conjuncture that had sustained Japan's postwar development. This conjuncture had institutionalized a number of truths: the safety of the country's nuclear energy policy, the probity of its regulatory systems and processes, and the neutrality of its scientific elite. State capture by corporations – namely their capacity to shape the formation of laws, policies, and regulations to their advantage – was helped along by a combination of forces in which universities were also implicated. On many fronts, the disaster sparked off a broad crisis in leadership which briefly galvanized Japan's long-standing antinuclear activism and swung public sentiments toward policies for alternative energy sources. But hegemony is hugely difficult to overturn. Rationales of "necessity" and "righteousness" helped to reinsert a "system of acceptability" toward nuclear energy (Kinefushi, 2015). Turning now to Australia, what might be learnt about leadership practices from the historical processes through which universities were objectified and made international?

---

## **Situating the Internationalization of Australia's Universities**

The engagement of Australia's universities with international students really began in earnest in the postwar era when universities were drawn into Australia's international relations objectives. A high point of internationalization was the Colombo Plan, a postwar intergovernment development assistance program involving some 26 countries initiated in 1951 at the height of Cold War animosities. The Plan enabled Western countries to exercise moral leadership by instituting economic, technical, and social cooperation projects with the decolonizing countries of the Asia-Pacific. Some 20,000 students were supported to study in Australia over three decades. The Plan has been described as a milestone in the reconfiguration of Australia from an enthusiastic advocate of a racialized immigration regime and aspiring colonial power in the Pacific, to a humanitarian country in the new moral landscapes of a decolonizing world order. The Colombo Plan is credited for setting

the foundations for Australia to become a desirable study destination for Asia's burgeoning middle classes (Auletta, 2000; Oakman, 2010).

Australia universities were involved in other international exchanges that predated the Colombo Plan, most notably scientific and scholarly exchanges with Britain and the USA. American philanthropic foundations empowered by the peculiarities of US taxation policies extended their largesse to Australian universities. The Rockefeller Foundation and Carnegie Corporation were just two bodies that provided funds to nascent Australian universities going back to 1926. Their support during the Great Depression constituted "...a cultural lifeline..." (White, 1996). These foundations were instruments of "soft diplomacy," charged with furthering liberal internationalism, then a key US national policy. In the postwar era good science and good scholarship were promoted to be codependent with Western liberal values (Bu, 1999).

A number of historical elements inform the contemporary leadership practices of Australian universities. First, it is noteworthy that its universities, like other instruments of the state, are strongly influenced by national identity-making projects drawn from Australia's settler colonial history. A largely romanticized view of British "settlement" has celebrated Australia's British roots and produced a narrative of settler heroism. In parallel with this founding sentiment, the country's foreign policies for a good part of the twentieth century has centered on an imagined identity of Australia as a trustee of Western civilization in the Pacific. The violence of colonial conquest and the forced assimilation of indigenous Australians remains a difficult topic, intruding every so often into university-state relations through "culture wars" so declared by the country's conservative political class. There is little appetite to defend the internationalized public university.

Second, the country's egalitarian self-image and the impact of human capital-driven social policies has created expectations that universities are a means for social mobility. University leadership has to balance desires for "useful knowledge" that stands to increase employment prospects, with the inherited knowledge of earlier generations and learning that is not yet recognized as useful knowledge (see, for example, Boulton and Lucas, 2011; Forsyth, 2021). Third, liberal democratic politics in Australia has offered qualified support for cultural and linguistic diversity, instead, yielding to an economic framing of Australian multiculturalism and limiting its emancipatory prospects. University leadership has followed suit. This background has rendered multicultural policies vulnerable to populist nationalism. The role of universities and support for international education in fostering cultural and public diplomacy has remained unappreciated by the public at large (Collinson and Burke, 2021; Rizvi, 2020).

Fourth, the embrace of market-oriented rationalities by the state to "re-form" the public sector has steered universities toward "New Public Management" (Marginson & Considine, 2000; Yates et al., 2016). University funding grew from 0.9–1% over two decades from 1989–2017 (Universities Australia, 2019). In 1989, the state met an average 78% of the costs of a student's university education; by 2017, that figure was down to 58% (Universities Australia, 2019,

pp. 10–11). New Public Management has presided over an increasingly expansive governance regime that progressively led to a weakening of academic self-governance (Marginson & Considine, 2000). University academics have become the targets of surveillance and intervention: assessed, evaluated, differentiated, and ordered into hierarchies of competence (Shore and Wright, 2015). Academic disciplines have been on the receiving end of political pressure to demonstrate relevance and economic utility (Forsyth, 2021; Jayasuriya, 2020; Yates et al., 2016). Government-instituted legislative changes have reconfigured the character of university governing bodies (University Councils), with corporate expertise in finance and management privileged ahead of experience in public service (Marginson & Considine, 2000). University councils have thus insulated themselves from the broad swathe of concerns clustered under the umbrella of public good: the development of an informed, engaged citizenry, well-educated and ethically grounded professionals, truth, and justice (Forsyth, 2020; Rizvi, 2020).

The characteristics of university marketization initiated by government policy led public universities to direct their energies toward a host of entrepreneurial activities such as the recruitment of full fee-paying international students from Asia, with China as a major source country (Rizvi, 2020). A “2-step migration” policy enabled Australia educated international students to apply for permanent residence; this policy maneuver positioned Australia favorably in the competitive global education market (Robertson, 2013). Income from international student fees helped neutralize the effects of funding cuts by a retreating state (Jayasuriya, 2020; Rizvi, 2020). University leadership teams supported the recruitment of an ever-increasing number of international students but fell short of directing resources toward teaching and learning support. Few academics were able to utilize the student diversity in their classrooms in pedagogically meaningful ways (Arkoudis et al., 2019; Marginson et al., 2012). The inherent precarity of the international student experience received little institutional attention. That a worrying proportion of international students were absorbed into circuits of precarious work, often underpaid and subject to poor treatment was news nobody wished to hear (ABC, 2015; also Marginson et al., 2012; Robertson, 2013).

## **A Crisis of Global Proportions: Universities and COVID 19**

In 2020 with borders slammed shut to control the spread of the novel Coronavirus 19, a perfect storm was brewing. Here was a university sector highly dependent on international student fees for its core business with tuition revenue channeled into vital research activities and other discretionary projects (Jayasuriya, 2020; Rizvi, 2020). An indifferent, if not hostile policy environment, allowed successive governments to neglect public universities with little electoral concern. In media and political circles universities were criticized for cosying up to China and failing to uphold academic freedom. Having abided by market-driven policy rationalities universities were now victims of their success. It was argued that they had sacrificed their responsibilities to domestic students by privileging international students; that

teaching had been sacrificed by universities' staking their reputations on securing a ranking in world-class league tables (Tudge, 2021). Border closures initiated unsuccessful lobbying from the international education industry for students to be allowed to return to Australia. The "value" of international students had rested on their objectification as a consumer of education, tourism, retail, and real estate (Rizvi, 2020). But nationalist fervor trumped economics (Collinson and Burke, 2021; Jayasuriya, 2020). Universities had devoted little energy to fostering public diplomacy, festering resentment grew toward international students and the international education sector (Rizvi, 2020).

The pandemic threw the inherent precarity of the international student experience into sharp relief. Persistent lockdowns and economic disruptions (at home and in Australia) exposed students to food and housing insecurities, extreme social isolation, and racial harassment. International students were denied any kind of income support from the Australian government, unlike their peers in the UK and New Zealand (Berg, 2020), leaving universities to work with charities to meet student needs for their most basic amenities.

---

## Critique as a Leadership

Crisis or its Greek variant *krisis* first appeared in the field of medicine to capture a medical event – a decisive moment between life and death. The crisis was "an intrinsic condition" involving the "judgement" or *leadership* of the physician (Kollesck, 2006, p. 399 cited by Prozorov, 2020, p. 4.) Over time, crisis acquired a profusion of meanings and uses: "The concept of crisis, which once had the power to pose unavoidable, harsh and non-negotiable alternatives, [was] transformed to fit the uncertainties of whatever might be favoured at a given moment" (Prozorov, 2020, p. 4).

From Plato's philosopher kings to the accounts of social theorists such as Weber and Gramsci, Western thought has a long history of exploring ideas about "leadership" and leaders. These historical trends have inspired contemporary lines of inquiry about the traits that are associated with effective and authentic leadership (Learmonth and Morrell, 2020). In contrast, studies inspired by Foucauldian thought reject the idea of a coherent, unified, sovereign subject whether that of "leader" or "follower" (O'Farrell, 2005, pp. 27–28). Foucault's ideas about subjectivity are at odds with leadership theories informed by social psychology or phenomenology. Foucauldian-inspired leadership rests on a broad conceptualization of power and its relation to practices of governance. Power, according to Foucault, is distributed, relational, and exercised in, and through, the social body. Power is omnipresent, it unfolds at macro-levels and through micro-practices. Power cannot be contained in the position of vice-chancellor or president of a University, nor is power concentrated in a singular entity called the state. Instead, power is *exercised* in and through knowledges, experts, techniques, technologies, and emotions. Sovereign power – whereby individuals exercise power in the way that a king once did – literally by "make or break," or "life or death"-type decisions, does still exist but is less commonplace.

The wider topic of governance is well canvassed in Foucault's vast archive of writings, appearing in his deliberations on power, discourse, and subjectivity on the intricacies of European statecraft. His reflections on pastorship – an individualizing power exercised by the discursive figure of the shepherd in Hebrew societies, have contemporary resonances for how leadership is understood, “. . . [this] strange technology of power [that] treat[s] the vast majority of [people] as a flock with a few as shepherds” (Foucault, 1994, p. 303). Without the shepherd's immediate presence and direct action, he observed, the flock would scatter. In contrast, in the Ancient Greek polis, the king was responsible for upholding the law (nomos) and did so by “binding together different virtues, contrasting temperaments, gathering lives together into a community based to assure the unity of the city” (p. 307).

Postcolonial, feminist, and Foucauldian-inspired approaches from the variegated school of critical leadership studies have contributed to “problematizing” the discourses and practices of leadership by exploring how these practices objectify students, educators, and administrators and managers (see Alvesson, 2020; Learmonth and Morrell, 2020; Liu, 2021; Nkomo, 2011). A host of empirical studies have examined how school leaders are disciplined to perform principalship like a “CEO” (see Niesche, 2011; Mifsud, 2017). More recent work has examined the manner in which leadership is assembled and made governmental. For example, through the training of leaders through leadership preparation programs (see Drew et al., 2008) and through performance-based measurement of leadership effectiveness (Deem, 2004; Loveday, 2021). Other lines of inquiry have interrogated the manner in which leadership education and the plethora of popular literature obscure the capture of the state by corporate interests producing in their wake structural antagonisms that blight the lives of people. As Alvesson (2020, p. 2) notes, “. . . social reality and popular leadership theories [are] moving in different directions.”

It is important to also see Foucauldian literature as offering productive strategies to address these problems, for example, by examining how ethical leadership might be exercised. For Foucault, ethical leadership involves practices of critique (“critical attitude”), which he describes as “a will not to be governed thus.” Foucault enjoins his audience to strive for an “aesthetics of existence.” To practice ethical behaviors and make ethical choices is difficult and ongoing (Liu, 2021; Nkomo, 2011). It demands perseverance, attention to detail, and curiosity, practices that are also found in artistic practice. Similar parallels have been identified elsewhere in studies of leadership where ethical leadership is understood as an artistic practice (English & Ehrich, 2016).

An ethical leadership is exercised through “critique.” But,

critique is not a matter of saying that things are not right as they are. It is a matter of pointing out on what kind of assumptions, what kinds of familiar, unchallenged, unconsidered modes of thought the practices that we accept rest. . . . Criticism is a matter of flushing out that thought and trying to change it: to show that things are not as self-evident as one believed, to see that what is accepted as self-evident will no longer be accepted as such. Practicing criticism is a matter of making facile gestures difficult (Foucault, 1988, p. 154-155).

Put another way, critique involves a person exercising “the right to question truth on its effects of power, and to question power on its discourses of truth.”

Foucault's work highlighted three dimensions of critique: "the activity of problematisation, the art of voluntary insubordination and the audacity to expose one's own status as a subject" (Lemke, 2011, p. 27). All three dimensions are crucial to the practice of ethical leadership.

Problematization – "thinking problematically" – goes beyond "critical analysis" as performed in social science research. Problematization involves identifying and interrogating the logics that inform a particular practice; it extends to the social imaginaries that shape and enable such logics to take hold and acquire legitimacy. Problematizations "... establish a certain distance from existing forms of acting and understanding while also [remediating] and [recombining] these forms" (Collier, 2009, p. 80). Crucial to problematization is attending to the manner in which persons are invited toward particular subject-positions and identities in and through forms of thought and actions. Problematization also involves questioning universals. Institutions such as "the university" are not regarded as coherent, integrated, monolithic entities. Rather they are experienced as "systems of heterogenous elements made up of connections, encounters, plays of forces, strategies and barriers" (Lemke, 2011, p. 31). Thinking of institutions as regimes of practices, that are held together by encounters, connections, and plays of forces, opens possibilities for unsettling the power relations that institutional authorities seek to impose. Fault lines are revealed; the edifice of the "neoliberal university" stands to be shaken.

Normative writings on ethical leadership are not usually framed around actions of refusal. Foucault's critique in sharp contrast flags "the art of voluntary insubordination" as part of being ethical. It is a call "to refuse to be governed thusly," "... like that, by these people, at this prices (Foucault, 1997 in Lemke, 2011, p. 33). The dangers involved in such an undertaking did not go uncommented; Foucault wrote persuasively about embracing risk by questioning established norms and having the 'audacity to expose oneself as a subject'" (p. 33). Critique, in short, involves questioning one's own ontological status through processes of self-distancing and self-examination. Performing critique, though, presents problems for those exercising executive leadership. The academic manager has been quick to comply with the values, aims, and routines more commonly associated with the corporate world than that of the university.

In the remainder of this chapter, the practices that define the world-class university are problematized to open up imaginative spaces for ethical leadership. By tracing the policy configurations which have constructed international education, it is possible to read the international student experience as "the canary in the coalmine." International education markets have sponsored forms of normativity that have reached the wider student body, exposing them to the vicissitudes of the market, to hardship and social inequality. Universities are in a strong position to promote alternative modes of international education, and to reject, or at the very last mediate the values of corporate capitalism. From the payment of commissions to education agents, shrouded in commercial-in-confidence agreements, to partnerships with questionable private sector bodies, and to the inflated wages of its leaders, the ethical conduct of universities has been under scrutiny for some time (ABC, 2015; Jayasuriya, 2020).

By using problematization as a tool, a number of practices undertaken by Australian universities can be interrogated. Universities invested heavily in

recruitment and marketing activities, above and beyond supporting the teaching, learning, and pastoral care of international students. Efforts in internationalizing the curriculum have been notably sluggish and piecemeal, making it difficult for socially immersive and participatory pedagogical teaching. Fee structures were three to four times greater for international students compared to domestic student, placing burdens on Asia's middle classes, where most students were drawn from. Large class sizes and heavy workloads meant many academics were constrained in their teaching of and learning from international students (ABC, 2015). Racialized tropes disguised system-wide problems; the "problem" was located instead in the "calculating," instrumentally driven Asian student seeking to "purchase" a degree. The international student came to be seen as an oppressive force, subjecting exhausted academics to plagiarized prose; their very presence seen as harmful to the revered reputation of the university. International students have also been considered victims, the objects of compassion and pity, lacking agency and necessitating ever more support, placing further demands on institutional resources (Indelicato, 2018). Problematization relocates the failures of accountability, away from the least powerful – the individual international student – onto to Australia's institutions. Through problematization, opportunities are opened to build solidarity with the cultural other, the international student.

Similarly, problematization uncovers the assumptions implicit in university-industry partnerships. One set of assumptions concerns the role of experts and their expertise. Experts are expected to *serve* industry and the national economy. Epistemologies are valued for their utility to industry, placing science and technology-oriented disciplines ahead of other disciplines in order of importance. University promotion systems are designed to reward service to industry. As revealed by the Fukushima disaster, experts were rewarded for supporting the objectives of Japan's energy industry. They also received recognition from the state for enabling techno-nationalism. In performing this role, other responsibilities fell aside, for example, being a critical public intellectual. A starting point for ethical and intellectual leadership would require universities to support different expertise, discursively and materially, such that different fields of knowledge might flourish.

---

## Conclusion and Reflections

Many universities strive or claim for themselves an "international" status. They point to various international engagements, the recruitment of international students, the presence of international faculty, and an "online" presence. Rarely are international universities examined for their commitment to civic contributions, both to national societies and to distant others. A study of leadership under conditions of crisis present opportunities to revive the importance of the civic functions of universities. Problematization and involuntary subordination can act as correctives to the normative, managed, and corporatized international university. Too many university leaders have played into the logics of competition and choice, claiming that their

institutions' survival has demanded their complicity (Loveday, 2021). Many have allowed their institutions to be censored by market need; what is difficult, innovative, or intellectually or aesthetically demanding has been easily discarded. Refusing such leadership may be a step in the right direction. For, "an easily governed university is no university at all" (Boulton and Lucas, 2011, p. 2515).

### Abstract

This chapter provides a wide-sweeping overview of the evolution of the education marketplace and the devolution of the common good values of public education. In doing so, it aims to highlight the market-based mechanisms that have accelerated the development of the contemporary neoliberal education system – a system that has grown increasingly removed from the early goal of serving the public good. This chapter places an emphasis upon the consequences for K-20 leadership and why these issues should receive sustained, targeted attention to reimagine a more equitable, democratic future of education.

Education markets · Leadership · Common good · Public education · Privatization · Neoliberalism · Politics of education · Social change · Collectivism · Individualism

**The Field of Memory**

The values, structures, and ideas of American education and the market largely originated from Enlightenment thinkers. Religious denominations – Catholics, Quakers, Anglicans, and Puritans – were an essential force behind the purposes and structure of the educational market. The American founders brought new educational purposes in civic virtue, the common good, and vocational training, which would be carried forward in the common and normal school movements. Industrialization and the Civil War led to new purposes and the expansion of compulsory education. The progressive era that followed advanced the often-competing goals of efficiency and democratic and child-centered education. As the economy and the state's role therein evolved following World War II, so too did the economy as consumerism, economic efficiency, and market-based reforms began to emerge.

**The Field of Presence**

Several terms have been used to describe the all-pervasive market-related discourse that cuts across contemporary K-12 and postsecondary education. Marketization, commercialization, commodification, corporatization, financialization, and privatization all signal massive shifts that have contributed to the transformation of education into a neoliberal field of presence. These forces have shaped the US education system into an expansive but highly stratified field in which consumers compete for education as a private, valuable form of capital. Within such a system, wherein access and inequality grow, leadership faces several competing challenges to institutional survival and serving the common good.

**The Field of Concomitance**

Education's market orientation has been heavily influenced by many disciplines, among them economics, business, sociology, political science, and anthropology. The global public management revolution and New Public Management principles have been embraced by educational leaders and policymakers to improve the standing of schools and colleges in the market. Policymakers and leaders have adopted the market-based reforms, business structures, and practices championed by Milton Friedman, Friedrich Hayek, and other neoliberal economists – all to compete in a *free* market.

**Discontinuities and Ruptures**

Though much about our public system of education has remained intact over time, including the notion that education is a common good, discontinuities have developed alongside this early belief put forth during the common school era. This chapter

illustrates that market influence has shaped public education from its early inception but was not apparent as an explicit force until the emergence of neoliberalism and market-based reforms of the post-war era.

### **Critical Assumptions**

The devolution of public education in the name of the market is based on several imperfect assumptions, including the most efficient and effective market is a free market in which competition and deregulation produce innovation and support the common good. Yet, these assumptions presume a perfectly free market in which leaders, parents, and students are rational consumers with information operating in a marketplace. The market not only fails to address the inequities in education but also reproduces them at all levels.

---

## **Introduction**

This chapter examines how market-based efforts have devolved, disrupted, and denigrated public education and the common good in the United States; how educational leaders (tacitly) support and challenge the threats to public education; and why these issues should receive sustained, targeted attention to reimagine a more equitable, democratic future of education. This chapter focuses on the evolution of the values, rationales, structures, and reforms of formal education markets in the United States, underscoring the implications for state-supported education and the devolution of education's position as a common good. The chapter ends with a discussion on several contemporary market-based challenges facing K-20 leadership.

---

## **The Evolution of Education Markets in the United States**

American education has long been characterized as a series of interconnected markets of formal, informal, and nonformal types of education. This chapter draws upon a sociopolitical foundation to define education markets as the social structures, arenas, institutions, and arrangements that facilitate the exchange of education (i.e., knowledge, information, training) between parties (Dill, 1997; Fligstein & Dauter, 2007; Slaughter & Leslie, 2001; Slaughter & Rhoades, 2004). In recent years, education markets have been conceptualized as a convoluted system of institutions (schools, colleges, and universities), consumers (students and parents), workers (teachers, faculty, administrators, and staff), the state (local, state, and federal governments), corporations, and other organizations (Levin & Belfield, 2003; Slaughter & Rhoades, 2004). Market-based reforms have been the central point of contention. Pro-market advocates argue the marketplace is the most effective way to provide education, whereas critics contend these shifts impact equity, public education, and education's promotion of the common good.

Although education's status as a common, private, and public good is constantly changing with the market (Dorn, 2017; Marginson, 2016), this chapter focuses on

how the recent market provision of education has affected the common good values of education. Herein, common goods refer to collective political goods with qualities of shared community, such as democracy, equality, equity, and knowledge.

In higher education, the market encompasses the for-profit behavior of colleges as well as “institutional and faculty competition for monies, whether these are from external grants and contracts, endowment funds, university-industry partnerships, institutional investment in professors’ spin-off companies, student tuition and fees, or some other revenue-generating activity” (Slaughter & Leslie, 2001, p. 154). K-12 education has also felt the full force of the market and market-based reforms, including the adoption of government performance regimes, shifts in curriculum, voucher programs, charter schools, and tuition tax credits (Apple, 2000; Labaree, 2010; Levin & Belfield, 2003). In K-12 and higher education, the education marketplace has evolved alongside a set of ever-changing values, structures, and rationales of schooling. Indeed, education markets have been heavily influenced by educational stakeholders internal to operations, in addition to external political, social, and commercial interests. Ultimately, these shifts have significant implications for equity and education’s role as a common good.

## Origins of the Education Market

The roots of American educational thought and the market can be traced back to Europe, Mesopotamia, and beyond. In Western thought, education, as a concept, is inexorably linked with the concept of the polis. Questions exploring education and the role of the state have been asked in one form or another in philosophical thought dating back to the Hellenic states. In *The Republic*, Plato lays out a foundational argument for the place of education in society, including the idea of enlightened philosopher kings who value knowledge, concepts of civic virtue, and the allegory of the cave (Lawton & Gordon, 2002/2019). Though divergence existed on pedagogy and the purpose of education, the underpinnings and values of the current educational marketplace can already be perceived in the different educational practices of the Greek city-states. For example, the Athenians viewed education as a central element to democratic citizenship, whereas the Spartans valued education for its practical, military training (Lawton & Gordon, 2002/2019).

The Catholic Church was integral to the expansion of the educational marketplace. Contemporary universities emerged out of a “need for institutions to educate priests and monks when it was considered by the Church authorities or other leaders that the monastic or cathedral schools were not providing education at a sufficiently high standard for future clerics and administrators” (Lawton & Gordon, 2002/2019, p. 52). The Church’s influence on education traditions, purposes, and markets in Western educational history is evident throughout the classical antiquity and medieval periods, including monastic education, scholasticism, and the development of medieval universities in Europe.

The Scientific Revolution and thinkers like Francis Bacon and Rene Descartes laid the groundwork for an Age of Reason. The Enlightenment was a move away from dogmatic faith toward empirical, rationalist thought and helped to establish the Western understanding of law, property, and liberty (Locke & Filmer, 1689/1884). Empirical experimentation and education served as the primary mechanisms of promoting reason and freedom. Several notable Enlightenment thinkers greatly influenced the American educational marketplace.

Aligning with other empiricists in the Enlightenment era, John Locke wrote on the role education should play in developing reasoned and free citizens. As Lawton and Gordon (2002/2019) highlight, Locke emphasized “the importance of ‘environment’ rather than ‘heredity’ in education” (pp. 83–84). In other words, a child’s brain begins as a *tabula rasa*, or blank slate, that can be molded with practical education and different experiences to build character and instill particular virtues (Locke, 1689). Locke understood children as living in a state of nature, who could not yet have the capacity for consent and self-determination of their freedoms within the law (Locke & Filmer, 1689/1884).

Education was a careful balancing act of fostering a free and engaged mind while also instituting enough control to develop strong habits and build character. Consequently, Locke emphasized the role of the parent and teachers in the education of children. Locke also published ideas around the purposes and forms of education. He believed that the purpose of education lies partly in developing one’s vocation, particularly for poor children. For instance, Baldwin (1913) writes that Locke “advance[d] ideas on object teaching, manual training, trade schools, and school gardening, [though] he neglect[ed] the cultural subjects of arts and music” (p. 187). Ultimately, Locke’s influence on education is best characterized by his understanding of child development and the role of vocational learning, which became instrumental in the development of the Common School Movement and the American educational marketplace.

Although both men developed similar thoughts regarding the importance of education on a child’s upbringing, Jean-Jacques Rousseau’s departure from Locke can be found in his approach to the provision of education. In *Emile*, Rousseau initially “advocated a child-centred approach to education rather than a teacher-centred or curriculum-centred programme. The teacher’s task was to observe the child, identify needs and provide experiences to meet those needs” (Lawton & Gordon, 2002/2019, p. 95). While his early beliefs favored learning as an activity free from society’s evils, Rousseau later advocated for the state’s right to educate its citizenry in a manner it deemed appropriate to fulfill the social contract (Rousseau, Dunn, & May, 2002).

Adam Smith further built upon these two views to argue for the public provision of a compulsory education system with private contributions. In *The Wealth of Nations*, Smith (1776/1976) argued that “the education of the common people requires, perhaps, in a civilised and commercial society the attention of the public more than that of people of some rank and fortune” (p. 419). It led Smith to support a quasi-public educational market. As Viner (1927) describes, “Smith supports the participation of the government in the general education of the people, because it

will help prepare them for industry, will make them better citizens and better soldiers, and happier and healthier men in mind and body” (p. 227).

These Enlightenment thinkers offer an early glimpse of two fundamental trains of thought that frame the ongoing debate over the purpose of education and the state’s role in the education marketplace. Locke’s perspective on the inalienable right of individuals and education as training and Rousseau’s ideas on the transference of individual rights for the common good are foundational to the American education market. Additionally, Smith’s *invisible hand* and advancement of deregulating markets heavily influenced contemporary market-based reforms in education. Enlightenment thinking sparked an education transformation by effectively setting the stage for education’s role to support the common good in a burgeoning democratic nation.

## The Beginnings of the Education Marketplace in America

The colonial education system was a hodgepodge of regional and religiously based forms of education, with the most developed systems (e.g., Puritans and Quakers) in the Northeast and the least developed in the South. For Puritans, education served to teach children, who were viewed as inherently bad, how to behave and read the Bible to fulfill their covenant with God, receive salvation, and improve society. In contrast, the Quakers embraced William Penn’s Frame of Government, which had provisions requiring “all parents to provide their young with elementary learning to address spiritual concerns” and “vocational education opportunities” (Lauderdale, 1987, p. 12). Concurrent with centuries of colonization worldwide, the ideas embedded within Penn’s thinking served as an essential development in the state’s role in supporting a more equitable education marketplace.

Early colonial education, specifically higher education, was rooted in Puritan and Anglican parochial training and a classical curriculum (Thelin, 2019). For example, Harvard University was founded to train ministers, and the College of William & Mary expanded the purpose of education to disseminating their Anglican teachings upon the Native Americans. The colonial colleges adopted their curriculum, residential structure, and other traditions from the fifteenth through eighteenth century British and European universities, an early indicator of a global nature of the education marketplace.

Although religious schooling continued to influence a budding educational marketplace, the founders shifted the rationale by incorporating Enlightenment thinking into a new republican ideal. Thomas Jefferson, Benjamin Rush, Benjamin Franklin, and Noah Webster, among others, all expressed the importance of education in the developing nation. Combining Locke and Rousseau’s ideas, Jefferson considered schooling as an important check and balance to republicanism, yet he also viewed the state as the appropriate provider of education to the masses. Like Jefferson, Rush described the need for a new form of education to ensure the viability and longevity of the burgeoning republican form of government. Rush (1786/1965) declared:

The business of education has acquired a new complexion by the independence of our country. The form of government we have assumed has created a new class of duties to every American. It becomes us, therefore, to examine our former habits upon this subject, and in laying the foundations for nurseries of wise and good men, to adapt our modes of teaching to the peculiar form of our government. (p. 9)

Franklin viewed education in the new nation as a chance to move beyond aristocratic traditions, with an opportunity for social mobility based on meritocratic ideals. Franklin (1749) wrote:

Something seems wanting in America to incite and stimulate Youth to Study. In Europe the Encouragements to Learning are of themselves much greater than can be given here. Whoever distinguishes himself there, in either of the three learned Professions, gains Fame, and often Wealth and Power: a poor Man's Son has a Chance, if he studies hard, to rise, either in the Law or the Church, to gainful Offices or Benefices; to an extraordinary Pitch of Grandeur; to have a voice in Parliament, a seat among the Peers; as a Statesman or first Minister to govern Nations, and even to mix his Blood with Princes.

The ideas and practices of the enlightenment, colonial, and early national periods laid the foundation for an American education system marked by a public-private nexus as well as liberal and vocational forms of education. It established the need for a reasoned (white) citizenry to support a democratic republic and combat the dogmas of religious monarchies of the past.

## The Making of an American Education System

The rise of widespread state-based schooling emerged in the early and mid-nineteenth century. As a response to a fast-growing market economy and the desire to preserve the Protestant republic, the Common School Movement aimed to strengthen a citizenry and “train the rising generation in morality, citizenship, and the basic skills represented by the three Rs” (Deschenes, Cuban, & Tyack, 2001, p. 529). The newly formed free and public institutions would constitute what Horace Mann referred to as the “great equalizer” by providing “equality of educational opportunity that would lead in turn to fair competition in the quest for achievement in later life” (Deschenes et al., 2001, p. 530). Although the market was not central to the Common School Movement's rhetoric, it would be central to shifting the narrative toward the relationship between public education and social mobility. As Labaree (2010) argues,

Compelled by the need to survive and the ambition to thrive in a market economy, citizens quickly began to think of education as something more than a politically desirable way to preserve the republic; they also saw it as a way to get ahead in society. (p. 20)

Common schools, however, were not common to all. Indeed, “the desire to establish public schools as a means of creating a common culture was heightened by increased immigration” and was, “in part, an attempt to halt the drift toward a

multicultural society” (Spring, 2018, p. 106). Protestant fears of “minority” cultures drove the Common School Movement as Spring (2018) contends:

Self-proclaimed protectors of Protestant Anglo-American culture worried about the Irish immigrants streaming ashore, the growing numbers of enslaved Africans, and the racial violence occurring in northern cities between freed Africans and whites. Also during the 1830s, President Andrew Jackson implemented his final solution for acquiring the lands of the southern Indians by forcing the tribes off their lands and removing them to an area west of the Mississippi. The Indian removal was called the “Trail of Tears.” Upon completion of this forced removal, the government was to ‘civilize’ the southern tribes through a system of segregated schools. (p. 146)

By 1879, the federal government opened its first boarding school, which led to the coercion and forcible removal of Native American children from their homes to assimilate them into the Protestant Anglo-American culture (Spring, 2018). Thus, as early public schooling formed during the common school era and rapidly expanded under a discourse of increased access, inequality of opportunity and outcome defined its foundation. Arguably, this was partly due to a growing market rationale that shifted the value of education from a common good to a private good (Labaree, 2010).

Within higher education, the Morrill Act of 1862 helped establish land-grant institutions – the nation’s “people’s” colleges that “still serve as a metonym for the promises and potentials of public higher education” (Stein, 2020, p. 212). As an early expansion of access to higher education, states were provided federal land to establish and maintain at least one college that would provide educational opportunities to learn the “practical arts alongside ‘other scientific and classical studies’” (Geiger & Sorber, 2013, p. x). However, some have argued the “land grant mission serves as a foil to critique the relationship between education and corporate interests” which “works counter to the larger social good by perpetuating a consumer society that creates a two-tiered economic structure, constructs more barriers to access, and more efficiently destroys environments” (Brown, 2003, p. 328). Notably, several scholars have challenged romanticized views of the land-grant university as primarily motivated by hegemonic economic interests (Brown, 2003; Geiger & Sorber, 2013) and colonial conquest of indigenous peoples and lands (Stein, 2020) rather than reinforce the rhetoric associated with egalitarian ideas for increasing access to higher education. As Stein (2020) asserts, “the ‘public good’ of land-grant institutions depended from the outset on profits made from capitalist markets and thus on processes of continuous accumulation” (p. 216). Indeed, both the Common School Movement and Industrialization, a primary antecedent of the Morrill Acts, moved education toward an increasingly stratified market. Widespread social inequities persisted in education throughout the Common School Movement and the Industrial Revolution.

Significant changes to the American education market occurred in the nineteenth century. In higher education, the Dartmouth Case clarified the public and private postsecondary education market. Many education reforms of the era embraced the egalitarian and democratic ideals of Penn, Franklin, and Jefferson

(Lauderdale, 1987). Education leaders, such as Horace Mann and Henry Barnard, advocated for a “universal” education during the Common School Movement, which affirmed the “state’s responsibility for tax-supported elementary education” (Guttek, 1970, p. 77). These efforts were furthered by westward expansion, urbanization, and commercialization, which led to the proliferation of schools offering more practical and vocational education. The education market expanded for women with Normal School movements for teaching led by Catherine Beecher and others. While formal education opportunities for Black Americans were limited, particularly in the South, the prospects began to (sluggishly and not without major challenges) improve following the Civil War. Education was viewed both as an equalizing tool of social mobility and as a way to prepare citizens for an industrialized and capitalist economy. This philosophical distinction between practical and classical education that emerged in the Colonial era continued to shape the structure of the education market into the Progressive era.

## The Progressive Era

Several social movements and reforms had implications for the marketplace in the first half of the twentieth century, including the widespread proliferation of compulsory public education, the expansion of the American high school, and the progressive movement. As the public education system expanded with the development of the public high school, “educational consumerism emerged as an unintended consequence of the invention of public high school in the nineteenth century” (Labaree, 2010, p. 21). Using Central High School, established in 1838 in Philadelphia, as a case study of the development of educational consumerism, Labaree (2010) argues that this early American high school:

introduced a form of educational distinction that was highly visible (Central was the only school of its kind in a large city), culturally legitimate (it was open to anyone who could meet its academic standards), and scarce (it offered a degree to only one in a hundred of the students entering the school system). These characteristics made a Central diploma quite valuable as a way for students to distinguish themselves from peers. . . . But by the 1890s, when growing clerical and managerial jobs created a market for high school graduates, the enormous political demand for access forced the school system to expand from two high schools (Central and its female counterpart) to a whole system of community high schools throughout the city. The newcomers ended up in the lower tracks of the newly expanded high school while the students from the high school’s older, middle-class constituency ended up in upper tracks, which helped accommodate both access and advantage in the same school. (pp. 21–22)

Propelled by increased demand, the expansion of secondary schools, and an efficiency rationale during the Progressive era, schooling became increasingly stratified between and *within* schools – moving students into particular academic or vocational tracks to take their appropriate place within the labor market. Segregation within and between schools was ushered along by the intensification of the market economy and corresponding shifts in public education that soon functioned

as a zero-sum game (Labaree, 2010). Thus, the structure of this efficient system “was geared to produce failure” for students from low-income and minoritized backgrounds (Deschenes et al., 2001, p. 531).

As a strand of the larger progressive movement, particular progressive reformers built upon and broadened the appeal of John Dewey’s experimentalist and instrumentalist philosophy of education (Guttek, 1970) and continued a tradition of rejecting a classical curriculum. With progressive reform efforts seeking to broaden the school’s role, education became a crucial mechanism of political, social, and economic progress. In addition to a vocational curriculum, this strand of the larger progressive movement argued for a more democratic classroom where the “teachers were seen as guides rather than taskmaster; and they were held responsible for the emotional, physical, cognitive, and psychological well-being of children” (Lauderdale, 1987, p. 21).

The impact of these reforms took years to materialize, and efforts faced stiff opposition by essentialists, such as William Chandler Bagley and Isaac Kandel. Guttek (1970) explains that for essentialists, “the most efficient means of cultivating an intelligent citizenry was by systematically training its children in the basic subjects of reading, writing, arithmetic, history, English, and foreign languages” (p. 199). This debate represents another example of a tussle around the purpose and forms of education in the marketplace. The essentialist arguments align more closely with a classical curriculum, whereas some progressives continue a tradition of promoting a practical education that allows children to explore their interests and direct their learning freely and independently.

## Post-War Period

Following World War II, the education market expanded as President Roosevelt and Congress used higher education as a tool to help soldiers reintegrate into the labor market (Thelin, 2019). For example, the inclusion of educational benefits within the Serviceman’s Readjustment Act of 1944, more commonly known as the G.I. Bill, helped to facilitate the postsecondary education system’s massification. This massification led to an increase in access, shifting postsecondary education from a privilege of the elite to something available for the broader population. While postsecondary enrollments ballooned, the benefits of the G.I. Bill and massification continued to exclude Black Americans and other underserved populations. The call for increased participation and equity in education was furthered when President Truman’s Presidential Commission on Higher Education released *Higher Education for American Democracy* in 1947, which “devoted substantial attention to the public community college” (Thelin, 2019, p. 269).

The federal government embraced an important nationalization role in the 1940s and 1950s. The success of large-scale applied research projects on the war effort had a profound effect on the mission and funding of higher education, including the creation of the National Science Foundation (Thelin, 2019). In 1957, Sputnik’s launch created a national fervor by highlighting the disparity between United States and Soviet technological advancements. This, along with the growing escalation of

the Cold War, further entrenched federal dollars within the higher education marketplace with the passage of the National Defense Education Act.

Amid growing attention to civil rights and existing social inequalities, questions surrounding access to educational opportunities that would allow for social mobility were of growing public importance. In the post-war era, the push for a more equitable, integrated education system was partly made using consumerist principles that involved notions of individual opportunity (Labaree, 2010). For example, in challenging “separate but equal” schools in the *Brown v. Board of Education* case, Labaree (2010) cites remarks made by Chief Justice Warren that emphasize the role of public schools in facilitating individual social mobility:

Today, education is perhaps the most important function of state and local governments...[I]t is a principal instrument in awakening the child to cultural values, in preparing him for later professional training, and in helping him to adjust normally to his environment. In these days, it is doubtful that any child may reasonably be expected to succeed in life if he is denied the opportunity of an education. Such an opportunity, where the state has undertaken to provide it, is a right which must be made available to all on equal terms. (pp. 28–29)

This emphasis upon the role of public schooling in individual social mobility (as a private good) captures a market-based shift in rhetoric from the original political purpose of public education in the common school era – that is, strengthen the larger citizenry (for the good of all). As Labaree (2010) writes,

For the desegregation movement, schools were critically important as a mechanism of social opportunity. Their purpose was to promote social mobility. Politics was just a means by which one could demand access to this attractive educational commodity. In this sense, then, *Brown* depicted education as a private good, whose benefits go to the degree holder and not to the society as a whole. (p. 30)

Thus, equitable education was driven by a market rationale, with the individual consumer pursuing education as a private good. However, within an education system driven by competition and built upon a foundation of racial segregation and inequality, the individual consumer would never be created equal.

The federal government’s role in education markets continued to expand throughout the 1960s. Education was crucial in the war on poverty, including President Johnson’s Great Society programs, which had the ambitious goals of eliminating poverty and racial injustice. For example, the Economic Opportunity Act of 1964, the Elementary and Secondary Education Act of 1965, and the Higher Education Act of 1965 provided substantial federal funds to support minoritized and low-income students at schools, colleges, and universities. The Job Corps, Federal Pell Grant, TRIO, and Head Start programs were all established during the ‘60s. These programs perfectly illustrate the paradox of the emerging education marketplace in America. On one hand, the federal government was nationalizing education with an influx of funding and programs to support access, research, and equity. On the other hand, many of the programs also characterized students as consumers within a marketplace, a philosophy that continued to grow in influence over the next few decades.

## Contemporary Thinking on the Education Markets

Following several decades of an ever-growing state-based and publicly supported education system, the 1980s ushered in a new period for American education exemplified by the growing prominence of market-based reforms and systems of education (Dill, 1997; Levin & Belfield, 2003). This transformation emerged for several reasons, including the perceived failure of the public education system, the role that played in America's competitiveness in the new global economy, and an embracing of neoliberalism by governments, corporations, and other organizations. Following Ronald Reagan's election in 1980, his administration chartered the US National Commission on Excellence in Education in 1981 led by Education Secretary Terrel H. Bell. The Commission released its historical report, *A Nation at Risk*, in 1983, which is perhaps the most tangible mark of the monumental shift in American education. Much like Sputnik, *A Nation at Risk* put education in the national spotlight and framed the issue around global economic competitiveness. Yet, the competition was not against the Soviets or a single country, but rather with a "global village." *A Nation at Risk* declared that America's schools were of low quality and failing to meet a competitive workforce's needs, thus needing substantial reform. Recommendations included strengthening graduation requirements and expectations at schools and colleges and increasing accountability.

*A Nation at Risk* was partially the result of an alliance between neoliberal and neoconservative movements on education, aiming to provide the "educational conditions believed necessary both for increasing international competitiveness, profit, and discipline and for returning us to a romanticized past of the 'ideal home,' family, and school" (Apple, 1993, p. 227). Apple (2000) characterizes the goals of the "conservative modernization" of education as:

The dramatic expansion of that eloquent fiction, the free market; the drastic reduction of government responsibility for social needs; the reinforcement of intensely competitive structures of mobility both inside and outside the school; the lowering of people's expectations for economic security; the "disciplining" of culture and the body; and the popularization of what is clearly a form of Social Darwinist thinking. (Apple, 2000, p. 3)

In addition to the neoconservative movement, neoliberalism and complementary theories (e.g., agency theory and human capital theory) have been the preeminent perspectives used by policymakers and academics to advance and explain the market discourse of education. In its simplest form, neoliberalism is a political-economic philosophy that suggests "human well-being can best be advanced by liberating individual entrepreneurial freedoms and skills within an institutional framework characterized by strong private property rights, free markets, and free trade" (Harvey, 2005, p. 2). With a foundation in economic liberalism, rational choice, and human capital theory (Friedman, 1962; Harvey, 2005; Spring, 2018), neoliberalism advances market-based policies and practices driven by individualism, consumerism, and the notion that the prosperity of society depends on the competition and innovation that only a free market can produce. It represents a revival of classical

economic liberalism, albeit with several differences. For example, classical economic liberalism advances a laissez-faire approach to the market, with the government primarily protecting life and property. However, neoliberalism embraces contradiction, using government as a tool to enact and implement policies to support a free market.

Numerous politicians, academics, and authors helped to encourage this educational shift toward the market during the post-war era, including Milton Friedman and Friedrich Hayek, Ronald Reagan, and Ayn Rand. None had a more significant impact than Friedman. Friedman was a key figure in the emergence of the second Chicago school of economics, which rejected Keynesian economics and advanced a neoclassical school of thought based on “a deep commitment to rigorous scholarship and open academic debate, an uncompromising belief in the usefulness and insight of neoclassical price theory, and a normative position that favors and promotes economic liberalism and free markets” (Kaufman, 2010, p. 133). The Chicago school of thought’s pro-market values were embraced by politicians and policymakers across the United States, particularly in education.

Friedman was a major proponent of neoliberal education policies, such as school vouchers, parental choice, merit-based pay, and shifting subsidies away from colleges and toward individuals to be spent at the institution of their choosing (Friedman, 1962; Spring, 2018). Friedman wrote extensively on vouchers and the role of government in his classic text, *Capitalism and Freedom*. On vouchers and parental choice, Friedman states, “governments could require a minimum level of schooling financed by giving parents vouchers redeemable for a specified maximum sum per child per year if spent on ‘approved’ educational services” (Friedman, 1962, pp. 77–78). Friedman went further, suggesting denationalizing schooling would offer consumers (parents) greater choice:

Denationalizing schooling would widen the range of choice available to parents. If, as at present, parents can send their children to public schools without special payment, very few can or will send them to other schools unless they too are subsidized. Parochial schools are at a disadvantage in not getting any of the public funds devoted to schooling, but they have the compensating advantage of being run by institutions that are willing to subsidize them and can raise funds to do so. There are few other sources of subsidies for private schools. If present public expenditures on schooling were made available to parents regardless of where they send their children, a wide variety of schools would spring up to meet the demand. Parents could express their views about schools directly by withdrawing their children from 1 school and sending them to another, to a much greater extent than is now possible. (p. 79)

Friedman’s advocacy of consumerism and competition extended into the higher education market as well. Friedman (1962) suggested the following about college subsidies and the implications for competition:

Any subsidy should be granted to individuals to be spent at institutions of their own choosing, provided only that the schooling is of a kind that it is desired to subsidize. Any government schools that are retained should charge fees covering educational costs and so compete on an equal level with non-government-supported schools. . . . The adoption of such arrangements would make for more effective competition among various types of schools

and for a more efficient utilization of their resources. It would eliminate the pressure for direct government assistance to private colleges and universities and thus preserve their full independence and diversity at the same time as it enabled them to grow relative to state institutions. (p. 85)

Friedman and other neoliberal academics and policymakers were highly influential in shifting the discourse around education markets and market-based reforms. This thinking departed from earlier paradigms that valued a prominent state in the nationalization of the education marketplace. The advancement of market-oriented reforms in education occurred alongside a global public management revolution. For instance, Hursh (2007) discusses the implications of market-based education reforms within the rise of global neoliberal policies that promote the private good:

The shift toward promoting corporate over social welfare redefines the relationship between the individual and society. Because governments are less responsible for the welfare of the individual, the individual becomes responsible for him or herself. As Peters (1994) described, within neoliberal societies the goal becomes creating the competitive, instrumentally rational individual who can compete in the marketplace. Not only does society become less responsible for individual welfare but also, as Marx observed, under market systems workers, which includes all those who must sell their labor to survive, are reduced to commodities. Under market-oriented education systems, students and teachers also become commodities. (pp. 17–18)

Despite the prominence of neoliberal and neoconservative ideology in academic writings and government policies and practices, detractors have suggested neoliberalism has significant implications for the common good, equity, and equal access to education. Theorists have embraced a range of perspectives to understand the implications of neoliberalism, including Marxist, neo-Marxist, neo-institutional, political-economy, social movement, accountability regimes, and elite theories, among other sociological and political theories (Giroux, 2014; Slaughter & Rhoades, 2004).

Contemporary discussions about neoliberalism and the market are often framed in relation to the state. Some scholars have argued the intertwining of the state, market, and professional systems have led to a neoliberal state. Concentrating on how external actors and networks interact to initiate change in higher education, Slaughter and Rhoades (2004) posit the theory of academic capitalism to explain universities' integration with the new, political economy, which has served as one of the preeminent theories about higher education markets and the knowledge economy (Slaughter & Leslie, 2001; Slaughter & Rhoades, 2004). Slaughter (2014) summarizes the theory of academic capitalism:

[It] attempts to tease out the ways in which new institutional and organizational structures that link state agencies, corporations, and universities develop to take advantage of the openings provided by the neoliberal state to move toward the market. Segments of all sectors—state agencies, nonprofits and nongovernmental organizations (NGOs), corporations, and universities—are involved. Universities are not simply acted upon by outside forces. Segments of the university, including faculty, administrators, and students, embrace market activity and its associated competition, while other segments are resistant (or neglected).

Despite the historical position of markets in American education, the market's role in formal American education has expanded following decades of neoliberal reforms advancing free-market competition, privatization, deregulation, and marketization principles within public education, governments, and other inter-related markets (Giroux, 2014; Harvey, 2005). Neoliberalism, which has been positioned as the dominant socioeconomic paradigm in education over the past 40 years, has refocused the market to commodify education and value the private (individual) benefits over the public (society) benefits of formal education. It has cultivated an education system that values market-based reforms seeded in accountability, competition, and free markets. It encouraged state disinvestment, the contracting out of services, and the rise of academic capitalism.

## **Educational Leadership in the Contemporary Marketplace**

Within the contemporary market-like conditions of education, leaders face a continuous onslaught of challenges related to, competition, doing more with less, and often, survival. Across all sectors, several shared mechanisms function to produce these market-like behaviors. Although it is beyond the scope of one chapter to capture a comprehensive analysis of all mechanisms at work across the US education system, this section discusses a few contemporary market-related forces that continue to challenge K-20 leadership and why these issues should receive sustained, targeted attention to reimagine a more equitable, democratic future of education.

### **Accountability Regimes: Performance-Based Funding**

The pursuit of excellence has led to numerous performance-based policies implemented in K-12 education. Following the publication of *A Nation at Risk*, performance-based accountability policies were eulogized as a solution to America's failing schools, a notion that corresponds to the larger accountability movement within the field of public administration. Accountability-centered reforms have increasingly used output measures (e.g., student achievement outcomes) to hold teachers and schools accountable, a striking shift from previous eras in which inputs (e.g., resources) were the primary consideration. Policymakers have employed top-down, performance-based accountability approaches to evaluate and hold schools accountable for performance. Schools and districts have been required to meet certain state and federal performance thresholds or face sanctions. Controversial sanctions have included reductions in state support, the removal or transfer of ineffective teachers, and the ultimate closure of schools that have consistently performed poorly. These reforms have stymied teacher autonomy in the classroom as the focus is placed on meeting state and federal performance requirements. It has led to "teaching to the test" and the eradication of teacher professionalization.

As K-12 leaders continue to face accountability regimes that regulate teaching and learning, dominate policymaking, and are closely linked to institutional competition and survival, so too do postsecondary leaders. As Mehta (2014) argues, over time, “calls for accountability in both sectors have intensified” (p. 882). In fact, K-12 leaders are no longer alone in the struggle for performance-based funding as universities and colleges are increasingly “subject to pressures from policymakers to improve their performance” (Kelchen, 2018, p. 702). In the 1980s and 1990s, higher education became subject to what was deemed a “new accountability” movement that linked funding and resource allocation to institutional performance (McLendon, Hearn, & Deaton, 2006). In K-12, high-stakes testing and other outcomes-based or performance-related accountability measures have long been criticized for exacerbating racial and class-based inequality. Within higher education, the same critique has been made (Dougherty & Natow, 2020). Notably, this shared mechanism presents persisting challenges for leaders, particularly for those serving students of color and encountering tensions between meeting the goals of equity-based institutional missions and the requirements of performance-based funding.

### **Accountability Regimes: Rankings**

The competitive nature of the accountability regime in education has also led to an influx of and greater reliance on ranking systems, both public and private. In K-12 education, many states have implemented A-F grading scales or ranking systems to accompany their performance-based accountability efforts. In higher education, rankings have become an integral aspect of the education marketplace, particularly non-public ranking systems, such as U.S. News and World Reports. Rankings may, to varying degrees, serve as an indicator for institutional quality for students, parents, and employers. Importantly, they influence institutional practices around admissions, tuition, and financial aid as college leaders are rewarded for accepting wealthier and better prepared high school students. Consequently, ranking systems have exacerbated concerns around stratification and limits on social mobility because traditionally underserved and minoritized populations are tracked into community and technical colleges.

Rankings have long drawn the ire of higher education scholars as a poor way to measure institutional quality. Despite the many criticisms of ranking systems, they are likely to remain an integral part of higher education through the foreseeable future. They have certainly shifted institutional priorities and practices as colleges and universities compete in a globalized academic arms race. Scholars and ranking organizations should emphasize that these rankings are rough estimates and consider different indicators of institutional quality. When possible, institutional leaders should reject competitive norms and embrace the values that best fit their institution’s needs. For ranking systems to hold value, a reevaluation of criteria is needed to improve validity and move away from arbitrary popularity contests. This likely means increasing the focus on what happens during college rather than the admissions’ process, the aspect that college leaders have most control over.

## Intermediaries, New Philanthropy, and Neoliberal Reforms in Education

There is also evidence of the rise of intermediary organizations across all sectors (Cantwell, 2018; DeBray, Hanley, Scott, & Lubienski, 2020; Orphan, Laderman, & Gildersleeve, 2018). Intermediary organizations are “boundary spanning” groups that translate, mediate, and connect two principal actors, such as state policymakers and school district personnel or academic researchers and philanthropists. Intermediary organizations serve a number of functions, including building capacity, overseeing network design and operations, providing technical assistance and coaching, facilitating collaboration between intermediaries, and communicating and advocating for initiatives. In education, intermediary organizations focus on numerous issues that move education toward the market, including postsecondary student success (e.g., pathways, predictive analytics, advising, equitable outcomes) and K-12 reforms (e.g., charters and vouchers). Intermediary organizations emerge in many forms, such as foundations, state higher education agencies, advocacy organizations, think tanks, and interest groups. In recent years, philanthropic foundations and affiliated intermediary organizations have pushed a powerful agenda in K-12 and postsecondary education.

Within K-12, “intermediary networks (IONs) have been instrumental in producing and disseminating research to advance agendas of K-12 school vouchers, choice and charter schools” (Aydarova, 2020, p. 2) – all of which constitute significant market-based, neoliberal educational reform efforts. As influential *invisible hands*, IONs also connect corporate, market-based interests to the postsecondary level. For example, Slaughter (2014) argues, “philanthropic policy organizations often intermediate among public, nonprofit, and private sectors to initiate policy that facilitates the entrepreneurial activity of universities” (p. 12). These activities include “university funding of research parks and incubators as well as curricula and student market activity; for example, e-learning and recruitment of full-fees-paying overseas students, academic tourism” (p. 12). Still, other philanthropies provide funding to universities and think-tanks to produce research that facilitates the entrepreneurial activity for the corporate interests of the foundation. For example, the Koch family foundations funded a network of institutions, organizations, and intermediaries to support the interests of their company, Koch Industries. This network targeted limited government, personal and corporate tax cuts, fewer social welfare programs, and rollbacks in government regulations (*viz.*, environmental protections).

Venture philanthropists, as part of a powerful political economy, have contributed largely to the reshaping of urban schooling. Lipman (2015), among others (deMarrais, Brewer, Herron, Atkinson, & Lewis, 2019; Saltman, 2009), argues that “entrepreneurial corporate philanthropy is a leading force reshaping public education in the USA” (p. 241) and places emphasis upon the inequality-producing nature of neoliberal reform efforts. For example, Lipman (2015) reveals the ways in which corporate philanthropists have exploited “disinvestment in urban schools and the fiscal crisis in the state to insert themselves into education policy and governance, operating as part of the ‘shadow state’ with particularly serious consequences

for African American, Latino, and other students of color” (pp. 241–242). Philanthropists have advocated for policies in which “failing” public schools can be replaced by charter schools, and advanced policies surrounding the standardization of a national curriculum (e.g., Common Core Curriculum), standardized testing, and merit-based pay for teachers.

Contemporary philanthropies have used new strategies to influence their largely neoliberal agenda to strive for excellence and provide greater choice. For example, the Lumina and the Bill & Melinda Gates Foundations have focused more attention toward advocacy and policy engagement, whereas older funders focused on capacity building. Higher education philanthropists’ IONs have forged a new purpose and public priority in higher education based on improving student success (Cantwell, 2018). The success of these reforms remains to be determined, particularly related to scaling reforms to large populations. Nevertheless, student success reforms often share values of academic capitalism and neoliberalism. Institutions and administrators have increasingly measured student success outcomes based on competition and profited from student success practices and programs, such as predictive analytic programs for advisors or luxury housing for students. Akin to institutions’ pursuit of prestige by marketizing processes in pursuit of research funding and accolades, institutions use the public priority of student success in hopes of becoming a national model of student success (Cantwell, 2018).

Leading at all levels of education in an era of pervasive neoliberal discourse and academic capitalism presents unique difficulties, forcing leaders to navigate new responsibilities and intensified challenges. Importantly, these challenges include reconciling tensions between engaging in market-driven behaviors and serving the common good. At the postsecondary level, increasing pressures have been described as “emanating from beyond the confines of campus” where, in this case, deans of education must “spend more time and energy pursuing new student markets, cultivating donations, advocating policy changes, and marketing their programs” (McClure & Teitelbaum, 2016, p. 794). Deans, presidents, and other administrators have felt this incessant need to serve as a cheerleader for the institution, proving to policymakers and the public that it is worthy of support. Relative to university administrators, Bok (2003) asks, “How can they decide when to heed the call of the marketplace and when to refuse its allure” (p. 32)? Within public education across sectors, perhaps one of the greatest struggles is how to compete within the current marketplace with fewer resources and while working toward more inclusive, equitable institutions.

---

## Conclusions and Reflections

This chapter has provided a review of how the evolution of the education marketplace relates to the devaluing of the common good values in education and devolution of public education. In the end, however, this chapter only scratched the surface. An entire volume could be dedicated to the history of education markets (Beadie, 2008), their impact on civic virtues and other purposes, and the role educational

leaders play in supporting or rejecting the marketization of education. Our review highlighted the role of Enlightenment thinkers in laying the foundation for the American education system and society. These ideas were incorporated into a quasi-public education market based on reason, liberty, and the common good. However, many leading educators, politicians, and theorists supported the expansion of education to a broader set of citizens to support the common good and democratic ideals. Over time, the education market has grown with reforms expanding state-financed schools, requiring attendance up to a certain age, and providing access to children traditionally left out of education.

The education marketplace, a steady feature of American education, has grown in prominence as education has increasingly been privatized, marketized, and faced significant austerity cuts (McClure, Barringer, & Brown, 2020). Neoliberal reforms and the emergence of the internet have reshaped the structure and delivery of education in the United States and globally. Significant reforms observed in K-12 and higher education, such as No Child Left Behind, vouchers, anti-union policies, charter schools, standardized testing, and performance-based funding, can all be attributed to the market's shifting inclination toward neoliberal, neoconservative, and New Public Management ideologies (Apple, 1993; Giroux, 2014). Despite claims that a typical marketplace is efficient and equitable, education markets have historically been neither free, efficient, nor equitable. The common good values of education will continue to be denigrated until education is valued in the marketplace as more than a private commodity, competitive tool, or driver of economic change during financial crises. And, while publicly supported schools and the common good are not synonymous, the devolution of both appears not to be a coincidence. Prior to the emergence of neoliberalism, the American education system had steadily increased state-based and publicly supported schooling, despite significant shifts in the values, purposes, and practices of education since the Common School Movement. Educational leaders will need to be intentional and persistent in order to revive the common good and democratic values of education.

While neoliberalism has become the dominant socio-economic paradigm of the past 40 years, numerous scholars have argued neoliberalism has been operationalized poorly and inconsistently. The normative perspective, which Ong (2007) describes as neoliberalism with a big "N," casts neoliberalism "as an entity, a unified state apparatus totally dedicated to the interests of unregulated markets" (p. 4). In this perspective, neoliberalism is an overwhelming force that supports efforts to privatize government operations "by selling off public holdings and services to private entrepreneurs" and "enmesh[ing] public agencies in 'quasi-markets' by creating fiscal incentives for those agencies to compete with each other to become more efficient" (Dougherty & Natow, 2020, p. 3). The term's broad overuse removes its explanatory power. How can one distinguish between the market-based reforms of classical economic liberals and neoliberals? More importantly, it leaves educational leaders with the impression they are powerless. However, operationalizing neoliberalism as a technology allows for a more refined theory and enables educational leaders, from the street to the capitol, the opportunity to challenge market-based reforms that undermine the common good. Leaders should view neoliberalism as a little "n" problem to

pinpoint and address the specific neoliberal policies and practices that hurt public education and the common good (Ong, 2007). Doing so might allow leaders to target the localized, embedded neoliberal mechanisms that reproduce inequality. For example, educational leaders and academics have advocated for measures of equity to be incentivized in performance-based funding systems for higher education. Others have highlighted specific forms of administrative academic capitalism that are applicable to all sectors of education, including cultivating major donations, building an endowment, and developing contracts with corporations and intermediary organizations.

While cracks in neoliberal and complementary free-market theories have begun to emerge, the mechanisms continue to be embraced by policymakers and education leaders across the country. Over the next few decades, education leaders at all levels have a key role in re-establishing the public's trust and proving the value of education to society writ large. They can combat neoliberal policies that remove the autonomy of teachers and faculty, create an education environment conducive to critical and creative learning, and restore education's role as a beacon of social mobility with values in equity and the common good.

## Abstract

Rural school leadership has its own complexity and nuance that differs from school leadership in the nonrural setting. The lack of scholarly research on rural school leadership relegates it to the shadows and creates a mystery about what is necessary for leaders to effectively serve the one in five students in the USA who attend a rural school.

## Keywords

Rural school leadership · Rural context and history · Rural foundations versus urban challenges · Leveraging school culture · Leveraging context

J. E. Wortman (✉)

National Institute for School Leadership, National Center for Education and the Economy, Washington, DC, USA

The chapter begins by exploring the historical and cultural roots of the rural setting and recognizing the power structures that underpin rural stereotypes and the systematic marginalization that lead to the deficit-based thinking about “rural as a problem to be fixed.”

After presenting a brief history of the increasing challenges and complexity of school leadership and the development of professional standards of leadership, the focus turns to how to apply the standards to rural school leadership. Using Hallinger’s (2016) school contexts as a foundation, a visual framework and model using a fulcrum and lever displays community context as one of the most significant context accelerators of effective rural school leadership.

The chapter concludes with the context-based leveraging role that school culture and research based rural leader practices play in demystifying rural school leadership.

### **Field of Memory**

The idea of rural school leadership in the context of a one room schoolhouse and with a single teacher for all. The rural school leader and teachers on par with one another. The “principal teacher” serving as another classroom teacher. Efficiency as the singular measurement of school leader performance. A “one-size-fits-all” scientific management approach for school leaders with management superseded by leadership, scholarship, or attention to context. Power structures initially favoring rural landowners even to the point of building the school calendar around the agrarian community context. Power structures transmitting to the wealthy and urban industrialists. “Rural as a problem” with cultural deficits needing to be fixed and brought to urban-centric standards. Systemic marginalization and cultural stereotypes in the rural setting. Trait-based perspectives of leadership as the dominant theory: “*Leaders are born not made.*” An education system with significant local control in the school setting.

### **Field of Presence**

Research, policy, and school leader practices directed toward the urban and suburban school settings. Education reform based on the urban and cosmopolitan America and education impact aligned with urban-dominated state governments. School consolidation as the major focal point for education reform in rural settings. A paucity of research with rural school or rural school leader focus. School leadership in general gaining in complexity. The development of empirical-based professional leadership standards. Lack of differentiation in the leadership standards or in principal preparation for the challenges associated with the unique rural context. School leader *what to do* as explicit, but *how to apply* with context specificity only recently emerging. Trait-based theory and situational theory of school leadership synthesizing and opening opportunity for the influence of context. Emphasis on collaborative leadership in the school setting with shared vision, mission, and core values built on a rural place-based foundation.

### **Field of Concomitance**

Metrics, measurement, data analysis, and international quality control standards from the business setting migrating to the education system. Mergers and acquisitions from the business world influencing rural school consolidation in the name of

*“bigger is better and simply a part of progress.”* Systems thinking, an emphasis on culture, and attention to whole-part-whole as a means of leaders seeing the big picture. The concepts of leverage, fulcrum, force, and acceleration originating in physics and applied to the language of leadership. The metaphor of vision as a true north compass point borrowed from astronomy.

### **Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field**

The advent of globalization and “the flat world” bringing international benchmarking and high standards for all to the education system – inclusive of the rural setting. Increased scholarly attention to rural education – rural matters when equity and social justice focus is on high standards for all. School leader accountability within the education system as a result of the plethora of student performance data and the ease of data analysis. Increased scholarly attention to the role context plays in school leader effectiveness.

### **Critical Assumptions or Presuppositions**

The assumption that rural school leadership is a mystery borne out of a historic backdrop of marginalization, deficit-based thinking, and lack of focus on the unique advantages in the rural context. The idea that a visual framework of Demystifying Rural School Leadership will serve as an integrative model to show how context and culture contribute to leader effectiveness. The use of specific research-based rural leader practices as the leverage for school culture. Rural school leader’s leveraging of school culture is effective only to the degree context – particularly community context – is considered.

---

## **Introduction**

The purposes of this chapter are to explore the history of the rural setting and school leadership in order to discourse some of the mystery associated with rural school leadership in light of the paucity of research. The chapter uses the concepts of context and culture as foundational ingredients of a visual framework designed to assist rural school leaders with the complexity of leadership in the rural setting and to help them leverage their practice.

---

## **Demystifying Rural School Leadership**

The idea of demystifying a concept carries with it the underlying assumption of the concept being currently shrouded in mystery. That rural school remains somewhat mysterious in the twenty-first century can be attributed to a number of factors including a “paucity of research on this specialized focus” (Preston & Barnes, 2018, p. 6). Part of the mystery then is why the context of rural leadership has been relatively ignored given that over 20% of the population of the United States

lives in areas classified as rural (Statistica, 2021) and more than 9.3 million – or nearly one in five students in the USA – attend a rural school. This means that more students in the USA attend rural schools than attend the nation’s 85 largest school districts combined (Showalter, Hartman, Johnson, & Klein, 2019). Former Secretary of Education Arne Duncan (2013) honed in on this lack of attention in his remarks at the Rural Education National Forum when he told attendees: “Inside the Beltway Bubble, rural education is still often treated as the poor second cousin of education reform.” Rural areas are often directly correlated to poverty and disconnection. To demystify rural leadership educational leaders must finally recognize the desperation this inattention fosters and commit to serving rural education with the resources, progressive approaches to education, and effective school leadership that it deserves. Answering the challenge of demystifying rural school leadership requires exposure to the roots of rural identity as well as history of the journey traveled.

---

## **Rural Foundations and the Urban Challenge**

An unfortunate rural stereotype that is wide-open for laughs, put-downs, judgment and bias creates barriers to rural education concerns and compounds the low level of consideration and attention and research from the educational community. Reality TV shows, comedians, and politicians have all contributed to creating a “less-than” and “second-class” standing for many things rural; and rural inhabitants themselves may have unwittingly contributed to their plight by way of passive acceptance of the narrative.

This current cultural dynamic, however, has deeper and more insidious roots in an American history that reveals intention and purpose around the re-defining of rural communities and schools. By examining the root of the rural story, we can trace power structures in European history that eventually transmit to colonial times and the origins of the United States itself (Surface & Theobald, 2014).

---

## **A Brief History of the Rural Status**

Centuries ago, during the classical and medieval times of Europe, rural communities ruled because power and control rested with large aristocratic landowners that included the royal family. During the Feudal Era of the early and central Middle Ages rural interests held the upper hand when it came to political decision making because of the wealth and influence that resided in the land barons, counts, dukes, and other royalty who ruled these large swaths of land where farmers lived and contributed to their rulers.

Eventually, as the Industrial Age began to change customs and seats of power, the wealthy and urban (i.e., bankers, skilled craftsmen, factory owners, etc.) sought power in the policy arena. This led to a series of events in nineteenth-century England that tipped control to the industrialists and “the ‘captains of industry’ were elevated to a high status while the status of farmers and rural dwellers dropped precipitously”

(Theobald & Wood, 2010, p. 20). As status shifted so did references to the rural dwellers by elites from “the commons of England” to “the lower orders.” These new references soon became part of the everyday language and were in practical usage well beyond the urban and wealthy in English society (Hammond & Hammond, 1920).

A parallel power struggle between urban and rural played out in America. As was the case in Europe, rural agrarian dwellers initially held leverage over the urban industrialists. Notable patriarchs Alexander Hamilton and Thomas Jefferson provide the visible and recognizable leaders of a competition between the New York City lawyer supporting a national bank versus the rural Virginia born landowner, farmer, and author of the Declaration of Independence. Prior to the colonies’ first Constitutional Convention in 1787, the rural versus urban power struggle manifested itself in Shays Rebellion in Western Massachusetts when the longstanding bartering system that was farmer friendly met with a new law requiring that debt be paid in specie (gold). Foreclosures and imprisonments of farmers for indebtedness ensued and farmers united and seized courtrooms and a state militia armory under Revolutionary War Captain Daniel Shay. Boston merchants formed a militia to end the rebellion by Shay’s unified farmers. However, the absence of a national army to oppose the rebel farmer set the stage for a pattern for urban commercialists to wrest power from the rural agrarian. The first of these moves involved creating a new form of government to prevent anything like Shays Rebellion from happening again (Theobald & Wood, 2010).

And so, delegates from each state met in Philadelphia and developed the Constitution under the leadership of urban ambassadors Alexander Hamilton and James Madison and absent of rural advocate Thomas Jefferson, who was in Paris as America’s Ambassador to France. Rural agrarian interests – the lifestyle of the significant majority of at the time – were missing a major force for their vision. The resultant and durable Constitution balanced power between three branches of the government but also insured that the elite would be ever prominent in policymaking; so obviously so, that America’s first Supreme Court Justice John Jay, one of the co-authors of the Federalist Papers, stated that “those who own the country ought to govern it.” Theobald and Wood (2010) described the tensions and differences between urban and rural interests in American history as follows, “. . . the differences created struggle, and the struggle created culture marked by mutual suspicion—and in some cases outright antipathy” (p. 22).

This mutual suspicion continued from the founding of America throughout its development. For instance, when Thomas Jefferson became President, he abolished the national bank created by Alexander Hamilton. This meant that America’s farmers no longer needed to contend with an institution they saw as profiting the urban elite and negatively impacting them. The power struggle continued when James Madison was elected President and reestablished the national bank. This was short-lived once the rugged and rural born American Revolution General Andrew Jackson become President and once again abolished it. Jackson’s nickname of “Old Hickory” led to his supporters being called “hicks” by urbanites, a derogatory label that still holds firm in the twenty-first century as a negative reference for rural inhabitants (Surface & Theobald, 2014).

For the greater part of the nineteenth century, residents in rural America were beholden to policies that favored urban, industrial, and commercial interests.

The twentieth century brought education impact policy that aligned with urban-dominated state governments. The once powerful landowners had given way to the urban industrial class and the language of “backward,” “hick,” and “living in the past” set the stage for legitimizing this urban control. Indeed, America’s dominant treatment over rural communities from the outset was driven by a belief in rural cultural deficits and a focus on problems associated with place – the rural place.

---

## Rural Schools as a Problem

Policy du jour in the early twentieth century urged consolidation of small rural schools much as small rural farms were swallowed up into income maximizing industrial agriculture models (Bonnano, 2014). Incentives abounded on both fronts for consolidation in the name of “bigger being better” and “progress being necessary.” Changing social and economic contexts over the course of the twentieth century led to efforts to make sense of the unique educational needs and challenges of the rural community. Rural schools became a natural focal point and Ellwood Cubberley (1912), a notable urban education reformer, deplored the state of rural schools, referring to the issue as the “rural school problem” (p. 75). Cubberley’s problem-centric perspective was shared by many of his peers and years later DeYoung (1987) described education reform of that era as “in essence based on a notion that rural ways of life were, and would increasingly become, archaic in emerging urban and cosmopolitan America” (p. 124). Acceptance of the “rural schools as a problem” construct behind the power of the largely urbanite early educational reformer contingent still echoes in the field today (Biddle & Azano, 2016).

Demystifying rural education and the leadership of rural schools begins by recognizing the role that cultural stereotypes and systematic marginalization played in this historical journey (and continues to play). It is against the backdrop of the history of rurality and the view of rural schools as a problem to be fixed that the historical evolution of the complexity and challenge of the school leader position unfolds and should be examined.

---

## School Leadership as Increasingly Challenging and Complex

The school leader position (i.e., principal, assistant principal) in American public schools is complex, contradictory, and misunderstood. The rural school context poses an even greater challenge for school leaders (Hazi, 1998; Spillane & Lee, 2014). In fact, of the many organizational changes in public education that occurred during the turn of the last century, few have had greater impact on the school than the development of the principalship (Rousmaniere, 2013a). Therefore, a brief look at the evolution of the position is important for contextualizing the present challenges associated with the role of principal in general and, subsequently the unique challenges associated with rural school leadership.

The idea of the principal serving the district central office and the school classroom from a position in the middle of both is two centuries old (Rousmaniere, 2013b; Spring, 2011). The power associated with the early school leader position was on par with that of teachers. In the early nineteenth century, the Industrial Revolution popularized scientific management, or “Taylorism,” and advanced the idea of management from the factory floor to the schoolhouse. Accordingly, efficiency became the mantra, and school became a hierarchical organization with top-down decisions based on scientific studies and cost effectiveness as the professional focus for school leaders (Spring, 2011). The standardization and lock-step orientation of grade levels, teaching materials and curricula, and curricula tracking comprised the framework used in training generations of administrators dedicated to a “one size fits all” approach. There was no attention to differentiation of any kind, and certainly not to the rural context.

The rural one room schoolhouse with a group of students supervised by a single teacher was anything but “efficient,” and rural school consolidation became the norm. Rural schoolhouses advanced to a collection of teachers supervised by one administrator – at that time, a teaching administrator. In the early twentieth, the administrator served as the principal teacher and as recently as 1958, 17% of principal survey respondents remained teaching principals (Spring, 2011). A commitment to scientific management and professionalization placed emphasis on administration and bureaucracy in lieu of the personalized teaching and learning in the rural school house.

Over the last two decades principal responsibilities have increased enormously in all settings. Rural schools and their leaders face environmental influences and challenges similar to their suburban and urban counterparts. Research on the role of the principal as school leader falls well short of capturing the experiences, challenges, and opportunities of the rural principal that are distinct from their nonrural counterparts (Budge, 2006; Hill, 2014; Johnson, Showalter, Klein, & Lester, 2014; Lynch, 2012). And while changing educational policies, federal and state accountability, financial constraints, poverty, and community engagement are common to all school leaders (Preston & Barnes, 2018); these challenges are compounded by unique rural context influences for rural school leadership.

These compounding influences include geographic isolation (Klar & Brewer, 2014), teacher recruitment and retention (Brenner, Elder, Wimbish, & Walker, 2015), district consolidation (Edwards & Longo, 2013), low levels of academic expectations and motivation (Budge, 2006), and lower levels of staffed teaching and administrative positions and organizational capacity (Parson, Hunter, & Kallio, 2016). Holding dual roles (e.g., principal/teacher or principal/superintendent) and divergent responsibilities (e.g., substitute teaching and teacher evaluation) limit the rural principal’s ability to focus on instructional leadership (Parson et al., 2016). The challenges and responsibilities rural leaders face in managing increasingly complex roles and fractured focus creates a context ripe for a standards-based leadership framework that may be modified to accommodate a rural environment.

## What We Know to Do: School Leadership Standards Emerge

In light of the complexity and significant influence of school leadership, efforts have been made to shape and focus the development and performance of all school leaders. In the late twentieth century, there was growing pressure to reform the quality of America's schools and their leaders. So much so that in 1994 the Council of Chief State School Officers (CCSSO) commissioned the Interstate School Leadership Licensure Consortium (ISLLC) to provide a set of empirically grounded principles and best practices to shape and clarify the development of school leaders. The resultant document – the ISLLC Standards for School Leaders – became the “gold standard” which most states use for K-12 administrator credentialing and performance criteria (Murphy, 2003; Usdan, McCloud, & Podmostko, 2000). Background and context for the ISLLC Standards and the more recent ISLLC replacement standards – the Professional Standards for Educational Leaders published by the National Policy Board for Educational Administration in October of 2015 – are critically necessary for effective rural school leadership.

Leadership standards establish the principled practice for school leaders. Demystifying rural school leadership requires the use of these principles as a lens, unwaveringly focused on a detailed threefold understanding of the rural context as relationship oriented, uniquely advantaged, and wholly collaborative. Nonetheless, application of the standards remains a complicated challenge for rural school leaders.

---

## The “Know to Do” Versus “How to Apply” Gap of Rural School Leadership

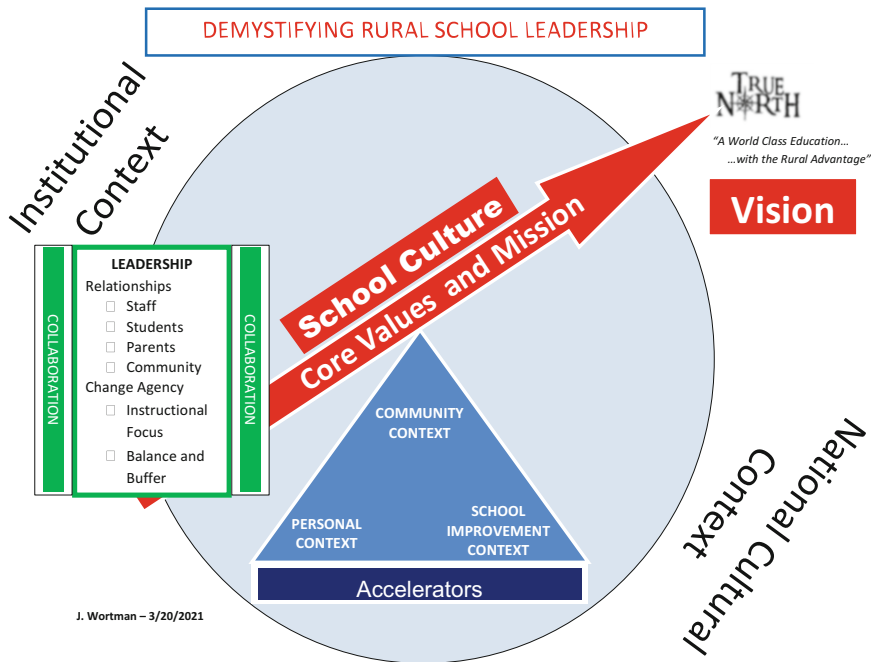

*“If you want to make small changes, work on your behavior; if you want quantum-leap changes, work on your paradigms.”* –Stephen R. Covey.

There is no mystery about what effective school leaders do – their behaviors paint a clear picture. At the same time, Hallinger (2016) points out: “Metaphorically, by placing the spotlight on leadership, researchers have unwittingly relegated the context of leadership to the shadows” (p. 6). The Professional Standards for Educational Leadership provide a compelling *what to do* for rural school leader effectiveness. But leadership must share the spotlight with school context if the application of the known universal leadership principles has any chance for success in the rural environment. Therefore, the *how to apply* leadership principles with context specificity looms large in demystifying rural school leadership. As Covey (2005) suggests, the right mental map is crucial and demystifying rural school leadership requires a deep appreciation for the rural context. Fortunately, at the very same time that there is renewed interest in rural education, contextual leadership is also appearing more frequently in the leadership literature.

Hallinger (2016) examined several types of school contexts and what has been learned about how they shape school leadership practices. The work of Bossert, Dwyer, Rowan, and Lee (1982) offered a foundation of external, principal, and district context. Hallinger extended Bossert's work to include community, institutional,

national cultural, political, economic, and school improvement contexts. Bossert advanced leadership context beyond the early scholarly assumption that leaders are unrestrained by their context (Bridges, 1977). And why shouldn't rural context have a seat at the leadership table as well? Kai Schafft, Director of the Center on Rural Education and Communities at the Pennsylvania State University, put it this way, "All of a sudden, rural is on everyone's mind" (cited in Pappano, 2017). Absent some of Bossert's context model limitations, Hallinger provides an applicable list of contexts necessary to examine the discourse associated with rural school leadership. These context features along with researched based leadership actions and behaviors are captured in a visual framework to allow for a clearer explanation of the demystification of rural school leadership (see Fig. 1).

In this framework (see Fig. 1), rural school leadership is situated within the *institutional* context – the education system – and *national* or *socio-cultural* contexts. The *community* context intentionally lies at the apex of the fulcrum due to the prominent impact of unique geographic location. *School improvement* context and *personal* context are also key components of the fulcrum. Each rural school has its own unique history and performance trajectory and the rural school leader possesses job knowledge, skills, attitudes, and experiences. These three contexts represent potential accelerators with utility for the leader to leverage advantages that influence consequences. Collectively, context drives the school vision which, in turn, guides

**Fig. 1** Visual framework: Demystifying rural school leadership. Incorporating Hallinger's (2016) context elements

strategy leading to decisions and actions (NISL, 2017). It is crucial for the rural school leader to avoid the temptation to lead with strategy in a *ready-fire-aim* sequence.

The National Institute for School Leadership (2017) defines a lever as internal and external actions that can be used to influence behaviors or to create consequences that might not otherwise occur or that might not otherwise be so powerful. Accordingly, the framework displays school culture as a powerful lever for an effective rural school leader. An extensive review of the literature by Preston and Barnes (2018) concluded that successful leadership in the rural school setting requires a culture of collaboration with relationship-centered change agent actions and an instructional focus. In essence, the rural school leader employs context-based strategies and actions that permeate the school culture with purposeful attention to a shared mission and core values.

---

## The Big Picture Impact of the Institutional and National Cultural Context

Hallinger (2016) defines the *institutional* context as the “education system as well as the state, regional, and district units that comprise it” (p. 8) and asserts that the system operates within a specific *national* or *socio-cultural* context. Both of these big picture contextual concepts emerged as significant to rural school leadership with the advent of globalization. Preglobalization rural school leaders worked in somewhat of a silo with significant autonomy and primarily their school district’s vision, mission, values, initiatives, size, and norms as context. Accountability policy for the education system at the national level and the focus on international benchmarking were previously a “given,” for all school systems, regardless of their environmental context, but both have impacted role definition and behavior of rural principals. More than ever, an effective rural school leader balances educational system reforms and a nationalized interest related to quality, accountability, and equity in tandem with the life-world of the local community. And, in some cases, buffers and paces the impact of these reforms.

Metrics and measurement from business practices have migrated into the education system as a data extreme means of accountability for quality control of student performance. National level reform policies involving accountability and business practice type statistical analysis have reshaped school leader practices (Shinkfield & Stufflebeam, 2012). The rural school leader is effective with these mandated changes by acknowledging the importance of institutionally determined state assessment goals; buffering and balancing them against community tolerance and understanding; all the while embracing the prominent social justice and equity platform that is permeating the education system – the *institutional* context. When used effectively, the priorities within the *institutional* and *national cultural* contexts create a sense of urgency for the *community* and *school improvement* contexts and produce creative tension and leverage opportunity for the rural school leader. Jackson (2010) asserted that globalizing trends in some rural communities compel members invested in the community into fierce resistance to threats to their rural identity. A rural leader’s failure to carefully confront community resistance to globalization while

simultaneously honoring local values, beliefs, and customs “can, in turn, limit the lives of the people whom that very resistance attempts to protect” (p. 73). The *community* context is a tightrope walk that requires personal skill and balance as well as understanding of the school’s improvement trajectory.

---

## Community, School Improvement, and Personal Contexts as Accelerators

*“Give me a lever long enough and a fulcrum on which to place it, and I shall move the world.”*

– Archimedes

### Community Context

To continue the metaphor, demystifying rural school leadership involves leveraging with a secure fulcrum of potential accelerators with demonstrably positive results. The rural school is situated within a *community* context, has a trajectory of student performance – the *school improvement* context, and a designated leader – the *personal* context. The community context is the central pivot point of the strategically placed fulcrum in this model (see Fig. 1). Bossert et al. (1982) asserted that “optimal leadership strategies are crafted in a *community* context” (p. 11). Rural activists and scholars are confronting the generic and standardized approach to schooling that rose from global capitalism and instead suggest a collective “argument for contextual sensitivity and place connections. . .an argument for the central consideration of community in the planning and conduct of education” (Corbett, 2016, p. 275).

Local history, heritage, unique assets, and challenges are all part of the community context. The socio-economic status of parents and parent and community involvement in the school are part of community context as well. Effective rural leaders embrace the idea of place-based education that connects youth to their community in lieu of explicitly or implicitly expecting them to eventually leave their rural setting (Gruenewald & Smith, 2008; Theobald, 1997). Places are not static; rather they are complex and ever-evolving spaces that invite a nuanced understanding of rurality. Instead of viewing rural areas as lacking the resources and amenities of suburban or urban schools and communities, a place-based approach creatively embraces unique and available assets. Place-based education in the community context addresses one of John Dewey’s (1959) central concerns about classroom learning as separated and isolated from daily life. Cultural theorists contend that local places provide specific contexts from which reliable knowledge of global relationships can emerge. Local place focus does not preclude interest in the globalized, multicultural world (Greenwood, 2012). When practiced well, local place focus enhances interest in the world at large.

Economy and politics are unavoidable aspects of the community context and effective rural school leaders recognize, work within, and mitigate associated

constraints. Both offer different sets of opportunities, resources, needs, and challenges. For example, state funding lags and does not make up for the lack of funding rural schools receive from local sources (Johnson, Strange, & Madden, 2010). However, doing more with less is a hallmark of rural schools and the per pupil expenditure rate is lower in rural communities than in urban centers (Smink and White, 2008). It is a challenge to attract highly qualified teachers to rural communities (Hammer, Hughes, McClure, Reeves, & Salgado, 2005). Nevertheless, there is increased advocacy for place-conscious rural teacher preparation “that is grounded in place building for sustainable and vibrant rural communities (p. 91)” with a new paradigm emphasizing the uniqueness and assets of rural places (Eppley, 2015; Green, Noone, & Nolan, 2013; Walker-Gibbs, Ludecke, & Kline, 2015). Furthermore, despite the American public discourse that historically asserts education is an “apolitical public service” (Spring, 2016), the political context does shape the behavior of school leaders.

Rural expert Michael Corbett (2016) maintained, “if you’ve seen one rural community, you have seen. . .well, one rural community” (p. 278). With an understanding of and belief in a particular community context, the rural school leader can effectively apply research-based leadership principles with greater effectiveness. Perhaps the best way to demystify rural education lies within rural school leaders themselves who increasingly champion their context to turn rural place deficit discourse inside-out and capitalize on their unique – though often overlooked – rural advantages.

## School Improvement and Personal Contexts

The business of school is learning and every school has a historical context that Hallinger (2016) referred to as the *school improvement* context and further described as an improvement trajectory and culture. The rural school leader faces a trajectory that empirical studies have broadly characterized in at least four ways: effective, improving, coasting, or ineffective (Ball, 2000; Day, 2005, 2009; Thomas, Peng, & Gray, 2007). Each trajectory defines the leader’s challenge and calls for a different set of strategies and actions, albeit a consistent vision for student learning. For example, an ineffective or turnaround school – poor and/or declining performance in student learning over time – initially commands a unilateral and directive leadership style prior to capacity building and eventually more of a distributive style (Day, 2009). The approach for an improving or successful school will differ. An effective rural school leader recognizes and understands the school improvement trajectory and culture and then adapts and refines leadership style and strategy to the school’s capacity and performance over time.

The rural school leader comes to the principalship with an individualized history and trajectory – a *personal context*. Personal context is the final component of the fulcrum context triad (see Fig. 1). This person-specific context embodies job knowledge, skills, attitudes, and experience and Hallinger (2016) notes that it “serves as a prism through which information, problems, opportunities, and situations are filtered and interpreted” (p. 7). In contrast to all other contexts, the locus of control for this person-specific context rests squarely with the school leader; therefore, preparation, professional development, ambition, and effort contribute heavily toward leader effectiveness and impact.

Zaccaro's et al. (2004) definition of leader traits grounds this personal context: "leader traits can be defined as relatively coherent and integrated patterns of personal characteristics, reflecting a range of individual differences, that foster consistent leadership effectiveness across a variety of group and organizational situations" (p. 104). The early scientific research tradition of traits as innate or heritable qualities (Galton, 1869) has shifted to include all relatively enduring qualities that distinguish leaders from nonleaders (Kirkpatrick & Locke, 1991). This broad interpretation suggests that some of the leader attributes (i.e., personal context) will be more stable and cross situational and others will be more context bound.

Longstanding debate exists pertaining to situational and personal attributes related to leader practice. Fiedler (1974) captured the tension between contextual and individual influences but his views allowed little room for interplay between these different factors. Contingency and situational leadership theory argues that an effective leader makes their practices and/or behaviors contingent upon the situations in which they work. Yukl (1981) emphasized that leaders must be flexible and adaptable to their environments or jeopardize their chances of success. Hersey and Blanchard (1982) concurred that individual skills are necessary but insufficient without adapting leadership style to context.

Successful leaders are sensitive to context and apply contextually sensitive combinations of basic leadership practices (Goldring, Huff, May, & Camburn, 2008; Leithwood, Harris, & Hopkins, 2008). Coherent and enduring traits still allow the rural school leader to vary actual behavior and still allow the necessary agility to adjust to both the community and the school improvement contexts. A major part of demystifying rural leadership extends beyond what Zaccaro, Kemp, and Bader (2004) described as "an amalgamation of attributes reflecting cognitive capacities, personality orientations, motives and values, problem-solving competencies, and general and domain specific expertise" (p. 120). Personal context and leadership attributes are essential and act as another potential accelerator but only within strategic application toward a common vision and with complete attention to all other contexts. Context drives vision and vision guides strategy toward decisions and actions. Ultimately, the accrual of decisions and actions create the powerful lever of school culture.

---

## Leveraging School Culture in the Rural Setting

Amid the aforementioned contexts, the model in Fig. 1 displays school culture as the lever for rural school leaders. It is not a mystery that leadership sets the tone and strongly influences the culture in any organization (Elder & Paul, 2012; Gruenert & Whitaker, 2015; Schein, 2010). To continue the metaphor, the rural school leader *leverages* specific principle-centered actions and behaviors that accommodate for context. These actions and behaviors hold purpose and intention toward a shared vision – *what is aspired*; mission – *what is done on a daily basis to reach the vision*; and set of core values – *the rules of engagement*. Leadership expert John Gardner (1990) describes vision as "seeing where the system fits in the larger context... a description outlining a possible future that lifts and moves people... or a discerning, in

the clutter and confusion of the present, the elements that determine what is to come” (p. 130). Mindful that the rural school is situated within the larger institutional context and national cultural context, a world class education is the only acceptable vision. At the same time, there are distinct and unique rural advantages within the community and school improvement context that are available to leverage. In combination, this creates a compelling true north vision for the rural school leader to leverage in the manner suggested by Gardner as the “possible future that lifts and moves people.”

Blaine Lee, author of *The Power Principle: Influence with Honor*, offers the following insight: “The principles you live by create the world you live in; if you change the principles you live by, you will change your world” (1997, p. 1). The principles of collaboration, relationships, and change agency exert the force that drives the school culture to the established true north vision (see Fig. 1). The rural school leader focuses on relationships; effects change as an instructional leader within a balance between local, state, and national policy; and relentlessly fosters a culture of collaboration among all stakeholders (Preston & Barnes, 2018). To be sure, these principles are important in all school settings; however, they deliver the research-based difference for effective rural school leaders.

The effective rural school leader fosters and leverages a culture of collaboration as the foundation for relationships and change agency. There is significant and longstanding agreement that leaders need others to help accomplish a group’s purpose and need to develop leaders across the organization (Gardner, 1990; Kouzes & Posner, 2008; Yukl, 2012). The rural school leader is the critical figure in making certain that a school vision is created (Leithwood, Louis, Anderson, & Wahlstrom, 2004; Murphy, Elliott, Goldring, & Porter, 2007). That said, others are more likely to support a school vision and the invitation to change that comes from a relationship-oriented collaborative process (Licata, Teddlie, & Greenfield, 1990). Collaboration is fundamental to the obvious challenge that exists to accomplish goals, carry out the mission, and make progress toward an ambitious vision.

The rural school leader also leverages relationships and recognizes people and not programs as the essential ingredient to success (Whitaker, 2020). The broad issue of leadership, school culture, and change is dominated by discussions and markers that measure actions, interactions, and relationships associated with the adults in the school setting (Gallucci, 2008; Hallinger, 2003; Louis Seashore, 2008). In rural areas, the school has a central social, institutional, and economic role. Rural schools function as centers of the community. The effective rural school leader takes full advantage of this and establishes healthy relationships with staff, parents, students, and the community.

School size enhances relationship opportunity since almost 64% of rural schools have 400 or fewer students, compared with only 39% of urban schools (Schafft & Biddle, 2014). School size advantages also allow rural school leaders to apply a personalized touch with students – even knowing them by name – and, in turn, create a learning environment responsive to their unique needs. The effective rural school leader communicates with, welcomes, listens, and responds to parent groups associated with school improvement efforts (Barley & Beesley, 2007; Irvine, Lupart, Loreman, & McGhie-Richmond, 2010). A collaborative and team-work style, strengthened with the principle of trust, mitigates some of the well-

documented isolation experienced by many rural school leaders. Rural school leaders strive for collegiality not simple congeniality (Fullan, 2011) and they nurture strong relationships and interpersonal connections with staff members. More so than urban principals, rural principals make themselves available to teachers when needed (Preston, 2012).

As change agent catalysts, rural school leaders are intentional about teaching and learning as the focal point of their effort (Fullan, 2006; Kondakci & Beycioglu, 2014). Some of the national culture and education system reforms may meet with resistance in the rural community. As an example, curricular changes for efficiency, uniformity, and a common body of information and skills may or may not carry knowledge, proficiencies, and values that have relevance to life in the rural community (Corbett, 2007, 2010). Accordingly, the effective rural school leader balances and buffers the current community context against pressures at the national cultural and education system level. The longstanding educational reform approach of standardizing and modernizing rural schools because “rural was a problem” (Biddle & Azano, 2016) requires the rural school leader to adeptly recognize the root cause of reform policy and, as the primary change agent, adjust instructional decisions in the best interest of students and the rural community they serve. Timing and the community context matter and the effective rural school leader wisely chooses when and how to make the most relevant instructional improvements.

---

## Conclusions and Reflections

### Demystifying Rural Leadership is Grounded in Context and Culture

Unraveling the mystery of leading rural schools in the flattened world of this twenty-first century requires that rural school leaders embrace the richness of the community context and leverage the school culture. The rural story in America illustrates an imbalance of power, resources, and attention that can easily invite passive acceptance of the “rural school as a problem” narrative that dominated the twentieth-century education reform landscape (Biddle & Azano, 2016). However, rural communities, rural schools, and the one in five students in the United States that attend a rural school deserve better. Effective school leadership is one means of changing the narrative. Rural families and rural youth have a different landscape than their counterparts in the city but it is no less important or complex. The same is true for rural school leadership – distinctive yet equally significant.

How significant is rural school leadership? Rural expert Michael Corbett (2016) announces it intensely: “The broad argument is that educational struggles and orientations in rural schools should be understood in relation to the crucial global challenges of sustainability and survival (p. 270).” Fortunately, the metrocentric and hegemonic vision of rural schools in a “discourse of decline” (Corbett, 2016) is experiencing a challenge from scholars and activists who refute that narrative and argue that rural continues to matter. Increasingly, the deficit-based, rural as a

problem, and urban as both answer and destination for anyone seeking success thinking is under appropriate scrutiny.

The great theoretical physicist Albert Einstein said: “*Genius is making complex ideas simple, not making simple ideas complex.*” The current education system that competes on the world stage is complex. High expectations for all students and equity of resources and opportunity regardless of circumstance are complex aspirations. Accordingly, the rural school leadership position is complex. Demystifying or simplifying rural school leadership fully recognizes these complexities and frames them within the school culture where the rural school leader has the greatest locus of control to identify unique advantages. Herein, an effective rural school leader nurtures a collaborative and relationship-centric culture as an agent of change for teaching and learning with a detailed understanding of the total context. In a very real sense, as Corbett expresses, “sustainability and survival” are at stake in solving the rural school leadership mystery.

## Abstract

The field of educational leaders, leading, and leadership is rife with folderols, fads, and fashions, from “Management by Objectives” to ‘Transformational Leadership’. This chapter identifies the dominance of corporate approaches rooted in Taylorism and the Hawthorne experiments, where there is evidence of novel innovations in organizations and research that actually demonstrates the endurance of control technologies. By examining labor, work, and action by educational professionals, the argument is made that the field of presence is one of absence, the field of concomitance is one of dissonance, and the field of memory is one of forgetting. The dominance of fads and fashions for labor and work generates activity but not action, where the analysis reveals possibilities for *activist natality* in ways that demonstrate *educative* rather than *corporate* 3Ls.

**The field of presence**

Educational professionals are corporatized by Taylor-Hawthorne determined folderols, fads, and fashions in ways that render them *absent* from thinking and strategizing.

**The field of concomitance**

Educational professionals are required to accept the need for structures, cultures, and identities to be corporatized through folderols, fads, and fashions in ways that create *dissonance* between innovation and professional values.

**The field of memory**

Educational professionals are required to adopt folderols, fads, and fashions in order to remember and so enact corporate imperatives based on *forgetting* that there may be alternative ways of practice.

**Discontinuities and ruptures which form the different viewpoints of this area of the field**

Taylorism and Hawthorne provide resilient continuities that have been reworked and modernized by educational professionals, researchers, business, and policymakers. The standpoint taken in this chapter is located in a long established research and practice tradition of plural knowledge production, and professional values. The discontinuities and ruptures are located in professional practice that promotes values and activism within communities and with researchers who undertake projects that are independent of corporate funding/influence, and who seek to present the situation and work on activist agendas for change.

**Critical assumptions and presupposition**

The chapter is based on a wide reading of both mapping and analysis of the evidence for and trends in folderols, fads, and fashions in a range of social science disciplines, educational policy initiatives and reforms, and professional identities and practices. The chapter draws on and provides perspectives in regard to the themes of this book (fields of presence, concomitance, and memory) and goes further by using Arendtian scholarship to not only examine the evidence for a relationship between folderols, fads, and fashions with labor and work, but to also present activist natality as way of thinking about change agendas.

---

**Introduction**

Evidence and debates about “fad” and “fashion” bandwagons rolling through research design and professional practice are evident in the natural and social science disciplines (see Abrahamson, 1991, 1996, 2009; Bort & Kieser, 2011; Dunnette, 1966; Peng, 1994; Starbuck, 2009a, b), with studies about the impact on national policymaking (e.g., Chwiero, 2014; Naim, 2000). The field of educational leaders, leading, and leadership is no exception and is replete with “fads” or within-

profession/organization innovations such as the “self-managing school” (Caldwell & Spinks, 1988), and an accumulation of connected “fashions” or outside-of-profession/organization innovations such as “transformational leadership” (Leithwood, Jantzi, & Steinbach, 1999). Studies about knowledge production in the field have examined the evidence for and impact of such bandwagons (e.g., Eacott, 2013; Gunter, 1997), with specific focus on particular leadership models (e.g., Lumby, 2016) and on the transfer of noneducation models from business settings (e.g., Peck & Reitzug, 2012). Importantly, critical analysis demonstrates that the study of “fads” and “fashions” is not a trivial matter but speaks to deeper concerns about research design and everyday practice in schools and universities.

The focus of this chapter is on the production and endurance of *corporate* leaders, leading, and leadership (3Ls) for educational services. The knowledge claims for fads and fashions are historically located in Taylorism and the Hawthorne Experiments. The argument developed is that the field of presence is in effect a field of *absence*, the field of concomitance is a field of *dissonance*, and the field of memory is a field of *forgetting*. Arendtian (1958) scholarship enables new understandings of the relationship between fads and fashions in the construction and enactment of labor, work, and action. The dominance of fads and fashions for labor and work generates activity but not action, where the analysis reveals possibilities for *activist natality* in ways that demonstrate *educative* rather than *corporate* 3Ls.

---

## Knowledge Production in the Field of Educational Leaders, Leading, and Leadership

The 3Ls are focused on formal leader roles, to the thinking, speaking, and doing as leading, and to the exercise of power with and over others as leadership. Globalized reforms to the 3Ls in public-services education are increasingly *corporate*, where the focus is on organizational structures, cultures and systems with line-management and data-determined practices that are enacted in the name of but separate from authentic educational purposes (Gunter, 2012).

The main features of corporate 3Ls are: first, ideas are primarily from a for-profit context and are focused on securing organizational hierarchy and unity, where values are framed according to branded distinction in a competitive market; second, processes are leader-centric based on the assumed causal relationship between the postholder and the efficacy of leading in order to exercise leadership powers over others as followers; third, change is controlled outside of the production site, where acceptance is enabled by the techniques of organizational psychology; and fourth, outcomes are planned, delivered, and measured, with data that demonstrate excellence, efficiency and effectiveness as a unified system. The intellectual and wider cultural traditions are located in the positivist and behavioral sciences as illustrated by Taylorism and the Hawthorne Experiments.

Taylor (1911) presented an organizational science based on ergonomics undertaken by a segregated workforce of management and design or production-line delivery. The worker is motivated by pay, and so time and motion audits required

effectiveness data to be used to improve the conditions in which outcomes are produced. The Hawthorne Studies (1924–1933) reported on a series of experiments designed to optimize working conditions on a production line (see Mayo, 1933), where the researchers found that group norms mattered to system efficiency. This revealed the need to take into account the relationship between production targets, micropolitical cultures, and emotional connections with work and supervision. Characterized as behaviors, the workplace became understood as a site of potential production failure unless leaders and managers understood how to engage with the worker.

In summary, the corporate 3Ls are rooted in Taylorist systems thinking and Hawthorne human relations approaches and are evident in the drive to find one best way of running a school or university known as The Theory Movement from the 1950s (see Gunter, 2020). This search for *the* theory has been updated through the adoption of transformational leader-follower vision and mission (and hybrids such as “distributed and “instructional”), that have been adopted and adapted from non-educational leadership models that would appeal to but also control educational professionals (e.g., Leithwood et al., 1999). The underlying ontology and epistemology remain Taylor-Hawthorne, but the field produces new models for the 3Ls that are each claimed to be novel and necessary to secure innovative change. Consequently, research of and practice within the field of corporate 3Ls is subject to “folderols,” “fads,” and “fashions.”

Folderols are defined as “those practices characterized by excessive ornamentation, nonsensical and unnecessary actions, trifles and essentially useless and wasteful fiddle-faddle” (Dunnette, 1966, p. 343). They may serve as etymological decoration: for example, delegation replaced by distribution, established professional titles replaced by the universal application of leader titles, practice is taken up with writing mission statements, and the field itself is subject to ongoing relabeling (Gunter, 2004). Such folderols are integral to “fads” and “fashions” where the bandwagon is more than a lexical change and offers problem definition and resolution. Hence, fads are “practices and concepts characterized by capriciousness and intense, but short-lived interest” (Dunnette, 1966 p. 343), and as such they are internally generated within an organization such as a school or a network such as a professional group or epistemic research community (Abrahamson, 1991). For example, fads for the corporate 3Ls include “the self-managing school” (Caldwell & Spinks, 1988) and “system leadership” (Hopkins & Higham, 2007) that fit with the business autonomy Zeitgeist, where there is a sense of belonging (Millar, 2009) through networked imitation (Bort & Kieser, 2011; Starbuck, 2009b). Researchers are located in fad production, where a commissioned project may be undertaken on the basis that the data and ideas can be easily diffused through training and second/third-hand transmission, and a principal may attend that training day and be required to cascade the content and experience with staff. Fads have to make sense because as Miller and Hartwick (2002) argue they fit the recognized crisis and so attract funding, and tend to be “prescriptive,” “one-size-fits-all,” and are easy to “cut and paste” from one context to another. In addition, the focus is on novelty, particularly by spurious claims of innovation, where integrity is based on acclaim recognition or “the status

and prestige of their proponents or followers, rather than the empirical evidence” (unpaged). The durability of fads is independent of its quality or effectiveness, and so there are “cycles,” “swings,” “stages,” and “bell-shaped” activity regarding take up and moving on (Abrahamson, 1996; Peck & Reitzug, 2012).

Studying corporate 3Ls demonstrates that there is something more in evidence than fads as packaged solutions, where “fashions” is used to describe changes to “supply and demand in a knowledge market” (Abrahamson & Eisenman, 2008, p. 720). In other words, while a fad is when “groups imitate other organizations within that group,” a fashion “assumes that organizations in a group imitate other organizations. . . that reside outside that group” (Abrahamson, 1991, p. 597). Such externalized solutions combine fan-fared novelty with responsiveness to urgent professional needs, and so fashion is “those manners or modes of action taking on the character of habits and enforced by social or scientific norms defining what constitutes the ‘thing to do’” (Dunnette, 1966, p. 343). Fashion-setters as influencers in the form of corporations, intellectuals, politicians, philanthropists, consultancies, and social-media stars and owners simplify and supply corporate 3Ls, and fashion-followers as researchers and professionals (plus children and parents) have activities to engage with. For researchers, the thing to do is to produce data that demonstrate causal relationships between a leader, followers, and/or student learning outcomes, and for the professional the imperative is to be seen to practice on the basis that leader activity will causally impact even if there are no data to prove it (see Abrahamson & Eisenman, 2008).

The fashions in corporate 3Ls focus on the exercise of power in order to structure and hence control individual agency, where a range of corporate techniques have been bought in and brought into schools and universities, for example, Management by Objectives (Drucker, 1954), and enabling the organization to shift from, Good to Great (Collins, 2001). These move beyond faddishness because, as Abrahamson and Eisenman (2008) argue, “fashions connect and cumulate, rather than constituting individual and unpredictable responses to breakdowns in institutional constraints” (p. 725). There is a need for a new fashion to be connected with previous fashions, through the logic of the crisis and the corporate 3Ls as the solution, but also to be distinctively progressive and novel (see Béland & Cox, 2013). Hence, fashions in corporate 3Ls are political and sociological – it is about decisions regarding what the knowledge agenda is, which knowledge is worth knowing and funding, and which knowers can be trusted to know in preferred ways. For example, the Ambition Institute in England offers a Masters in Expert Teaching where “Charlie” provides a soundbite of acclaim based on how the program focuses “on teaching excellence, not writing extended essays or dissertations” (Ambition Institute, 2020, unpaged). The product is distinguished from that offered by research-intensive universities, and where eligibility is not based on accreditation but on the need to “be receptive to feedback and be hungry to improve” (Ambition Institute, 2020, unpaged). What matters are fashionable providers who guarantee training for identities and purposes that are presented as “innovative” and “empowering,” but are actually designed to routinize practice and dispose of those who demonstrate originality (e.g., contract renewal/termination) (Gunter, 2018). Hence, there is a need to understand not only

how fashions are packaged but how they are diffused with “*social* bandwagon effects” (Newell, Robertson, & Swan, 2001, p. 7, original emphasis), and in ways that have authority.

## Innovation in the Field of Educational Leaders, Leading, and Leadership

Folderols, fads, and fashions are integral to creating and sustaining a faux innovation agenda in the corporate 3Ls field. Innovation is a folderol label for noneducational reforms of public education, enabled by within-profession fads but largely driven by external “business-located” fashions encoded in reform imperatives to change power structures, particularly to discipline and rework notions of professionalism. Taking a case study example, the UK government reforms for education in England have been examined at school (e.g., Hughes, 2019), system (e.g., Courtney, 2015; Rayner, Courtney, & Gunter, 2018), and government (Gunter, 2018) levels, and the approach has been to: first, remodel, through the construction of a preferred type of school principal; second, responsabilize, through rewards (performance related pay) and “name and shame” punishments (school closure); third, redesign, through the focus on policy delivery practices; fourth, restructure, through the dismantling of local democratic control and replacement with autonomous businesses; and fifth, reculture, through controlling what is imagined, said and done in regard to problem identification and solutions.

The rationalities and narratives used in reform documents, speeches, and guidance present the novelty and vitality of serious reforms that are advantageous for all if only they adopt them. The speedy reform imperative was framed as “There Is No Alternative” (TINA) with “No Excuses” for poor performance, with the exclusion of “enemies” who think and do otherwise. The UK government designed, funded, and staffed the National College for School Leadership (NCSL) in England from 2000 to 2018 to control 3Ls knowledge production, where the legacy of codification of best practice remains and is based on tactical decisions about “which organization they should imitate” (Abrahamson, 1991, p. 595). The NCSL was a laboratory for folderol, fad, and fashion development for the profession in England and also impacted globally through the promotion, cascading, and diffusion of corporate 3Ls as generic and globally relevant solutions to the problem of public services education (Gunter, 2012). In Arendtian (1958) terms, a school principal is trained to *labor* and *work* and be relentlessly busy through *activity*, but is prevented from taking authentic educative *action* for students and communities (Gunter, 2018). This is outlined in Fig. 1.

Professional...	Labor	Work	Activity	Action
Ideas	Internal/Derivative	External/Craft	Cascading	Internal/External
Processes	Packaging	Adaptation	Diffusion	Questioning
Outcomes	Delivery	Performance	Data	Originality

**Fig. 1** Labor, work, activity, and action (based on Arendt, 1958)

What Fig. 1 illustrates is how educational professionals as researchers, teachers, and postholders in schools and universities can take up a position (agency) or be positioned (structure) in regard to professional ideas or knowledges, processes or skills, and outcomes or achievements of themselves and/or those they work with (colleagues, students). Consequently, an educational professional *labors* by accepting narrow ideas, the adoption of prepackaged processes, with a focus on securing outcomes, and *works* by tactically using ideas and process to adapt requirements to a context, and to demonstrate how standards have been met. Current trends show that educational professionals are being identified, recruited, trained, accredited, contracted, and managed in order to primarily labor and work. The combination of labor and work generates *activity*, where ideas are communicated and diffused in order to produce the right type and level of data. Alternative trends are in evidence whereby educational professionals exercise agency by taking *action* through intellectual work and practices regarding knowledge and understanding, questioning, and developing novel approaches to research and practice.

## Laboring innovations

Innovation as labor is about survival at a time of unyielding precarity, and so educational professionals recognize that contracts may not be renewed and/or the school could close, and so the focus is on prepackaged problem-solving in order to deliver reforms. Labor uses and makes demands for more folderols and fads and enables fashions to sustain cumulative types of instrumental and behaviorist knowledge production.

There are particular examples of Taylor-Hawthorne labor that are recommended for transfer to education (e.g., Hallinger & Snidvongs, 2008):

*Management by Objectives* was launched by Drucker (1954), where he outlines the identification of objectives that are then managed sequentially in order to secure controlled outcomes. This management technique has been updated through the *Balanced Scorecard* (Kaplan & Norton, 1992) that enables data to be organized around finances, customer views, organizational arrangements and future-thinking, in order to ask what the data mean, and how the organization is viewed and fit for purpose (Karathanos & Karathanos, 2005).

*Total Quality Management* was communicated by Deming (1986) as the requirement for quality to be everyone's responsibility based on continuous improvement (Murgatroyd, 1993). An updated version, though clearly distinct from TQM, is Hammer and Champy's (1993) *Business Process Re-engineering*, whereby notions of breaking with the past and downsizing of the organization are recognized as vital to bringing about revolutionary change (Davies, 1997).

*Transformational leadership* has become field orthodoxy for the corporate 3Ls where technologies of objectives and quality needed a focus on the people in leader roles. The identification of "competences" (Jirasinghe & Lyons, 1995) and "capacity building" (Youngs & King, 2002) have given recognition to notions of

trait, styles and contingency that have already been popularized, but it was the shift from transactional to transformational forms of leadership that sutured positivist and behavioral science to form the case for charismatic visioning (Leithwood et al., 1999).

The presentation and adaptation of such management fads and fashions is often through the use of bullet/dot pointed lists of easy-to-remember phrases (Gunter & Willmott, 2001). What seems to matter most is how to make the conditions for the innovation acceptable (Abrahamson, 1991), particularly with educational professionals who have potential access to alternative sites of knowledge production. The focus is about identifying and rewarding who is an “adopter” and who should be neutralized as a “laggard” (p. 586), where the corporate 3Ls is dependent on shared compliance dispositions (e.g., Astle & Ryan, 2008) who turn around “failing” and “coasting” schools (see Peck & Reitzug, 2012), using a combination of prescriptions (e.g., Stoll & Fink, 1996) and bolstered by victory stories (e.g., Clark, 1998).

## Working on Innovations

Innovation as work is about crafting and producing, and for educational professionals this means shaping lessons that must produce a work-ready workforce. Realistically one-size-fits-all reforms may not work in the particular context, and so the focus is on accepting and potentially extending/developing externally crafted packages of “know-how” in order to undertake effective tactical adaptation of the changes. Work uses and produces folderols and fads and enables cumulative fashionable innovation to be accepted.

It seems that: “fashionable management techniques must appear both rational (efficient means to important ends) and progressive (new as well as improved relative to older management techniques)” (Abrahamson, 1996, p. 255). Consequently, for educational professionals as teachers and postholders, the fear of losing out through the rapid restructuring of the system with new school types such as academies in England means that the principal may accept the change on the basis that it is inevitable and so it is better to get involved “now” while advantages can be secured (see McGinity & Gunter, 2017). In addition, new roles open up for the profession such as the CEO of a Multi-Academy Trust where corporate dispositions are revealed and strengthened through practice as corporate 3Ls (Hughes, Courtney, & Gunter, 2019). School principals take on the challenges of making the reforms work (e.g., Kulz, 2017), creating dynamic crafted corporate solutions (e.g., Caldwell and Spinks, 1998); and embrace “new” leadership models as instructional (see Eacott, 2017) and distributed (Lumby, 2016). Running alongside this are researchers who need to be ready to deliver commissioned evaluation projects that focus on producing statistical data that make causal connections between corporate 3Ls and student outcomes (e.g., Day, Gu, & Sammons, 2016), and to translate fashionable innovative models into quick reading and training manuals (e.g., Barber, Moffit, & Kihn, 2011). Peck and Reitzug (2012) argue that:

... the appearances and disappearances of MBO and TQM in the educational leadership textbooks may help to illustrate the functioning of the fashion-setting market in school management. The sudden appearance of a school leadership fashion in a textbook may reflect the attempt of the authors, in the role of fashion setters, to satisfy the needs and wants of the reader, in the role of fashion follower, to have access to the latest trends in educational leadership. Once a fashion gains currency in the educational leadership realm, it may in fact be incumbent upon the authors of a textbook to include the fashion as part of a revised edition to demonstrate that the textbook as a whole still has relevance to the field. (Peck & Reitzug, 2012, p. 368)

The failure of educational researchers to meet demand and to rise to this evidence-informed and often normative challenge means that projects are awarded to reliable research (e.g., Earl et al., 2003) and consultancy (e.g., PricewaterhouseCoopers, see PwC, 2008) teams. Primary research funding is cut, and investment is made into certain types of projects that require prescribed methodologies, for example, RCTs (Eacott, 2017).

## Actively Innovating

Labor and work generate activity but not – in Arendtian terms – any authentic action. Innovation as activity is focused on endlessly replenished “make-overs” as modern and novel, accepted from popular gurus and social-media influencers, on the basis that they will enable the educational professional to deliver a higher standard of research and/or education (Eacott, 2017; Gunter & Thomson, 2009). Knowing otherwise is denounced and censured in how knowledge exchanges are framed and conducted. Activity is about cascading in the form of training and feedback, diffusion through everyday language and data production in order to secure delivery to the correct level of performance: “an informational cascade occurs when it is optimal for an individual, having observed the actions of those ahead of him, to follow the behavior of the preceding individual without regard to his own information” (Bikhchandani, Hirshleifer, & Welch, 1992, p. 994).

Busy-ness has to be visible and open to acclaim and reward, and it can be: first, classroom-based through “brain-gym,” “multiple intelligences,” “teach like a champion,” “growth mindset,” “assertive discipline,” and “the resilience doughnut”; second, desk-based through the collection, analysis, and communication of vital data to demonstrate individual, group, and organizational “value-added” performance calculations benchmarked against national standards; third, organization-based by building a commitment to the data through vision and mission, enabled through the practicality of monitoring as Management By Walking About (later: *The New Management by Wandering Around* [MBWA]; see Streshly, Gray, & Frase, 2012) in ways that check delivery; fourth, resource-based through the use of data to justify decision-making, and to support external bids to funders to sustain and claim new income streams; fifth, network-based as “one of us” within “professional learning communities,” having the right type of connections in order to make deals for new educational products and services; and sixth, culture-based in order to ensure that everyone knows their place in

the established hierarchy because “there is no I in team,” take their responsibilities seriously by demonstrating “emotional intelligence,” and are incentivized through the title of leader, the notion of “deep” leadership, and the opportunity to have work delegated to them through leadership distribution.

While knowledge claims from Taylorism and Hawthorne tend not to be mentioned by name, the underlying conceptualization of labor and work, and the relationship of the human to that labor and work is enduring, and illustrated by the popularity of business prescriptions for successful companies such as Peters and Waterman’s (2006) *In Search of Excellence*, and Collins’ (2001) *From Good to Great*. For example, what Collins (2001) has done is to package failure as a visceral avoidance imperative in ways that speak to authentic professional concerns in educational services and provide opportunities for personal security and potential advancement. His argument is that even though there are huge barriers, some companies break through and sustain “greatness” because of their Chief Executives, where seven characteristics of these companies are provided. One of these characteristics is entitled: “First Who, Then What,” where the metaphor of a bus is used to communicate the requirement to get the right people on the bus and work out the destination, and get the right people in the right seats. Collins’ (2001) book has been translated into educational services by Gray and Streshly (2008) where the failing school and failing children is a valid and urgent narrative and where Collins’ prescriptions are used to question and create the narratives for the dismantling of employment law in the name of disposing of people who do not fit the vision. Push back on this idea of getting people off the bus has recognized that this actually means “throwing people under the bus,” where the seemingly benign processes do damage not only to the “thrown” but to the “thrower,” and to the organization and wider educational system (see Courtney & Gunter, 2015). What this example illustrates is a form of “authorized inaction,” where educational professionals are required to be active and “make a difference” but not to take authentic action, and so are industrious in designing and deploying templates, collecting and evaluating numbers, and making performance calculations about worth (Gunter, 2018).

---

## Activist Natality

The field of corporate 3Ls in education is dominated by labor and work fads and fashions as forms of *fabricated innovation*, and in deploying the Foucauldian (1972) themes in this book we provide some explanations:

**Field of presence:** Fads and fashions are constructed and legitimized in statements (e.g., training manuals, meeting agendas, development plans) that objectify Taylorist external control of professional identity and practices as “manifest, nameable, and describable” and manipulate Hawthorne relational compliance regarding what can be thought and said, and who can speak with authority (Foucault, 1972, p. 41). In effect, fads and fashions require educational professionals to locate in a field of *absence*, where the original site of knowledge production is irrelevant to the recipients of know-how transfer, where the “fad-ness” and “fashion-ability” and the social and organizational positions of those who constitute the

discourses, is sufficient for effervescent adoption. The essential characteristic of a fad is that its fad-ness discredits or obliterates what has gone before.

**Field of concomitance:** Fads and fashions are constructed and legitimized as change imperatives necessary for dealing with the problems in schools as organizations (e.g., efficient and effective work practices; productivity and performance related pay), whereby “analogical confirmation” of the business and the school as unitary organizations combined with “models that can be transferred” enables the adoption of self-incentivization, and other-regarding surveillance (Foucault, 1972, p. 58). In effect, fads and fashions require educational professionals to locate in a field of *dissonance*, where agency has to relentlessly implement what challenges professional values and the purposes of public education because authentic agency has been relocated to the corporate sector.

**Field of memory:** Fads and fashions are constructed and legitimized through both the exclusion of and hostility to what used to be recognized as authentic claims to know (e.g., professional judgment and discretion are disciplined and eradicated by various Taylor-Hawthorne rationalities such as Management by Objectives, that are speeded up by acronyms such as MBO, until the next acronym comes along). In effect, there are “statements that are no longer accepted or discussed, and consequently no longer define either a body of truth or a domain of validity” (Foucault, 1972, p. 58). In effect, fads and fashions require educational professionals to locate in a field of *forgetting*, where alternative ways of thinking and doing are not possible and are actively censured (Gunter, 2020).

The legacy of Taylorism and the Hawthorne experiments endures within field knowledge production whereby, in Foucauldian terms, the *presence* of the beliefs and experiences of corporate individuals and transmitted through philanthropic foundations (Saltman, 2010) and the absence of professional values (Gunter, 2020); the *concomitance* of the corporation and the school is facilitated by economic cycles (Hartley, 2016) and the *dissonant* realities of reform enactment (Rayner & Gunter, 2020); and the *memory* of what is known and is worth knowing is enabled by the billability of consultant as “all knowing” (Gunter & Mills, 2017); and the proactive *forgetting* by researchers who do not think about how they may be complicit in this process (Gunter, 2020). For example, project funding means that research has been turned into income generation and outputs into citation data (Miller, 2009; Starbuck, 2009b) where the spaces for primary research are narrowed (Bitektine, 2009). Educational professionals in schools are encouraged to demand relevance, and so researchers: “lose sight of the essence of the problems that need to be solved and the questions that need answers” (Dunnette, 1966, p. 348). In addition, this tends to be a feature of globally influential Anglo-American academia (Tienari, 2009) and it is sustained through how new researchers are inducted into the field (Miller, 2009). This analysis is critical but somewhat pessimistic, because it suggests that there is no alternative to Taylor-Hawthorne.

In Arendtian terms, action and activism are different from activity, whereby Arendt (1958) makes the case that as humans we have natality, or the capacity to do new things. Innovation as action, in Arendtian (1958) terms, is based on entering the public realm and spontaneously presenting a standpoint, seeking to understand other standpoints, and relationally exchanging ideas with unique humans. For educational professionals, such *activist natality* means interplaying practical and intellectual knowledges and expertise within plural knowledge production processes, and using knowledges to question and develop original insights that enable

children to know the world and to be aspirational about their capacity to change it. Action exposes and challenges folderols, fads, and fashions and is located in knowledge production that is inclusive and democratic, and focused on social justice. Consequently, educational professionals as teachers and as researchers lead on knowledge production within civil society, where validation is related to debate and not compliance.

Activist natality exposes fabricated innovating through major disruptions to the authority of what can be thought and said. This happens in a range of ways: first, the corporate 3Ls do not actually work, even in their own terms of “best practice” or “getting the job done,” where, for example, Lumby (2016) not only reveals the mythology around distributed leadership but also argues that “it is a displacement activity that facilitates turning aside from the core issue of inequality in learners and staff” (p 165); second, the corporate 3Ls do serious damage not only to those who are meant to be served by public education but also to the private providers who are meant to gain from it (see Carrasco & Gunter, 2019); third, those who are active in producing the 3Ls can experience “Damascene” conversions, where Ravitch (2010) outlines her attraction to markets, then her admission that reforms in the USA are mistaken, and her major shift as a policy actor away from choice and accountability; and fourth, high-quality primary research has not disappeared, in spite of brutal strategies designed to eliminate it from professional concerns in classrooms through to universities, where policy scholars such as Ball are recognized by teachers as making a difference intellectually to professional understanding (Gunter, 2013).

Activist natality provides the opportunities to develop different agendas. Educative action is located in different knowledge claims to those espoused in the corporate 3Ls and is based on partnerships between educational professionals who are occupationally located in different parts of the education system (e.g., part-time postgraduate masters and doctoral programs; collaborative research projects, Wrigley, Thomson, & Lingard, 2012), where the research agenda is independently designed and funded based on transparent indicators of research quality. Consequently, there are alternative vibrant sites of research that support the development of educational 3Ls, and this has a number of features: first, ideas are ontologically and epistemologically plural and originate from a range of sources; second, processes recognize that leadership is not always the function of structural roles, “it does not reside *in* an individual but in the relationship between individuals, and it is oriented toward social visions and change” (Foster, 1989, p. 46, original emphasis); and third, outcomes are focused on social justice access and participation that enables all to perform and realize their aspirations.

Educational professionals as researchers, teachers, and postholders already have access to the educational 3Ls, where the field is replete with evidence about the realities of doing the job and that there are alternatives that work better and are more socially just. For example, while academization has become the fashion bandwagon in England, it is the case that schools do not automatically convert their status (e.g., Rayner & Gunter, 2020); and while educational professionals are required to secure hierarchical instructional control over pedagogy, it is the case that that schools do not

automatically position children as objects of organizational improvement (e.g., Thomson & Gunter, 2006). In addition, while teachers and parents are required to operationalize austerity, it is the case that cuts to staffing and the curriculum, along with school closures have led to public protests (Gunter, 2018); and while school principals have been trained and accredited as transformational leaders, it is the case that social justice values are in evidence in community work, and what Shields (2010) has identified as transformative leadership (see Winkley, 2002). Indeed, there are landmark texts that speak to the field in ways that cannot keep being ignored (e.g., Callahan, 1962), and there is evidence that ignoring these “warnings from history” could mean that public education is turned into a site of antidemocratic trends (e.g., Gunter, 2018).

What has to be addressed is that folderols, fads and fashions demonstrate that seemingly novel but bad ideas can have longevity (Sunstein, 2001), but this is not inevitable (Peng, 1994). Following Arendt (1968), it seems that teaching, researching and leading are taking place in dark times, but she argues that illumination is possible from those who think for and otherwise as educative action (see English, Papa, Mullen, & Creighton, 2012). Perhaps a starting point is to understand not only why professionals are provided with fads and fashions, but to focus on why professionals turn to fads and fashions, and how they might be enabled to turn to a range of intellectual resources, particularly since there are an increasing number of school principals who are admitting to their disappointment that the promises made about the relationship between reforms and educational innovation are not actually borne out in reality (e.g., Leo, Galloway, & Hearne, 2010).

---

## Conclusion and Reflections

The argument deployed in this chapter is that the corporate 3Ls depend for their survival on a continual quest for “the next big thing,” so that *leaders* are positioned as innovators, *leading* is understood as an exceptional attribute, and *leadership* retains its combination of credibility and mystique. Folderols provide up-to-date and dynamic language, image, and practices that demonstrate the modern. Fads require previous beliefs and practices to be expunged from the field of memory. Fashions cause previous iterations of leadership to become serially unfashionable and thus those who are in leader roles are rendered missing within the field of presence. In the field of concomitance, etymological and practical folderols, fads, and fashions are mobilized and flow as leading edge knowledge production in order to make beliefs and practices variously palatable, usable, and ultimately disposable in educational leadership. The conclusion is that most educational professionals as researchers, teachers, and principals are rendered busy with activity, but in reality they labor and work rather than engage in action. Nevertheless, there are encouraging examples of activist natality where researchers, teachers, and principals refuse corporate makeovers and seek to make a difference based on professional values, social justice, and plural knowledge production.

## Abstract

Foucault's archaeological framework helps establish certain historical conditions of leadership that challenge intersectional leadership possibilities. Historically, a leadership that follows a "one size fits all" epistemology grounded in White male criteria has led to glaring problematics with leadership that marginalizes various minority groups. This chapter highlights a troubling situation that compromises leadership theory's evolution to fit a globalized world in the twenty-first century – a status quo within leadership discourse that highlights gender neutrality and thus disregards the experiences of women in the margins. Intersectionality theory is grounded in a post-structural, feminist critique that challenges the epistemology of leadership theory and addresses areas that merit theoretical expansion. Views framed from a feminist intersectional perspective serve as an intellectual counter to combat the marginalized

representation of women of color within the canon of leadership. By tracing the intellectual history of intersectionality theory using Foucault's archaeology of knowledge framework, a dialectic discourse between intersectionality and educational leadership epistemologies begin to identify the space where the two bodies of knowledge intersect and the conditions that make this possible.

---

**Keywords**

Critical feminism · Educational leadership · Epistemology · Foucault · Archaeology of knowledge · Intersectionality · Single-axis identity · Transformation identity politics

**The Field of Memory**

Leadership is rooted in a single-axes, positivist, "one size fits all" epistemology; merely integrating women into an analysis of leadership theory is insufficient and fails to engage identity beyond an additive, hierarchal strategy without considering their varied identities and social locations; leadership is grounded in hegemonic, dominant perspectives; traditional assumptions of masculinity and the gendered construction of leadership lead to epistemic oppression; power relations dictate what leadership should look like and who should be leaders.

**The Field of Presence**

Intersectional studies of leadership branch out to include post-structural, feminist critiques that challenge the historical hegemonic, positivist epistemologies of leadership; diverse, nondominant, and minority perspectives flourish; different ways of understanding educational contexts and leadership are recognized; focus is on who might be leaders and how circumstances of social class, location, ethnicity, and cultural worldview affects work and identity; recognizes women of color's unique experiences to produce critical innovative leadership approaches; an intersectional lens provides the epistemological complexity necessary to discern how the intersection of privileged and marginalized identities can coexist among leaders.

**The Field of Concomitance**

Rooted in critical feminism and critical race theory, intersectionality is influenced by queer theory, postmodern theory, hermeneutic ontology, standpoint epistemology; intersectionality works with critical theory, hermeneutics, post-structuralism, post-modernism, and critical feminism to make visible how marginalized women are being constructed by or within diverse social conditions; intersectional analyses in leadership refer to the interaction between gender, race, and other categories of difference in individual lives, social practices, institutional arrangements, and cultural ideologies, and the outcomes of these interactions in terms of power; employed by feminist scholars from different disciplines (philosophy, social sciences,

humanities, economy, psychology, business, organizational studies, law), different theoretical perspectives (phenomenology, structuralist sociology, psychoanalysis, deconstructionism), and different political persuasions (feminism, anti-racism, multiculturalism, disability studies).

### **Discontinuities and Ruptures**

Vague and ambiguous definitions claim intersectionality is an analytical approach, a framework, a paradigm, a research program, a description of personal identity, a theory of expression, a counter-hegemonic political program, a methodology; varied labels include interrelations of oppressions, multiple oppressions, multiple social divisions, mutual constitutions, considerable differences, hybridities, simultaneity, numerous oppressions, multiculturalisms, multiplicities, post-colonialism, differential consciousness, inappropriate/d otherness, multi-gendering, multiple other, lattice of difference; scholars believe there is a necessity to correct or refine the intellectual validity of intersectionality; as a project under construction, disagreements are related to (mis)appropriation, identity politics, and intersectionality as a travelling theory; claims of European erasure of race that move away from the original intent of intersectionality are pervasive; debates are concerned with whether intersectionality applies only to some demographics and not others.

### **Critical Assumptions**

Intersectionality has been adapted beyond critical race and feminist scholarship to confront wide-ranging issues, power dynamics, and discursive fields; rather than producing more trustworthy knowledge, intersectionality offers more situated and contextual knowledge and more axes of difference to explore; the intent of social justice and transformational change when applying intersectionality is critical; intersectionality is neither a grand narrative nor a universal body of knowledge.

---

## **Introduction**

This chapter traces the intellectual history of intersectionality theory by employing Foucault's (2012) archaeology of knowledge framework. The idea of intersectionality itself is ubiquitous in many disciplines. It requires an in-depth critique to determine its controversies, ruptures, erasures, limitations, and strengths. A dialectic discourse exists between intersectionality and educational leadership epistemologies that identifies the space where the two bodies of knowledge intersect and the conditions that make this possible. But a more specific question might be asked: *How might feminist educational leadership benefit from intersectionality?*

The chapter is structured around a brief description of Foucault's (2012) archaeology of knowledge, and the contextual information which therein grounds the analysis of intersectionality's intellectual history. Subsequently, Foucault's (2012) archaeological method is applied to document the evolution of its intellectual history.

Such an analysis facilitates the possibility of a feminist leadership paradigm using intersectionality as an analytical approach. The remainder of the chapter establishes the changing historical conditions of leadership, outlining the need for a contemporary leadership paradigm that considers marginalized female leaders within the context of race, gender, and class that advances beyond the prevailing White dominance paradigm of leadership. The following question might be asked: *What are the compromising aspects of current leadership discourse when exploring the possible contributions intersectional theory might make to leadership theory?* There is a discussion devoted to leadership evolution, specifically feminist leadership, which addresses the intersection of leadership and intersectionality. A feminist leadership discourse allows latitude for transforming traditional, modernist, positivist leadership paradigms. The chapter addresses questions such as: *How and why did leadership theory evolve to include feminist theory? Why does a post-structural feminist paradigm synchronize so well with intersectionality?*

---

## Foucault's Archaeology of Knowledge

While not a formal theory, Foucault's (2012) archaeological methodology offers an approach that could allow us to validate a theory or phenomena. This process does not trace the chronology of events in history but instead abandons preconceptions about historical continuity by describing the disruptions, thresholds, differences, and complex discourses that have developed over time. The "history of ideas" concerns the transitions between historical worldviews and the accompanying narrative or discourse (dis)continuities that falter under closer inspection. Foucault (2012) points out that discourse is a means of controlling the social practices and institutions in a society. An archaeological analysis aims to reveal historical conditions that made knowledge development possible. Foucault's (2012) understanding of history is not a traditional approach within a paradigm of historical investigation. Instead, when tracing a phenomenon or theory, he follows a discontinuous approach rather than simple linear continuity. This approach validates discontinuities as typical rather than atypical phenomena. When analyzing ideas, however, Foucault (2012) does not seek meaning in a chronological or linear discursive progression but relies on natural but radical paradigm ruptures that ameliorate and foment the evolution of knowledge.

Foucault (2012) posits a different methodology when looking at the past not based on static, inert memorization of events. He claims that a universalized recollection of past events limits any possibility of examining the idea or event within its unique context and examines the conditions that precede, surround, or follow the idea's development. Doing so would allow for the evolution of an idea (Foucault, 2012). This approach stresses the importance of reviewing the history of an idea in all of its peculiarities related to context, timing, conditions, who is speaking and who they represent. Then the rules of forming an idea, not having anything to do with the chronological or hierarchical processes, acknowledge "forms of succession," "forms of coexistence," and "procedures of intervention" that reify and validate those ideas

(Foucault, 2012). He concerns himself with: *Why, for instance, did an idea become, at a given moment, an object of knowledge?*

---

## **An Analysis of Intersectionality Using Foucault's Archaeology of Knowledge**

### **1900s: Social Activism as the Foundation of Intersectionality**

Intersectionality entered the twenty-first century as a formal discourse making a significant contribution to social science research and the development of feminism. A lesser-known fact is that the concept has its roots in a long history of Black female activists beginning in the mid-1800s, during the women's movement in the USA when White women marginalized women of color. For centuries Black women were banned from higher education and voting. Consequently, early Black abolitionists and social activists found their voice through activism outside of formal academic institutions with oral history, poetry, music, journalism, and creative nonfiction (Grzanka, 2014). Notable activists such as Maria W. Stewart, Sojourner Truth (Isabella Baumfree in Boston, Massachusetts), Audre Lorde, and Ida B. Wells-Barnett served as central figures in the early history of intersectionality (as cited in Grzanka, 2014).

These early activists criticized the prevailing societal and legal exclusions that defined womanhood based on White European and White American norms, excluding Black women and rendering their experiences invisible (Mays & Ghavami, 2018). Maria W. Stewart used public speaking to highlight the various interlocking systems of racialized gender oppression that affected Black women's position in public spheres. These early forms of intersectionality thinking argued that gender was corrupted by "maleness" and race with "Whiteness." As a result, Black women were rendered invisible (as cited in Mays & Ghavami, 2018). Intersectionality continued to develop throughout the twentieth century by theorists, literary figures, and activists identified as Black womanists, Black feminists, Chicano feminists, Hispanas, Xicanistas, and sister/outside (Anzaldúa & Moraga, 1984).

Intersectionality has a lengthy and redoubtable history in philosophy and sociology. Themes that focus on individuals' position in complex multidimensional societies are founded on intersectionality core concepts. Durkheim, Marx, and Weber were founders of traditions related to class schisms and factions, industrialization and divisions of labor. Intersectionality has become pivotal to political movements related to race, racism, anti-imperialism, anti-racism, (neo-)Marxist feminism, (neo-)Marxist anti-racism, migration, and coalition politics (Carastathis, 2016).

### **Twentieth Century: The Legal Perspective of Intersectionality**

Black feminist politics of the early 1900s catalyzed the development of intellectual intersectionality in the 1960s and 1970s. By the 1980s, Kimberlé Crenshaw (1989)

was recognized as the first scholar to bring intersectionality into the formal academic discourse. She remained faithful to the origins of Black women's oppression by dedicating her metaphor of the traffic intersection to a century of Black feminist scholar-activists. Crenshaw's (1989, 1991) legal contributions to intersectionality recognized Black women's longstanding intellectual contributions to theorizing and combating oppression. In particular, she argued that the legal code only recognized single-axis identity (i.e., race or gender). This code failed to account for how Black women's gendered racism/racialized sexism differed from White women's and Black men's experiences and created workplace discrimination which was allowed to exist within the boundaries of the extant legal system. Crenshaw (1991) argued that ignoring race when discussing gender emphasizes the oppression of people of color and anti-racist perspectives that reinforce women's oppression. As an epistemology, intersectionality was reconfigured in the late 1980s by legal scholars who investigated how the legal system ignored female African Americans' lived experiences. These scholars fought to achieve racial justice within a systemic racist society and represented the legal-scholarship movement of that time period (see Bell, 1987; Delgado & Stefancic, 2012; Kennedy, 1998; Williams 1992 as cited in Crenshaw, 1991).

Simultaneously, sociologist Patricia Hill Collins (2000) wrote: "social theories developed by multiply marginalized women . . . reflect women's efforts to come to terms with lived experiences within intersecting oppressions" (p. 9). Collins (2000) was instrumental in establishing the notion that a "matrix of domination" impacts Black women "in which intersecting oppressions originate, develop, and are contained" (p. 228). The Black lesbian Combahee Women's Collective (1986) boycotted oppression and domination by emphasizing how critical it was to acknowledge multiple forms of domination. Written works by Black feminist scholars supported these ideas (see bell hooks' "Ain't I a Woman?" 1981; Hull, Scott, and Smith "All the Women Are White and All the Blacks are Men: But Some of Us Are Brave" 1982 as cited in Schiller, 2000).

Intersectionality was influenced by other theories such as queer theory (Duong, 2012), postmodern theory (Lyotard, 1984), hermeneutic ontology (Heidegger, 1962), standpoint epistemology (Code, 2000), and views of ethics and care (Nodding, 2003). Gloria Anzaldúa and Moraga's (1984) research on borderlands introduced border crossing themes, border space, boundaries, and relationality relevant to contemporary intersectionality.

Queer theory, like intersectionality theory, is an interdisciplinary approach to identity and the human experience and like intersectionality theory, is "world-making" (Duong, 2012, p. 378). That is, it has the power "to wrench frames" (Duong, 2012, p. 371). An in-depth examination of identity is central to the concept of intersectionality, as it is to all the epistemologies that contribute to its development.

Postmodern theory, a key influence on the concept of intersectionality, focuses on skepticism regarding modernity's universal narrative. Having its start in the 1970s and gaining prominence in the 1990s, postmodern theory questions the existence of only one objective reality in favor of a range of realities and epistemologies. Postmodernism holds no "grand narrative" or metanarrative that accurately describe

the world, only multiple, localized, contextual micronarratives. In other words, there is only the particular for the postmodernist not the universal. And there are only stories about the world, no objective world itself (Lyotard, 1984) – tenets that harmonize well with intersectionality.

Hermeneutical ontology foreshadowed intersectional themes. A core tenet of hermeneutical ontology is utilitarian in that things are said to exist and are defined due to their pragmatic operations in the real world (Heidegger, 1962). “Being-in-the-world” and “being-with-others” contradict traditional notions of mind/body dichotomy. This is particularly true concerning phenomena such as race and gender, where an interpretation of identity lies at the core of intersectionality (Botts, 2017).

Standpoint theory, a concept that emerged from Marxist ideology, acknowledges how inequalities between men and women influence knowledge generation. Standpoint epistemology originates with the idea that all social knowledge claims are inherently gendered and perpetuate structures of power and privilege (Code, 2000). Standpoint epistemologist knowledge production is political. According to standpoint theorists, the oppressed have had to learn to adapt to the social order’s workings to function within it, but which also undermines that order (Code, 2000). Intersectionality’s focus on the oppression of the marginalized knower resonates well here.

Themes found in moral and care ethics are significant contributions to intersectionality’s epistemological basis (Noddings, 2003).

## **Twenty-First Century: Many Disciplines/Many Definitions**

As we have seen, intersectionality has been profoundly influenced by several critical theories in the twentieth century. By the twenty-first century, intersectionality had already served many purposes within several disciplines (e.g., transnational feminism, critical race, disability, queer, transgender, and globalization studies). Even though Black women’s oppression in the USA initiated the activism that formed the intersectionality foundation, its reach eventually transcended this group’s plight. Intersectionality since the early 1900s has gradually made an integral contribution to the feminist canon of literature.

While scholars agree that the provenance of intersectionality lies in critical-race theory and feminism, an exact definition of intersectionality still remains equivocal. Cole (2008) stated that intersectionality “is a paradigm for theory and research offering new ways of understanding the complex causality that characterizes social phenomena” (p. 179). Cho et al. (2013) view intersectionality as an analytical sensibility that stresses “what makes an analysis intersectional is not the use of the term intersectionality...nor its drawing on lists of standard citations...what makes an analysis intersectional...is its adoption of an intersectional way of thinking about the problem of sameness and difference and its relation to power” (p. 795).

Scholars differ on what true intersectionality is, although they agree that its applications are abundant. For some, intersectionality constitutes an analytic

approach, a framework, a theory; a paradigm, or a combination of those, while others view intersectionality as a research program, a description of personal identity, a theory of expression, a counter-hegemonic political agenda as well as methodology (see list of scholars in Botts, 2017). As a research program, the concept of intersectionality focuses on how socialized-identity markers like race, gender, sexuality, (dis)ability, and class interact with and affect the phenomenon being researched (Botts, 2017). As a description of personal identity, intersectionality disrupts the idea of describing personal identity in mono-linear categories (Botts, 2017). As a theory of oppression, intersectionality represents the idea that “axes” of oppression (such as race, gender, class, sexuality, and ability status) intersect the oppressed’s lives (Crenshaw, 1989, 1991). As a counter-hegemonic political agenda, European, androcentric, and White biases are viewed as the cause of systematic exclusion from the realms of legitimate knowledge (Bilge, 2013).

Disciplines that employ intersectionality are equally varied. For example, intersectionality thought has increased in business, management, leadership studies, and organizational reviews (Atewologun, Sealy, & Vinnicombe, 2016). Although rooted in African-American women’s experiences, other feminist women of color both from within and outside the USA have influenced intersectionality (e.g., Cho et al., 2013; Grzanka, 2014). Anzaldúa and Moraga (1984) speak to interlocking systems of oppression from a Chicana lesbian feminist position.

Intersectional perspectives and the complex social phenomena they refer to are dichotomized into different names and labels. These include interrelations of oppressions, multiple oppressions, multiple social divisions, mutual constitutions, considerable differences, hybridities, simultaneity, numerous oppressions, multiculturalisms, multiplicities, post-colonialism, differential consciousness, and inappropriate/d otherness. While intersectional research in leadership exists, other terms are often applied (Hutchinson & Underwood, 2020). Nevertheless, this does not necessarily invalidate the research for intersectional scholarship, since these studies inherently embody the core tenets of intersectionality. For example, Hutchinson and Underwood (2020) advance notions of what they call “multi-gendering” and “multiple others,” or “lattice of difference.” Some researchers use the concept of intersectionality more blatantly than others, reflecting either different disciplinary traditions or the possibility of a lack of awareness of earlier knowledge traditions (Crenshaw, 1989, 1991).

---

## Rewriting the Narrative: A Corrective Project

In sifting through these debates, a central goal of recent scholarship is to “correct” or refine the intellectual validity of intersectionality. Scholars are prone to “revisit,” “rethink,” or identify “blind spots” in previous literature (Nash, 2016). There is an intense culture of amelioration in the twenty-first century with the hopes of gaining more precise knowledge. The more we revisit intersectionality, the more axes of oppression are added. Yet, it may be fair to say that rather than producing more

trustworthy knowledge, intersectionality offers more situated and contextual knowledge and more axes of difference to explore. Rice et al. (2019) stress that the ideal would be for scholars to preserve the intent of social justice and transformational change when selecting appropriate intersectional methodology and theoretical designs.

## Critical Movements

Researchers have broadened and adapted intersectionality beyond critical race and feminist scholarship to confront wide-ranging issues, power dynamics, and discursive fields. As a ubiquitous pervasive theory, intersectionality has generated significant controversy and redoubtable critique. Debates shift continually depending on the discipline in question. These are as diverse as epistemology, discursive landscape, social differences, and political sociology (Botts, 2017). There are many contradictory perspectives – for example, a lack of universal definition; ambiguous methodology; the ubiquitous use of Black women as subjects; appropriation by White feminism to the detriment of Black feminism; and disturbing conceptions of identity politics (see Bilge, 2013). Better known as “critical movements” in intersectional archaeology, these debates offer differing perspectives highlighting disruptions, ruptures, erasures, and overall challenges in the twenty-first century that can ultimately assist scholars in their research for improvement.

As a relatively newly named discourse, intersectionality has neither a grand narrative nor a universal body of knowledge. There does seem to be agreement, however, that intersectionality cannot be considered within the standard canon of research. There are, however, a set of shared ideas that focus on the following: how race, class, gender, and sexuality constitute intersecting systems of power; how specific social inequalities reflect these power relations from one setting to the next; how identities of race and gender are socially constructed within multiple systems of power; and how social problems and their remedies are typically created (May, 2015). Since intersectionality is continually evolving, scholars and activists must engage in debates that influence its evolution. One example of this is the archaeological knowledge analysis approach which makes transparent a project under construction. Yet there is still room for provocative, innovative investigative avenues, even though there is little agreement regarding a definition and the existence of fiercely debated issues surrounding the meaning and scope of intersectionality (Alexander-Floyd, 2012; Collins, 2015). Questions such as the following are of particular interest in this scholarly field: *For whom who is intersectionality? What are its purposes? How might it be operationalized? What are its main underlying assumptions?*

## (Mis)Appropriation

While this chapter’s intent is not to provide a comprehensive overview of extant debates and controversies, a few salient provocative ruptures are discussed. When examining one of the more contentious debates in the intersectionality controversies,

the history of White feminism is an essential catalyst for the theory's existence and the basis for discussion and debate. Both Black feminism and intersectionality are dwarfed by a White Euro-centric paradigm of sovereignty, the Global North, and the academy. Consequently, some critics (e.g., Bilge, 2013) believe that an erasure of the origins of Black-American feminism and activism in the twenty-first century has occurred due to the dominance of White Euro-centric researchers who appropriate the theory. These European scholars are accused of rewriting the approach and alienating it from its original intent and context. Scholars argue that intersectionality's appropriation in the European academy tends to obfuscate racism by labelling research as intersectionality (Bilge, 2013). Nash (2016) finds the "remaking [of] the analytic apart from Black women's bodies" troubling since such "an analytic centred on Black women [would] not be palatable or desirable as a field-defining analytic" (p. 17). Alexander-Floyd (2012) stresses intersectional research must honor its "focus on illuminating women of colour as political subjects and the gender, racial, class, and sexual politics that impact their lives" (p. 19). For many scholars, the whole point of intersectionality is to validate marginalized voices and de-emphasize the experiences/interests of privileged groups.

This militant perspective contrasts counter-arguments that a social-justice agenda as the core tenet of intersectionality should *not* limit this research approach by demographic selection (for example, privileged vs. marginalized populations). In further defense of appropriation, some European feminists (cited in Lykke, 2005) insist that intersectionality originated with German social psychologist Moritz Lazarus and sociologists Georg Simmel and Ange-Marie Hancock, 2007, and Stoetzler 2016. Other Europeans attribute the birth of intersectionality to the twentieth-century Russian feminist revolutionary, Alexandra Kollontai (cited in Lykke, 2005). This claim of discovery serves to uphold European scholars' insistence that intersectionality need not focus exclusively on Blackness or women. The nuances surrounding this debate are intricate and transformative. It is also critical to account for the context in which Euro-Western researchers appropriate intersectionality, and why it might look different from that of the intersectionality used by Black feminists. For example, in some disciplines, Euro-Western researchers cite difficulty adopting intersectionality as an analytic tool because of their disciplines' ongoing rootedness in Euro-Western frameworks and methodologies. These dynamics explain, in part, why scholars may have rewritten the genealogy of intersectionality: to downplay its focus on social transformation from the racialized, sexualized bottom-up approach to better align with dominant knowledge systems in their field. In Europe, racism is not recognized and often conflated with multiculturalism. Intersectionality's use in Europe is surrounded by controversy as European scholars are accused of excluding race from the methodological equation. Yet, when we apply Foucault's archaeology of knowledge, we see an example of how ideas become protean in different historical contexts. The German antidiscrimination law was cited as an example of identifying the specific configuration of social situatedness in a given historical context. Because of its Holocaust history, in a genocidal application of race politics, there is a reluctance to work with that category and remains true in many European contexts.

In more recent work (see Cho et al., 2013), Black founding feminists themselves view intersectionality as universally applicable. Broadening the theory to examine the relationship between oppression and privilege allows for acknowledging the visible and invisible positions to ensure that power relations and privileged categories remain unnamed and under-theorized (Anthias, 2013). Far from narrowing intersectionality's scope, such an approach restores the broad applicability of intersectionality as a methodological direction and concedes that intersectionality is political. Nash (2016) points out another crucial and contested point where researchers use intersectionality to manage complexity rather than to understand/transform oppression. Furthermore, Anthias (2013) wonders how many differences (e.g., race, gender, class, disability) should be incorporated into a given study and should they be equally weighted? Are they always equally salient? (p. 129). Appropriations have been critiqued for diluting the idea of intersectionality. For example, the concept of multiculturalism refers to varying cultures contributing their ethnic cultural diversities in superficial cultural celebrations (e.g., food, dress, music). Bilge (2013) refers to such practices as "ornamental intersectionality" – a neoliberal approach that "allows institutions and individuals to accumulate value through good public relations and 'rebranding' without the need to address the underlying structures that produce and sustain injustice" (p. 405).

### Identity Politics

In the twenty-first century, intersectionality has been criticized for being a rebranded albeit sophisticated version of identity politics. A generic explanation of identity politics describes a group of people of similar religions, race, social backgrounds, class, or other identity factors which face oppression organized around similar political agendas. In this section, the shifting meaning of the term intersectionality is discussed and contrasts its new mainstream usage as a variation of identity politics. This critique reflects a concern by scholars that the early conception of intersectionality theory to analyze capitalism and make resistance more effective is being minimized, ignored, and even erased (Litvin, 2018).

In a *Time Magazine* interview in February of 2020 (Steinmetz, 2020), Crenshaw emphasized that intersectionality is *not* identity politics and it was never her intent to conflate the two concepts. She stresses that Black feminists first formulated intersectionality theory to critique identity politics and provide an alternative perspective. The Combahee River Collective relied on the concept of identity politics to make visible the need for emancipatory political affiliations in order to address racism in the women's movement. Their identity politics was intended to establish coalitions to erase oppression (Litvin, 2018). Critics argue that contemporary identity politics have neutralized anti-racial efforts and the Black freedom movement's revolutionary vision has been replaced with a more narrow and limited understanding of identity itself. Instead of creating solidarity, identity, in this case, seems to serve as the basis for an individual's political beliefs which is divisive. "The framework of identity reduces politics to whom you are as an individual and gaining recognition as an individual, rather than your membership in a collectivity and the collective struggle against an oppressive social structure...As a result, identity

politics paradoxically ends up reinforcing the very norms it set out to criticize” (Litvin, 2018).

What remains is a polemic about the politicization of intersectionality and its implications. The rupture this causes in the history and archaeological evolution of the concept has resulted in the emergence of a new range of intersectionality meanings. Some might attest to a reclaiming or renaming of intersectionality as a political practice. Despite that, rethinking identity politics might still offer relevancy to the discussion of intersectionality. Ilomen (2019) cites Lorde’s (1984) work (see also Gloria Anzaldúa and Paula Gunn Allen) who introduces “transformational identity politics” as a complex interactive process that displaces conventional boundaries between apparently disparate social groups. Opportunistic intersectionality promotes “identity politics” by preventing coalition building (Cho et al., 2013). These single-axis approaches to determine identity limit the potential for coalition building and solidarity. Crenshaw (1991) believes that identity is inherently coalitional. Employing post-structuralist claims concerning the contingency of identity, for example, Leslie Hahner (2012) maintains that intersectionality should be conceptualized not as the confrontation between coherent, stable identities, but rather as the “constitutive relationship between discourse and subjectivity” (p. 152). She names this “constitutive intersectionality” and argues that it can account for how identifications shift in response to different situations. Aristeia Fotopoulou (2012) similarly identifies two ways of undertaking intersectional research: one in which deconstructing categories is central and the second in which categories are employed “critically, strategically and selectively” (p. 24).

### **Travelling Theory**

The intersectionality travel across cultures beyond the US borders has expanded the concept and its most fundamental goal of addressing empowerment (Salem, 2016). Exporting intersectionality to non-Western parts of the world (e.g., Africa, Middle East) requires that Western conceptions be deconstructed and then reconstructed to adapt to the context and demographics of analysis (Salem, 2016). Salem (2016) cites the works of scholars such as Davis (1990), Audre Lorde (1984), Lugones (2007), Gloria Anzaldúa (1987), and Ramón Grosfoguel (1999) who all serve to caution the importing of US colonial notions of feminism to how intersectionality can and should work outside the USA. Both Nash (2016) and Collins (2015) critique intersectionality’s cooptation in various academic and professional contexts; they have also resisted the idea that intersectionality has a singular, controllable, or “true” intention. Said (1983) also presents a caveat that cautions us to be aware of how theories can lose their originality and critical stance as they travel from one cultural domain to another. However, it’s entirely possible they can also transform in positive ways as they travel. Knapp (2005) claims that complex theories are prone to diluting their complexity and misrepresenting the theory. Alexander-Floyd (2012) argues that the distillation, contortion, and misrepresentation of intersectionality can be traced to the contemporary academy and are often directed uniquely towards European

contexts. Bilge (2013) describes the erasure of Black feminist history through appropriation as a way to “depoliticize intersectionality, to whiten, and eliminate its function as a tool for political change” (p. 405). Depoliticization itself moves away from the foundations of intersectionality. It results in “diversity management” – the phenomenon of merely borrowing the intersectionality language but failing to undertake a real intersectional analysis or challenge inequalities (Paur, 2012). Since dialogue across difference is difficult, Nira Yuval-Davis (2011) recommends traversal rooting practices and shifting where researchers interrogate their histories/ positionalities while gaining fluency in others’ historical/new conditions of oppression and struggle – a critical activity for any research that claims to be intersectional. Despite criticisms of the misappropriation and misrepresentation of intersectionality, scholars suggest that these contortions might ultimately legitimize the theory. This makes it more accessible to a broader demographic of users, including subjects who represent privilege and the heterogenous, White male demographic. Not surprisingly, intersectionality’s travels constitute a contested space (Parker & Samantrai, 2010). A Foucauldian analysis illustrates how intersectionality’s contextual complexities reveal multiple theoretical framing and development due to differing standpoints, contexts, perspectives, and needs.

---

## **Studying Leadership Using Intersectionality: A Critical Approach**

### **Leadership Discourse**

An archaeological critique of intersectionality compares discursive formations of ideas in different periods. Historical periods reflect various institutions, structures, politics, socioeconomic conditions, and sociology of thought. All of these variances influence the creation and legitimization of ideas, knowledge, or epistemologies. Nevertheless, each set of historical conditions cannot illuminate the causes or transition of one way of thinking to another at a different period in history.

Foucault’s archaeological framework helps establish certain historical conditions of leadership that challenge intersectional leadership possibilities. Histories of leadership abound in the literature but the discourse discussion adds different conceptual ideas to approach leadership’s vast terrain (Niesche & Gowlett, 2019). Foucault sought to disrupt the notion of a universal or standard leadership approach by characterizing the plurality of discourse or, alternatively, establishing ensembles of discourse (Niesche & Gowlett, 2019). Historically, a leadership that follows a “one size fits all” epistemology grounded in White male (and White female) criteria has led to glaring problematics within the field of leadership that marginalizes various minority groups (Niesche & Gowlett, 2019). This chapter highlights a troubling situation that compromises leadership theory’s evolution to fit a globalized world in the twenty-first century – a status quo within leadership discourse that highlights gender neutrality and objectivity as the most significant factors in knowing why the central discourse celebrates White male knowing.

## **A Discourse of White Male Knowing and Gender-Neutral Paradigms That Exclude**

For the most part, positivist conceptions ground an early leadership epistemology. Much of the leading scholarship reinforces the recognition and legitimacy of some leadership paradigms over others. The most apparent shortcoming of leadership's historical constructions is a profound gender bias against women within leadership discourse. This status quo results from an established hegemonic hold within leadership, which was historically maintained by those who set the norm itself – White men (Acker, 2012). Nixon and Sinclair (2018) suggest that the discipline of leadership itself made the construct of gender invisible. By making some leadership dimensions invisible, these dimensions become undiscussable, beyond critique, challenge, and change, thus discounting and ignoring women as knowers, particularly marginalized women (Nixon & Sinclair, 2018).

Understanding the inner mechanics of a theory involves addressing how a discipline is defined (Dugan, 2017). When there is a lack of definitional clarity, omission, erasure, or delegitimation of one paradigm over another, epistemology's workability and credibility come into question and limit possibilities for transformation (Dugan, 2017). But transformation in leadership requires a paradigm shift from positivist paradigms to post-structuralist conceptions of leadership. This would involve the deconstruction of the type of power that perpetuates epistemic biases against women as leaders.

Ultimately, the epistemological foundation of traditional leadership is flawed due to inherent bias in a knowledge system that excludes nondominant perspectives. Early frameworks underlying leadership theories highlight traditional assumptions of masculinity and the gendered construction of leadership (Nixon & Sinclair, 2018). A leadership canon of dominant archetypes of White male leaders comes with entrenched beliefs related to aggression, dominance, and privilege (Nixon & Sinclair, 2018). Such an epistemological framework situates leadership theory within an archetype with mythic power, but just as significantly, the framework itself resists deconstruction (Nixon & Sinclair, 2018). Given the predisposed epistemological bias within leadership, Nixon and Sinclair (2018) argues that gender neutrality keeps hidden the impact of power on gender.

Foucault's archaeology provides a set of conceptual tools to understand how an unlevel knowledge field's nuances produce and maintain epistemic oppression (and privilege). This analysis explains the epistemic impact exclusion has on marginalized knowers' ability to create, develop, and apply knowledge. Fricker (2007) calls this "hermeneutical injustice" – a form of epistemic neglect, resulting in intellectual inequity (p. 6) and is evident in the discourse of leadership. The subject of gender is often overlooked and minimized or framed within a masculinist paradigm. As a result of epistemic injustices, specifically hermeneutic injustices, women, as leaders, function within a "fragmented, contradictory, and androcentric" discourse (Ford, 2006, p. 78). Given the epistemological gaps within the discipline of leadership and the resulting bias, the collective impact is a discourse predicated on excluding marginalized ways of knowing (Niesche & Gowlett, 2019).

## Intersectionality as a Feminist Critique

This section will seek to initiate a dialogue based on several questions: *What conditions make intersectionality about leadership possible? How might educational leadership and intersectionality theories mutually contribute to benefit each other?* Intersectionality theory is grounded in a post-structural, feminist critique that challenges the epistemology of leadership theory and addresses leadership areas that merit theoretical expansion. Research reveals that the current academic focus within leadership remains skewed toward male interests, even as increasingly diverse perspectives have been integrated into the academic canon. To systemically alter this male-normed pattern within leadership warrants a review of knowledge production that considers various accounts of determining what is valid. One way of changing this historically-normed White male stereotype is to acknowledge the epistemic bias present within leadership theory's epistemology. Understanding this leadership reality for nondominant perspectives invites opportunities to include these heuristics as vehicles for empowering marginalized subjects to alter leadership's epistemology. Views framed from a feminist perspective have served as the intellectual counter to combat the marginalized representation of women and individuals of color within the canon of leadership (Storberg-Walker & Haber-Curran, 2017). A Foucauldian critique is appropriate here since it challenges the basis for leadership assumptions and norms. Furthermore, such an analysis confronts the dominant leadership discourse and suggests alternative understandings of the field and its inherent applications. According to Bailey (2014), "Understanding how the unlevel knowing field produces and maintains epistemic oppression (and privilege) requires a set of nuanced conceptual tools for explaining the impact epistemic exclusion has on marginalized knowers' ability to produce knowledge" (p. 62). The lack of credibility ascribed to marginalized constituents contributes to this intellectual disconnect. Advocating different ways of understanding educational contexts and leadership illuminates the various pressures and opportunities that come to bear on school leaders, the portrayal of leadership and the dominance of certain discourses (Niesche & Gowlett, 2019). Foucault's (cited in Niesche & Gowlett, 2019) work helps us understand how leadership in education manifests and the challenges and potentialities for change. Foucault's archaeological analysis of intersectionality begins a conversation about the possibility of adding to leadership knowledge via intersectional research in the twenty-first century.

Extensive studies on women's experiences and leadership challenges in schools already exist (see Rhode, 2017). Much of this research focuses on the intersections of educational leadership in studying female principals' experiences; however, less research examines women's leadership identities as heterogeneous (Davids, 2018). There is already much research around females' relative scarcity in leadership roles (see Rhode, 2017). While there have been numerous and diverse perspectives as advocated through critical theory, hermeneutics, post-structuralism, and feminism concerning educational leadership, what remains largely unexplored, however, is how female forms of leadership and identity are being constructed by or within the

ambient social conditions connected with their position. In this regard, Eacott (2011) explains that because the research agenda of educational leadership has employed a narrow and under-theorized view of practice, which has limited itself only to “what leaders do,” the discursive nature of social interactions are usually not taken into account. Researchers often address only a single identity or, at most, just one intersection of identities at a time, depending on the situation (Petsko & Bodenhausen, 2020). Traditionally, the study of female experiences in education and other sectors focused on female and male workplace experiences or interactions related to occupation, salary, and promotion (Rhode, 2017). Gender disparities focused on the lack of access to authority positions, management support, executive training, and remuneration (Rhode, 2017).

Appointing women to leadership positions in corporate and public sectors has consistently been a universal and redoubtable challenge (Eagly & Carli, 2012). Even in liberal socioeconomically progressive societies, women remain largely underrepresented in positions of leadership (Eagly & Carli, 2012). A growing body of research is emerging however, examining African-American female leaders’ double oppression in the USA and Black and other women of color’s triple oppression in developing countries (Schmidt & Mestry, 2014). There are many concerns about the attitude of resignation towards the status quo that limits women’s access to leadership positions. These include the crisis around the dearth of women in leadership positions, not just in education but also in corporate and government positions. Despite the low numbers, recent research reveals that women are well suited for challenges involving organizational complexity. Interestingly, some theorists now perceive female leadership styles as assets in nonhierarchical organizations that are managed under a team-based paradigm (Oakley, 2000).

Notably, the leadership literature is restricted in its use of intersectionality with poor representation of women of color and the unique experiences and challenges they face. The research, focused almost solely on women in leadership, makes up most of the scholarship rather than concentrating on intersectional or even multiple social groups. Black, Latina, and Asian women remain underrepresented in leadership positions and research (Miller, Kerr, & Reid, 2010) while all women “suffer from underrepresentation at the administrator level . . . Latinas and African American women show the lowest levels of representation” (Miller et al., 2010, p. 217). Intersectionality allows us to determine who might be leaders and how circumstances of social class, location, ethnicity, and cultural worldview might affect work and identity (Schneider & Bos, 2019). Intersectionality demonstrates that barriers are not the same among all women or even among all women of color. There are different stereotypical assumptions about Black, Asian, and White women that need to be distinguished, clarified, acknowledged, and refuted, if possible (Rosette, Koval, Ma, & Livingston, 2016). For example, Asian women are believed to have high technical competence levels but stereotypes feed into their lack of assertiveness which would affect them in a leadership role. Stereotypes depict Black women as less competent (even less intellectual) and aggressively vocal. Rosette et al. (2016) claim that “because Black women tend to be viewed as masculine rather than feminine, they may not be evaluated negatively when acting dominantly,” which

can work in their favor (p. 11). Given that Black women are expected to be strong and assertive, they may, however, not experience the agency restrictions that other women do and consequently Black women may face more sanctions than White women for errors and failures in the job (Rosette et al., 2016). Stereotypes of Indigenous women remain underdeveloped given most organization's limited experience with this ethnic subgroup and its relatively small size (Le, 2020).

Riad (2011) adds, "Leadership is not independent of the power relations within a given cultural context" (p. 831). Such power relations often dictate what leadership should look like, who should be the leaders, and leadership practice. Consequently, an "ideal-leader model" locates White males as the hegemonic demographic based on the status quo. Recognition for women of color's unique experience to produce similar and critical innovative leadership approaches is needed. The extant body of literature is generally characterized by single-axis, reductionist, additive, and unitary examining women's experiences (Petsko & Bodenhausen, 2020). However, these results do not yield a complete profile of the women being studied. An intersectional approach is beneficial for this task. For example, it prompts us to ask, *What might we learn by examining leadership's racialized and gendered history? What are the enduring consequences of that history? Specifically, who leads? How do they lead?*

Intersectional analyses can assist researchers better to evaluate diverse leadership consequences for policymaking and policy implementation. Crenshaw's (1991) emphasis on the political element of intersectionality is relevant here. Women of color may experience the strain of the contentious dialectic inherent to antiracist and antisexist politics, both of which may be significant factors in how they lead. This may motivate essential questions to be asked: *In what ways are women of colors' policy priorities unique, and with what consequence? In what ways does their social location at the intersection of race, ethnicity, gender, sexuality, and other social categories inhibit or advance their ability to affect policy outcomes?* Intersectionality offers a theoretical tool to challenge, critique, and deconstruct power imbalances in educational leadership. Intersectionality's capacity to interconnect privilege and oppression allow us to understand how power influences identity affiliations which illustrate intersectionality's value to leadership discourse. By focusing on established epistemic biases and limitations within leadership theory, intersectionality can alter these inveterate epistemological infrastructures by causing epistemic friction or even an entire paradigm shift. Intersectionality contests male-normed traditions and gender neutrality within leadership theory by offering theoretical tools to address these frictions. By disrupting traditional canons of leadership theory, the principles of identity, social location, and structure, collectively examined through an intersectional lens, provide epistemological insight into leadership theory by offering a way to engage women's leadership and its many possible manifestations. The ability to address entrenched norms within the discourse of leadership constructs an opportunity to revisit how women engage their respective leadership identities, utilizing an intersectional lens.

This chapter analysis illustrates the epistemological linkages that bind together the (seemingly) disparate epistemologies of intersectionality and leadership. This systematic exclusion from being present within the production of knowledge and recipients of knowledge impacts all epistemological traditions, including leadership

theory. Merely integrating women into an analysis of leadership theory is insufficient. This single-axis approach fails to engage identity beyond an additive, hierarchical strategy without considering their varied identities and social locations. In this respect, applying an intersectional lens provides the epistemological complexity necessary to discern how the intersection of privileged and marginalized identities can coexist among leaders.

---

## Conclusions and Reflections

In summary then, since its inception, the concept of intersectionality has been lauded as one of the most important contributions to feminist scholarship to date. Despite its popularity, there has been considerable confusion concerning what the concept means and how it can or should be applied in feminist inquiry and leadership. This chapter excavated the intersectionality phenomenon within contemporary feminist scholarship and leadership as a means to expand and broaden both intersectionality and leadership theory. Intersectionality refers to the interaction between gender, race, and other categories of difference in individual lives, social practices, institutional arrangements, and cultural ideologies, and the outcomes of these interactions in terms of power. The theory is regularly used by feminist scholars from different disciplines (philosophy, social sciences, humanities, economy, and law), theoretical perspectives (phenomenology, structuralist sociology, psychoanalysis, and deconstructionism), and political persuasions (feminism, anti-racism, multiculturalism, queer studies, and disability studies). Not surprisingly, heated theoretical debates, reaching polemical heights, have pervaded the USA and Europe. Most feminist scholars today would agree that intersectionality is essential to feminist theory, judging by the discussions that have emerged around the concept, despite sharing the same confusions around its ambiguity. Some suggest that intersectionality is a theory; others regard it as a concept or a heuristic device but some still see it as a reading strategy for doing feminist analysis. Controversies have emerged about whether intersectionality should be conceptualized as a crossroad (Crenshaw, 1991), as “axes” of difference (Yuval-Davis, 2011) or as an independent dynamic process (Staunæs, 2003). It is not clear whether intersectionality should be limited to understanding individual experiences, theorizing identity, or interpreted as a property of social structures and cultural discourses. Disruptions along the way raise questions and controversies about its appropriation by scholars to advance beyond the ubiquitous Black woman, the political implications of identity politics, and the pros and cons of intersectionality as a travelling theory.

The question of how a theory so ambiguous could be regarded as a formidable addition to contemporary feminist approach and to leadership theory leads one to ask whether a more coherent conceptual framework and methodology can harness the complex contexts it was initially intended to address? This chapter’s intent was not to answer this question unequivocally but rather to illustrate the confusion and the complexity that pervades intersectionality and, at the same time, highlight its many uses by a variety of scholars and for a variety of reasons that seem to depart from its

original intent that yield profoundly powerful contextual findings that cannot be ignored.

A Foucauldian archaeological analysis has enabled an etymological examination of its genealogy to the present day. Such an analysis is not limited to a historically linear view and, as such, was able to offer illustrations of the potential for a heuristic or theory to be expanded and broadened to meet the needs of twenty-first-century feminist leadership research. In this discussion, the goal was to understand and embrace an approach that thrives on ambiguity and incompleteness, but that has proven, nevertheless, profoundly illuminating. The chapter sought to investigate the paradox between the recent intersectionality success within feminist theory and its confusion among feminist scholars about what it is and how to use it in the twenty-first century.

In essence, intersectionality addresses the most central theoretical and normative concern within feminist scholarship: acknowledging differences among women. The very fact of differences among women has become the leading subject of feminist theories in recent years. This is because it touches on contemporary feminism and leadership. Intersectionality addresses differences by examining the implications of race, class, and gender on women's identities, experiences, and struggles for empowerment. It has been mainly concerned with the marginalization of poor women and women of color within White, Western feminist theory. A shift in research approaches gradually occurred to examine how race, class, and gender interact and intersect in women's lives to produce and transform power relations (Anthias, 2013; Collins, 2000). Intersectionality seems ideally suited to the task of exploring how categories of race, class, and gender are intertwined and mutually constitutive, giving priority to questions like how race is "gendered" and how gender is "racialized," and how both are linked to the continuities and transformations of social class. While intersectionality is most often associated with US Black feminist theory and the political project of theorizing the relationships between gender, class, and race, it has also been adopted and elaborated on by feminist theorists inspired by postmodern theoretical perspectives. This approach views intersectionality as a project which deconstructs the binary oppositions and universalism inherent in the modernist paradigms of Western philosophy and science (Brah & Phoenix, 2004). Intersectionality fits neatly into the postmodern project of conceptualizing multiple and shifting identities. Critical perspectives inspired by poststructuralist theory – postcolonial theory (Mohanty, 2003), diaspora studies (Brah & Phoenix, 2004), and queer theory (Duong, 2012), all seeking an alternative to the study of identity, have seemingly embraced intersectionality. Intersectionality coincides with Foucauldian perspectives on power that focus on dynamic processes and the deconstruction of normalizing and homogenizing categories (Staunæs, 2003). Intersectionality seems to embody a commitment to the situatedness of all knowledge (Haraway, 1988). Thus, it makes a research space for intersectional locations in the production of feminist leadership theory (Lykke, 2005). Despite a false truth that early feminism was inclusive, such a feminist approach remains politically and theoretically imperialistic and ethnocentric. Contemporary feminism, that includes intersectionality, offers a novel and crucial link

between critical feminist theory on the effects of sexism, class, racism, and a critical methodology.

In conclusion, when assessing an archaeological analysis of intersectionality, some important implications for its use become apparent. With the increasing acceleration of intersectionality as a travelling theory across disciplines, demographics, and contexts, the concept runs the risk of being misused, misunderstood, erased, and underutilized in its full depth and potential (e.g., Bilge, 2013; Carbado, 2013). Specifically, what gets missed, are references to the concept's roots in Black feminist activism and scholarship, its contemporary advancements in feminist/gender/sexualities/women's studies, and its focus on understanding and challenging structures/systems of power and their manifestation as oppression and privilege. Understanding intersectionality as a field of study includes understanding how the field came to be (its roots and evolution), what content and themes characterize it, and how it is situated in current power structures and relation to other fields (Collins, 2015; Grzanka, 2014).

Furthermore, for its successful use, it is incumbent upon any scholar to apply the concept of intersectionality in a manner that challenges the idea that intersectionality is only relevant when applied to some demographics over others. An essential impact of intersectional analysis has been to correct the invisibility of experiences beyond the seemingly single-axis boundaries of gender, race, sexual orientation, etc. (e.g., women of color) experiences. Nevertheless, these translations of intersectionality have tended to involve a focus on specific axes of power such as gender/sexism, race/racism, and sexual orientation/heterosexism more so than on other axes, such as ability status/ableism, class/classism, trans identities/cisgenderism, and nationality/xenophobia. To this end, it becomes necessary to scrutinize and adjust intersectionality discourse to avoid implying that intersectionality applies only to some people. Instead, intersectionality can yield a breadth of experiences of social inequalities, including understudied axes of power and experiences of privilege along with oppression. To encourage naming social inequality and power, scholars and practitioners need to engage with several reflective questions, including "What are my assumptions about where intersectionality is located (e.g., in person, in context)? What does the language I use... suggest about my emphasis on individual characteristics (e.g., gender, ethnicity, sexual orientation) versus sociocultural systems (e.g., cisgenderism, heterosexism, racism, and sexism)? What are the implications about an emphasis on identity as static versus shifting in context of interpersonal, structural, historical, and other power dynamics?" (Moradi, 2016 p. 120). Reflecting on these questions can help to identify limitations of current conceptualizations and discourse on intersectionality. By intentionally adopting attention to purposes of social justice, critical social theory, and activism, there is a call for expanding the use of intersectionality toward fuller engagement with its roots in Black feminist thought and contemporary advancements in feminist/women's studies, interdisciplinary richness and potential, and its central aims to challenge and transform structures/systems of power, privilege, and oppression.

## Abstract

The field of educational administration/leadership's rise is chronicled in this chapter as a search for a foundation upon which to establish a leadership practice. At first, the field's emergence is aligned with and to concepts and practices from business and management. The rise of postmodernism as a mix of texts in linguistics, philosophy, and history introduced a form of criticism called de-construction. De-construction is a radical but potent tool of postmodern analysis that reveals often hidden hierarchies of domination and power. As a field, educational administration/leadership may not be able to discern any more significant discoveries or constructions regarding leadership in its conventional form as it is conceived and taught in most university programs. Postmodernism can become the driving force to reconceptualize the field and keep programs from becoming lodged in a new form of academic architectonics that fails to unlock greater human potential and equality, and also prevents a new doxa from being established.

### Field of Memory

The era of modernity is generally said to have been framed by the writings of Rene Decartes (1596–1650) and took full flower through the Enlightenment period. However, it never actually ended and is still regnant in many fields, for one educational research (National Research Council, 2002) and for another educational leadership/administration (Culbertson, 1988; Griffiths, 1959, 1988; Halpin, 1958).

Modernity is propelled by the idea that human reason propagated in several forms of rationality, was the principle means for humans to live and serve as the answer to the problems of life. One downside of this attitude of living was that, “Modernity also produced a set of disciplinary institutions, practices, and discourses which legitimate its modes of domination and control” (Best & Kellner, 1991, p. 3). The reason was that “the logic that hides behind Enlightenment rationality is a logic of domination and oppression. The lust to dominate nature entailed the domination of human beings. . .”(Harvey, 1990, p. 11).

Trying to find a temporal space where a line of demarcation between modernism and postmodernism can be discerned is exceptionally difficult. In fact, Ward (2003) has observed that, “We can point to no single date and claim that it marks either a chasm or a point of transition between the two periods” (p. 13). He went on further claim that, “The two can be said to inform each other to such a degree that, in reality, they cannot be separated” (p. 13).

The arts and the field of aesthetics have been an area where both modernism and postmodernism have been publicly exposed and expressed. Harvey (1990) asserts that the reason is that in the dynamics between boom and bust capitalist accumulation and over accumulation a certain time-space compression has been at play where waxing and waning have produced gaps between scientific knowledge and moral judgments. Harvey (1990) observes that:

The confidence of an era can be assessed by the width of the gap between scientific and moral reasoning. In periods of confusion and uncertainty, the turn to aesthetics (of whatever form) becomes pronounced. Since phases of time-space compression are disruptive, we can expect the turn to aesthetics and to the forces of culture as both explanations and *loci* of active struggle to be particularly acute as such moments (p. 327).

One moment of the gap occurred in the time period 1900–1930 (Fowler and Bostrom, 2002) and expressed itself in literature, psychology, philosophy, political theory, and the arts. Ransome (2010) defined modernism as:

A short-hand term for describing the various social, cultural and institutional features associated with the historical period of modern society. Used with reference especially to cultural change, modernity also denotes the widespread acceptance of modern ideas and modern values. Modernity is not just something that can be described but is also constitutive of a set of beliefs and attitudes about what being modern is and what it means to live in a modern society (p. 447).

Fowler and Bostrom's (2002) definition was quite similar:

Modernism is generally seen as an artistic response to a range of philosophical and social changes which undermined the securities on which 19th century literature was founded, including the impact of: writings by Charles Darwin (1809–92), Karl Marx (1818–83), Sigmund Freud (1856–1939), urbanization; cultural alienation; world war. . . Modernism is marked by self-consciousness and by a plethora of technical innovations designed to disrupt the 'commonsense' of traditional discourse (p. 348).

According to Fowler and Bostrom (2002) some examples of modernist thought can be found in the work of poets Ezra Pound, T.S. Eliot, and the Irish writer James Joyce. They also indicated that the thoughts on language of Ferdinand de Saussure could be considered a contemporary movement within structuralism.

Bowers (1984) has identified key elements in the ideology of modernism. They are:

1. An outlook that change, instead of being feared, was to be seen as something positive. The roots of this belief went all the way back to the 16th and 17th centuries. The caveat with this embrace of change was that it had to be anchored in rational thought, and when it was, it could then be seen as progressive. Change was a sign of progress.
2. Once rational thought became the mantra linked to change, then the seat of authority could be shifted from external forms of power to the rational individual who could choose to accept those changes if they did not agree. Authority could be divorced from tradition.
3. Another ancillary thought was that as change was rationalized by linking it to reason, a person could then free themselves from the past and its outdated perspectives and attitudes that could not be supported by fact and logic alone. The chief target of reason was religious thinking which professed beliefs that bordered on the embrace of magic. According to Bowers (1984), "Moral absolutes that previously could be grounded in religious teachings gave way to natural laws governing supply and demand in the economic sphere and to utilitarianism in the area of public policy" (p. 12).

One consequence of the dominance of the tenets of modernization thus far stipulated have led to the emergence of what Bowers (1984) describes as producing, "The main apostles of modernizing consciousness are the "liberal technocratic educators who operate within the mainstream of the educational establishment, but their influence over public schools appears to come from the dominant position they hold in the teacher-training institutions" (p. 14).

One result of what Bowers (1984) labels “modernizing consciousness” of people preparing educators

in efficient management techniques, generate a continual stream of theories to improve classroom instruction and administrative control of the school, conduct research to validate their knowledge claims and produce curriculum materials that give the appearance of individualizing the learning of information is increasingly one-dimensional (p. 15)

As Bowers (1984) opines, the agenda of the liberal-technocratic educators has been around for decades. It was responsible for theories of managerialism being superimposed on educational systems, intelligence testing, and the use of a menu of behavioral techniques employed in the classroom. “Another key element of the liberal-technocratic educator’s patterns of thought is the belief that change, based on abstract ideas and theory, is progressive” (p. 16). This is one reason why the proposed changes are called “reform”.

It also should be obvious that while modernism and its tenets have had their day in the arts and literature, it remains very dominant in science, medicine, agriculture, manufacturing, engineering, and education. There is no clear line between modernism and postmodernism. The lack of precision with definitions, the absence of common characteristics and borders, and the lack of coherent body of specific ideologies or narratives often leaves neophytes adrift when trying to understand postmodernism. Postmodernism has no such “essence”. Ward (2003) explained that calling some practice, style, idea, explanation *postmodern* was a way of framing something, and, “You are bringing an idea to it, rather than discovering a quality *in it*. In doing so you are ultimately linking it to a set of ideas about the world and our relationship to the world” (p. 15).

Perhaps the best distinction between modernism and postmodernism was explained by Lyotard (1997) when he said, “I will use the term *modern* to designate any science that legitimates itself with reference to a metadiscourse [while] making an explicit appeal to some grand narrative, such as the dialectics of Spirit, the hermeneutics of meaning, the emancipation of the rational or working subject, or the creation of wealth” (p.xxiii). The word “meta” means above and without the need to be seriously questioned any longer.

Lyotard (1997) uses the metaphor of a game in modernism because he understands that science is a game with its own rules. While science attacks serious threats to its own status as a privileged discourse, it often fails to question itself on the same grounds. Lyotard (1997) defines *postmodernity* as “incredulity toward metanarratives” (p. xxiv), or translated into modern discourse, disbelief in grand theories of any kind. Three of the most well-known metanarratives are Marxism, fascism, and neoliberalism. Another would be the discourse of positivistic science (Woods, 1999).

The line of demarcation between modernism and postmodernism becomes a bit blurry at times. The notion that these two terms represent a binary presents a temptation to see the distinctions as sharp and absolute. Lyotard (1997) offers a counterfactual by proffering the view that, “A work can become modern only if it is first postmodern. Postmodernism thus understood is not modernism at its end but in the nascent state, and this state is constant” (p. 79). This perspective would posit the

idea that modernism itself is in a kind of permanent doubt about its own beliefs. It is perpetually skeptical. When it becomes compelling skepticism, it enters a postmodern state.

### Field of Presence

The epitome of modernistic thinking, which remains regnant in much of the research undertaken in educational leadership today (see Wang, 2018), traces its lineage back to the famed Vienna Circle (1910–1940) and its thinking which produced logical positivism or sometimes referred to as logical or scientific empiricism (Carnap, 1984). The emphasis of scholars in the Vienna Circle centered on a rational attitude toward investigation and research, and they believed that “every knowledge that is factual, is connected with experiences in such a way that verification or direct or indirect confirmation is possible” (Carnap, 1984, p. 302),

The very wide appeal of the approach of the Vienna Circle in other countries is often grouped under the rubric of *the unity of science* movement. This effort was anchored in the premise that, “There is a logical unity of the language of science [because] the concepts of different branches of science are not of fundamentally different kinds, but belong to one coherent system” (Carnap, 1984, p. 303). However, even as Carnap (1984) was explaining what the *unity of science movement* was about he also admitted that, “There is today no unity of the laws of science (Carnap, 1984, p. 303). Similarly Horgan (1996) observed over a decade later that, “the goal of finding a unified theory of all of nature’s forces seems impossibly distant. In fact, no field of science has yielded any truly deep discoveries for a long time” (1996, pp. 27–8).

It is difficult to capture the locality or position of postmodernism in the *field of presence*. Part of the difficulty is that there is not a coherent body of theory or knowledge that is exclusively identified as *postmodern* with discrete borders or even a group of common advocates. English (2013) called postmodernism, “the anti-theory” (p. 871) and observed:

While postmodernism is antitheory in content, it is not antitheory qua theory. It is only when theory becomes a metanarrative, beyond serious questioning that the postmodernist objects. Postmodernism then is a form of critique, not only of theories but the practices based on them as well. It ought to keep theorists a little more humble and open to dissent when they know their work can be deconstructed and unraveled with postmodern criticism (p. 875).

Ward (2003) avers that “the term postmodernism has been in widespread use for three decades, but the story of its spread through culture is fairly complex” (p. 4). Ward (2003) also indicates that its first use was in academia and confined largely to the arts, “but soon became a descriptive term for all sorts of proposed shifts and changes in contemporary society and culture” (p. 4). One outcome is that each discipline has defined and applied it in somewhat different contexts and situations so that there is not a universally accepted notion of what postmodernism is or means. So postmodernism may refer to a general state of affairs in a particular society; a cluster of ideas which attempt to explain the state of affairs; a kind of artistic style, or all of the aforementioned items (Ward, 2003, p. 6). Harvey (1990) offered his own

version when he proffered, “Postmodernism can be regarded, in short, as a historical-geographical condition of a certain sort” (p. 328). Understanding postmodernism begins by recognizing what it isn’t. It doesn’t have properties. It proceeds through negation, that is, denying or criticizing the basis of some modernistic beliefs and/or practices. Such negations do not result in a law or principle or a narrative becoming one.

Contemporary intellectual battles between modernism and postmodernism recur throughout the present. The crux of the confrontation centers on notions of science and the role of science in modern society. In modernistic terms science involves a quest for universalism, unification and reduction to basic laws or principles, a search for certainty, and ultimate answers. Postmodernists reject this kind of search because in their view, such quests are usually linked to a search for power and domination. Science is too easily yoked to a totalizing discourse. Many postmodernists reject the search for the narratives or theories that are no longer seriously questioned, the so-called *metanarratives*.

Best and Kellner (1991) summarize the postmodern view that, “Modern science, for instance, legitimized itself in terms of an alleged liberation from ignorance and superstition as well as the production of truth, wealth, and progress” (p. 165). Educational administration/leadership remains firmly fixed in the long history of modernism and the undying inheritance from the Vienna Circle scholars. Wang (2018) echoes the same sentiment when he observed:

The findings in this study do not provide compelling evidence suggesting the paradigm shift in the theoretical groundings of educational leadership research. That is, the growing number of concepts and their increasing interconnectedness suggests that incremental knowledge accumulation – the evolution, rather than revolution, of knowledge in the field (p. 356).

Repeated admonitions from a variety of critics of educational administration/leadership for more rigorous research in the paradigm of modernism have failed to deliver it and are unlikely to do so (see also English, 2007; English & Ehrich, 2015; Levine, 2005).

### **Field of Concomitance**

The educational administration/leadership field has a long history of adopting concepts from business and other scientific fields. Wang (2018) notes in his study of concepts in educational administration that the field may see applications from “psychology, behavioral economics, and cognitive neuroscience to study school leaders’ decision-making process” (p. 354). Similarly, postmodern sources also come from many disciplines outside educational leadership and even education. Foucault averred that “the entire field of the human sciences, the space of representation within which they are able to operate, rests upon categorical schemata taken over from other disciplines. The fact that this field can appear, and that something can appear within it, is only possible as a consequence of having borrowed constituent models from the empirical sciences” (Visker, 1995, pp. 37–8).

There is no coherent doctrine that defines postmodernism, nothing even approaching the famous Vienna Circle (1924–1936) which gave rise to logical

positivism also called logical empiricism and which included philosophers, logicians, and mathematicians, such as Rudolf Carnap, Philipp Frank, Kurt Godel, Herbert Feigl, Hans Hahn, Otto Neurath, and Friedrich Waismann. The positivistic agenda espoused by these adherents included a search for a unified science with a universal language of science (Carnap, 1984). It also posited that “there is a distinction to be drawn between objective facts and social values, where facts are considered to be unmediated by any theoretical framework and that only empirical validation or falsification is the stamp of ‘real’ inquiry” (Smith, 1996, p. 16).

Table 1 shows some of the fields, countries, and books that some of the most prominent postmodern thinkers have authored. The fields where these postmodernists seem to find a common intellectual home include philosophy, sociology, and history.

Some of those individuals in the table would also be described as adherents of structuralism and poststructuralism. They would include Jacques Derrida, Michel Foucault, Jean Baudrillard, Jean-Francois Lyotard, Gilles Deleuze, Frederick Jameson, and Felix Guattari (Allison, 1999a). Structuralism is not so much a movement but an interlocking intellectual outlook which was interdisciplinary involving such fields as “anthropology, philosophy, literary theory, psychoanalysis, political theory, even

**Table 1** A Partial List of Notable Postmodern Advocates and their Academic Disciplines

Postmodernist	Birth/Death	Country	Academic Discipline(s)	Most Famous Publication
Jean-Francois Lyotard	1924–1998	France	Philosophy, sociology, literary theory	<i>The Postmodern Condition: A Report on Knowledge</i>
Michel Foucault	1926–1984	France	Philosophy, psychology, history, art	<i>The Order of Things</i>
Jacques Derrida	1930–2004	France	Philosophy, literary criticism, history	<i>On Grammatology</i>
Jean Baudrillard	1929–2007	France	Philosophy, sociology, cultural theory	<i>The System of Objects</i>
Gillies DeLeuze	1925–1995	France	Philosophy, art	<i>Difference and Repetition</i>
Frederic Jameson	1934–	United States	Comparative literature, philosophy	<i>Postmodernism, or, The Cultural Logic of Late Capitalism</i>
Emmanuel Levinas	1906–1995	France	Jewish philosophy, ethics, existentialism	<i>Totality &amp; Infinity</i>
Richard Rorty	1931–2007	United States	History of philosophy, comparative literature	<i>Philosophy and the Mirror of Nature</i>
Pierre-Felix Guattari	1930–1992	France	Philosophy, linguistics, semiotics, psychotherapy	<i>Anti-Oedipus</i>
Slavoj Zizek	1949–	Slovenia	Philosophy	<i>Less Than Nothing</i>

mathematics” (Allison, 1999a, p. 882). Broadly speaking structuralism is centered in the linguistic work of Ferdinand de Saussure (1988) who was a scholar of linguistics interested in establishing a science of language. Saussure’s work “viewed language as a system of signs, which was to be studied *synchronically*, that is to say, studied as a complete system at a given point in time. . . Each sign in the system has meaning only by virtue of its difference from the others” (Eagleton, 1983, p. 96).

As a derivative of structuralism Scatamburlo (1998) noted that, “theories which fall under the rubric of poststructuralism reject modernism’s epistemic foundations or master narratives as totalizing, repudiate modern theory’s search for a foundation of knowledge, criticize its apodictic truth claims; and renounce the rational, autonomous Cartesian subject” (p. 169). Postmodern thought still resonates with this perspective into the present day.

### **Discontinuities and Ruptures**

Postmodernism represents a significant shift, if not a rupture, in the continued application of modernism’s “. . . meta-languages, meta-theories, and meta-narratives [which] tended to “gloss over important differences, and failed to pay attention to important disjunctions and details” within “multiple forms of otherness as they emerge from differences in subjectivity, gender and sexuality, race and class, temporal (configurations of sensibility) and spatial geographic locations and dislocations. It is this aspect of postmodernist thought that gives it a radical edge. . .” (Harvey, 1990, p. 113).

This juxtaposition anchors postmodernists’ belief that progress occurs through dissent. For example, Lyotard (1997) identifies three conditions for modernist knowledge. They are: (1) searching for and identifying metanarratives to legitimize claims they are foundational (ultimate, first principles); (2) the predictable outcome of legitimation and exclusion, and (3) a quest for homogeneity in legitimizing certain epistemological claims and morality. “Postmodern knowledge, by contrast, is against metanarratives and foundationalism, it eschews grand schemes of legitimation: and it is for heterogeneity, plurality, constant innovation, and pragmatic construction of local rules and prescriptives agreed upon by participants, and it is thus for micro-politics” (Best & Kellner, 1991, p. 165).

Collins (1998) echoes similar thoughts when he observes that with postmodern perspectives, “No general explanations are possible; there can be no general theory of ideas, sociological or otherwise. Yet paradoxically, postmodernism is itself a general theory of ideas. The theory has been accumulating in intellectual networks for several generations” (p. 11). Collins (1998) indicates historically, postmodernism was the result from phenomenological movement by Edmund Husserl and Martin Heidegger, and another branch from of Saussure’s work on the semiotics of language.

### **Critical Assumptions**

Usher and Edwards (1994) point out that education as a field poses a special dilemma for postmodernism and its thinking. The reasons are not hard to discern:

Education is very much the dutiful child of the Enlightenment and, as such, tends to uncritically accept a set of assumptions deriving from Enlightenment thought. Indeed, it is

possible to see education as the vehicle by which the Enlightenment ideals of critical reason, humanistic individual freedom and benevolent progress are substantiated and realized (p. 24).

In fact, the more traditional assumptions undergirding logical positivism, i.e., *scientific empiricism* are still very much alive in the sciences today and in debates regarding scientific verification and standards in educational research specifically (see National Research Council, 2002). The major assumption was the belief in the “exclusive truth-predicting capacity of science in contrast to religion, metaphysics and folk traditions: that science was better able to analyze and consequently predict accurately the course of life events” (Woods, 1999, p. 227). Methods of verification were critical because a corollary assumption was that the “facts” were lying just out there waiting to be discovered. The exemplar of proper investigation was to model inquiry in the social sciences.

Despite its ambitions, social theory consistently failed to provide adequate scientific ‘foundations’ for itself: the attempt to demarcate science from non-science persistently foundered. Time and again science proved to be deeply entrained with the dynamics of social control and domination. The model of natural science as a paradigm for knowledge began to be rejected because people increasingly saw it as part of a larger, corrupting, techno-scientific cultural imperative (Woods, 1999, p. 228)

Belief in the pursuit of a unified science, the ability or effort to separate objective facts from social values, and where the facts were assumed to be pure without any infringement from theory came under fire and eventually proved to be unsustainable. There are no “theory free” observations.

Debates about the pursuit of truth, especially when postmodern approaches compared to scientific investigation were applied was described by Collins (1998) as the “goal displacement” phenomenon (p. 789) which starts with antagonistic sniping across existing intellectual divides (for an example see English, 1996; Willower, 1996).

Each side accuses the other of hindering insight; the process of intellectual history is merciless toward both. Their conflict is one more manifestation of the very general process of conflict which drives intellectual change. Neither conservatism nor radicalism at any one level is a guide to what will emerge as their positions are transformed at later levels of the abstraction-reflexivity sequence. Goal displacement means that, from the point of view of the participants, subsequent intellectual history is always a matter of rude surprises (p. 789).

While it is difficult to map the precise points of contestation between modernism and postmodernism, the literature does suggest some generally accepted demarcations between them (Skinner, 1985), though they may differ in actual practice and traditions in different fields and disciplines (see Davies & Foster, 1994).

The long line of modernistic development in the social sciences, of which education is but one, and educational leadership is a specific manifestation, reveals significant effort to create a stable and all-encompassing knowledge base which would lead to logical methods of inquiry complete with replicable models of

improved practice, and the ultimate prize, a *science of management* (Culbertson, 1988; Donmoyer, 1999). While today most theorists in the educational leadership field have abandoned the quest for a science of management, a few are still struggling to develop the grounds to attain it with revised approaches (see Evers & Lakomski, 1996; Lakomski & Evers, 2017).

---

## Introduction

Leaders and leadership are all around us. Simply by virtue of positional occupancy in a bureaucracy individuals may be branded a “leader.” Yet even as humans, experience *leadership*, engage or perform acts referred to as *leading*, the whole thing remains somewhat of a mystery: composed, observed, felt, performed but illusive, hard to define, nearly impossible to standardize. As researchers the rules of observation or logic as the case may be to specific kinds of rituals collectively known as science. The “rock” upon which science exists and forces our mental processes to conform to is itself a kind of game (Oreskes, 2021). It is anchored in assumptions and presuppositions. It has rules which, if violated, may result in being expelled from those who are also playing the game. Censure is one kind of punishment for not playing by the rules (Kuhn, 1961). Banishment is another. But the great engine of science remains *doubt*. Indeed one definition of science is that it is perennial ritualized doubt. However, a trenchant criticism of the lack of doubt in modernistic science contains many postmodern voices. The irony is that while science doubts most everything, it doesn’t doubt itself. Whether this is flaw is debatable. The postmodernist would point out it is a contradiction, viz. there’s no doubt about doubt in the game of science.

To fully understand the nature of postmodernism as it pertains to educational leadership programs and practices, it is necessary to grasp what came before, i.e., modernism. The reason is that as postmodernism either challenges and/or rejects many, if not most of the perspectives and claims of modernism, it refuses to offer substitutes for what it criticizes or rejects.

Postmodernism is the criticism of modernistic thinking and methods, But even as it debunks and negates modernism, such criticism offers no antidotes or place holders (Hicks, 2016). Part of the reason is that to replace modernistic thinking about things, there is no way that postmodernists would not commit the same errors they are critiquing. For example, if postmodernists reject the duality of a center/margin binary via de-construction, they would then not erect another such binary in its place.

The reputed “father” of modernism and scientific empiricism, Rene Descartes, put forth four maxims that ostensibly were his “method” for scientific inquiry. They were:

- 1) “Never to accept anything as true if I did not have evident knowledge of its truth. . .and to include nothing more in my judgments than what presented itself to my mind so clearly and so distinctly that I had no occasion to doubt it. . .
- 2) The second is ‘to divide each of the difficulties I examined into as many parts as possible.

- 3) The third is 'to direct my thoughts in an orderly manner, by beginning with the simplest and most easily known objects in order to ascend little by little. . .to knowledge of the most complex.
- 4) And the fourth is to 'make enumerations so complete, and reviews so comprehensive, that I could be sure of leaving nothing out' (Gottlieb, 2016, p. 9).

Within the last 20–30 years educators in the USA, and those that prepare them, have adopted a form of ritualized science that has resulted in the construction of an elaborate and bureaucratized interagency *apparatus* (also called in French the *dispositif*) that controls entry to educational positions in the schools and the universities, if not through licensure then through the earning of advanced degrees or both. Certain practices or benchmarks, sometimes referred to as standards, have been established in a special way, i.e., they are “evidence based” which ostensibly means that some sort of logical and empirical vetting has elevated them to the position of a *master narrative*, or *metanarrative*, which once erected is no longer seriously questioned, viz. it is beyond doubt. Mahatma Gandhi, hardly a postmodernist, captured the spirit of postmodernism when he observed:

... every ideology that pretends that it must not be put in doubt in the interests of society or civilization or something else, becomes the natural basis for dogmatism or fanaticism. In Socratic terms, all *logos* must be submitted by its author or follower to critical examination, with the same sincere will to understand the criticism of others and, if necessary, to proceed to the requested corrections and adjustments of views which the other participants in the dialogue are expected to show (Iyer, 1973, p. 249).

Proponents of engaging in continued inquiry despite claims of practices being supported by “evidence,” and do so by pointing out flaws, false logic, and/or inaccuracies in the reigning game of science at a particular time, have acquired a loose umbrella moniker called postmodernism which covers an increasingly widening front and fount of criticism.

Of all of the challenges posed to contemporary educational leadership programs that stand out as the bastion of tradition, conservatism, and “the” barrier to change is the hoary inheritance of so-called post-positivistic empiricism. It is the equivalent of a mental Maginot Line in the way leadership is conceptualized, taught, researched, debated, funded, and rewarded. The discourse is so strong that alternatives and differences are either marginalized, minimized or ignored. The severity of the challenge to the current notions of the “field” of educational administration have a long trajectory. To understand the contestation the history of the field itself needs to be examined.

## **Educational Administration: A Continuing Quest for Identity, Legitimacy and Hegemony**

While school administration has a long history in the growth of the public function of schooling, that is, when schools became more than one room in a makeshift structure in a community, it became necessary to have someone pay attention to cleanliness,

safety, supplies, internal coordination, scheduling, discipline, acquisition of books and other instructional materials which were not centered in teaching. These duties later came to serve as a foundation of a new role called *the principal teacher*. As schools became larger and more complex encompassing more students and more classrooms, the need for a full time administrative officer who was not teaching became apparent. Later this role simply was referred to as the *principal*. This need became accelerated with the creation of the graded school in 1848 in Quincy, Massachusetts which had been modeled after the German gymnasium's creation in 1537 (Boykin, 1890–1891). By 1860 “. . . every town and city of any consequence in the country as well as many populous rural communities, had its own unified system of schools organized on a graded basis with a defined course of study, embracing definite time limits, the whole sanctioned and protected by legislative enactment” (Bunker, 1916, p. 54).

At this time there were no schools of education and certainly no departments of educational administration. Further, the development of these institutional forms was a slow process and connected to larger socio-political issues of the times. The progression came in the form of well-known public school administrators (largely city school superintendents) being asked to teach courses on school administration at progressive universities. The emphasis was on problems of practice, or the “how to” of various issues facing organizational management (Culbertson, 1988). It is at this juncture that the beginnings of a “field” as an organized area of information or knowledge began to form.

The peculiarities of establishing, maintaining and advancing an academic area are formidable. The most obvious problem is that there is no final authority to determine legitimacy of a viewpoint or a specific agenda. As stipulated by Bourdieu, “Legitimacy is indivisible: there is no agency to legitimate the legitimacy” (Bourdieu & Passeron, 1971/2000, p. 18).

A new field such as educational administration in the early twentieth century claimed legitimacy by aligning itself to strong allies to form coalitions; to the dominate knowledge base of the times, the acquisition of some form of political exclusivity and/or to enhanced economic capital (funding). Thus, educational administration formed allies with college presidents and business executives to advocate the need for professional training of school administrators and linked itself to *science* and especially *scientific management*, whose new practitioners were professionally prepared in the new departments of educational administration centered on efficiency and the reduction of costs (see Tyack, 1974).

A *field* is therefore, as sociologist Pierre Bourdieu indicated, a very fluid social space where entities (groups, individuals, agencies) compete for legitimacy, survival and domination (Bourdieu, 1984/2009, 1996). Fields are therefore constantly in tension and flux and educational administration as a field remains so today. Whereas in the past professors of educational administration relied on the tenants of *scientific management* to claim exclusivity in preparing school leaders, today it is total quality management (TQM) and its derivatives, scientific research which is put forward as *evidenced based research*, national leadership standards connected to accreditation requirements (the connection to powerful allies) and the acquisition of increased

funding and support from outside agencies (the Wallace Foundation which supported educational standards for preparation programs).

Then as now, “The actual job of helping to create a ‘learned profession’ and of the superintendency fell to another key group in the interlocking directorate of centralizers, the professors of educational administration” (Tyack, 1974, p. 135).

The professors of educational administration fetish with finding and/or creating a knowledge base in the field is at its heart the quest for continuing legitimacy and for domination in an increasingly contentious social space, where the university’s role is being questioned as a “faulty pipeline” (Broad Foundation, Thomas B. Fordham Institute, 2003) and the need for accredited licensure based upon university training derided as unnecessary (Hess, 2003).

These attacks on the field of educational administration and the professors and practitioners in it, are stoutly defended by an interlocking group of institutions which include federal agencies which insist on the presence of accreditation standards to qualify for grants along with state departments of education which issue licenses to lead, the test publishers who create the exams upon which the license is based and with such standards yoked to university preparation program programs (see National Policy Board of Educational Administration, 2018) whose courses must become the means to teach them.. Foucault (1980) termed this intersectionality an “apparatus” or a *dispositif* and he explained what he meant by the term:

What I’m trying to pick out with this term is, firstly, a thoroughly heterogeneous ensemble consisting of discourses, institutions, architectural forms, regulatory decisions, laws, administrative measures, scientific statements, philosophical, moral and philanthropic propositions—in short, the said as much as the unsaid. Such as the elements of the apparatus. The apparatus itself is the system of relations that can be established between these elements. Secondly, what I am trying to identify in this apparatus is precisely the nature of the connection that can exist between these heterogeneous elements. Thus, a particular discourse can figure at one time as the programme of an institution, and at another it can function as a means of justifying or masking a practice which itself remains silent (p. 194).

The field of educational administration/educational leadership is a bricolage of agencies and other discourses focused in a situation to define, regulate, and dominate an activity or professional function. Foucault (1980) referred to this as *a regime of truth*. By this he meant the truth to be “understood as a system of ordered procedures for the production, regulation, distribution, circulation and operation of statements. ‘Truth’ is linked in a circular relation with systems of power which produce and sustain it, and to effects of power which it induces and which extend it” (p. 133).

The many layered construction of what is considered a “professional field” represents an example of creating a monopoly. That is the unsaid of a professional field. The “field” of educational administration is more acceptable to those not in it or denied entrance to it if its legitimacy is tethered to some impersonal and neutral foundation such as “science” or “professional consensus.” However these social constructions inevitably must be anchored by a metanarrative, an essentialist rationale which is above serious questioning. The creation of such a monopoly is why neoliberal economists such as Milton Friedman (1960) and F.A. Hayek (1960/2011)

eschewed all licensing and certification of nearly all groups including teachers and school administrators (Hess, 2003). Their position was as long as such monopolies exist the free market cannot function properly. The logic of the market place becomes the ultimate arbiter of what that is good for everyone.

A postmodern critique begins with a fundamental rejection of this essentialism as part of its outlook. The co-construction of the field of educational administration by many agents, among the most prominent were the early professors of educational administration, and one in particular, Elwood P. Cubberley (1929) of Stanford, who had a profound influence on the nature of administrative work, most importantly the school superintendency.

---

## Postmodernism's Most Powerful Analytical Tool: Deconstruction

Howard Felperin (1988) examined postmodernism's most potent method of analytical assault known as *deconstruction*:

The search for the founder or originator of the discourse of deconstruction, flagrantly post-, modernist and avant-garde as it is, would discover, upon examination of the major texts, a number of earlier candidates already nominated as worthy of the honour. The short-list of nominees might well have to stretch back behind the deconstructors of the present to include those relatively recent inquisitors of language who underwrite their work—such acknowledged precursors as Heidegger, Nietzsche, and Freud—or even well behind them to Gorgias and the pre-Socratics, who did their ur-deconstructive philosophizing before writing had fully become its medium and who would themselves have had to have, within the logic of deconstructive or differential textualism, their own, ever more remote, precursors (pp. 104–5).

Deconstruction and a de-constructive analysis of a text involves a deep reading of it. Deconstruction is imbued with the assumptions and methods and vocabulary of *structuralism* and after *post-structuralism*. And these, in turn, rest on the pioneering work of Ferdinand de Saussure (1857–1913), a “Swiss linguist and founder of the school of structural linguistics” (Allison, 1999b, pp. 815–6). Niesche (2014) explains that, “deconstruction works in identifying the contradictions of logic within a text, exploring those assumptions that are often taken for granted, or go unnoticed in more ‘traditional’ readings’. Deconstruction also aims to disturb the hierarchies of binaries that are often explicitly articulated and also in more subjugated forms” (p. 17).

What contemporary students of educational administration/leadership have to understand is that the critique of the field by postmodern scholarly critics is not empirically grounded, but rather exists on a plane that is centered in the linguistic/philosophical base of an understanding of the logic and rules of language apart from its content. And since everything is expressed in language, showing the ambivalences, contradictions, gaps, and endlessly shifting meanings between words not only denies even the idea of a foundation but negates the quest for some sort of finality of meaning. This is the epitome of the philosophical problem of *infinite* or *vicious regress* in which a “series of items each of which is in some sense dependent

on a prior item of a similar sort” (Tolhurst, 1999, p. 954) or the definition of one word must depend on another word which is undefined, etc. which is a never ending process. One always ends up with an undefined word.

There are two historical examples in the USA of critique and de-construction in educational leadership prior to the new century. A well-known critique was Thorstein Veblen’s scathing (1918) work *The Higher Learning in America: A Memorandum on the Conduct of Universities by Business Men*. The de-construction example is a notorious work, Raymond Callan’s (1962) *The Cult of Efficiency*. While Veblen was intimately acquainted with that “businesslike standardization and bureaucratic efficiency [which] are evident in the current state of the public schools” to which “the resulting abomination of desolation is sufficiently notorious” he decried “the movement toward a perfunctory routine of mediocrity should logically be expected to go forward at a progressively accelerated rate” (p. 193) in the universities. While Veblen’s analysis and criticism were not only prescient, but are as applicable then as now, his work was not as grounded historically as Callahan’s, nor was it as interdisciplinary and did not explore the sociocultural and literary dimensions as profoundly. Veblen’s intellect, his razor sharp wit, led many readers to assume his book was primarily one of satire and not a serious analysis of the real problems in universities.

Raymond Callahan’s (1962) *Cult of Efficiency* is an example of how de-construction can be a force to engage in a radical reconsideration of precedent, history, and prevailing dogma. Provenzo (1990) commented on *The Cult* by nothing that, “What Callahan did do was take a traditional area of educational history—school administration and more specifically the history of the school superintendency—and debunk the myths surrounding it that had been created by individuals such as Cubberley” (p. 6). Button (1990), a contemporary of Callahan called *The Cult of Efficiency* a book of importance, lasting importance” (p. 67) and indeed the passage of time is testimony to his view. Button called *The Cult* a revisionist book, “before that term was often used:

It was an account of the impact upon school administration and schooling of business management methods; of cost accounting, of the growth of school systems’ central bureaucracy intended to emulate those of private enterprise, of research growing from industrial efficiency studies, and of educational research intended to foster business management and efficiency in the schools.

It dealt critically, for the first time, with the ‘rationalization’ of schooling, and the accompanying centralization of authority in school systems. It described the historical origin of the great eruption of bureaucratization of schools, if not the origin of bureaucratization. The development of aggrandizement of the profession of school administration was justified in the name of ‘efficiency’ (p. 68),

Callahan’s deconstruction was powerful because it involved an analysis of a total system. In the words of Gasche (1988) it represented “a meditation on what we want to call the *general system*” (p. 2). And with *Cult*, Callahan exemplified it as “. . . a well ordered procedure, a step-by-step type of argumentation based on an acute awareness of level-distinctions, a marked thoroughness and regularity” (Gasche, 1988, p. 3).

De-construction probes the ambiguities of concepts within language, the fact that concept and meaning can only be defined by relationships to other concepts within systems of thought and argument. Such conceptual chains within a text may contain contradictions which form fissures and a false sense of unity which can be exposed and seriously questioned. Gasche (1988) has referred to the presence of such *arche-synthesis* as masking a non-unitary presence in linguistic lines of argument.

Callahan, an historian and not a professional administrator, read the literature of the field on two levels. The first read is the one most people would use in traversing a text, sometimes called *superficial*. This was a general and not a detailed read. The second read “is a fine grained, distinctly deconstructive reading, which explores the tensions, the loose threads, the little ‘openings’ in the text which the classical reading tends to close over or put off as a problem for another day” (Caputo, 1997, p. 76).

One method of that second deconstructive read has been used by Michel Foucault in his books and other writings as the *genealogical method*. This approach has been described by Dreyfus and Rabinow (1983):

For the genealogist there are no fixed essences, no underlying laws, no metaphysical finalities. Genealogy seeks out discontinuities where others found continuous development. It finds recurrences and play where others found progress and seriousness. It records the past of mankind to unmask the solemn hymns of progress. Genealogy avoids the search for depth. Instead, it seeks the surfaces of events, small details, minor shifts, and subtle contours. It shuns the profundity of the great thinkers our tradition has produced and revered. The interpreter as genealogist sees things from afar. He finds that the questions which were traditionally held to be the deepest and murkiest are truly and literally the most superficial. This certainly doesn't mean that they are either trivial or lacking in importance, only that their meaning is to be discovered in surface practices, not in mysterious depths (pp. 106–7).

For the graduate student or the interested educational historian, these forms of postmodern critique are anchored in linguistics, literary criticism, and philosophy, not the usual off the shelf traditional field centric texts so common in educational leadership department courses anchored to national standards and accreditation matrices. Educational leadership as a field is usually experienced ahistorically, the typical student unaware (or uninterested) in how the course content was created and the many agendas, forces and political compromises which produced that content. They encounter the educational leadership curriculum as a certainty, anchored in law, regulations, traditions, and topical themes which mirror the immediate professional literature of the day.

Postmodern interrogation of the extant sacred texts in law, finance, negotiations, personnel, curriculum, organizational theory, decision making, human development, the principalship or the superintendency reflect the procedures and demands of the status quo. The idea is that graduate students should be able to enter the field with as little disjunction between that world and that of the university as possible.

Perhaps the most obvious outcome of the superficial treatment of topics in many of the educational leadership programs is the low quality of dissertation research. Levine's (2005) review of 28 schools of education criticized the research content as “superficial and lacking in rigor. . .confusing scholarly and practical inquiry, flitting from topic to topic, prizing breadth over depth, and being abstruse” (p. 44). Archbald (2008) also

echoed similar sentiments that “little attention. . .to the powerful structures and values holding in place the traditional research dissertation” has occurred, nor has it “examined the in-depth distinction between research and organizational problem solving” (p. 704).

An AERA task force in educational administration made five recommendations in 2000 to improve research in educational administration. Paraphrased, they were:

1. Present new knowledge to its audience
2. Be relevant to identifying, analyzing, and solving significant educational problems
3. Provide appropriate warrants for its assertions and conclusions.
4. Be relevant to identifying, analyzing, and solving significant educational problems
5. Be communicated effectively to its primary audience (Riehl, Larson, Short & Reitzug, 2000)

The heritage of the proliferation of superficial dissertation topics has been traced to the field’s early and still lasting infatuation with efficiency studies from business, “The result was an emphasis upon the techniques and mechanics of administration” (Callahan, 1967, p. 14). In addition early departments of educational administration were isolated silos which existed apart from the range of academic disciplines which would form the course content for a more advanced and theoretical approach to research and inquiry. To a large extent this attitude still prevails in contemporary times.

Furthermore, the aligning of course work to national standards, research with dissertation forays centered in practice has resulted in little interest or incentive to deeply challenge the existing theoretical base of leadership with faint understanding that advances in leadership practice can only occur when the theoretical base in which leadership is examined is changed. Researchers only see what they expect to see. Things not expected to be seen are not seen, evidence that theory comes before practice.

---

## **The Promise of Postmodernism to Restructure Existing Leadership Field Architectonics**

Architectonics refers to any “comprehensive system of thought, a systematic arrangement of knowledge” (Reed, 2014, p. 2). Renfrew (2015) explains that architectonics “also denotes, precisely, *form*—conceived in terms of the ‘deep’ structural relations between value-contexts” (p. 49). Architectonics includes perception, and vision, and a specific world view. However it is one that it is not one which is fixed, but rather “a model of fluid and *dynamic relationships*, grounded only in the inescapable locatedness of the actual human being who stands at the heart of it” (Renfrew, 2015, p. 34). The architectonics of educational administration/leadership, at least in America, is very close to being fixed, or at least moribund, mired in the logic of neoliberalism which is also intellectually compatible with measurable concepts and analysis shaped and defined within behavioral/structuralism, post-positivism, accreditation hegemony and national standards.

Clearly it is going to take more than occasional criticism to create a more flexible and rigorous architectonics and theoretically grounded curriculum in educational administration/leadership than what currently exists in order to confront the legacy of business approaches and neoliberal ideologies which continue to dominate the field and the logic of work within it. Bourdieu (2001) has called this “the doxa” (p. 1). “Doxa are the core beliefs, attitudes, principles, or concepts considered true and proper regarding the nature and relationships of things. The *doxic attitude* encompasses the often unstated but shared beliefs about how practices in schools should be defined, advanced and/or evaluated. This attitude is usually unquestioned and accepted as a given” (English & Bolton, 2016, p. 23).

Postmodernism and its forms of inquiry, its refusal to search for and establish patterns of thought which become enshrined metanarratives, its exposure of power and how forms of power are interwoven in what is falsely presented as neutral, and its radical interrogation of the continuing orthodoxies in method act simultaneously to perpetuate the status quo. Without interrogation, this state of affairs will ensure that there are no new discoveries to be produced and significant breakthroughs are unlikely to occur in the field. One positive outcome of the refusal of postmodern scholars to enshrine new metanarratives means that “If we are to look for solutions to educational problems, then the work of Lyotard and Derrida may actually assist to frame concerns and issues in ways that had not previously been defined or conceptualized” (Niesche, 2014, p. 25).

The realization that there are no essences to be found can be liberating. For some the erection of essences, the establishment of a foundation upon which to build a field, the creation of standards and the construction of a defensible intellectual refuge to define meaning and purpose, also brings an end to imagination and a premature need for closure to deal with ambiguity and uncertainty. To a large extent this has been the course of affairs in educational leadership over the last half century. Consistency prevails over curiosity.

A powerful metaphor is that of the earth’s geology. Texts are words on the surface, words whose meaning is constantly shifting as they are rearranged. Under the earth’s surface lies the lithosphere comprised of massive tectonic plates, huge slabs of solid rock formed billions of years ago in the earth’s history. Upon these plates the surface features of the earth, its mountains and oceans rest. Compared to a linguistic text, the plates would represent the linguistic structure in which words float, subject to the laws of linguistic logic, unique to each language. Deconstruction is the probing of the linguistic structures themselves. That is why deconstruction is a deeper analysis than criticism. It is a very deep criticism. Beneath the linguistic structure as with the tectonic plates lies unfinalizability, a Bakhtinian concept which means that “our conscious self lives by its unfinalizability, by its unclosedness and its indeterminacy” (Bakhtin, 1973, p. 53). In living things life remains perpetually open and without any final reckoning which only comes with death.

Postmodernism does not promise to create a new architectonics for educational administration/leadership. What it does pose is a prickly method to challenge the type of closure which has come to be characterized as “normal” in the field, and to

prevent the door of innovation and creativity from being closed and the field from becoming fossilized. Postmodernism creates the intellectual space to think differently and to be protected from erasure.

Postmodern skepticism and strategic doubt create the intellectual space for alternatives to be born and to hold off the defenders of the exiting doxa from challenging it. Postmodern thinking consists of permitting questions to be posed, “of the systems by which discourse is subjected, for they inculcate rituals, certify qualifications of speakers, constitute groups of doctrinal adherents, and distribute access to [the] discourse” (Shumway, 1992, p. 107).

---

## Conclusions and Reflections

As an applied field of practice, educational administration/leadership remains firmly in the thrall of both the mechanics and content of modernism via the science it embraces, perpetuates and honors. That form of science which continues to be regnant in its top-tier journals, textbooks, and comprises the dominant corpus of its annual conferences and conventions of refereed papers, and to which government and foundation grants and other forms of financial largesse are awarded, is thoroughly post positivistic, empirical in a variety of methodological forms and buttressed by a systems of regulation, accreditation, licensure, and other forms of enforcement, all representing what Feyerabend (1993) has called “the consistency condition” (p. 24). This condition is created when the field’s researchers and practitioners require the new hypotheses must be consistent with all of the prevailing theories of the day. Not only the extant theories, but the standards and procedures, irrespective of the theory involved. This practice reinforces and sanctifies the status quo. If the status quo also includes superstition, prejudice, inequalities and outright racism these are also enshrouded within the same structure.

The field was created by a quest for a foundation upon which to build a scientific practice. This is thoroughly modernistic agenda. But modernism is centered on certainties. It represents a search, indeed a quest for a foundation, an essence upon which to ground its theories. But even a staunch modernist such as Karl Popper (1968) recognized the ultimate futility of this venture:

The empirical basis of objective science has thus nothing ‘absolute’ about it. Science does not rest upon solid bedrock. The bold structure of its theories rises, as it were, above a swamp. It is like a building erected on piles. The piles are driven down from above into the swamp, but not down to any natural or ‘given’ base, and if we stop driving the piles deeper, it is not because we have reached firm ground. We simply stop when we are satisfied that the piles are firm enough to carry the structure, at least for the time being (p. 111).

In a postmodern sense, language represents Popper’s metaphorical “swamp”. No matter how deeply the theoretical piles are driven, there’s only more swamp. There’s no finality in language. The only permanent thing possible is temporality ad infinitum.

This state of affairs should provide a renewed platform to not search for new finalities which would be futile, but to a new dynamism which seeks not to dominate

and control, but to understand. Postmodernism, in its relentless de-construction of all metanarratives, offers one way to ensure there are no new such leadership doxic certainties which can escape a relentless structured doubt.

## Abstract

Although the field of educational leadership has been dominated for over a century by technical and rational perspectives, debates about this positioning are almost as long-standing. By the end of the twentieth century, calls for more critical theories focused on students who had not traditionally been successful in educational institutions as currently constituted became more frequent. The result is a somewhat crowded field of competing and often overlapping theories. Compounding what has become a confusing and inefficient field is the lack of definition of terms, shifting signifiers, competing theories, and frequent atheoretical guidance offered to practitioners.

The purpose of this chapter is threefold: to provide an etymology of transformative leadership theory (TLT); to distinguish it clearly from transformational leadership; and to present it as a critical, comprehensive, and activist theory that foregrounds diversity, equity, inclusion, and justice. The chapter outlines the two underlying assumptions or hypotheses of TLT (absolute regard and deep democracy) and eight interconnected guiding tenets.

The chapter concludes with consideration of the advantages and limitations of TLT and a brief consideration of why more critical theories seem to have had little sustained impact on the field.

Transformative leadership · Democracy · Inclusion · Equity · Mindsets · Values · Normative · Critical · Comprehensive · Social Justice

**The Field of Memory**

In some ways, educational leadership is a relatively new concept, related to earlier, scientific management, and concepts of administration and organizational theory. The first known use of the word “leadership” is reported to have been in 1821, when the suffix “-ship” was added to the word leader, although many languages have no single comparative word to reflect the concept. In 1841, leadership was associated by Carlyle with “heroes,” thus setting the stage for the Great Man theory of leadership. Other theories often considered to hold little validity include trait, transactional, and autocratic, individualized theories. In the 1950s, a group of educational administrators (known as the Chicago school), wanting to promote the credibility of the profession, urged a focus on descript and the elimination of the “ought” in administrative studies. Two decades later, the debate about the validity of “objective facts” and subjective perceptions erupted into the Griffiths–Greenfield debates, sometimes known as the “paradigm wars,” focused on methodological and often epistemological differences. The tension persisted, with the 2002 National Research Council deliberation about what constitutes “scientific inquiry,” although in some areas the dominance of scientific management is slowly losing sway. Instructional leadership, and technical “school improvement” emphases dominant at one time, have been replaced by more comprehensive and relational approaches. Tensions still also exist between a “nonaffirmative approach” and more normative theories which attend once again to the “ought.”

**The Field of Presence**

The website of the International Institute for Management and Development (IMD) located in Singapore and Switzerland states: “Throughout history, great leaders have emerged with particular leadership styles in providing direction, implementing plans and motivating people. These can be broadly grouped into 5 different categories:” authoritarian, participative, delegative, transactional, and transformational” (IMD.org). These five theories which primarily emphasize organizational effectiveness and

efficiency tend to be the primary leadership theories covered in most textbooks and leadership preparation courses. In contrast, this chapter offers transformative leadership theory (TLT) a comprehensive, normative, and critical theory of leadership grounded in equity, inclusion, and justice. It refutes the concept that leadership needs to be nonaffirmative and nonnormative. Instead TLT posits that leadership theories need to prioritize beliefs, values, and assumptions, recognizing they are antecedents of policies and practices that perpetuate injustice, marginalization, and oppression as well as providing opportunities for change and transformation.

### **The Field of Concomitance**

The origins of leadership studies are often traced to early military treatises such as Sun Tzu's *Art of War* (2010) or management treatises like Taylor's *Principles of Scientific Management* (1919). Subsequently, key concepts from scholars from various other disciplines influenced the field, including the ideas of Marxist philosopher Gramsci, French sociologists and philosophers Foucault and Bourdieu, Russian philosopher and literary scholar Bakhtin, and many others. More recently, ideas from anthropology, psychology, cultural studies, media studies, ethics, and critical theory have also become influential. Transformative learning theory (Mezirow, 1996), culturally relevant and relational pedagogies (Ladson-Billings, 1995; Milner, 2011), curriculum studies (Cranton, 2016; Pinar, 2011), and antiracist strategies (Dei, 1993; May, 1999) can no longer be ignored. The discipline known as educational leadership comprises numerous interconnected roles, responsibilities, topics, and theories – all of which reflect the complexity of leadership and the need to understand the context within which one operates, to clarify one's goals, and to identify one's nonnegotiable principles and practices.

### **Discontinuities and Ruptures**

Leadership as command and control is giving way to leadership as collaboration and relationship. Traditional goals of socialization, assimilation, indoctrination of students into existing culture are giving way (at least in common parlance) to a recognition of the value of diversity, multiculturalism, and multiple perspectives. A focus on equality (treating everyone the same) is yielding to equity (treating everyone according to their needs). The need for objective and often quantitative studies of leadership has surrendered to a recognition (thanks to T. Barr Greenfield and others) of the importance of positionality and subjectivity. The wider social context, originally eschewed as a factor to be ignored because leaders cannot do anything about it, is now widely recognized as of central importance. Social justice, although sometimes recognized as a contested, shifting signifier that can be used to support almost any position, has again gained prominence and, in some circles, credibility.

### **Critical Assumptions**

Given changing demographics and increasing public awareness of populations that have suffered marginalization, oppression, and exclusion, a comprehensive and critical theory of leadership which foregrounds equity, inclusion, and justice offers the best way to transform schools for the good of all individuals, groups, and society as a whole.

Of the commonly discussed theories, only the concept of transformative leadership appears to provide an appropriate direction. (Quantz, Rogers, & Dantley, 1991, p. 96)

It is only through the adoption of a fundamentally new perspective, an alternative paradigm, that educators can be empowered to implement truly transformative changes. (Nicoll, 2014, p. 49)

Beliefs, values, and mindsets result in implicit bias, are reflected in policy, and determine action. A critical and comprehensive theory of leadership must therefore address beliefs and mindsets.

What separates successful leaders from unsuccessful ones is their mental models or meaning structures, not their knowledge, information, training, or experience per se. (Johnson, 2008, p. 85)

Transformative learning challenges our ways of thinking and helps us to critically examine the fundamental assumptions underlying our worldview or mental models, resulting in life-changing insights. (Anello et al., 2014, p. 3)

A comprehensive and critical theory of leadership addresses various forms of marginalization and oppression, including racism, homophobia, xenophobia, and foregrounds equity when making all decisions, including those related to facility, personnel, budgets, curriculum, policy, and so forth. Transformative leadership is

an exercise of power and authority that begins with questions of justice, democracy, and the dialectic between individual accountability and social responsibility. (Weiner, 2003, p. 89)

Greenfield (1980) recognized that moral decisions are part of the everyday life of educational leaders and therefore that the “*is* and *ought* are intimately joined in human interaction” (p. 32). A comprehensive approach to leadership combines both concepts.

---

## Introduction

This chapter will explore the development of transformative leadership theory, distinguish it from transformational leadership, and, drawing on the many scholars who promote transformative leadership, articulate a theory of transformative leadership, describing its underlying assumptions, hypotheses, and tenets.

---

## The Roots of Transformative Leadership

When one types “*transformative leadership*” into many search engines, what is most often shown is a series of articles and programs related to *transformational leadership*. Yet, the Oxford Reference Dictionary indicates that the two are not synonymous, although both derive from the old French verb *transformer* and the Latin *transformare*, meaning to change the form of something. Etymological sources

suggest that transformative implies causation, or “having the power to cause transformation,” and is indicative of agency, while transformational is more descriptive, as “pertaining to transformation.”

In leadership theory, the origins of both transformational and transformative leadership are most frequently attributed to James McGregor Burns’ *Leadership* (1978) in which he used the term “transforming” leadership as distinct from transactional leadership to refer to a form of leadership that is complex and powerful. Although he did on occasion use the term transformational, he did not use the term transformative. By recognizing and addressing the needs of followers, transforming leadership “is a relationship of mutual stimulation and elevation that converts followers into leaders and may convert leaders into moral agents” (p. 4). Burns concluded that leaders had to first clarify within themselves their own personal goal, second, determine whom they are leading, and third, define their organizational goals. He then stated that leadership “can be defined only in terms of, and to the extent of the realization of, purposeful, substantive change in the conditions of people’s lives” (p. 461).

Later, in his 2003 book, *Transforming Leadership*, Burns distinguished between *change* (a substitution of one thing for another) and *transformation* (a metamorphosis of form or structure) and argued for a form of leadership that would result in metamorphosis, as indicated by the nature and not the degree of change. Transforming leadership is “democratic and participatory” (p. 26) and is firmly grounded in transforming values. Burns posited that “deep and durable change, guided and measured by values, is the ultimate purpose of transforming leadership” (p. 213). He again argued that leadership is a moral undertaking, whose

greatest task—the task even, of a global leadership—must be to respond to the billion of the world’s people in the direst want, people whose pursuits of happiness might begin with a little food or medicine, a pair of shoes, a school within walking distance” (p. 2)

Similarly, William Foster, an early proponent of transformative leadership, argued that for a theory of educational administration to be “adequate,” it would need to be explanatory, social, and critical” (1983, p. 3), and that it should “not only look at the conditions in which we live” but decide how to change them (1986, p. 185).

Hence, according to both Burns and Foster, the success of leadership is to be assessed in terms of substantive and material changes in the lived realities of others. This is, in large part, a major distinguishing aspect between transformative and transformational leadership.

Transformative leadership is clearly focused on making substantive change within and outside of the organization by effecting increased equity in the lived realities, learning environments, and working conditions of others. Transformational leadership in contrast aims at the efficiency and effectiveness of the organization as a whole and posits four main components (each with associated subcomponents): setting directions, redesigning the organization, managing the instructional program, and developing people (Leithwood, 2011). Here one notes a clear focus on topics that relate to overall organizational effectiveness such as organizational problem-solving, climate, and outcomes. However, transformational leadership does not

fulfill Foster's criteria in that there are no inherent values related to changing or improving social conditions; nor does it respond to Burns' call for substantive and material changes in the lived realities of others. In contrast, one could identify a direction that might be exclusionary rather than inclusive; one could design the organization to focus on "traditional western" values, rather than valuing multiple perspectives, and so on.

---

## Transformational Versus Transformative Leadership

Several scholars are explicit about the differences between transformational and transformative leadership. Blackmore argued that while seductive, the

Transformational leadership discourse appropriates critical leadership perspectives while depoliticizing their social-justice intent, as the notion of transformational leadership has been framed narrowly within the school-effectiveness-improvement paradigms. (2011, p. 21)

Similarly, Starratt (2011) posited that

The distinction between transformational leadership and transformative leadership is an important one, not only for the field of education, but also for leadership theory in other fields, including public administration, business administration, and leadership in the professions . . . transformative leadership starts out with a focus on the most obviously disadvantaged . . . (pp. 131–132)

Transformative leaders, whether in social services agencies, nonprofits, police departments, or higher education institutions, bring to their positions a focus on those who have traditionally been marginalized, oppressed, or disadvantaged.

Shields explains that "transformative leadership is normative; it broadly defines a desired state toward which we strive. But it is not prescriptive" (2018, p. 20). Each leader must determine how to implement the principles in ways that take into account the priorities and needs of each context in order to provide equitable, inclusive, and socially just working/learning environments for all as well as to promote a more just and equitable society.

---

## Early Conceptions of Transformative Leadership

Soon after the 1978 publication of *Leadership*, disjunctures become apparent between Burns' introduction of transforming leadership, subsequent approaches to transformational leadership, and, in response, the rise of transformative leadership. Denhardt and Campbell note that despite Burns challenge that conceptions of leadership should address questions of values and morality, subsequent to his 1978 publication, the "previous focus on morality and values is largely replaced with an emphasis on a more value-neutral perspective" (2007, p. 559). van Oord (2013) comments that Burns "derives his model of leadership from a

number of managerial assumptions,” and argues that for Burns, “the leader is always the top job in an institution...[and] the leader remains a leader just as followers remain followers” (p. 421). Given Burns’ emphasis on understanding and “supporting the needs of followers,” the question of who is a follower becomes central. One can infer that if the followers are typically thought of as fellow white male leaders and the “clients” or students are more diverse, considerable dissonance might ensue. Thus, despite Burns’ desire for the transforming leader to create substantive and material change, the remnants of scientific management and technical solutions presented obstacles to deep and lasting transformation. Nevertheless, the work of Paulo Friere, Jack Mezirow, and William Foster helped to move the field forward.

---

## Paulo Freire

Weiner (2003) asserted the importance of considering Paulo Freire’s work when “developing a theory of transformative leadership” in that it “offers a geography of leadership within a terrain of democratic struggle” (p. 91). Among the elements of this expanded terrain, Weiner describes conscientization – the development of a critical consciousness, curiosity, hope, and critique as central to the “radical democratic sphere.” Moreover, Weiner cites others who have argued similarly, including Aronowitz (1998) and Giroux (1983). In her review of several authors who write about the influence of Freire, Jackson states that he has “continually been associated with themes of oppression and liberation” (2007, p. 199), and in particular, emphasizes Freire’s “transformative optimism” and his acknowledgment of education as a political act. Miller, Brown, and Hopson (2011), stated that “Paulo Freire (1923–1997) is widely regarded as a central figure in the reconceptualization of education as a liberatory action” (p. 1082) and argued that Freire’s concepts of conscientization and dialogue are central to new conceptions of educational leadership, as is his emphasis on the whole educational arena, including educational institutions and “*the complex social contexts that surround them*” (italics in original, p. 1094). Moreover, acknowledgments of the influence of Freire on new, critical, and transforming approaches to both pedagogy and leadership are frequent in the literature.

---

## Jack Mezirow

Although never associated with leadership studies, per se, Mezirow’s theory of transformative learning has also influenced the development of transformative leadership in that it is grounded in critical theories, and “proposes social justice and change as an aim of adult education” (Fleming, 2018a, p. 121). At the same time, his approach to transformative learning seems to rely more directly on the individual than on social change, as he describes transformative learning as

the process of becoming critically aware of how and why the structure of our psychocultural assumptions has come to constrain the way in which we perceive our world, of reconstituting that structure in a way that allows us to be more inclusive and discriminating in our integrating of experience and to act on these new understandings.... (Mezirow, 1985, p. 22 in Fleming, 2018b, p. 3)

Nevertheless, the focus on becoming critically aware, on changing mindsets, and on acting on new understandings is consistent with approaches to transformative leadership.

---

## **William Foster**

Foster was one of the early theorists of educational administration who firmly rejected scientific research based on a functionalistic model as inadequate. In response to the ongoing influence of managerial and technical approaches, Foster, an early proponent of transformative educational leadership (although like other early advocates he continued to conflate the terms), complains:

The idea of leadership as a transforming practice, as an empowerment of followers, and as a vehicle for social change has been taken, adapted and co-opted by managerial writers so that now leadership appears as a way of improving organizations, not of transforming our world. What essentially has happened is that the language of leadership has been translated into the needs of bureaucracy. (. . .) Transformational leaders are now those who can lead a company to greater profits. (Foster, 1989, p. 45)

Foster called for a theory of leadership grounded in a radicalized political economy model, because “the reconceptualization of leadership in terms of the political distribution of cultural and social resources can, however, lead to a recognition of its critically transformative possibilities” (1983, p. 16). This emphasis on transforming practice and action permeates subsequent conceptions of transformative leadership.

---

## **Transformative Leadership Theory**

The early theorists discussed above influenced the work of many scholars in the last decades of the twentieth century, and with increasing frequency and urgency, into the twenty-first century. Moreover, those who study transformative leadership theory comprise a diverse group of intellectuals that includes, for example, white and Black, male and female, educators, sociologists, nurses, development activists, indigenous scholars from North and South America, Scandinavia, Britain, New Zealand, South Africa, and Zimbabwe. Each draws on the key concepts of conscientization and reflection, dialogue, and relationships, but perhaps more importantly, as Gumbonzvanda states, “the notion of transformative leadership derives from an understanding that we have to address the root causes and the underlying factors

that create inequities” (2012, p. 4). She identifies some criteria for determining whether leadership is transformative including whether it demonstrates a commitment to transform underlying social, economic, political, and cultural factors that perpetuate discrimination and oppression, and the need for a “robust, visible, and articulated position to promote the transformation of institutions, policies, norms, behaviors, and attitudes” (p. 5). These are the criteria one also finds in some of the most fully articulated approaches to transformative leadership theory.

Quantz et al. (1991) identify five ideas which they argue “can form the basis of a new dialogue on leadership in schools” (p. 98): schools are arenas of cultural politics, organizations must be based on democratic authority, transformative leaders should come from all levels of an organization, transformative leadership requires a language of critique and possibility, and leaders do not gather followers, but help promote conditions and discourse which cultivate more leaders. They argue that transformative leaders can no longer understand schools in systemic terms “as a whole with a single common interest” (p. 113); moreover, TLT requires civic courage that fights “inevitable resistance” when one strives to restructure power and work for democracy.

These five key ideas were subsequently enhanced in important ways. Dantley (2005) advocated the inclusion of spirituality (as opposed to religious dogma) that “crafts a sense of self and provides the impetus to resist forms and practices of dehumanization and oppression that are sometimes promoted by the dominant culture” (p. 657). Cooper (2009) made explicit the need for cultural work, for transformative leaders to broaden their “cultural knowledge, engaging in critique and resistance, and building coalitions with diverse groups to promote cultural responsiveness, educational equity, and social justice” (p. 696). Bolivian scholars, Anello et al. (2014) articulated a values-based conceptual framework for transformative leadership focused on the need to transform beliefs, mindsets, and assumptions in order to promote personal transformation as well as contribute to the advancement of civilization. Drawing on Mezirow’s transformative learning theory, they argue that

Transformative learning challenges our ways of thinking and helps us to critically examine the fundamental assumptions underlying our worldview or mental models, resulting in life-changing insights. (p. 3)

Thus transformative leadership takes seriously Johnson’s (2008) finding that

what separates successful leaders from unsuccessful ones is their mental models or meaning structures, not their knowledge, information, training, or experience per se. (p. 85)

However, TLT goes well beyond mental models to address policy and practice in comprehensive ways. van Oord (2013) acknowledged TLT’s primary focus on an activist agenda and its commitment to equity and social justice, saying

scholars such as Shields (2010, 2012) have in recent years successfully endeavoured to define and theorize transformative leadership as distinctively separate from the transformational approach. Transformative leadership is characterized by its activist agenda and its overriding commitment to social justice, equality and a democratic society. (pp. 422–423)

In her attempt to define and theorize transformative leadership, Shields attempted to integrate not only the above influences, but the dominant themes and concepts from the many scholars who either used the term transformative leadership or whose work influenced its development, (including but not limited to Bogotch, 2014; Caldwell et al., 2012; Follett, 1940/1973; Giroux, 2004; Keddie, 2006; Martin & Griffiths, 2014; Mertens, 2010; Rusch & Horsford, 2009; Santamaria, 2012; and Tillman et al., 2006).

---

## Two Principles of Transformative Leadership

Shields' (2020) conception of transformative leadership begins by reflection on what comprises a theory and acknowledges that in social science, a theory is a group of ideas, concepts, or guiding principles that help to predict, explain, or understand the relationships between or among concepts (sometimes known as variables). Transformative leadership theory begins with two general principles that can be "tested" empirically: absolute regard (Starratt, 1991) and deep democracy (Green, 1999). The principle of absolute regard hypothesizes (to use the language of quantitative research) that when one is fully respected, included, and valued, it is easier to focus on the task at hand, and thus that individual performance will improve. In schools, therefore, if a student does not have to worry about being bullied as he or she leaves the classroom, or that others will discover her transgender identity, or that Immigration and Customs Enforcement (I.C.E.) will have arrested their undocumented parent while they are at school, then the student will be more able to focus on the specific learning activity and their academic performance (often as evaluated inappropriately solely by test scores) will improve. Similarly, for adults in a workplace, if the environment is respectful and inclusive, they will not have to worry about a supervisor looking over their shoulder, and they will be better able to perform appropriately.

The second principle, deep democracy, relates to the concept of public good as opposed to individual development. It hypothesizes that when individual achievement is balanced with the importance of public good and emphasizes the need for collective, civic engagement, and social responsibility, then society and democracy (understood as mutual benefit for all) as a whole are strengthened.

---

## Eight Interrelated Tenets

These two principles are supported by the following eight specific, interrelated tenets:

- A mandate to effect deep and equitable change
- A need to deconstruct knowledge frameworks that perpetuate inequity and injustice and to reconstruct them in more equitable ways
- A need to address the inequitable distribution of power

- An emphasis on both private and public (individual and collective) good
- A focus on emancipation, democracy, equity, and justice
- An emphasis on interdependence, interconnectedness, and global awareness
- The necessity to balance critique with promise
- A call to exhibit moral courage (Shields, 2016, 2018, 2020)

The first tenet suggests the need to critically examine one's own assumptions, the organization within which one works, and its social context, in order to determine whether there are inequities that must be addressed, and whether one has the personal knowledge and commitment to do so. Once one has conducted the preliminary self-reflection and data analysis, one can move to the second tenet: the deconstruction of knowledge frameworks that perpetuate inequity and reconstruction of frameworks in more equitable ways.

This second tenet is particularly important in that it requires a transformative leader to address issues of racism, homophobia, transphobia, xenophobia, ableism, agism, classism, and so on. In other words, although some conceptions of leadership for social justice focus almost entirely on race or ethnicity, and others primarily address gender inequities or socio-economic status and poverty, the transformative leader must be aware of, and address, the intersections of these and other forms of discrimination, including colonization, deficit thinking, and implicit bias. In this way, TLT is definitely an antiracist leadership theory, but includes much more.

The next two tenets also address the overall organizational environment, including governing and operating procedures and policies that perpetuate power imbalances, and that over-emphasize individual, private good, to the exclusion of public good. As Quantz et al. argued in 1991, TLT "does not imply the diminishing of *power*; but the diminishing of *un-democratic power relationships*" (p. 102). The focus in transformative leadership, therefore, is the need to redistribute power in more equitable ways, to ensure that everyone has an equal opportunity to be heard and to participate fully in the cultures and structures of the organization or democratic society. This leads directly to an examination of the concept of public good, of community empowerment and transformation. Weiner (2003), for example, asserts the need to

link not only the private and public, but also the empirical and theoretical, the everyday and the future, the imaginative and the real, the past and the forgotten, history and tradition, power and knowledge, and learning and life. (p. 98)

Tenets five and six suggest areas of focus that will help in the organizational transformation, and, for schools, will lead to a re-examination of curriculum and pedagogy as well as of policies and practices. A focus on emancipation, democracy, equity, and justice requires ongoing reflection about every aspect of organizational life, as transformative leaders address ways in which the curriculum may marginalize people from traditionally minoritized groups, ways in which fiscal decisions advantage some groups to the disadvantage of others, or ways in which policies fail to take into consideration the variety of lived experiences or circumstances of all members.

Hence, implementing a one size fits all discipline policy in schools will likely result in disproportionate suspensions of certain groups. Holding parent conferences during the day ignores the financial hardship for nonsalaried parents who work for an hourly wage. Similarly, failure to permit employees to take paid time off work for such activities as voting or a medical appointment again advantages salaried rather than hourly paid employees. Although addressing discriminatory organizational policies and practices is a starting point, a transformative leader will also emphasize interdependence, interconnectedness, and global awareness and ensure that all members of the organization understand, and take responsibility for, how what happens locally affects the material lived realities of people around the world and vice versa. The global covid-19 pandemic of 2019–2021 provides an excellent example of this. As cases surged in India, for example, requests for oxygen, raw materials for medicines, and relief from patent requirements were heard urgently in the Western hemisphere; at the same time, it was widely recognized that until the pandemic was eliminated globally, travel and health would continue to be affected everywhere.

The final tenets emphasize the global nature of transformative leadership theory. They remind transformative leaders of the need to combine both critique and promise. It is easy to identify areas needing transformation, but much more difficult to act in ways that offer redress. This need for advocacy and activism requires considerable moral courage, for when offering redress and challenging inequity, backlash is almost unavoidable. When one seeks the kind of transformation defined by Burns as “a metamorphosis in form or structure, a change in the very condition or nature of a thing, . . . , a radical change . . . as when a frog is transformed into a prince or a carriage maker into an auto factory” (2003, p. 24), there will be those who feel they are losing power or privilege. Nevertheless, deep-seated and systemic change are required if there is to be a more socially-just and inclusive educational system.

---

## **TLT: A Comprehensive Theory**

Among the many current leadership theories in widespread use, some rely on technical solutions and approaches, some focus on process, and some address specific inequities such as a lack of cultural relevance and responsiveness, racism, gender inequity, or homophobia. Others still focus on leadership traits or dispositions, including the need to build relationships, to foster trust, to act authentically, or even the need for charisma (which has been disputed for years).

Many theories address what occurs within the organization but ignore a wider structural analysis of inequitable power arrangements, implicit bias, and ongoing systemic discrimination. And many still ignore the critical role beliefs, values, and mindsets play in perpetuating inequity. A heavy focus on organizational needs and outcomes generally fails to acknowledge, as Greenfield argued over half a century ago that “organizations are invented social reality” (p. 4), influenced by the different ways in which people in the organization see and interpret things, and hence that “beliefs are always of greater consequence than facts in shaping behavior” (1974, p. 6).

Transformative leadership theory responds to the need for a critical and comprehensive theory of educational leadership. It acknowledges the need to address the many forms of marginalization, oppression, and prejudice that perpetuate both an unequal playing field and inequitable outcomes for many in organizations. In schools, these inequities affect both teachers and students. Yet, the same inequitable situations are ubiquitous, existing in higher education, community organizations, nonprofits, as well as both governmental and for profit agencies. TLT does not reject measures of efficiency or effectiveness, yet goes well beyond, addressing both what happens within organizations and the external factors that perpetuate deep seated systemic and societal inequities. It calls for transformation both from within and from outside the organization itself.

---

## Widespread Influence of TLT

Indeed, the appeal to those who strive for equity, inclusion, and social justice is that TLT is a normative, critical, comprehensive, and activist theory that offers principles for action that can result in transformation. Bruce and McKee (2020) assert,

we predicate our work on the assumption that inherent to leadership development is the drive and desire to lead for equity and justice. That leadership must be as much (or more) about the dismantling of inequitable systems as it is about exerting influence (p. 149)

For that reason, they developed “The Oaks Leadership Scholars—a co-curricular transformative leadership development program in The College of Agriculture and Life Sciences at NC State University” (McKee & Bruce, 2020, p. 51). Elsewhere the global scholars program of the MasterCard Foundation, which provides support to 15,000 deserving young people over 10 years so they can complete their university education,

Is designed to foster transformative leadership by equipping Scholars with the knowledge, tools, capacity and motivation to make a difference in their countries and regions of origin . . . Transformative leadership is about making or influencing positive change and addressing inequity. The concepts of critique and promise are central. (2014, p. 3)

The global applicability of TLT is also a strength. In 2016 and again in 2018, the global edition of *University World News*, a network of “five dozen education journalists based in more than two dozen countries, with representation in all regions,” ran a series of articles on transformative leadership; the ongoing influence of the topic is reflected on its website, where one of the horizontal menu headings is “transformative leadership.”

Another indication of the impact of transformative leadership is its use as a conceptual framework in doctoral dissertations. *Proquest*, a large repository of dissertation, identifies 3893 doctoral dissertations about transformative leadership, over 70% of them completed since 2010. These cover a wide range of topics

including special education, school lunch programs, homeless, nursing, the automobile industry, gender, Christian education, the pharmaceutical industry, and counseling and comprise numerous contexts including Africa, Mexico, the Caribbean, Korea, Australia, New Zealand, North America, and the United Kingdom.

Practitioners also attest to the reasons why they have adopted TLT to guide their work. Bieneman states:

As an elementary school principal, I have adopted an agentic perspective and positioned myself as a transformative leader who is willing to live with tension and challenge in order to create schools that are equitable, inclusive, and socially just. (2011, p. 235)

And, adopting this stance, the results of her student body moved from 62% of a largely white student body meeting or exceeding standards to 85% of an increasingly diverse and impoverished student body at that level 5 years later (p. 234).

Transformative Leadership Theory is becoming widespread and well-known as an approach that “demands that leaders not only see the necessity for systemic change but also develop the skills and behaviors necessary to lead that change” (Bruce & McKee, 2020, p. 150).

---

## Conclusion and Reflections

Despite the previous claim that TLT is becoming widespread and well-known, it risks being lost in the myriad of theories responding to urgings for new leadership theories and approaches, including Burns’ (1978) demand for a “complete revolution of our social systems,” Foster’s (1986) assertion that leadership needed to be “fundamentally addressed to social change and human emancipation” (p. 48), and Quantz, Rogers, and Dantley’s (1991) belief that “traditional leadership theories are inadequate for meeting the present challenge” (p. 96). These calls for new approaches have not been confined to education, but also appear in other disciplines as when business authors Caldwell et al. (2012) asserted “the need for a new approach to leadership in a world that seemingly lacks a moral compass” (p. 176).

In part in response to these pleas, and in recognition that technical approaches to educational reform have not worked, numerous approaches to a more socially just form of leadership have emerged, each focusing on specific aspects of social justice, inclusion, equity, or transformation. Moreover, although the undefined term “social justice” has generally been coopted in support of both conservative and liberal positions, its use as a focus for theories of leadership has continued. Some theories are variously named for specific emphases such as social justice, multiculturalism, cultural relevance and relationships, antiracism, and democracy. Some underscore the concept of context and suggest a focus on urban education, higher education, rural education, and so forth. A few argue the need for equity reformers to “also deconstruct the prevailing beliefs and politics that sustain racial and class privilege [and] engage issues of power by extending beyond the school” (Oakes & Rogers, 2006, p. 15, 31). Still others invite followers to “see themselves” inside theories, and,

therefore, based on identity constructions related to race, religion, sexuality, and gender identity ask readers/spectators to become participants in the theories themselves (Agosto & Roland, 2018).

All of these approaches seem to reside somewhat uncomfortably and often competitively within what Donmoyer (1999) called a “big tent” of leadership theories. Although debates among theorists no longer center on methodological issues, the competition now is more focused on how best to address the substantive challenges that afflict schools and specifically, how best to provide for the differing needs of both dominant and minoritized students. What is disturbing, however, is that, despite the myriad of new theories focused on schooling, little significant and sustainable change has occurred.

Despite general agreement among “social justice-oriented” leadership theories, particularly critically-oriented theories, that equity and justice need to be foregrounded, tensions and competition among them contribute to the lack of meaningful and sustainable change. In some cases, a relatively narrow focus on those who “look like” or share the experience of, proponents of a particular theory, may limit its impact. In other cases, lack of dialogue or understanding among theorists prevents solidarity; and of course, when one builds a career on the development of a theory, it is difficult to move beyond it.

In part, both the worth of critical, social justice-oriented theories and the problem of proliferation reside in what Hodgkinson (1983) called the naturalistic fallacy, in that “values are certainly inextricably intertwined with facts but this does not mean that there is any intrinsic or causal relation between the two categories” (p. 34). Moreover, Hodgkinson identified three types of values: preferences, those based in rationality, and those that are transrational and “imply an act of faith or intent or will as it is manifested in the acceptance of a *principle*” (p. 39). Relying on a rational argument to attempt to resolve a values dispute is likely a futile endeavor.

Because transrational values may be incommensurable, the solution may be to return to the nature of one’s context. Working for the education of girls and women in sub-Saharan Africa or Afghanistan may draw inspiration from a gender-based theory. Trying to overcome the effects of crushing poverty in a homogeneous rural community may require an understanding of class structure. Addressing racism in one of America’s large urban areas, one may focus on antiracism or anti-Blackness. The key is the need for a theory that can lead to, and guide, action. Moreover, in recognition that education and educational leadership are inextricably political, theory must be tempered with a degree of pragmatism that asks and answers the question of “what works” to accomplish a given outcome.

Transformative leadership theory is one approach that attempts to integrate values, principles, and actions with a view to transforming organizations and society and making a substantive improvement in the lived realities of those who have typically been the most oppressed, marginalized, and excluded. For that reason, it should have a prominent place in the lexicon of any educational leader wanting a comprehensive, critical, and action-oriented approach to equity and justice.

## Abstract

This chapter discusses the etymology of feminist theory in the field of educational administration and leadership. The ideas of this text are organized into three categorical schemes found within *The Archaeology of Knowledge* (1971), including the field of presence (current scholarship), the field of memory (vestiges of ideas no longer, or less, accepted), and the field of concomitance (ideas that have been transferred from other knowledge bases). In speaking to these ideas, the analysis of the impact of feminist theory in/on the field of educational administration considers the major assumptions and presuppositions embedded in the literature, as well as ruptures and discontinuities of thought that have occurred over time.

## Keywords

Feminist theory · Feminism · Educational administration · Educational leadership

## Introduction

Similar to all scholarly discourses, the ideas, practices, understandings, and influences of feminist theory on/in educational administration evolve over time. However, even as some of the ideas or emphases have shifted, the scholarship in this field tends to coalesce around common “touchstones” related to feminism and/or educational administration: (a) the nature and conceptualization of feminist theory/ies; (b) the nature of feminist research methodologies and pedagogies; (c) “big ideas” inherent within feminist work in/on educational administration; (d) topical foci considered to be “in scope” of the field of educational administration and the contexts of research; (e) resistance to feminism, and; (f) critiques and concerns within/to feminist positioning.

This chapter is organized into three categorical schemes found within *The Archaeology of Knowledge* (1971). The shifts in understanding for each of the above mentioned touchstones are discussed to elaborate upon feminist ideas that may no longer be accepted but have had considerable influence in the scholarship of educational administration and leadership (field of memory); current feminist thinking within/about educational administration and leadership (field of presence); and ideas that have been borrowed or brought into the field of educational administration from other disciplines (field of concomitance).

The ideas of this chapter are framed by feminist theoretical perspectives that have influenced the discourses of educational administration through their publication in eight of the primary journals (and their research associations) focused on educational administration and leadership:

- *Journal of Educational Administration* (first international journal focused on educational leadership, management and administration)
- *Australian Educational Researcher* (Australian Association for Research in Education)
- *British Educational Research Journal* (British Educational Research Association)
- Educational Management, Administration and Leadership (British Educational Leadership, Management & Administration Society)
- *Canadian Journal of Education* and *Canadian Journal of Educational Administration and Policy* (Canadian Society for the Study of Education)
- *International Studies in Educational Administration* (Commonwealth Council for Educational Administration and Management)
- *Educational Administration Quarterly* (University Council of Educational Administration)

These journals have had a major impact on the global discourses of educational administration and leadership over time, and therefore serve as primary texts for shaping the ways in which feminism has been taken up within the field. Given the sources from which the ideas of this chapter are drawn, it must be acknowledged that the etymology of feminism described in this work is premised on a Western understanding of educational administration (or its critiques), and one that privileges English as the language of scholarship. These two factors embed particular

assumptions and presuppositions within the discourses related to feminist theory and educational administration that are discussed in this text.

After describing the etymology of feminism in educational administration and leadership, the chapter turns to a discussion of two primary ruptures in the feminist scholarship of educational administration. It then moves to a description of the critical assumptions that tend to underpin current feminist studies of administration and leadership. The chapter ends with reflections on the nature and impact of feminism in/on the scholarship of educational administration and leadership over time, and introduces global trends that may influence future feminist work in the field.

### **The Field of Memory**

A field of memory includes those statements, ideas, or practices that are “no longer accepted or discussed, and which consequently no longer define either a body of truth or a domain of validity” (Fairclough, 1992, p. 46) but may have left traces in the vocabulary or metaphors of that field (in a kind of memory). For the purposes of this chapter, it also includes ideas that may be contentious or less accepted, but that have had considerable influence on the scholarship over time.

In the case of feminist’s influence on educational administration and leadership, writers have constantly critiqued the limitations of second wave reforms for their lack of influence on changing fundamental assumptions about gender and power relations in educational leadership (Glazer, 1991; Keddie, 2005, 2009). Yet, the constructs of meritocracy, androcentrism, liberal visions of equity, individualism, and epistemic marginality remain embedded within much of the scholarship in educational administration and leadership, although critiques of the failing of these constructs are growing. Current feminist critiques from non-Western writers in particular have demonstrated the ways in which White Western (female) academic privilege has been embedded within the leadership literature that disregards, marginalizes, or even demeans the experiences of women outside of these spaces (Ngunjiri, 2010; Phendla, 2008; Quadar & Oplatka, 2008).

Second, feminist writers have consistently raised concerns about treating gender as a unified category (Young, 1995). Cautions against essentializing leadership experiences based on sex or gender have grown over time (Blackmore, 2006; Capper, 1992; O’Malley & Capper, 2015; Quadar & Oplatka, 2008). So has the need to avoid creating dualisms or binaries when discussing gender and leadership (Coleman, 2005; Ngunjiri, 2010). For example, there exists a growing critique of research that delineates essentialized “women’s ways leadership” styles given the critiques that articulate the ways in which this work has reified dualisms based on sex, and essentialized leadership experiences based on gender, White privilege, or other intersectional characteristics (Grogan, 1999).

Perhaps the strongest critique of early feminist thought that influenced the literature base of educational administration and leadership is its failure to adequately address concerns related to class, race, ethnicity, social history, sexuality, gender orientation, language, national origin, religious belief, and/or ability. The field of memory in this regard is replete with work premised on assumptions of a unified “sisterhood” that misunderstood and/or misrepresented leadership experiences due to its failure to

acknowledge the impact of a host of intersectionalities, particularly those related to race and national origin. Even though many feminist writers over the last three decades discussed the need to consider intersectionality, it was not a primary focus in early feminist efforts in educational administration and leadership (Bloom & Erlandson, 2003; Glazer, 1991; Rusch, 2004; Young, 1995). In addition, it was not until the twenty-first century that authors who openly critiqued the assumptions of White privilege and White supremacy that underpinned earlier feminist work in/and the field of educational administration and leadership were published in these influential journals (Armstrong & Mitchell, 2017; Bloom & Erlandson, 2003; Irby, 2014; Phendla, 2008). Similarly, the recognition of the hegemonic influence of Western knowledge systems (including Western feminist knowledge) and/or the need to decolonize leadership research and theory has only recently appeared in the feminist scholarship of educational administration (Blackmore, 2010; Ngunjiri, 2010; Phendla, 2008; Quadar & Oplatka, 2008). To that end, scholars suggest that the field of memory in much of the feminist work in educational administration and leadership to date has been premised on privileged assumptions based on whiteness, class, and national origin that must be reconceptualized if it is to offer truly powerful explanatory theoretical perspectives on administration and leadership.

### **The Field of Presence**

For the purposes of this chapter, the field of presence consists of those statements, understandings, concepts, practices, and ideas that are considered to be truthful, “involving exact descriptions, well-founded reasoning, or necessary presuppositions” (Fairclough, 1992, p. 46). To that end, it is difficult to discuss the current influence of feminism on educational administration and leadership without reference to the genealogy of thought that has developed over time. By commenting on the touchstones mentioned in the introduction, this section offers a fulsome description of how the state of current thinking within and across the field of thought came to be.

### **Conceptualizations of Feminism**

There exists much diversity in feminist conceptualizations within the scholarship of educational administration and leadership. The two feminist perspectives that have had the most influence on this body of scholarship include critical feminism (Blackmore, 2000, 2006, 2014; Glazer, 1991; Rusch, 2004) and post-structural feminism (Capper, 1992; Grogan, 1996; Wallace, 2010). Jill Blackmore (2000) articulated what is perhaps the central question for researchers who conceptualize their leadership understandings through a critical feminist theoretical perspective by suggesting that it is premised upon “who gets what, how, why, and with what effects for individuals, particular social groups and society?” (p. 18). There is a tendency in this work to conduct structural analyses of policy, organizational dynamics, capital, and/or global trends that lead to systemic understandings of how gender inequities are created, enacted, and/or reified in local, national, and/or global contexts. Much of this work has centered on the economic, political, and social structures that influence

educational administration and leadership. For example, this literature has often considered the gendered impacts of neoliberalism on educational policy and restructuring. These analyses have emphasized how the increasing marketization of education, regulation and accountability measures, and standardization of policy and practice have subsumed and/or reframed gender concerns within a more general diversity discourse and negatively impacted girls' and women's access to, and influence on, education and leadership across the globe.

Those who write from a post-structural perspective focus on the ways in which discourse legitimates (or delegitimizes) subject positionalities. From Grogan's (1996) perspective, "feminist post-structuralism is a combination of the espousal of social change fundamental to feminist critical theory and the focus on language and discourse offered by post-structuralism" (p. 26). These writers tend to focus on how constructs of power, language, subjectivity, and resistance impact upon the ways in which people come to understand what it means to be an administrator or to lead effectively, as well as the ways in which these discourses have been normalized and gendered. Certain subject positions are more or less available to people depending upon how they are caught up in discursive fields of leadership. These studies have asked gendered questions related to "whose knowledge counts" in the field of educational administration and leadership, and how the power relations inherent within these discourses have included or excluded, and constrained or privileged, differently positioned men and women (and/or their intersections with race, class, national origin, etc.).

Over time, a number of conceptualizations have either incorporated elements of critical or post-structural perspectives within their purview, or they have applied alternative frameworks from external disciplines or bodies of knowledge to the study of educational administration and leadership. These include conceptualizations such as postmodern feminism (Grogan, 1999); sex-segregation theory and labor queue theory (Tallerico & Blount, 2004); feminist economic theory (Mahitivanichcha & Rorrer, 2006); Black South African feminism (Phendla, 2008); and post-colonial feminism (Blackmore, 2006; Quadar & Oplatka, 2008). This combination of epistemological and/or methodological perspectives allows for diversity of perspective to deepen feminist conceptualizations of leadership and leads to more sophisticated analysis in research. The contributions of major thinkers from alternate disciplines are elaborated upon in the section of this chapter on the field of concomitance.

The volume of published feminist work focused on educational administration and leadership was at its height between 2000 and 2009, but has diminished over the last decade in the journals that are represented in this chapter. Current feminist framings tend to invest in issues of intersectionality and/or combine feminist perspectives with other theoretical positionings, particularly but not exclusively focused on issues of race, decolonization, and national origin. This includes, for example, scholarship that incorporates more intentional focus on issues of intersectionality (Martinez, Rivera, & Marquez, 2020); Black or African feminist theory (Armstrong & Mitchell, 2017; Ngunjiri, 2010); critical race/Whiteness studies combined with feminist perspectives (Blackmore, 2010; Irby, 2014); and neo-Gramscian/feminist theoretical frameworks (Jubas, 2015). There continues to be significant attention to

how sex/gender inequities are discursively (re)produced and reified through language, structure, and policy, and how they differentially impact individuals based on their subject positionalities.

## **Feminist Methodologies and/or Pedagogies**

Feminist scholars have remained true to the idea that there exists a need to center research and/or methods on the experiences of sex and/or gender (Cumings Mansfield, Anjalé Welton, & Young, 2010; Young, 1995). Much attention has focused on research methodologies such as life history research (Kyle, 1993), critical feminist interpretive case studies (Dillard, 1995), and feminist standpoint theory (Bloom & Erlandson, 2003). In keeping with the genealogical influence representing critical feminist and post-structural feminist thought, as well as developing conceptualizations focused on intersectionality, feminist methodologies that have been acknowledged in the current research base of educational administration and leadership include Latina feminist testimonios (Martinez et al., 2020); feminist biographical narrative inquiry (Sherman, Beaty, Crum, & Peters, 2010); and feminist critical policy analysis (Diko, 2014).

Though not highly prevalent in the literature, feminist scholars advocate for feminist pedagogies to be enacted within the practice of educational administration and leadership. For example, Glazer (1991) advocated for feminist pedagogies of empowerment to be enacted within the contexts of professionalism and educational administration. Blackmore (2010) discussed the need to engage in pedagogies of discomfort that help to unsettle notions of privilege and power in educational leadership, particularly as they relate to issues of intersectionality and the politics of difference. O'Malley and Capper (2015) articulated the need for a feminist public pedagogy that moves beyond the school to foster social justice within and across communities. Interestingly, the recognition of the value of feminist pedagogies to/for educational administrative practice has not yet made its way into the plethora of research on instructional leadership (Leithwood & Jantzi, 2008) or leading for learning (Townsend & MacBeath, 2011) that is highly prevalent in the educational administration and leadership scholarship, yet it offers a significant contribution to this line of leadership research.

## **“Big Ideas” of Feminism**

A number of “big ideas” continue to influence feminist scholarship in educational administration and leadership. The first idea focuses on the need to understand the relations of power that exist within schools, governance structures, and leadership contexts (Capper, 1992; Grogan, 1999; Mahitivanichcha & Rorrer, 2006; Ng, 1993). In addition, there exists a growing urgency to attend to the historical and global political/economic shifts that continue to shape women's lives or movements, impact gender equity, and/or stymie the efforts of feminists or feminism (Blackmore, 2014;

David, 2011; Jubas, 2015; Kenway, 1997). The feminist aim to conceptualize the scholarship of educational administration and leadership from a broad sociopolitical and socioeconomic perspective was prevalent during the marketization of education that occurred in the 1990s in Australia and the United Kingdom (Blackmore, 2000; Keddie, 2005, 2009; Taylor, 2001). This aim has taken root once again due to growing concerns related to the need for greater economic and social justice across the world, recognition of the gendered effects of global capitalism, and acknowledgment of the differential impacts on health and wellness due to the COVID-19 pandemic.

Another “big idea” that influences the body of feminist scholarship in educational administration and leadership is the recognition that feminist work is risky, troubling work, and that those who engage in it are often vilified, ostracized, or mocked (Ng, 1993; Wallin, 2008; Young, Mountford, & Skrla, 2006). Nevertheless, calls for feminist activism, or the suggestion that feminism necessitates activist work, remain prevalent within the discourses of educational administration and leadership (Blackmore, 2014; Keddie, 2009; O’Malley & Capper, 2015; Taylor, 2001). Embedded in this discourse, however, also exists the recognition that differently positioned individuals have differential abilities to take on, or to accept the potential consequences of, feminist work or activism. To that end, the very act of engaging in feminist effort carries assumptions of privileges (or marginalities) that may be impacted by (or impact upon) a host of intersectional subject positions.

A third “big idea” that underpins feminist scholarship in educational administration includes the need to deconstruct the patriarchal and masculinized nature of the discourses of educational leadership and management that continue to reify gendered norms and foster inequities (Dillard, 1995; Grogan, 1999). This idea has been particularly salient in the growing literature base premised in anti-colonial or anti-Whiteness stances that have demonstrated the global influence of White Western patriarchy on leadership study and practice (Blackmore, 2010, 2014). As a consequence, calls for counterhegemonic stories that speak back to mainstream ideas of administration and leadership are once again increasing (Phendla, 2008; Quadar & Oplatka, 2008), and are highlighted by feminist perspectives that align with anti-racist and anti-colonial frameworks (Armstrong & Mitchell, 2017; Irby, 2014; Khalifa, Khalil, Marsh, & Halloran, 2019; Ngunjiri, 2010).

## Topical Focus and Contexts of Research

Feminist work in educational administration and leadership has consistently focused on four major topics: (a) women/men in leadership roles (Coleman, 2005; Mahitivanichcha & Rorrer, 2006; Martinez et al., 2020; Quadar & Oplatka, 2008); (b) policy, politics, and reform (Blackmore, 2014; David, 2011; Keddie, 2009; Kenway, 1997); (c) leadership preparation (Cumings Mansfield et al., 2010; O’Malley & Capper, 2015; Rusch, 2004; Wallace, 2010); and (d) leadership practices (Diko, 2014; Dillard, 1995; Irby, 2014). Within and across these topical foci, feminist scholars advocate for educational reform with a focus on justice and equity. However, definitions of what constitutes justice or equity within the scholarship of educational administration and

leadership shift significantly over time, and conceptualizations of sex/gender are taken up very differently in these diverse discussions.

Amid the complexity and plethora of feminist effort that has been undertaken to study educational administration and leadership, what is somewhat disappointing is that there has been little change in the nature of topics studied outside of the four topics listed above. This acknowledgment was described by Fitzgerald (2003) as “discourses of privilege” that have developed around constructs such as leadership profiles, patterns, and practices such that “distinctions between and among women have collapsed in the attempt to provide a meta-narrative that describes and defines women’s experiences and practices as educational leaders” (p. 10). This may be interpreted to suggest that although feminist work has offered alternate perspectives in/on educational administration and leadership, it has done so within a rather narrow, normalized menu of options that fall quite typically within the traditional canon of educational administration of leadership, and often has the effect of homogenizing experience – or at least what gets published does so. In addition to topical focus, feminist research focused on educational administration and leadership has seen an increasing shift toward fewer conceptual pieces (Blackmore, 2010, 2014; David, 2011), a growing attention to higher education contexts (Cumings Mansfield et al., 2010; Jubas, 2015; O’Malley & Capper, 2015; Wallace, 2010), and forays into nonformal leadership roles (Diko, 2014). This is suggestive of less feminist theoretical presence in leadership scholarship, which plays into charges of anti-intellectualism that is a common concern in/for leadership programming and scholarship. Although it reflects a growing diversity of contexts within which leadership research is being undertaken, this diversity of context is tempered by the focus on quite traditional topical areas and constructs that questions the extent to which feminist constructs will lead to new ways of thinking, being, or doing in the field of educational administration and leadership.

## **Resistance to Feminism**

A strand of ideas woven throughout feminist work in educational administration and leadership outlines the ways in which resistance to feminism continues to be evidenced. The first means by which resistance is enacted includes the continued and deliberate lack of attention to feminist theory and feminist concerns within the canon of educational administration and leadership (Skrla, Reyes, & Scheurich, 2000; Young, 2005). In fact, many scholars of this canon have perpetuated this disengagement by listing feminism (often as a “new” paradigm) with a host of other perspectives (critical theory, postmodernism, etc.), and suggest that these perspectives have influenced educational administration but offer little to no further attention or discussion of its influence or value (Donmoyer, 1995, 2020; Hallinger & Leithwood, 1996; Heck & Hallinger, 2005; Ribbons & Gunter, 2002; Roegman & Woulfin, 2019; Scribner, López, Koschoreck, Mahitivanichcha, & Scheurich, 1999). This lack of intentional effort to discuss the influence of feminism except as an “other” potential perspective before moving on to what “really matters” subtly but

surely undermines feminism's perceived value and importance to the field of educational administration and leadership.

A second idea inherent in the literature base that speaks to resistance to feminism in educational administration and leadership considers how some individuals (or researchers) deliberately disassociate from feminism to avoid negative personal or professional repercussions (Fennel, 1999; Skrla et al., 2000; Young et al., 2006). There also exists a perspective that "the need for feminism is over" in educational administration and leadership, and that gender issues are no longer of concern (Grogan, 1999; Young et al., 2006). Alternately, references continue to be made to the belief that "tables have been turned" and that boys/men are the ones facing discrimination (Keddie, 2009; Kenway, 1997; Young et al., 2006), even though little attention has been focused on the intersectionalities that disproportionately affect these sex/gender claims.

Finally, the continued characterization of feminists as "angry women" or "women out of control" has been noted by a number of writers over time (Ng, 1993; Stockard & Kempner, 1981; Young et al., 2006). In fact, many authors have commented on the continuing sexism in the field of educational administration and leadership that leads to the invalidation and subversion of women's concerns articulated by men and women alike (Diko, 2014; Skrla et al., 2000; Young et al., 2006). In addition, writers have acknowledged the anti-feminist sentiment that exists within the broader society that shapes policy and practice (Blackmore, 2014; Diko, 2014; Keddie, 2005, 2009) and filters into classrooms, schools, and education systems in ways that often go unnoticed but have the effect of reifying systemic inequities.

### **The Field of Concomitance**

The field of concomitance refers to those statements, facts, ideas, and theories that have originated in other disciplines and have been transferred to educational leadership or management. The feminist conceptualizations and methodologies that have been most evident in the literature base of educational administration and leadership have drawn from disciplines such as history, sociology, philosophy, psychology, political science, economics, law, post-colonial studies, gender studies, and cultural studies (Blackmore, 2006; Grogan, 1999; Phendla, 2008; Quadar & Oplatka, 2008; Tallerico & Blount, 2004).

Many of these contributions have shaped how feminist thought influences the study of leadership practice. For example, the work on motherhood introduced by sociologist Patricia Collins (1995) and philosopher Sara Ruddick (1989) helped to frame feminist understandings of, and barriers to, leadership for women in administration. The works of psychologist Carol Gilligan (1993) and philosophers Virginia Held (1993) and Nel Noddings (1992) have shaped how researchers understand women's traditional leadership roles, as well as the influence of the ethic of care on leadership decision making and practice. Additionally, constructs stemming from feminist economic theory and feminist organizational theory such as structural time crisis, ideal worker norms, and labor and occupational queues have influenced scholarship related to access and representation of women in the superintendency (Mahitivanichcha & Rorrer, 2006; Tallerico & Blount, 2004).

Other scholars opened up avenues for rethinking how educational administration and leadership could be conceptualized, as well as the methodologies chosen for its study. Philosopher Nancy Fraser influenced the study of feminist considerations of justice within educational administration and leadership, and offered critiques of liberal feminism and identity politics (Fraser, 1997). Scholars such as philosopher Sandra Harding (1991), political scientist Nancy Hartsock (1985), and sociologist Dorothy Smith (1990, 2005) provided scholars of educational administration and leadership theoretical depth in their discussions of feminist epistemologies, and introduced standpoint theory/methodologies that reshaped the study of women's experiences in leadership. Smith's work on institutional ethnography helped researchers problematize women's local experiences within the relations of ruling. This methodology has been incorporated in much of the feminist research in educational administration and leadership even though it has also been critiqued for its potential to reify binaries and objectification (Walby, 2007).

A number of scholars have influenced feminist thought in the field of educational administration and leadership through their work on post-structuralism. Feminist historian Joan Scott's (1986) scholarship emphasized how gender is an important category of analysis in research. Her works considered how power, language, and experience shift over time to shape events and define people's positionalities. Philosopher Judith Butler (1990) is renowned for influencing understandings of third-wave feminism and queer theory. Her work has helped those in the field of educational administration and leadership (re)consider how gender performativity is ascribed, enacted, and reified within leadership efforts. Michel Foucault (1980) and Jean-Francois Lyotard (1984) greatly influenced thinking in relation to critical theory, post-structuralism and postmodern thought that in turn was taken up by feminists working in the field of educational administration and leadership. Consideration of the relationships between knowledge and power, discourse, subjectivity, and resistance significantly shaped how scholars of educational administration and leadership think about their work and its consequences for differently positioned subjects who are discursively created and impacted through and by relations of power and knowledge. The work of these post-structural scholars in turn influenced education scholars such as Colleen Capper (1992), Patti Lather (1991), and Bronwyn Davies (1994) whose work introduced post-structural thought into educational leadership scholarship, research methodologies, and pedagogical practice.

Another scholar whose thinking related to critical and post-structural theory is Chris Weedon (1997). Her work in the area of feminist cultural politics and multiculturalism influenced thinkers in the field of educational administration and leadership to consider how constructions of race, class, etc., interacted with gender to produce different experiences for differently positioned people. Sociologist Patricia Collins (1991) is one of the first scholars whose work on Black feminist thought was recognized in the field of educational administration and leadership. Her scholarship critiqued second wave feminism for its failure to recognize how gender and race intersect, and served to illuminate assumptions of White privilege inherent within traditional leadership discourses. Finally, Kimberlé Crenshaw's (1989) development of the construct of intersectionality has reshaped feminist work in educational

administration and leadership by opening the door for scholars to consider how multiple subject positions and systems of oppression can overlap for individuals, creating very different experiences of and with leadership.

A final, more recent influence on feminist thought in educational administration comes from scholars who work in the area of post/anti-colonial studies. These scholars consider the differential gendered effects of colonialism and leadership on colonized peoples, particularly on women and girls (Alexander & Talpade-Mohanty, 1995; Battiste, 2005; Fitzgerald, 2003; Tuhiwa Smith, 1993). The fact that this scholarship is not new, but is only recently being taken up in the scholarship of educational administration and leadership, speaks of how deeply rooted the constructs of whiteness, colonialism, Western privilege, and patriarchy in leadership studies are. The research and study of leadership includes the study of the institutions, systems, and practices that were historically put in place to displace peoples indigenous to their stolen territories, and transform their ways of knowing, being, and doing. To that end, it is perhaps little wonder that anti-colonial calls for the restructuring, if not dismantling, of the very systems upon which the traditional leadership canon and its privileges have been validated and perpetuated have been suppressed. It is also why there exists growing critiques from anti-colonial feminists toward White Western feminist leadership theory that has tended to position White women for leadership as understood through a colonial power lens at the epistemic and practical expense of others.

### **Discontinuities and Ruptures**

As noted in the earlier sections, most feminist scholars who study educational administration and leadership have conceptualized their work from critical or post-structural perspectives. The differentiation between critical and post-structural perspectives was arguably the first significant rupture within the feminist body of scholarship related to educational administration and leadership. This branching out shifted the focus of attention, methodologies, and level and nature of analysis of study in the conceptualization and design of research. It also served to disrupt unified categories of knowledge of sex or gender that had often gone unquestioned by early critical feminist theorists who had been informed by second wave feminism. Coleman (2005) recognized the deterministic dangers of “essentialist feminism” when she described it as:

a view of women as different and celebrating women and their potential (Gilligan, 1982) as collaborative and caring, leading to the logical conclusion that women operate in a different and, implicitly better way than men. However, ‘all women are not all one way’ (Schmuck, 1996, p. 353) and neither are all men. It is now generally recognised that there is a range of different ways of being a woman leader or a man leader and that the differences between women will be just as great as the differences between women and men. (p. 15)

Other writers began to query how critical feminism did not necessarily disrupt additional categories of meaning such as race or class. This critique was leveled by Colleen Capper (1992) in relation to Judith Glazer’s (1991) critical work on the impact of feminism on the research and practice of educational administration:

while tangentially alluding to other oppressions, [Glazer's contentions] ring suspiciously of a White, middle-class view of feminism. . . her version of feminism obscures the layers of oppression within gender (such as race and class), and further, that while briefly describing post-structural views of feminism and their import on partiality, her work tends to privilege gender over race and class rather than claiming many parallel and intersecting aspects of such oppression. (p. 111)

Within this theoretical argumentation, however, post-structuralism was not without its own critiques. Blackmore (2000), for example, suggested that post-structuralism can serve to distract scholars from focusing on systemic inequities that have had major impacts on education:

While post-structuralists have tended to focus on the texts and images of cultural globalisation, it was economic globalisation that has impacted greatest on the nature of educational work. Feminist post-structuralist concerns with the local and framed by discourses about contingency and particularity can divert attention away from a systemic understanding of the politics of difference at a moment of radical economic restructuring. (p. 18)

In the last decade, the focus on intersectionality and the combination of feminist perspectives with those found in economics, sociology, anti-racist, and anti-colonial studies has caused yet another disruption in the trajectory of feminist thought in educational administration and leadership. Analyses have become more complex, assumptions are more fully deconstructed for potential hegemonic bias related to diverse factors, and recognition of how oppressions are layered for differently positioned individuals has grown. As Khalifa et al. (2019) noted:

Indigenous and minoritized womanist and feminist epistemologies (Fitzgerald, 2003; Suzack, Huhndorf, Perreault, & Barman, 2011) are invaluable to understanding the interlocking (Collins, 1986) and intersectional (Crenshaw, 1989) nature of oppression in colonial models of schooling and education, particularly in relation to the interplay between imperialist, White supremacist, capitalist, and patriarchal structures that work collectively and independently to divide, silence, and stifle Indigenous and minoritized women in their struggle against the patriarchy of colonialism (hooks, 2004; Khalil & DeCuir, 2018).

It is anticipated that these disruptions (and others) will continue to shape how feminism is theorized and enacted within educational administration and leadership. It is also likely that further disruptions in thought and research will occur as researchers struggle with issues of global import: the economic, political, and social sustainability of our human and nonhuman world (Pilgrim & Davis, 2015); the impacts of living in a world of surveillance (Dubrofsky & Magnet, 2015); the health and wellness of global populations (Walls, Butler, & Dixon, 2015); and the growing demands for inclusion of alternate worldviews that have traditionally been epistemically marginalized (Vaditya, 2018).

### **Critical Assumptions**

Though the scholarship of feminism in/and educational administration is diverse, and there may be as many conceptualizations of feminism “out there” as there are

scholars willing to engage in the work, there do exist some (relatively) common assumptions within current feminist thought related to educational leadership that are implied within the literature base. As is noted in the sections on the fields of memory and presence, some of this thinking has shifted over time as perspectives have become more inclusive. Current assumptions tend to include the following:

1. *Sex/gender matters.* Sex/gender remains necessary and valuable constructs upon which to center theory and research in the field of educational administration and leadership.
2. *Sex/gender is fluid.* Sex/gender is not a unitary construct, and scholars must be careful to avoid creating dualisms and/or essentialist assumptions within their efforts that characterize the experiences of “some” as the experiences of “all.”
3. *Feminist thinking includes diverse thinking.* There exists a need to study how sex/gender is taken up in leadership studies from multiple and interdisciplinary perspectives in order to consider the multiplicity of ways and forms that sexism and patriarchy remain prevalent in educational administration and leadership theory, research, and practice.
4. *There exists no unified or unitary “sisterhood.”* Sex/gender must be considered in light of intersectionalities that differently position individuals with leadership discourses and practice over time and in multiple contexts (race, class, national origin, ability, language, etc.).
5. *Relations of power matter.* Almost all feminist work in educational administration and leadership studies how relations of power shift, are negotiated, or constrained in leadership contexts, with an emphasis on how these relations of power evidence or impact sex-based or gender-based norms and/or discourses.
6. *Deconstructing discourse is important.* There remains the contention within feminist circles that the normalized discourse of educational administration and leadership remains gendered, and that there exists a need for scholars to deconstruct how this discourse reifies sexism and patriarchy conceptually, within research circles, and in practice.
7. *Privilege (and marginalization) exists everywhere.* Feminist theorists and researchers must continually engage in reflexive practice that critiques their potential to reify and/or perpetuate hegemonic positions (academic feminism, whiteness, global north privilege, Western privilege, etc.) amid a discourse that ostensibly advocates for equity.
8. *The vilification of the “f-word” is ubiquitous.* Resistance or outright rejection of the term “feminism” has occurred over time within the academic circles of educational administration and leadership. Such resistance exists as a perennial tension for those who engage in feminist work, and scholars must “trouble” the canon with caution. There are very real personal and professional risks associated for those involved in feminist work, even though for most feminist scholars, fighting for equity and justice is a way of being more than a way of thinking.

## Conclusions and Reflections

In conclusion, feminist thought has influenced the knowledge base of educational administration and leadership, though its influence has not been as robust as it could/should be. This failure is due, at least in part, to the fact that many researchers who wish to study sex/gender in/and educational administration and leadership have themselves been influenced by a largely androcentric leadership literature base in their leadership programs that has vilified and/or been skeptical of feminist theory even as the research may focus on topics that might lend themselves to feminist analysis (i.e., women/men in leadership, etc.). In fact, many studies of women in leadership, for example, have avoided, minimized, or even openly disavowed the use of feminist frameworks to conceptualize their work. Those who have unapologetically claimed feminism within the canon of educational administration and leadership have done so often at significant cost to themselves personally or professionally. What references to feminism exist in the leadership literature base often references the failure of second wave reforms, implies a fear of radicalization inherent within the more conservative echelon of leadership studies, and focuses on topics of study and research that reify normative, essentializing, White Western understandings of educational administration and leadership. When it is mentioned in leadership meta-analyses, feminism remains firmly on the periphery of the knowledge base, acknowledged yet cast aside, thereby sending a subliminal but not-so-subtle message regarding its perceived significance and value.

In essence, feminist theory in educational administration and leadership discourse has fallen prey to the paternalism that it rails against. It remains on the periphery of the traditional canon, even though it has extended the knowledge base, has served to describe the inequitable landscape and experiences of/with leadership, and has made real gains in pockets of influence for White Western women in particular. It has not significantly changed the normative discourse that is studied in leadership programs even though its potential to shift that discourse is immense. Those who conduct feminist work continue to fight for legitimacy and space in this discursive field, even as they foster change in the interest of equity and justice. However, it is possible that feminist leadership perspectives, informed by complex economic, political, cultural, and sociological constructs, will become increasingly necessary and prevalent in leadership thought/practice as global sustainability crises make it impossible to deny or avoid the inequitable social tensions that differentially affect individuals on the basis of sex, gender, or other intersectional characteristics.

Feminist researchers continue to (re)theorize the conceptualization and study of educational administration and leadership. They work tirelessly to critique current thinking in order to avoid falling into atheoretical and/or anti-intellectual pursuits inherent in utilitarian reductive educational administrative scholarship. Given recent declines in feminist scholarship related to educational administration generally, and declines in feminist conceptual work in particular, there exists a need to reinvigorate the theoretical knowledge base and move beyond traditional leadership topics of study to extend what is acknowledged and legitimated as feminist scholarship within the canon of educational administration. This includes the introduction of the work conducted by scholars whose institutional affiliations are outside of Western institutions in the United

States, Canada, Australia, and the United Kingdom, and whose feminist theorizing is informed by cultural and linguistic traditions that have not previously been legitimated in the traditional discourses of educational administration and leadership. Although there exists a growing diversity of scholarship in the literature base from authors of non-Western countries that tangentially references feminism, it is often not the primary conceptualization or methodology for the work. This provides evidence of a genealogical acknowledgment of the assumptions of Western feminism but also the critique (and perhaps rejection) of its utility in diverse contexts.

It is because feminism has been critiqued so often that it has been able to shape-shift to reflect and accommodate new ways of thinking, being, and doing. Feminist theory must be acknowledged for its diverse intellectual and methodological genealogy that allows for comprehensive and complex analyses of leadership theory, research, and practice. Though the critiques of feminism remain, and scholars must perennially guard against the encroachment of privilege and bias in its conceptualization and enactment, gender has become recognized as a legitimate category of analysis, as has its intersections with other categories of analysis. Rather than being irrelevant, feminist theory offers to the scholarship of educational administration and leadership the possibility of renewal, of inclusive perspective, and multiplicity of voice. It asks theorists to consider their own privileges, to acknowledge the ways in which they have been complicit in the perpetuation of inequity, and to reframe their understandings and actions accordingly. This is not accomplished without conflict or discomfort. . .but that is the nature of equity work. Just as it is the nature of leadership.

## Abstract

This analysis first traces the development of constructivist thinking and then analyzes leadership literature for the roots of constructivist thinking in its evolution. While the word, constructivism, is a fairly recently developed term, constructivist thinking surprisingly actually stretches back into the Dark Ages. Its progression is traced through the ages to the present and then the same model is used to inquire into thinking about leadership. Finally, both are synthesized into a theory and practice of constructivist leadership.

In the treatment of constructivism, the two major forms of constructivist thinking are analyzed, namely, psychological and social constructivism. Psychological constructivism deals with how individuals learn, how they develop knowledge, how they construct their own worlds, while social constructivism

---

A. Shapiro (✉)  
University of South Florida, Tampa, FL, USA

focuses on how the social world is constructed. Interestingly, as can be predicted, both major forms have generated a moderate and a radical branch. Both will be presented with the controversial conclusion that radical social constructivism questions the objectivity of science and our common sense notions of “reality.” Explorations of both question the validity of notions about the objectivity of science and the general understanding of “reality.”

The next focus is on creating a theory and practice of constructivist leadership, by first examining relevant major theorists in the field such as Barnard, who focused on communication and leadership, followed by Lambert et al. who examined in turn interpersonal relationships followed by Bryk and Schneider whose research discovered trust as quintessential for effective leadership.

Next to be examined is Wilson, Byar, Shapiro, and Schell’s Tripartite Theory of Organizational Change and Succession with its three phases that all organizations careen through in their careers as an example of organizational entropy. Its four styles of leadership behavior are then parsed out. Its theory of organizational dynamics’ application to constructivist leadership is quite apparent. Next to examined is the leader as a change agent facilitator. Keeping in mind the virtually inevitable forces of entropy, several educational reform plans are cited that, if sustained, can thereby empower faculty and administrators and defeat these destructive forces.

A summary, conclusions, and implications end the document.

---

### Keywords

Constructivism · Symbolic interactionism · Psychological constructivism · Social constructivism · Theory · Reality · Leadership · Leadership and acceptance of communication · Leadership and relationships · Leadership and trust · Leadership and organizational dynamics and the Tri-Partite Theory of Organizational Change and Succession · Entropy and organizations · Educational reforms as change strategies to control organizational entropy

### The Field of Memory

Conceptions of scientific inquiry. Conceptions of “reality.” The idea of what is true. The idea that all knowledge is constructed. The idea that there are no eternal realities. The idea that the social world is socially constructed. The idea that scientific constructs and concepts, that science itself is constructed. The idea that conceptions of leadership are socially constructed. The idea that a number of key contributions to leadership theory can be utilized in developing a theory and practice of constructivist leadership. The idea that leadership can function as a change agent/facilitator. The idea that organizations mindlessly generate a career that careens through three stages and, therefore, are subject to the forces of entropy. The idea that various styles of leadership generally are characterized by each of the three phases of an organization’s stages and that one is a combination of two styles. The idea that the forces of entropy entrap organizations. The idea that administrators can subvert the forces of

entropy with carefully designed reform educational models that generate heavy involvement of all constituencies.

### **The Field of Presence**

No theory of knowledge nor of leadership satisfies our thirst for greater insight into both. Various theories that are constructed may be useful to expand our insights into both the nature of knowledge and of leadership, hopefully. Somewhat slowly, new theories emerge that provide greater insights into the nature of knowledge. Various leadership theories dominate thinking, practice, and literature only to see new constructs emerge that provide divergent insights into the nature of leadership and the organizations that host and influence their practice. New theories shine different constructs on the nature of leadership such as communication theory, relationships theory, and relational trust. The impact of the force of entropy on organizations and the potential impact of leadership on entropic forces becomes evident when stages of organizational development are studied. Various leadership models appear to emerge when organizations shift into new stages of development, two of which can be considered constructivist in nature. Mechanisms consisting of structure and process appear useful to prevent the forces of entropy from overwhelming organizations.

### **The Field of Concomitance**

The social sciences provide a rich field from which to draw constructs. Leadership has long been a focus of the social sciences, while constructivism is a considerably more recent field of study. Literature on leadership harkens back to the Homeric tradition, from whence is drawn the construct of the hero. Thus, the fields of philosophy, history, sociology, psychology, anthropology, and political science provide sources for literature on leadership. Certainly, Kant provides original thinking to support constructivist theory, such as observing that certain aspects of our knowledge of the physical universe were constructs of our cognitive apparatus. Similarly, Kuhn is a source for generalizing that new constructs emerge to change any scientific fields' most basic beliefs. Besides the major contributions of philosophy, the social science sources for constructivism include education, history, sociology, psychology, and anthropology. Such constructs as communication theory, interpersonal relationships, scientific inquiry, and in social psychology, symbolic interactionism provide major underpinnings for both leadership and constructivist inquiry. To that may be added organizational theory to provide further insights into synergizing both fields.

### **Discontinuities and Ruptures**

All fields of knowledge face disruptions as new theories develop. New theories and practices of leadership are merely new theories, rejecting the idea of progress. New theories add divergent dimensions to our armamentaria of knowledge and leadership theories. Social movements comprise the architects of discontinuity and rupture. Social movements can change organizations and thus the succession of leadership models adopted by changing organizations. Changing leadership in itself can be disruptive to organizations. Adopting constructivism as a model is disruptive, but can ensure new growth and change.

### Critical Assumptions

So-called “realities” are constructed and do not exist in nature. The fields of science are also constructed, thus changing over time. The assumption that one can influence his/her organization can be useful. The assumption that one can influence the career of his/her organization for the good may be facilitative. The assumption that knowledge itself and leadership theory and practice can be useful. The assumption that constructivist thinking and practice can alter an organization and its leadership behavior may be important.

The overwhelming consensus as the twentieth century closed has been that knowledge is constructed. (D. C. Phillips, *Constructivism in Education*)

Constructivism has become the reigning paradigm in education today. (S. Hausfather, *Educational Horizons*)

The development of collective meaning is an essential characteristic of a learning organization. (Peter Senge, *The Fifth Discipline*)

---

## Introduction

The purposes of this chapter are to explore the development of constructivist thinking through the ages and to develop a theory of constructivist leadership. First, a conceptual history of constructivist thought and practice as our analytic model is presented. Mentioned briefly are two major concepts of constructivism and then two major aspects of constructivism, psychological and social. Insights toward a comprehensive theory of constructivist leadership are developed.

---

## The Roots of Constructivist Thinking

While use of the word, constructivism, is recent, amazingly, the first tendrils of constructivist thought stretch back to the Dark Ages, to Bishop Nicole D’Oresme in 1377.

In his musical aesthetics, D’Oresme formulated a modern ‘theory of perception’, which was not the perception of objective beauty of God’s creation, but the constructive process of perception, which causes the perception of beauty or ugliness in the senses. Therefore, we can see that every individual perceives another ‘world.’ (Taschow, 2003)

Four hundred years later, Kant contributed to constructivist thought, as philosopher D. C. Phillips (2000, p. 8) observed, Kant

argued that certain aspects of our knowledge of the physical universe (time and space for example) were the product of our own cognitive apparatus – we ‘construct’ the universe to have certain properties, or, rather, our faculty of understanding imposes those temporal and spatial properties on our experience.

This represents a huge change from the prevailing imagery that God's world is perfect and impervious to mere human input.

Next is Descartes' (1637) assertion that he examined all of his beliefs, which he reduced to his famous "I think, therefore, I am" statement. While this does not move him entirely into the constructivist camp, he questions his beliefs unless they could be proven. He perceives that his thinking results in his existence. Rousseau (1762) believed that students learn through their experiences, senses, activities, preceding Dewey by centuries.

Marlowe and Page (1998, p. 17) noted "Pestalozzi (1801–1898)...believed that the student's mind receives impressions through observation and experience and that these impressions produce ideas and an organized mental structure that the student uses to compare, separate, sort and conclude." Both Rousseau and Pestalozzi edge into constructivist thinking.

Piaget (1954) actually worked with children empirically to determine how they thought, writing *The Construction of Reality in the Child*. He asserts that each child constructs his or her own reality, a phenomenal conclusion. "According to Piaget, learners construct their own knowledge schemes in relation to, and filtered through, previous and current experiences" (Marlowe & Page, 1998, p. 18). This revolutionary work moves into constructivist thinking.

For Piaget, a child's construction of reality differs considerably from that of adults. Marlowe and Page (1998, pp. 13–19) cite Dewey, Bruner, Freire, and Vygotsky contributing to constructivist thinking, although not using the word. Dewey thought that projects should be the center of curriculum to increase student motivation and involvement to increase student knowledge and skill. For Bruner (1961), discovery was the keystone to education. Discovery increased intellectual ability, ability to solve problems, motivating interests, and cognitive structures.

George Herbert Mead (1934), Dewey's colleague at the University of Chicago, who developed social psychology, thought that the individual's self is constructed from social interaction. His student, Herbert Blumer (1969), developed the school of Symbolic Interactionism, critical to constructivist theory because it explains social behavior in terms of how people interact with each other using symbols.

---

## The Trunk: The Major Forms of Constructivist Thinking

D. C. Phillips (2000, pp. 6–7) was commissioned by the National Society for the Study of Education to edit *Constructivism in Education: Opinions and Second Opinions on Controversial Issues*. Phillips thought at least two different constructs had developed, one consisting of an idea about the bodies of knowledge or disciplines that have developed during human history. The second deals with differences

in understandings about how people learn and thus, how teachers should teach, based on these principles.

Phillips believes that constructivists' ideas about how people learn led to psychological and social constructivism.

## Psychological Constructivism: Moderate and Radical

Psychological constructivism is concerned with understanding the individual psychologically, thus dealing with how people learn and develop knowledge, constructs, beliefs, and attitudes:

Roughly, this . . . type of constructivist view is that learners actively construct their own ("internal," as some would say) sets of meanings or understandings; knowledge is not a mere copy of the external world, nor is knowledge acquired by passive absorption or by simple transference by one person (a teacher) to another (a learner or knower). In sum, knowledge is *made, not acquired*. (Phillips, 2000, p. 7)

Each person builds his/her ideas, perceptions, grasp of new facts, understandings of new information, symbols, and attitudes based on our existing knowledge, our bodies of information. We build these through our experiences.

These perceptions are supported by sociologists Berger and Luckman's *The Social Construction of Reality* (1966), asserting that people tend to construct their realities based on their society and culture. People construct their realities based on gender, age, socioeconomic class, religion, rural, urban or suburban subcultures, experiences. Each person perceives the world quite differently based upon these factors, plus more.

Some might believe that twins develop similar perceptions of most things, but that is not valid. Usually, an older twin is able to tell which is the older twin since his or her behavior provides significant behavior. The older twin is treated differently than the younger. Therefore, each person constructs his/her own world differently – a fundamental constructivist tenet.

If moderate psychological thought develops, surely someone will construct a radical psychological model. Ernst von Glasersfeld (1995, p. 1) startles us by asserting that his understanding of the concept of blue may differ from mine, which, he notes "is profoundly shocking." Both Phillips and von Glasersfeld propose

We cannot be certain any two individuals will construct the same understandings; even if they use the same linguistic formulations to express what they have learned, their deep understandings might be quite different. (Phillips, 2000, p. 7)

This viewpoint is on target since no one is able to share similar experiences and yet perceive these experiences identically. Von Glasersfeld, however, misses perceiving the processes that make us human, social animals. This comprises the power of culture and its underpinning vehicle, language. Language itself is socially constructed. Mead (1934) noted that the human mind, the "self" all humans form, and our society are all socially constructed.

## Social Constructivism: Moderate and Radical

This second form of constructivism is essential to analyzing constructivist leadership since it is within organizations that leadership develops and functions. Sociologists consider organizations as socially constructed, shared realities. Phillips states that it

Embodies a thesis about the disciplines or bodies of knowledge that have been built up during the course of human history. I have described this thesis as, roughly, that these disciplines (or public bodies of knowledge) are human constructs, and that the form of human knowledge has taken in these fields has been determined by such things as politics, ideologies, values, the exertion of power and preservation of status, religious beliefs, and economic self-interest. This thesis denies that the disciplines are objective reflections of an “external world.” (2000, p. 6)

For moderate social constructivism, the social world is socially constructed as demonstrated by Berger and Luckman’s provocative 1966 title, *The Social Construction of Reality*. The *entire social world* is socially constructed, from our merest habits of eating with silverware, to driving on the right (except in the UK), to shaking hands in greeting, to not spitting on the floor.

Examples abound. Soccer has been highly popular all over the world, but until recently, not in the United States. Cricket is enormously popular in the United Kingdom, but mystifying to US audiences. English is read from left to right, whereas Hebrew is read from right to left and Chinese is read up and down. English starts every sentence with a capital letter, but Hebrew capitalizes a few letters when they end a sentence.

Gergen (1994) adds insight with his four social constructivist dimensions (quoted by Samier & Miley, 2020, p. 177)

that counter the dominant realist traditions of organization: communal rationality that is culturally-embedded instead of assuming a culture-free rational agency; socio-cultural processes that produce ‘pictures’ of realities instead of the scientific empirical observational method; language as part of social action, creating meaning through organized forms of interaction that constitute reality instead of the realist view of language as a representation or reflection of reality; and a multi-culturation of meaning that varies from culture to culture that is humanistic and variable instead of the ‘narrative of progress’ that is inherent of a more ‘scientific’ perspective that aims at an often dehumanizing generalization theory or model.

Pinker cites historian David Wootton in describing what an educated Englishman’s beliefs were in 1600:

He believes witches can sum up storms that sink ships at sea. . .

He believes in werewolves, although there happen not to be any in England – he knows they are to be found in Belgium. . .

He believes Circe really did turn Odysseus’s crew into pigs. He believes that mice are spontaneously generated in piles of straw. . .He has seen a unicorn’s horn, but not a unicorn.

He believes a murdered body will bleed in the presence of the murderer. He believes that there is an ointment, which if rubbed on a dagger, which has caused a wound, will heal the wound. . .He believes that a rainbow is a sign from God and that comets portend evil. . .He

believes, of course, that the earth stands still and sun and stars turn around the earth once every 24 hours.

A century and a third later an educated descendent. . . would believe none of these things. (Pinker, 2018, p. 9)

This social construction of reality exemplifies the extremes to which a society can influence its people. Pinker cites sociologist Robert Scott's generalization that in the Middle Ages, "the belief that an external force controlled daily life contributed to a kind of collective paranoia."

Rainstorms, thunder, lightning, wind gusts, solar or lunar eclipses, cold snaps, heat waves, dry spells, and earthquakes alike were considered signs and signals of God's displeasure. As a result the "hobgoblins of fear" inhabited every realm of life. The sea became a satanic realm, and forests were populated by beasts of prey, ogres, witches, demons, and very real thieves and cutthroats. (Pinker, 2018, p. 9)

Visiting Paul Revere's rather small house of 12 kids and 2 adults leads one to conclude that in colonial times, the concept of privacy did not exist. It is a recently developed construct, but with lots of emotional meaning – today.

---

## Radical Social Constructivism – A Major Threat to the Assumed Objectivity of Science and Mathematics

Radical social constructivism is a horse of another color. It seems to push our perceptions of reality somewhat strongly. The radical constructivists' "strong program in the sociology of knowledge" believes

That the form that knowledge takes in a discipline can be *fully explained*, or *entirely accounted for* in sociological terms. That is, . . . what is taken to be knowledge in any field has been determined by sociological forces including the influence of ideologies, religion, human interests, group dynamics and so forth. . . this group of thinkers wishes to deny that so-called knowledge is in any sense a reflection or copy of that "external reality" that the community in question is investigating. (Phillips, 2000, pp. 8–9)

Most hard scientists and mathematicians went ballistic about radical social constructivism, leading to the "science wars." However, Phillips notes that science's major concepts did not drop out of heaven like manna. They were developed by humans.

It should be clear that the concepts we use, whether in every day or in the scholarly disciplines, did not descend – fully formed – out of the blue. There was a time when the concepts of "energy" or "mass" or "molecule" or "psychosis" or "working class" did not exist; and the halting and interactive process can be traced by which these concepts and the very things or categories themselves were developed. (Phillips, 2000, p. 88)

Kuhn (1962) notes that science's concepts are hardly eternal, that radical new ideas at times are very slowly adopted, many scientists holding onto their familiar,

older paradigms. Some wag noted that new shifts in major paradigms become adopted when the old generation dies off.

Zais (1976, pp. 85–86) states, “Scientific theory should not be regarded as an objective map that describes and explains reality but rather as” quoting James Conant (1952) “a policy – an economical and fruitful guide to action by scientific investigators.” Zais continues

Scientific, empirical-rational methods had shown that a scientific theory was not, as had been thought, a value-free, objective description of reality, but a construct invented to advance human endeavors. . . Theory regarded as a map, as mentioned earlier, purports to tell us what the world is really like. It implies *discovered* knowledge, which literally represents an uncovering of the nature of reality. By contrast, modern scientific theory – that is, theory regarded as a policy for action – claims only to tell us what are the best *representations* of the world in terms of present experience. Knowledge from this point of view is regarded as *constructed*, that is, fabricated on the basis of human experience for particular ends-in-view. . . theory may vary accordingly as purposes for which it is constructed may vary. . .

Zais cites esteemed physicist Bridgman (1950, pp. 86–87):

As we have noted in a previous paragraph, all of the evidence available seems to indicate that the revolution in modern physics has rendered the “map” concept of scientific theory both an illusion and a presumption. Scientific theory not only *does not* describe the nature of reality, but it *cannot*. The reason, some physicists contend, is that theory is a product of human thought processes, and modern physics suggests that human thought processes may not correspond sufficiently to the structure of nature to permit us to think about it at all.

Thus, the nature of reality and the concept of existence become meaningless, not because of the nature of the world, because of the construction of the human mind, meaning that man finds it impossible to transcend his own human reference point. Bridgman (1950, p. 87) notes, “We cannot even express this in the way we would like. . . it literally is true that the only way of reacting to this is to shut up.” Bredo (2000, p. 149) supports this “As an article on quantum mechanics on *Scientific American* suggested, ‘The doctrine that the world is made up of objects whose existence is independent of human consciousness turns out to be in conflict with quantum mechanics and the facts established by experiment’” (D’Espagnot, 1979, p. 158).

Concerning the question of whether knowledge is made or found, Bredo (2000, p. 150) asserts “The issue actually goes much deeper. The deeper issue is whether the objects that are known are given independently of the knower, or are in some way made or constructed by the knower’s activities. Put in another way, the contentious issue is not whether knowledge is made or found, but whether ‘reality’ is made or found.” This can lead the unsuspecting seeker to emerge with mutually polarized positions. Fortunately, Bredo tries to resolve this by turning to Mead (1934).

Viewed in this non-dogmatic way a scientific conclusion represents the conclusion of the latest inquiry, not *the* conclusion of inquiry. This approach allows science itself to evolve, reconstructing present conclusions when new facts call for it. When science is placed within

the world, rather than outside of it, the rigid division between the nature and human is also eliminated, leaving in its place various sciences with differing aims and objects, all of which involve some form of participation in the phenomena being studied. (p. 150)

Bredo (2000, p. 152) concludes that perhaps “the world is many ways,” that employing Mead focuses on our interaction with both the natural and social worlds. We interact with both, so that scientific conclusions are not eternal truth, merely those of the latest inquiry.

Rosalind Driver, a major pioneer in science education, helps:

Any account of teaching and learning science needs to consider the nature of the knowledge to be taught. . . The objects of science are not the phenomena of nature but constructs that are advanced by the scientific community to interpret nature. . . the point is that, even in relatively simple domains of science the concepts used to describe and model the domain are not revealed in an obvious way by the “book of nature.” Rather they have been invented and imposed on phenomena in attempts to interpret and explain them, often as a result of considerable intellectual struggles. (1986, p. 11)

Blumer (1969) coined the term *symbolic interactionism* in analyzing human social behavior, thus trashing the notion that things have an inherent meaning:

Symbolic interactionism does not regard meaning as emanating from the intrinsic makeup of the thing that has meaning, nor does it see meaning as arising through a coalescence of psychological elements in the person. Instead, it sees meaning as arising *from the interaction* between people. The meaning of a thing for a person grows out of the ways in which other persons act toward the person in regard to the thing. Their actions operate to define the thing toward the person. . . the meaning of things is formed in the context of social interaction, and is derived by that person from that interaction. . . the use of meanings by the person in his action involves an *interpretative process*. (pp. 4–5)

---

## The Branches and Leaves of Constructivism

### Leadership and Constructivism

This section focuses on developing a theory and practice of constructivist leadership. Amazingly, the number of books on constructivist leadership consists of three by Lambert et al. and three by Shapiro, which will be discussed later. Only two works on constructivism and organizations have been published, both by Shapiro (2009, 2013).

Following the model used in getting a handle on constructivism, this section first explores insights developed by the father of administration, Chester Barnard.

Patently, constructivism involves the construction of meaning by individuals immersed within social groupings in which they interact.

### Chester Barnard

Chester Barnard, the chief economic officer of Bell Labs, contributed key insights into constructivist leadership before the term was invented. Barnard (1938) thought that to be effective, to have power and authority, leaders’ communications had to be

*accepted* by subordinates, contradicting the prevalent idea that authority and power came from superiors. Barnard states the exact reverse, *authority must be accepted by one's subordinates* for it to exist. They accept it because they believe the communication comes from a source vested with the *right* to make decisions or communications, a stunning insight. Thus, if an administrator loses support of subordinates, he/she actually has no authority nor power. This happens, but rarely.

Barnard delineated four conditions for accepting a communication:

1. The person(s) must understand the communication adequately.
2. The communication cannot be inconsistent with the person's perceptions of the purpose of the organization.
3. The communication cannot be contrary to the individual's perceptions of his or her purposes.
4. The person must be able to carry out the directive mentally and physically.

If American soldiers in the Iraq war were ordered to torture Iraqis and felt that it was inconsistent with their sense of morality, they may have refused. FBI agents refused, although some CIA agents did not.

In the *Functions of the Executive* (1938), Barnard delineated three interlocking, essential functions of any executive, the first being to facilitate a common purpose. The second is to facilitate designing a system of communications as direct as possible in order to accomplish a common purpose. The third is to facilitate establishing a system of cooperation to achieve a common purpose. All three are essential to the effective functioning of any organization, hence Barnard's unusual title.

Barnard changed the way we perceive organizations from treating organizations as their structure to perceiving them as a series of small, informal social systems which provide keys to achieve the organization's purpose, and which can serve to protect individuals. Without systems of communication and cooperation, it is impossible to achieve a common purpose, to develop loyalty to that purpose and to each other, which are, patently, constructivist in nature. Barnard's recognition of the small group/social system as the basis for organizations to function provides a fundamental insight to constructivism since it establishes the essential role of social systems to understand how organizations function.

Barnard implicitly recognizes the essential role of trust and respect for individuals and is quite adamant that administrators operate in a climate of morality, all central to constructivist principles.

### **Lambert et al.: Relationships**

Five decades later, Lambert et al. (1995) proposed a theory of constructivist leadership as follows:

Constructivist Leadership that entails

The reciprocal processes that enable. . .  
 Participants in an educational community to construct meanings. . .  
 That lead toward a common purpose of schooling. (p. 51)

“Since leadership is viewed as enabling reciprocal processes among people, leadership becomes manifest within the relationships in a community. . .” (p. 32). Lambert et al. perceive leadership as making things happen, facilitating developing a purpose.

Lambert cites Poplin and Weeres’ (1993) study, finding the most important factor in schools is *relationships*.

The researchers, who were teachers, conducted the study in a series of dialogues, writing this remarkable statement:

For it is in the coming to know that we came to want to act. It is in the listening that we changed. It is in the hearing our own students speak, as if for the first time, that we came to believe. This is what we heard. . . *Relationships dominated all participant discussions* about issues of schooling. No group inside the schools felt adequately respected, connected, or affirmed. (p. 19)

“No group in the schools felt respected, connected, or affirmed,” a commentary on American education after decades of forced reform resulting in many school personnel becoming alienated.

Lambert and Poplin and Weeres comprise exemplifications of Blumer’s (1969) symbolic interactionism, with researchers deriving insights from interactions among respondents and concluding that relationships form the core of schools, and of all organizations.

### **Trust: Bryk and Schneider**

Bryk and Schneider (2002), two sociologists studying elementary schools in Chicago, note that they stumbled onto a missing ingredient in school reform: relational trust which rested on four bedrock supports:

1. Respect
2. Competence
3. Integrity
4. Personal regard for others

“Again and again,” notes Gewertz (2002, October) “they found that teachers and principals who had one another’s trust, and the trust of parents, had exhibited strong and consistent signs of all four” of these bedrock supports (p. 3).

The researchers examined 100 schools that had made the most and least gains, finding that the schools with high levels of relational trust “had a 1 in 2 chance of being in the ‘improving’ category, compared with lower-trust schools, which had a 1 in 7 chance” (Gewertz, 2002, October, p. 3). Without relational trust, administrators have a 14% chance of improving a school.

All the huge focus on school reform, all the emphasis on teaching to the test, all the enormous energy on test-prep is wasted, is inconsequential, unless trust is built. And trust is undermined by the ceaseless emphasis on forced testing, rather than on relationships – with the staff and with the students.

Gewertz quotes Bryk and Schneider,

In this regard, relational trust constitutes a moral resource for school improvement. . . People in a school community are involved in one another's lives, and sometimes we forget about the importance of the way they interrelate with one another and how that makes a difference in the way learning takes place.

This is about not forgetting the people. I think that's what we've brought back to the table. (p. 4)

The themes of trust, of relationships, of morality, glitter like diamonds in thinking about constructivist leadership. That these behaviors underlying relational trust relate to leadership goes without saying.

Central school administrations undercut trust by insisting that they have full authority to appoint teachers instead of involving administration and staff. Gewertz points to the negative impact that poverty and size exert on schools, but notes that even poverty is overcome by relational trust. As for school size, Shapiro (2009) provides strategies to overcome the negative impact of large schools.

---

### **The Tri-Partite Theory of Organizational Change and Succession: Wilson, Byar, Shapiro, and Schell**

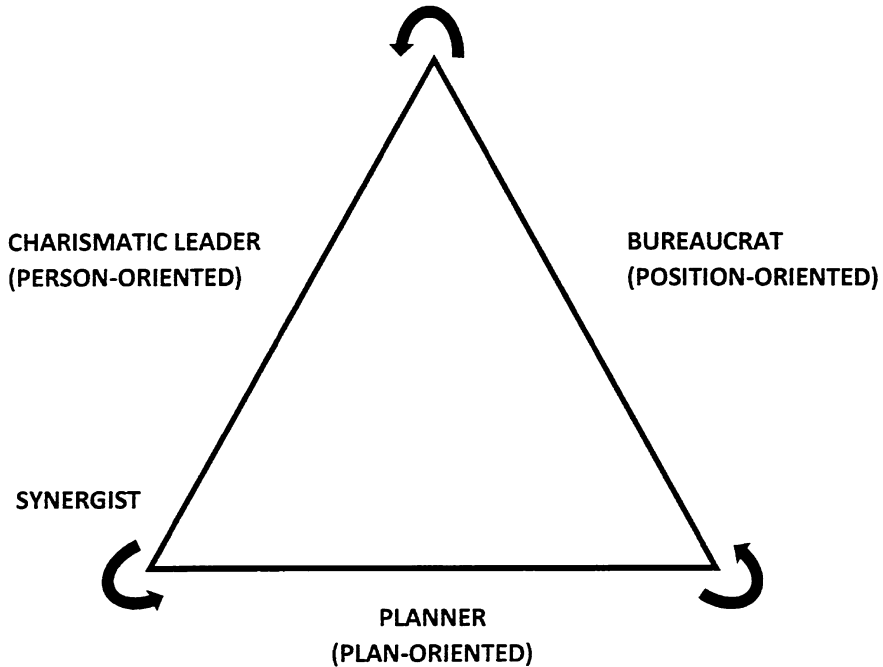

Wilson, Byar, Shapiro, and Schell (1969) thought it vital to examine organizational dynamics, so they analyzed the phases or stages that organizations career through in their careers.

They concluded that a trajectory of three phases developed. The first, a charismatic or a person-oriented phase, was followed by a planning phase and the third by a bureaucratic or position-oriented phase. Obviously, this is a theory of entropy. In thinking about this, the authors discovered that once in a while a leader who combined both charisma and the ability to plan might be found. The team called this administrator a synergist, borrowing the term from medicine in which two drugs acting together produce far greater results than each operating alone.

The change in leadership and phases in an organization's career occur because of organizational dynamics. In the third phase of its career, a bureaucracy, people both within and outside of the organization see it as stationary, resisting change, increasingly unable to meet its employees' and those it serves' needs. If it is a unit within a larger organization, or if it is the entire organization itself, this becomes increasingly apparent to the board, or to the administrator leading the organization (Fig. 1).

The solution is to find a charismatic leader or a synergist to wrench the unit out of its doldrums and refocus on developing and achieving its purposes. The charismatic leader energizes the organization, refocuses on its purpose, and gives it new vigor, new energy.

But after a small handful of years, the charismatic moves on, so people are anxious to keep up their momentum. They find a planner to develop plans to achieve

**Fig. 1** Phases of Organizational Change: Tri-Partite Theory

their goals. This is also a dynamic phase of the organization's career. After a while, things become more and more routinized, vigor seems to decrease, the planner leaves, and someone usually within the organization is selected to run it. This bureaucratic phase of the organization's career is usually the longest lasting, unfortunately, until once again, the organization needs rescuing from its nonfunctional, bureaucratic phase. This describes the process of organizational entropy.

Organizations experience charismatic and planning phases, which are constructivist phases in their career. The organization is most constructivist when it has a charismatic leader, a planner, or a synergist. The discussion by Barnard and Lambert points to the necessity of planning. The Wilson et al.'s study brings more precision and an ability to predict that organizations will experience going through a planning phase in their careers. This supports Barnard's insistence on the necessity of planning to achieve a common goal.

One of the foci of Shapiro (2000) is the leader as a change agent, and another examines organizational dynamics, with a third focusing on power in organizations.

Shapiro (2009) digs into the dynamics of organizations, such as images, organizational cycles, and pulls, and focuses on establishing oneself and the nature of power in organizations. It also provides case studies on a process of turning a school into a constructivist model.

---

## The Leader as a Change Agent/Facilitator

This role of the charismatic or planner or synergist fits admirably into extensive literature on the leader as a change agent. As Wilson et al. (1969) note, these leaders are essentially change agents. They enter into an organization to make changes. Somewhat recently, some administrators see themselves as fulfilling either charismatic and/or planning roles.

This formulation has become an organizational cult phenomenon with courses and literature focusing on leaders as change agents, some quite academic, others more in a “how to” vein. Lunenburg (2010), for example, provides a serious focus. Change agents can be internal or external.

Many consultants, regionally, nationally, and internationally, often fulfill the role of change agent, to meet organizational needs. Such change agents have included W. Edwards Deming, Stanton Leggett, and a host of other people of more or less fame. Deming focused on understanding the system and in pursuing quality, which is largely responsible for the majority of cars driving our streets being Japanese and Korean. Those two nations took his approaches seriously, while the Big Three American carmakers, probably in a bureaucratic phase of their organizations’ careers, were less accepting, at least for quite some time.

---

## Developing Reforms and Systems to Generate Change in the Organization

A considerable literature has developed pertaining to reducing a large school’s size by decentralizing it into a small schools or a house schools plan. This involves developing a plan, which can generate a good deal of energy and focus and which can create many positive outcomes. Advantages are numerous. For example, if Barnard’s (1938) three indispensable elements of an organization are used, that is, a clear purpose, shared cooperation, and a system of clear communication, manifestly, a smaller school can more readily establish a shared purpose since people in a smaller system can develop a greater sense of participating and belonging. Similarly, since people feel closer to each other, get to know each other, cooperation can occur more readily. In a smaller organization, communication is more often a face-to-face basis so the organization becomes a small folk society with direct communication occurring much more frequently.

Many other advantages can be discussed, among them increased relational trust, greater academic achievement (Bickel & Howley, 2002; Fowler & Walberg, 1991), decreased toxic climates, closer social relationships, plus other educational factors.

Similarly, developing a Professional Learning Center (PLC) can operate as a plan which can generate a good deal of energy and faculty involvement in professional study. Stohl, Bolam, McMahan, Wallace, and Thomas (2006) co-authored a review of the literature that is instructive. PLC’s can be a major enterprise for teams of

faculty and/or administrators to improve their educational understandings and professional practice. Often, a planning period once a week or every other week can be instituted to facilitate the purposes of the effort.

Magnet schools, originally developed in the 1960s and 1970s to desegregate schools, can comprise a reform effort which can develop improved quality in schools. Usually small in size, and public in nature, they focus on developing a specialized program to attract both student and parents (hence the “magnet” term). Such schools often attract parents who become strongly supportive. Magnets can develop all sorts of programs, only limited by the imagination of the founders and limitations of the school system. Examples include special programs for special education, programs for the gifted, outdoor education models, foreign language immersion models.

A host of different education models have developed, but this chapter will focus on two, among them the Montessori schools and Waldorf schools. Montessori schools are essentially organizations that develop self-directed, activities-oriented, collaborative models, often for primary students (Whitecarver & Cossentino, 2008). Teachers develop age-appropriate activities to guide the students. The model was developed by Montessori over 150 years ago and it still widely practiced.

The Waldorf schools also provide a model that attracts the loyalty of parents and students. Developed over 90 years ago by Rudolph Steiner, it attempts to develop pupils’ intellectual, artistic, and practical skills in an integrated and holistic approach (Petraash, 2002).

Manifestly, other models exist. The charter school movement and the voucher movement certainly can be cited. Some charters are public, others are private. However, a full discussion of their quality far exceeds the purposes of this chapter, other than noting that a full third of charters have collapsed.

---

## Summary, Conclusions, and Implications

This study attempted to pull together elements toward a comprehensive theory of constructivist leadership, first focusing on the development of the constructivist construct. It dug into the roots, trunk, and branches of constructivism from the fourteenth century to today, including the two major forms of constructivism, psychological, and social. Elements of constructivist leadership were synthesized, starting with Barnard’s perception that subordinates must accept communication from a leader for his/her authority to exist, to Lambert’s insistence that relationships are essential to effective leadership. Both insist that morality is essential for any organization.

Bryk and Schneider found that relational trust was quintessential for effective leadership. The Tri-Partite Theory of Organizational Change and Succession noted that organizations are entropic, careening through three phases in their careers: charismatic, planning, and bureaucratic, with leaders corresponding to those phases. And a rare leader, a synergist, combines charisma and planning, with the first two and the synergist being constructivist leaders.

Constructivist leaders were considered as change agents.

The problem with maintaining a constructivist organization lies in the entropic nature of organizational dynamics; thus, developing planning strategies is essential.

Living in and creating constructivist organizations can be exciting, dynamic, challenging. They are safe and open to learning. They can provide the most satisfying experiences of a professional lifetime.

## Abstract

Distributed leadership is a commonplace feature of educational leadership, management, and administration (ELMA) nomenclature. This was not the case before the late 1990s, though aspects of a distributed approach to leadership thinking is evident prior to this in the context of groups. The chapter starts with a review of leadership, the subject of distribution. Leadership, however, is not a clearly defined phenomenon and often relies on a preceding adjective in the hope of bringing clarity. The adjective, *distributed*, emphasizes and assumes that leadership is already spread in either a latent or active state across entities or is spread by an entity to others. Sitting beneath the surface of these assumptions are ontological questions related to leadership. Two ontologies, entitative and process, are used to illustrate how distributed leadership is both a contribution to leadership conceptualization and practice in education, and an addition to the mishmash of adjectivalism and ontological variation in what counts as leadership knowledge.

e-mail: [howard.youngs@aut.ac.nz](mailto:howard.youngs@aut.ac.nz)

In addition, multiple positions across ELMA regarding distributed leadership and knowledge development prevent distributed leadership from having a shared meaning. Despite these ongoing issues, promise of further development may lay in some of the practice and process directions emerging in ELMA and the leadership field.

---

**Keywords**

Distributed leadership · Distributed perspective · Shared leadership · Post-heroic leadership · Entitative ontology · Process ontology · Leadership practice

**The Field of Memory**

A predominant focus on leader-centric models has lessened due to the rise of post-heroic models, such as distributed leadership. The term delegation has been replaced by a functional form of distributed leadership.

**The Field of Presence**

Distributed leadership is usually positioned as a means of spreading leadership to achieve organizational improvement and/or a distributed perspective is used as a unit of analysis for understanding practice labeled as leadership. Distributed leadership is common across ELMA nomenclature and has a lesser profile in the leadership field.

**The Field of Concomitance**

Shared leadership, which has its origins in group research, has continued in the leadership field as a group-level construct. Distributed leadership is usually attributed as having the same roots, though is positioned more as an organizational property.

**Discontinuities and Ruptures**

Distributed leadership in ELMA has become more distant from leadership studies literature over time. The distributed perspective is distinct from distributing more leadership. The past decade has seen the emergence of variegated perspectives and contributed to contestation and debate across ELMA.

**Critical Assumptions**

Entitative ontology informs most distributed leadership literature, whereas a greater focus on practices and the application of process ontology may reveal new understanding of practice labeled as leadership, provided critical studies are undertaken.

---

**Introduction**

The overall purpose of this chapter is to trace the conceptual development and thought of distributed leadership in ELMA and why distributed leadership has become a mix (up) of ontologies and positions. The term variegated is emphasized, due to distributed

leadership not only having different perspectives, but the differences are discrete, and using the analogy from biology exhibit quite different colors. Before any analysis of the origins of distributed leadership takes place, the first section focuses on the substance of meaning in the terms: *distributed*, *leadership*, and *distributed leadership*. Substance of meaning brings forth the ontological questions, first what leadership is, and secondly depending on what leadership is, how does the distributed aspect add meaning to leadership? The ontological assumptions and knowledge positioning in this first section are then used to inform the three sections that follow. These three sections draw specific attention to the origins and emergence of distributed leadership, followed by the variegated perspectives of distributed leadership across ELMA, and conclude with possible paths of future knowledge development.

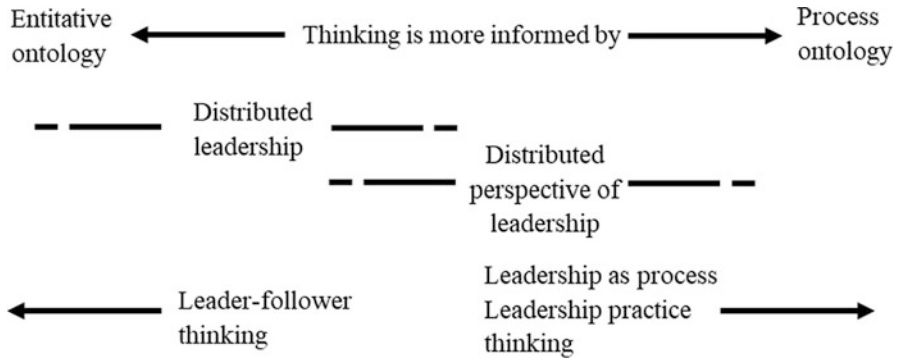

---

## Leadership and Distributed Thinking

Leadership is associated primarily with influence, expertise, and/or traits emanating from an entity, usually a person in an organizational role that has responsibility and authority attached to it. Associated theories, such as transformational leadership, are described as heroic, leader centric, or focused. If leadership is assumed to be both good and needed across an organization, then leadership (responsibility) is distributed to other entities, either through creating more leadership roles and/or distributed by an entity who has the authority to distribute leadership to others. This used to be called delegation, a term that has to an extent been replaced with one form of distributed leadership in ELMA.

In addition to these formal organization functions of distribution is the view that leadership can also emanate from any person in an organization. Leadership here is not restricted to specific roles, and using an entitative ontology, leaders and followers are interchangeable. In contrast to leader-centric theories, distributed leadership is usually positioned as a post-heroic theoretical concept, alongside other post-heroic variances such as shared leadership, collective leadership, collaborative leadership, and democratic leadership. Post-heroic leadership theories can still rely on an entitative ontology. One variation is a relational view of leadership, where the unit of analysis shifts from individuals (entities) to the relational space between individuals (Crevani & Endrissat, 2016; Uhl-Bien & Ospina, 2012). This variation may be evident when distributed leadership is used more as a distributed (or distributive) perspective of (leadership) practice, rather than as a means to distribute leadership work and responsibility. Fitzsimons, Turnbull James, and Denyer (2011) provide an overview of relational-entity and relational-processual positions as part of their discussion of alternative approaches for studying distributed and shared leadership.

In contrast to an entitative ontology in distributed leadership knowledge, practice theory (see Nicolini, 2012) is a lesser used Process ontology (see Rescher, 1996) and practice theory (see Nicolini, 2012), provide additional means of understanding distributed leadership beyond entitative ontology. Here, the focus shifts from entities to process, from practitioners to practice, and from causal associations of leader with followers and context to emergent, fluid, sociomaterial, and spatiotemporal locations

**Fig. 1** Thinking about distributed leadership

as a means of understanding practice. There is a decoupling of leadership from entities (Youngs & Evans, 2021). Leadership as a practice recurs and evolves over time and in the moment (Raelin, 2016). One way of defining leadership in line with process ontology is that leadership may “be the moment-by-moment production of direction, or collective agency in changing and setting courses of action” (Crevani & Endrissat, 2016, p. 42). For example, in ELMA, Wilkinson and Kemmis (2015) employ “a practice-informed approach” (p. 343), drawing on Theodore Schatzki’s site ontology perspective, examining how “the pre-existing cultural-discursive, material-economic and social-political set-ups or arrangements which prefigure the conditions for leading practice also must be transformed” (p. 344). Here the focus is the interrelation of practices, rather than how actors connect in a practice (Kemmis et al., 2014; Wilkinson & Kemmis, 2015). The latter is the focus of Spillane’s (2006) distributed perspective of leadership, discussed later in this chapter, and at the time of writing in 2021, Spillane (2006) was the most cited source for distributed leadership according to Google Scholar, followed by Gronn (2002). A distributed perspective of leadership became evident in the early 2000s theorizing of Spillane, Halverson, and Diamond (2001), and Gronn (2000, 2002). The range of blended thinking, used in the analysis of distributed leadership in the sections that follow, is illustrated below, while acknowledging there are other possible ontological positions that may be used (Fig. 1).

## The Origins and Emergence of Distributed Leadership

### Etymological Origins of “Distributed” and “Leadership”

The first occurrence of *leadership* in a dictionary was in the 1821 version of the *Oxford English Dictionary* (Case, French, & Simpson, 2011). The verb *lead* and the noun *leader* appeared much earlier. Grace’s (2003) etymological research locates the origin of the root word *lead* to around AD 800 and *leader* around AD 1300. This does not limit applying contemporary understandings of leader and leadership to events and people from around AD 800 onward. Civilizations prior and classical

leadership studies provide evidence of leaders, and concepts, principles, and patterns of leadership (Bass, 2008; Wilson, 2016). Indigenous ontologies also predate Western contemporary leadership theory and thought, such as those evident in a Māori perspective of leadership, can also acknowledge a source of authority in leadership can come through ancestral efficacy (Henry & Wolfgramm, 2018), where leadership dispersion is spread across time as ancestors inform the present. In addition, Australian Aboriginal knowledge shows leadership dispersion and collectivity is not confined to contemporary organizations, but has been in existence for centuries (Sveiby, 2011).

*Lead* is “from the Anglo-Saxon Old English word *loedan*, the causal form of *lithan* – to travel” (Grace, 2003, p. 3 of 16). This can conjure a metaphor of an individual leading the way, traveling along a path, if the singular noun *leader* is used. The etymology of *lead*, *leader*, and *leadership* must be understood in the context of the times. Wilson’s (2016) analysis of sixteenth-century European truth about leadership illustrates how its meaning shifted over several centuries of critical junctures across European societies. This contributes to her thesis that leadership “is fundamentally a social, political invention . . . not something fixed in ‘human nature’” (p. 10). The implication here for distributed leadership is the need to clarify what *leadership* means in the context and times it is being used, otherwise leadership may become an empty signifier, an issue that can emerge when leadership does not mean anything specific (Kelly, 2014) or lacks sufficient meaning so that it is reliant on a preceding adjective to bring some clarity that is perhaps lacking in defining leadership. Leadership meaning may then be located more in the adjective preceding the term leadership, so a particular meaning is advanced through adjectivalism, in this case that leadership is distributed.

Carlyle’s 1840 lecture set in motion the equating of *leader* with *Great Men* and heroic acts, where the imagery generated through this has made it “now nigh on impossible” (Case et al., 2011, p. 246) to not see leaders as heroic male entities and leadership as the characteristic of these leaders (Case et al., 2011). As an antithesis to this, shifts toward post-heroic leadership constructs and critical leadership studies (CLS, see Collinson, 2011) have progressed the leadership field “toward more relational, distributed, and gender-aware understandings” (Case et al., 2011, p. 246), though there is still a tendency of leader-follower dualistic thinking within some of these shifts. Because of the interest and romanticism (Meindl, Ehrlich, & Dukerich, 1985) with leadership, no matter which view is taken, leadership has been elevated to a “must have” (Wilson, 2016, p. 6) if challenges are to be overcome. The argument for more “must have” leadership meant it was just a matter of time before the nomenclature *distributed leadership* became popular (Youngs, 2009), as well as *leadership* becoming more commonplace than *management* across ELMA (Gunter, 2016).

The origin of *distribute* is somewhat more contested compared to *leadership*. Butts (2017) suggests some scholars propose the Aramaic  $\sqrt{prms}$  (meaning, to distribute) has a Semitic etymology, whereas others suggest it is “a loadword from Greek  $\pi\rho\nu\omicron\eta\sigma\alpha\iota$ , the aorist infinitive of  $\pi\rho\nu\omicron\eta\acute{\omicron}$  ‘to perceive, foresee; to provide, take care of’” (p. 245). An English etymology indicates *distribūt* is a stem of the Latin *distribuere*, where *tribuere* (cf. tribute) can mean assign, grant, allot, and to

divide among (Hoad, 1996). In the case of distributed leadership, the past tense *-ed* literally means leadership has already been divided and assigned among others. If an association is made with *delegate*, derived from *dēlēgāre* (f.), it brings together *dē*, down and *lēgāre* to send on a commission away from (Hoad, 1996). In an example from the 1960s, “one can, therefore, say that in order to assure for the Chief the freedom necessary in view of the exercise of his principal function, which is to plan, it is expedient to distribute in favour of different levels of the hierarchy delegation of authority” (Migeon, 1965, p. 51). This perhaps has some alignment to one form of distributed leadership where leadership (authority to act) is delegated down through an organizational structure and co-missioned to and/or with others.

Whether *distribūt* or *dēlēgāre* is intended in the use of *distributed leadership*, both illustrate a functional distribution of leadership from an individual entity or a group entity to others. These literal origins assume leadership has some substance which can be passed on from one to another, or one can divide the leadership they supposedly have and grant it to others. It is a matter of consideration as to whether or not this functional distribution happens in practice or is able to happen at all. It all depends on what is meant by *leadership* when the term distributed leadership is used.

## Contemporary Origins of Distributed Leadership

A number of leadership and ELMA publications explore the origins of distributed leadership. For example, see Bolden (2011), Gronn (2000, 2011), Fitzsimons et al. (2011), and Youngs (2009, 2020). The origins and knowledge production of distributed leadership located in education contexts are informed by a broader intellectual history of ELMA. For an authoritative analysis of ELMA intellectual history and knowledge production, see Gunter (2016) and, in particular, Gunter, Hall, and Bragg (2013) for specific analysis of distributed leadership knowledge production. In addition, a distributed perspective of leadership is evident in Ogawa’s and Bossert’s (1995) conceptual argument that leadership is an organizational quality, flowing “through the roles that comprise organizations” (p. 225).

“Distributed leadership” became a commonplace term in ELMA from the start of the millennium and first appeared during the 1990s in a small number of ELMA publications. In the leadership field, the nomenclature “distributed leadership” first appeared in the 1980s. The origins of distributed leadership are often traced back to group research, from which has also stemmed shared leadership. The latter’s theoretical origins are often evident in team-based literature (Fitzsimons et al., 2011). The underlying principles and thought related to leadership dispersion, either through an entity dispersing leadership or acknowledging leadership is a latent or active property already dispersed beyond formal organization leadership or management roles, emerged a lot earlier. Chronologizing examples of underlying principles and thought (shown hereafter) illustrate the gradual emergence of distributed leadership as distinct from and in addition to focused leadership.

### Origins Outside of ELMA

Simmel's (1902a) discussion of group size determining sociological forms of groups is perhaps one of the earliest published articles where the organization of (larger) groups "demands a definite quota of its units as a guiding body" (p. 24), suggesting a dispersion of leadership beyond a single person. "A group of a certain extent and beyond a certain stage in its increase of numbers must develop for its maintenance certain forms and organization which it did not previously need" (p. 2). In part two of his discussion (1902b), he provides an example of an aggregation of leaders. "Even in recent time the Czechish secret society Omladina was constituted according to the principle of quintettes. The leadership of the society belonged to numerous 'hands,' which consisted in each case of a 'thumb,' i.e., the chief leader, and four 'fingers'" (Simmel, 1902b, p. 190).

Leadership as a diffused property is evident in the 1920s writings of Follett (Graham, 1995), where she argued that leadership may emerge from anywhere and not be restricted to those in managerial positions. A socially critical and agentic argument is evident in her reasoning, where she states managers should give employees opportunity "to grow capacity or power for themselves" (Graham, 1995, p. 111). A similar emancipatory argument is evident in Crutchfield (1932), who perhaps is one of the first to bring the terms *distributed* and *leadership* together.

The urge toward leadership is stronger and more commonly distributed than is generally supposed. We lack leadership because we lack faith in the so-called common man. We use the same leaders over and over until they reach the point of diminishing returns. We assume that because a person won success in some form, he is destined to be successful in others. Leadership in a democracy cannot be inherited neither can it be purchased . . . The leader's greatest service to his community comes when he finds in his community the men and women whom he may encourage to assume leadership. (pp. 362, 363)

One of the earliest published references bringing the terms *shared* and *leadership* together is located in a study of preschool children. Parten's (1933) observations of children's social participation during a free play hour in a nursery school resulted in leadership being viewed as both a property of a group as well as an individual. "Leadership is a function of the personnel of the group and of its activities, as well as of each individual child" (p. 430), where "shared leadership replaces a large amount of the independent play" (p. 438). Leadership as a group property as well as an individual property is also evident in Benne and Sheats' (1948) research of group roles. "Groups may operate with various degrees of diffusion of 'leadership' functions among group members or of concentration of such functions in one member or a few members. Ideally, of course, the concept of leadership emphasized here is that of a multilaterally shared responsibility" (Benne & Sheats, 1948, p. 41).

The examples presented thus far start to identify an additional conceptualization of leadership thinking beyond an individual leader, which is also reflected in Bales' (1954) acknowledgment of the importance of social leadership in addition to that of a group leader.

Gibb (1958) contributed to leadership thought, progressing leadership from being a fixed-only property to an emergent property. Leadership, “as a property of interaction” (Gibb, 1958, p. 104), “emerges in a group as part of a more diffuse differentiation of roles by which group members more expeditiously achieve group goals and satisfy their individual group-invested needs . . . in any group there may be, at any time, a *number* of leaders” (pp. 102,103).

Gronn (2000, 2020, 2011), in his commentaries of distributed leadership history, highlights Gibb’s forms of leadership distribution, accumulative and systemic. Accumulative is a numerical interpretation of distribution where the totality of leadership acts is the sum of each individual leadership act. Systemic is holistic in nature, where leadership could pass from one group member to another, depending on the situation. (Youngs, 2020, p. 3 of 24)

Gibb’s publications about leadership in groups are sometimes presented as the “cornerstone” of contemporary distributed leadership origins and have contributed to the acknowledgment of ambiguity between leaders and followers. The unfixing of leadership from the exclusive few, so leader and follower roles become interchangeable, and leadership is viewed as a process, rather than an attribute, is evident in Tannenbaum’s and Massarik’s (1957) framing of leadership.

. . . leadership as a *process* or *function* rather than as an exclusive attribute of a *prescribed role*. The subordinate often influences the superior; the customer, the salesman; and the group member, the chairman. In any given relationship, the roles of the influencer and the behavior often shift from one person to the other. Conceptually, the influence process or function is present even though the specific individuals taking the roles of influencer and behavior may vary. Thus, the leader role is one which is rarely taken continuously by one individual, even under specific conditions with the same persons. Instead, it is one that is taken at one time or another by each individual. (p. 3)

This line of thought, according to Bowers and Seashore (1966), does not undermine the authority of those in formal leadership roles, further sowing the thought that a wider dispersion of leadership is not at the expense of formal leaders’ authority.

. . . leadership may be either “supervisory” or “mutual”; that is, a group’s needs for support may be provided by a formally designated leader, by members for each other, or both; goals may be emphasized by the formal leader, by members to each other, or by both; and similarly for work facilitation and interaction facilitation. This does not imply that formally designated leaders are unnecessary or superfluous, for there are both common-sense and theoretical reasons for believing that a formally acknowledged leader through his supervisory leadership behaviour sets the pattern of the mutual leadership which subordinates supply each other. (Bowers & Seashore, 1966, p. 249)

The leadership thinking presented above is a stream that shapes contemporary distributed leadership. The profile of distributed leadership did start to emerge in the 1980s, albeit well in the shadow of transformational leadership that started to come to the fore in the late 1970s and 1980s. Bolden (2011), in his Scopus database analysis of distributed leadership publications, shows distributed leadership rarely figured during the 1980s and 1990s, and if works were published during these

decades, distributed leadership lagged behind the profile of shared leadership from the 1990s to the early 2000s.

One of the first references to distributed leadership post the 1970s was made by Beck and Peters (1981), where their key point was that distributed leadership as a studied phenomenon was not new. “Distributed leadership refers to the idea that there are several different leadership functions which must be performed by several different people. This is a phenomenon which has been studied for many years, primarily by social psychologists” (p. 43), a reference back to the work of Gibb and others. Brown and Hosking (1986) were another to make links back to Gibb in relation to the coexistence of distributed influence and focused leadership. “Whether focused or distributed, leadership characterizes social organization, and is recognized in participants shared sense of a social order” (Brown & Hosking, 1986, p. 76).

Possibly, the first distributed leadership model was Barry’s (1991), which he argues was uniquely suited to self-managing teams. The model brought together envisioning leadership, organizing leadership, and social leadership. “At its heart is the notion that leadership, is a collection, of roles and behaviors that can be split apart, shared, rotated, and used sequentially or concomitantly. This in turn means that at any one time multiple leaders can exist in a team, with each leader assuming a complementary leadership role. It is this characteristic that truly differentiates this approach from the person-centered approaches described earlier” (p. 34). House and Aditya (1997) divided distributed leadership into three forms: delegated leadership, co-leadership, and peer leadership; the first broad classification of distributed leadership forms in the leadership field.

Early signs of distributed leadership being positioned as “a” (or “the”) preferred mode of leadership in and for organizations are evident in Senge (1993). “Knowledge-creating companies will require distributed leadership” (p. 5). “In the traditional, resource-based organization, leadership and top management are synonymous. In the knowledge-creating company, leadership is a distributed phenomenon. The organization is full of leaders operating at different levels and around different issues” (pp. 14, 15).

The commentary related to distributed leadership over time increasingly branched away from the group focused origins that have stayed with shared leadership and team leadership. Distributed leadership was being situated as an organizational property.

### **The Pre-millennium Emergence of Distributed Leadership in ELMA**

The seeds contributing to the establishment of distributed leadership in ELMA as “the normatively preferred leadership model in the twenty-first century” (Bush, 2011, p. 88) are:

- The political and post-welfarist education reforms of the 1980s.
- With a subsequent increase in emphasis on self-managing organizations, site-based management, improvement, effectiveness, and efficiency.
- That contributed to issues of head teacher/principal/senior leader overload.

- As well as emphasizing principals as transformational and strong leaders, albeit as teacher leadership research was growing.
- While there was a loosening of leader and follower from fixed to transferable states across an organization in the leadership field.
- In addition to emerging post-heroic alternatives to leader-centric and heroic leadership thought in the leadership field.
- Emerging arguments for process-based ontologies in organizational theory (for example, see Chia, 1997).
- Emerging arguments to understand leadership as practice.
- ELMA voices ranging from post-welfare enthusiasts and subtle apologists through to critical commentators (see Thrupp and Willmott (2003) for their treatise of ELMA literature at the time). For more on positioning across ELMA see Gunter (2016) and in relation to distributed leadership, see Gunter et al. (2013).

The diverse factors listed above have contributed to distributed leadership being understood from a range of perspectives, informed by differing ontologies of leadership (Youngs, 2020). Distributed leadership emerged in times, “not since the late nineteenth century, when the present organizational contours of mass public education emerged, has the political rhetoric of school reform been so broad and comprehensive” (Elmore, 1990, p. 3). Distributed leadership not only is situated in an education context, but a political one too. Critical commentators and research will tend to include one or more of the following as part of their critique: neoliberalism, new public management (NPM), neo-Taylorism, managerialism, social (in)justice issues, power, democratic principles, micropolitics, colonization, and oppression of indigenous/cultural identity and agency.

Change leadership literature in the 1970s and 1980s emphasized strong leadership (which is usually equated with a clear visionary leader at the head of an organization), yet education research studies in those decades appeared to contradict this, showing leadership tasks were apparent across numerous roles (Heller & Firestone, 1995). Associations instead were made with Kerr’s and Jermier’s (1978) substitutes for leadership (Heller & Firestone, 1995).

Contributing to the strong leadership, leader-centric and heroic perspective were ELMA literature supporting post-welfarist reforms with little or no engagement with critical perspectives of self-management, thus reifying the role of principal/head teacher without much challenge from elsewhere across ELMA at the time (Thrupp & Willmott, 2003). For example, Beare, Caldwell, and Millikan (1989) argued:

The principal is, in the final analysis, the custodian of a culture. It is appropriate then, that transformational leadership should be the concept addressed in the next chapter (p. 98) . . . Outstanding leadership has invariably emerged as a key characteristic of outstanding schools . . . outstanding leaders have a vision for their schools – a mental picture of a preferred future – which is shared with all in the school. (p. 99)

In addition, “a vision for the decade ahead [the 1990s] calls for strong leadership . . . where . . . we refer . . . to leaders having a commitment to and a capacity to articulate a vision for self-management” (Caldwell & Spinks, 1992, p. 202). On the

one hand, Caldwell and Spinks (1992), were advocating here for extraordinary leaders, while on the other hand claiming they were not promoting “a superperson as leader” (p. 203), and were stressing the need “for widely dispersed leadership” (p. 203).

Two push-back factors came into play. Firstly, the subsequent overloading and unsustainability of responsibilities and tasks associated with principals/head teachers, and secondly the growing acknowledgment that leader-centric models were not reflective of leadership practices across an organization. Distributed leadership became an alternative model to those that focus solely on head teacher’s work, but is not a post-millennium idea, where Thomson (2009) (1983, cited in Thomson, 2009) argued that delegation is the most practical understanding of distributed leadership. Avoiding head teacher overload, a product of education reforms over decades led to a greater distribution of work through schools (Gunter, 2001). This distribution of work:

the neo-Taylorist approach to getting new tasks done efficiently and effectively has been given a new-wave gloss in which delegation is the means through which individuals in teams can learn and develop . . . Sharing or distributing leadership has another understanding, and has less to do with managerial efficiency and more to do with educational leadership working within and developing democracy. (Gunter, 2001, p. 131)

Gunter (2001) was one of the early voices bringing critical engagement to the emergence of distributed leadership as delegation dressed up in new clothes, as well as suggesting that any distribution of leadership should have democratic intent.

The possible first signs of a process ontology (as an alternative to the entitative norm evident in leadership and ELMA studies) came in Smyth’s (1989) edited book, *Critical perspectives on educational leadership*, now positioned as seminal in critical perspectives within ELMA, thus standing in stark contrast to the advocates and subtle apologists of the reforms as discussed by Thrupp and Willmott (2003). An example of promoting a process ontology is evident in Watkins’ (1989) chapter.

. . .rather than examining organizations and their designated leaders in simplistic functionalist terms of merely operating in order to solve particular problems (p. 26) . . . leadership should be seen as a process dialectical relationship . . . such a processual perspective implies that there is not one preordained or designated leader within the organization, but that at any time any one member of the organization can come to the forefront to provide guidance in resolving the tensions and contradictions that beset organizations. As a consequence, a dialectic view of the leadership process focuses on the human agency of all members of the organization as that agency interacts with the constraining or enabling structure of the institution. (pp. 28, 29).

Throughout the 1990s, principles aligned to distributed leadership became apparent. For example, Razik’s and Swanson’s (1995) textbook for developing educational leaders promoted a “new paradigm,” with “leadership as a relationship involving multiple followers and multiple leaders who engage in shared or collaborative leadership. The roles of leaders and followers are not etched in stone but can shift” (p. 63).

In addition, studies started to elaborate on leadership practices from less of a leader-centric perspective, instead reflecting a broader distributed perspective. For example, Thurston's, Clift's and Schacht's (1993) case studies of four schools showed that leadership responsibility was evident across all staff and did not reside only with the principal. Polite's (1993) case study of a middle school's major change process presents possibly the first distributed leadership typology in ELMA. Leadership aggregation consisted of leaders of influence, leaders of curriculum, leaders of groups, leaders of direction, and leaders of resistance, where individuals were associated with more than one of these forms over time (Polite, 1993). During the 1990s, there were "limited amounts of prior evidence about distributed leadership" (Leithwood, Jantzi, Ryan, & Steinbach, 1997, p. 3) so for Leithwood's et al.'s (1997) mixed methods study, the theoretical constructs of transformational leadership (aligned to principal leadership) and teacher leadership were brought together. Both, however, are usually associated with entitative thinking regarding leadership, so even though a broader lens was being used, ontological assumptions about leadership were still largely entitative.

### **Foundational Keystones and a Diverging View**

During the early 2000s, the profile of distributed leadership quickly increased and came out of the shadows of the leader-centric dominated leadership field and ELMA. Post-heroic models of leadership become prominent and given the policy reforms of the previous two decades across education; it was of little surprise how distributed leadership became so popular. The merging of these factors meant distributed leadership became inevitable as a preferred model of leadership in education (Youngs, 2009). "In education" is a significant point here. "Distributed leadership" has a high profile across ELMA, but less so in the broader leadership field.

The two most cited distributed leadership sources (as of July 2021), Spillane's (2006) and Gronn's (2002) independent theorizing of leadership, where the unit of analysis is a distributed perspective, are often portrayed as the foundation of distributed leadership across ELMA. In addition to these sources, distributed leadership literature also draws on Spillane et al. (2001) and Gronn (2000). Neither Spillane nor Gronn advocate for a greater distribution of leadership in their original conceptual frameworks, hence a distributed perspective of leadership is an appropriate way of describing these. Both acknowledge the aggregation of leadership, with Spillane defining this as "leader-plus." In addition, Spillane focuses on practice, through collaborated distribution, collective distribution, and coordinated distribution, whereas Gronn focuses on three forms of concertive action: spontaneous collaboration, intuitive working relations, and institutionalized or regulated practices. These foci shift the unit of analysis more to practices, rather than the leader. One point of difference between Spillane's and Gronn's frameworks is that Spillane draws on terminology associated with entitative views of leadership, so leaders, followers, and their situation are the core components of his framework, with the use of leaders and followers deemed by Gronn (2003) as unhelpful. Spillane (2015) explains:

A distributed perspective, then, conceptualizes practice in a very particular way: practice is not just about the actions of individual leaders, though they are clearly relevant; it is fundamentally about *interactions* among leaders and among leaders and followers. And, leaders not only influence followers but followers also influence leaders in these interactions. (p. 281)

Where Spillane's and Gronn's frameworks overlap is in drawing attention away from a leader-centric position of understanding leadership to a practice-informed perspective. Over the following 10 years, the high profile of distributed leadership is confirmed in meta-reviews of ELMA research (Gumus, Bellibas, Esen, & Gumus, 2018; Tian & Huber, 2021; Wang, 2018). Gronn (2011) started to raise concerns as to whether too much emphasis was being given to the dispersion of leadership at the expense of acknowledging individual sources of leadership. His review of distributed research studies suggested that hybrid configurations of focused and dispersed leadership were a more accurate account of what was reported in distributed leadership research studies and went as far to call himself a skeptic of distributed leadership (Gronn, 2016).

Following the initial frameworks of Spillane and Gronn, the first major ELMA review of distributed leadership research was published (see Woods, Bennett, Harvey, & Wise, 2004). Around the mid-2000s there was an acceleration of distributed leadership publications across ELMA. These consisted of research studies (some published more than once) and reviews. The most cited review at the time of writing this chapter (July, 2021) is Bolden's (2011), who,

concluded that descriptive and normative perspectives which dominate the literature should be supplemented by more critical accounts which recognize the rhetorical and discursive significance of DL in (re)constructing leader–follower identities, mobilizing collective engagement and challenging or reinforcing traditional forms of organization. (p. 251)

During the period 2004–2011 multiple typologies of distributed leadership emerged. For a comparative review of these typologies and recurring themes emerging from other literature reviews see Youngs (2020).

---

## **The Variegated Perspectives of Distributed Leadership Across ELMA**

Two directions, at times overlapping, are initially apparent in ELMA, distributed leadership, and a distributed (or distributive) perspective of leadership. An entitative view of distributed leadership focuses on the multiple sources of leadership across an organization's staff and a normative view within that advocates that a wider distribution of (more) leadership to more staff may lead to organizational improvement, though this should not lead to assuming distributed leadership "is some sort of panacea" (Harris & DeFlaminis, 2016, p. 141). A distributed perspective does not advocate or imply a wider distribution is required. Instead it provides a unit of analysis where leadership practice is not limited to those in organizational leadership

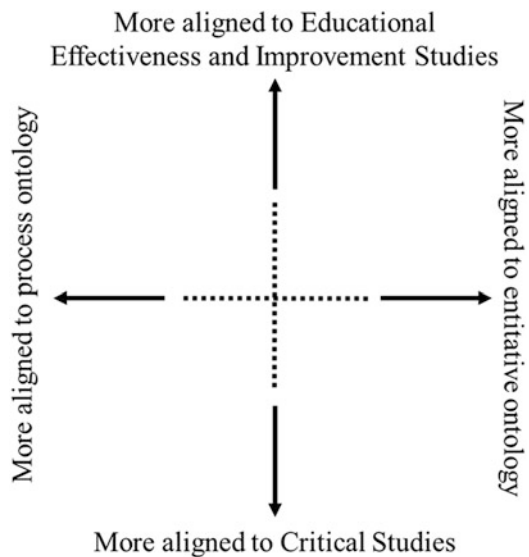

roles. Harris and DeFlaminis (2016) argue there are two positions, one where distributed leadership is a unit of analysis and another which is “a more practical or applied view” (p. 141).

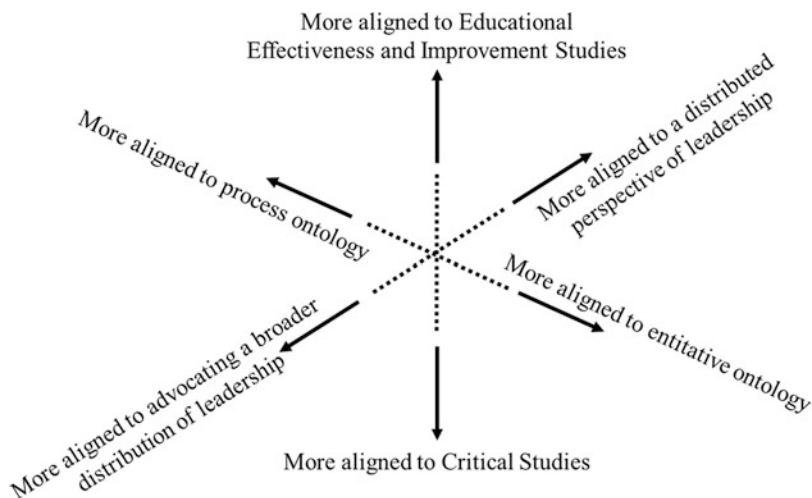

In addition to these two directions (no matter what terminology is used) is where the application of each direction is positioned by ELMA commentators and researchers. Two factors can be considered here. Firstly, is the use of either direction more aligned to educational effectiveness and improvement studies or more to critical studies? For more on ELMA positioning refer to Gunter (2016), and for CLS see Collinson (2011). Secondly, ontological consideration is needed in relation to how leadership is defined. Is the leadership definition (whether explicit or implicit in the source of literature) aligned more to entitative thinking of leadership or more to process thinking of leadership, or does it attempt to blend two ontologies?

This is summarized in the following two diagrams. Figure 2 presents a framework for locating any educational leadership study. Figure 3 adds the dual directions of distributed leadership across ELMA.

The axes of Figs. 2 and 3 include dotted lines. If the ends of the dotted lines were all linked across the three dimensions in Fig. 3, then a sphere would be apparent. It is in this sphere where perhaps many distributed leadership commentaries and research may be located. For some they are in the sphere because it is not made clear by authors where the commentary or research study is located. For others, it may be because an eclectic positioning is sought, so positioning is closer to the nexus of the three axes. Given that entitative ontology informs most leadership theorizing, research, and application, most distributed leadership literature tends toward this way of thinking and advocates a considered dispersion of leadership as a possible lever for improvement (for the latter see Harris and DeFlaminis (2016)). Despite the

**Fig. 2** Locating ELMA leadership commentary and research studies

**Fig. 3** Locating ELMA distributed leadership commentary and research studies

promise distributed leadership appears to provide as “an alternative to the unjust power differences and inequalities that condition effective participation in leadership . . . it has yet to convincingly address these issues” (Woods & Roberts, 2018, p. 5), thus highlighting a need for studies to lean more toward critical studies.

In addition to multiple locations within these three axes are two other considerations, whether or not distributed leadership commentary and research is situated in group or organization settings, and whether a relational ontology of leadership (see Crevani & Endrissat, 2016; Uhl-Bien & Ospina, 2012) is more apparent than either an entitative or process ontology. The multiple possible locations of distributed leadership contribute to the acknowledgment across ELMA that distributed leadership is challenging to define as a concept and has led to debates regarding how research findings should be interpreted, what is missing from stated and implied assumptions made by authors, and how crucial distributed leadership or a distributed perspective is for ELMA.

## Possible Paths of Future Knowledge Development

Across ELMA, there is agreement that “distributed leadership is predicated on the assumption that it will bring about beneficial effects that would not occur with singular leadership” (Bush, 2011, p. 90). Distributed leadership continues to be positioned as a post-heroic concept. However, distributed leadership is not the only model in use across ELMA. For example, transformational leadership has continued to be promoted as the best practice model for running schools as a business (Gunter, 2016), as well as being evident across ELMA research studies along with instructional leadership (Gumus, Bellibas, Esen, & Gumus, 2018; Wang,

2018). In addition, any model of leadership is influenced by country and local state education policy, so many variations of models will continue to emerge. Any quest for a uniform understanding and application of distributed leadership is therefore an impossibility, particularly given the multiple locations of distributed leadership commentary and research studies discussed earlier. In addition to this are our own implicit leadership and implicit followership theories, thus rendering further variation as these will differ from person to person. Youngs and Evans (2021) explore in more depth how our implicit theories can help identify untested assumptions regarding our ontology-in-use regarding distributed leadership. Cognizant of these issues, three paths of possible development are provided.

### **Practice Theory and Process Ontology**

In a review of ELMA research studies from 2007–2016, Tian and Huber (2019) reveal a shift from leader-centric to practice-centric studies. At the forefront of a practice theory–informed understanding of leadership in ELMA is the practice architectures developed by Kemmis et al. (2014) (see also Wilkinson & Kemmis, 2015) and applied in research studies. Further studies positioned as a distributed perspective of leadership may continue to draw on Spillane’s framework, though ELMA researchers now have another option, to apply the practice architectures developed by Kemmis et al. (2014). In addition, the leadership field has a small but growing number of commentaries and applications of leadership-as-practice (L-A-P). A starting place for applying the variations of L-A-P discussed by a range of leadership authors, including Philip Woods from ELMA, is Raelin’s (2016) edited book, *Leadership-as-practice: Theory and application*. Here there is a deliberate focus on practices rather than practitioners. Aligned to some of this L-A-P commentary is an intentional shift from entitative ontology to either relational or process ontology. For an example of the latter see Crevani (2018). ELMA and “leadership research and development activities must rise to the *ontological* challenge of *processes* rather than *things*” (Wood, 2005, p. 1101). Following a path where practice theory and process ontology merge to inform distributed perspectives of leadership in ELMA may further an understanding of practice (labeled as leadership) as it unfolds in education organizations. Links can also be made to the organization theory field where there has been a focus on process organizational studies (for example, see the *Perspectives on Process Organization Studies* series of books, published by Oxford and overseen by series editors, Ann Langley and Hardimos Tsoukas).

### **Returning to Where It Started: Group Research**

The historical roots of distributed leadership construct development lay in group studies, mainly carried out in the 1950s. Shared leadership and team leadership research and development continue to focus on group contexts, whereas distributed leadership, particularly in ELMA, has become positioned more as an organizational construct. ELMA research that focuses on instructional/educational leadership

research is almost unanimous in that leadership (whether leader centric or post-heroic) has an indirect association with student learning. Educational organizations rely on groups structured around faculties, departments, and specialized permanent teams or fixed term project teams to hopefully enhance and support the conditions conducive to supporting teachers and relational environments that support student learning. With a greater focus in the leadership practices flowing and emerging within and across groups, it means turning attention back to shared leadership, group development, group interactions, and team learning (for example, see Decuyper, Dochy, & Van den Bosshe, 2010). Focusing on group settings is not restricted to those groups structured according to division of labor and responsibility; alliances associated with friendship and social movements also exist in groups that are not restricted to organization structure. This makes any study of practices labeled as leadership complex, but not unattainable. Some of the groundwork for studying practices has been laid in ELMA (e.g., Gronn, Spillane, Kemmis, Wilkinson et al.) and leadership studies (e.g., Raelin, Crevani).

### **Making Connections with Other Post-Heroic Variants**

The nomenclature “distributed leadership” is commonplace across ELMA, but not across the leadership field. Sometimes there may be a reticence in ELMA to go outside of its field regarding leadership, however this places ELMA at risk from field knowledge group think, and the same literature within ELMA being referenced again and again. It is important ELMA maintains a guardianship watch over the educational aspect of educational leadership, management, and administration, and be more connected to leadership knowledge development streams beyond education. Some of these streams are:

- Leadership-as-practice (discussed earlier)
- Process ontology (discussed earlier, see also Wood & Dibben, 2015)
- Shared leadership (as discussed earlier, see Döös & Wilhelmson, 2021)
- Collective leadership (see Fairhurst, Jackson, Foldy, & Ospina, 2020)
- Emergent leadership (see Alvehus, 2019)
- Indigenous leadership worldviews aligned to post-heroic leadership (see Spiller, Maunganui Wolgramm, Henry, & Pouwhare, 2020)

---

### **Conclusions and Reflections**

Variegated perspectives will remain with future knowledge development concerning distributed leadership. An understanding of distributed leadership can exist but only on the assumption that “understanding” is not singular, but plural and at times paradoxical. It then becomes the responsibility of any person or group who provide commentary and/or research regarding distributed leadership to make clear the location of their work (as some do) so the ELMA community see what makes distributed leadership a

variegated concept. Variegation is also expected because the leadership field is a contested space, as well as leadership being used (or captured) as a popular (and simplified) means to bring about change and address problems.

This chapter started with two questions regarding what leadership is, and depending what leadership is, how does the distributed aspect add meaning to leadership? It perhaps is all too straightforward to provide answers to “what is distributed leadership?”, such as “it is the distribution of leadership,” or “leadership is a distributed property of effective organizations,” or “distributed leadership is a preferred alternative to leader-centric models.” In a way these responses may all ring true to some degree, but the problem, and the reason why this chapter has been written in the way it has, is to say “hang on a minute, what do we actually mean by leadership?.” If we are not clear with an ontology that informs meaning, then what is actually being distributed? It may not be leadership after all.

## Abstract

Mindful leadership is a new build from a foundation of mindfulness, dating back 2,500 years. As such, this chapter provides a narrative of the building blocks that have been conceptualized by neuroscientists, psychiatrists, psychologists, and scholars, and articulated, as research and empirical evidence to be transferred to a new home – that of mindful leadership. At the time of this writing, a single agreed-upon definition of mindful leadership does not exist, although depictions include the qualities, traits, and characteristics that mindful leaders employ. An unwritten, agreed upon element of what it means to be a mindful leader by the authors who conceptualize the same, described essential qualities of awareness, being fully present, and ultimately that mindfulness is a *way of being, not doing*. Perhaps the issues of *being*, instead of *doing*, seems contradictory to the way that people visualize leaders, who are often described by action verbs such as develop, plan, organize, or design. Mindful leaders influence others in the organization by how they listen, respond, avoid criticizing and judging, and offer compassion and empathy, characteristics and qualities that speak to the affective, humanistic, and altruistic side of leading. Mindful leadership invites a journey *inward* that may

ultimately cultivate a sense of community or sangha. Mindful leaders slow down the busyness of the usual overwhelm and mind wandering by allowing stillness for reflection and growth. If this one chapter fulfills the intended hope and expectations, it will allow for a contemplative view of mindful leadership that invites others on the journey uniting the science with the art of mindfulness, while offering a read that integrates the theoretical and conceptual elements, with one that is experiential.

**Keywords**

Mindfulness · Mindful leadership · Compassion · Way of being · Meditation

*Mindfulness helps leaders to stop and listen to hear, learn not to judge, learn patience, develop spaciousness around problems and issues, become truly aware of what is happening in the moment, accept what is happening instead of denying or avoiding it, develop compassionate understanding, generate self-compassion for their own shortcomings or missteps, and importantly learn to let go of things that are in the past or those that cannot be changed.* Wells (2016, p. 121)

**The Field of Memory**

Mindful leadership is a relatively new construct in the field of leadership; it is a derivative and extrapolation of mindfulness practice, which has its roots in Buddhist thought. Jon Kabat-Zinn, the once molecular scientist who is credited with articulating the vision of mindfulness practice in the Western world, and the one who developed Mindfulness-Based Stress Reduction (MBSR), offered this explanation of the roots of mindfulness,

The systematic cultivation of mindfulness has been called the heart of Buddhist meditation. It has flourished over the past 2,500 years in both monastic and secular settings in many Asian countries. In recent years the practice of this kind of meditation has become widespread in the world. Although at this time mindful meditation is most commonly taught and practiced within the context of Buddhism, its essence is universal. (2009, p. 12).

Understanding what mindfulness is and is not is important in comprehending how it may serve leaders in an organization. Mindfulness practice is a form of meditation, where people focus on the present moment, noticing the breath as it enters and leaves the body, practicing watching the thoughts and emotions that enter and leave the body for the insights or questions they bring. Mindfulness is not about clearing the mind of all thoughts; it is about noticing what the mind is bringing for attention. As people practice mindfulness, they learn how incessant the mind is with a constant barrage of thoughts and emotions. Mindfulness teaches to watch for storylines of thoughts, and to simply bring the awareness back to the present moment. Mindfulness practice reinforces the importance of no criticism or judgment. Practitioners learn to rest with awareness of the present moment, allowing the stillness of that moment to be as constant as one's breath. Leaders are ones who are continually

evaluating and analyzing at work; mindfulness teaches the importance of sensing, noticing, feeling, and observing as new or different metrics. Mindfulness practice can also occur in walking, eating, body scans, sitting, or lying down.

Mindfulness is referenced in the context of psychological study, neurobiology, and psychotherapy and used in a variety of clinical settings. Although psychological or medical references to mindfulness are included in substantial publications and printed materials, mindful leadership takes a departure to the traits and states of mindfulness and transports them to describe what leadership qualities that may find a home in a workplace environment. The largest departure from the field of leadership is to depict mindful leaders as being fully present, listening, showing compassion, and descriptions of what is generally referred to as the soft skills of leadership, or what Goleman (2013) refers to as, “the hard case for soft skills” (p. 235). Goleman elucidates qualities such as listening, showing empathy, where relationship strengths such as influence and persuasion, team, and collaboration matter (p. 235). He further summarized by discussing the emotional aperture where leaders read the emotional climate of a group, impossible to do without being fully present and aware (p. 239).

Mindfulness, with its adherence to present moment awareness, fosters a variety of examples that relate to qualities or characteristics that may serve leaders. Siegel and Germer (2012) related that mindfulness assists people in stepping out of the thoughts that are automatic as people wrestle with resisting what is, in helping to learn to be with discomfort, in nonreactivity as an automatic response, in gaining insight, in watching what might be the mind’s continual defenses, in learning how the mind causes its own suffering, its ability to embrace and give space to opposites that the mind creates about the self, and in developing compassion for self and others (pp. 30–33).

### **The Field of Presence**

The definitions that exist for mindful leadership reference the qualities and characteristics of a leader who is fully present and listening with empathy to build a culture of engagement and commitment. As such, the descriptions of mindful leadership practices are built on a foundation of the qualities and characteristics of mindfulness practice that Kabat-Zinn (2018) defined as his operational definition of mindfulness, “. . . the awareness that arises from paying attention on purpose, in the present moment, and non-judgmentally” (p. xxxiv). Because mindfulness has been positively linked with work engagement and job performance, negatively correlated with mindfulness and turnover intention (Dane & Brummel, 2013), and was correlated with better functioning within the workplace (Glomb et al., 2011), the attention to the leader’s role in influencing these conditions has been a natural and compelling path in its conception and construction.

Additionally, medical benefits, research outlining cases of stress, burnout, job turnovers, attrition rates, anxiety, depression, or other emotional issues that can derail business workers or leaders, have impacted the development of mindfulness practices being considered or utilized in the workplace. Mindfulness practice assists in furthering the expressed understanding of what it means to be employed in a variety of industries, where complexity and change are constants. Kabat-Zinn wrote

(2009), “The stress in our lives is now so great and so insidious that more and more people are making the deliberate decision to understand it better and bring it under personal control” (p. 2). Mindfulness assists in personal control to cope with and learn to process the stress of daily life, including personal and workplace stress.

Another strong rationale to include mindfulness in the affective construction of workplace is fostered by the strength of empirical and scientific research attesting to the efficacy of mindfulness in helping people deal with chronic pain, depression, and anxiety (Baer, 2003). Mindfulness practice has been shown to benefit both psychologically and physiologically (Hyland et al., 2015). Leaders respond to the stressors of the workplace, and they bring their personal stress with them to it as well; their leadership influences the people and practices of the workplace with actions including their *way of being*.

### **The Field of Concomitance**

Mindful leadership has had its foundation of construction in several fields, still providing research and empirical evidence about its effectiveness. For example, Brown and Ryan (2003) presented a theoretical and empirical review of the role of mindfulness in psychological well-being, demonstrating that “dispositional and state mindfulness predict self-regulated behavior and positive emotional states” (p. 822), qualities that are important to leaders.

Brown, Ryan, and Creswell (2007) explained the conceptual alignment, with other concepts, and included traits of attention and awareness that are important to leadership,

The concept of mindfulness is most firmly rooted in Buddhist psychology, but it shares conceptual kinship with ideas advanced by a variety of philosophical and psychological traditions, including ancient Greek philosophy; phenomenology, existentialism, and naturalism in later Western European thought; and transcendentalism and humanism in America. That this mode of being has been commonly described suggests its centrality to the human experience, and indeed, mindfulness is rooted in the fundamental activities of consciousness: attention and awareness. (p. 212)

The interest in mindfulness and the importance of what it means to being intentional about present-moment awareness continues to grow exponentially (Brown & Ryan, 2003). Major corporations, the US army, hospitals, and schools have programs for training in mindfulness (Gelles, 2015; Jha et al., 2015; Tan, 2012).

The disciplines listed above have provided layer after layer of the construction of mindful leadership, building upon each brick and mortar of publication, study, original thought, and the integration of thought, leading back centuries. It is the integration of the disparate fields that has opened a window for its application to the human experience in an offering that may benefit both the individual and the organization, hence, the mindful leader and subsequent mindful leadership.

### **Discontinuities and Ruptures**

Fields of knowledge are subject to evolving visions as people and circumstances change the landscape. As such, the study of mindfulness practice in the Western

world has included various peer-reviewed publications that align mindful leadership with the ancient practice of meditation. The rupture of contemplative thought for viewing leadership is one that is discontinuous with prevalent leadership roles that place a heavy emphasis on *doing* as opposed to a way of *being*, and on management or technical priorities as opposed to those that are inclusive of affective, humanistic leading. The language of leading as a *way of being* is not a passive term; the language is actually a powerful example of another way of interacting. The adoption of mindful leadership is disruptive in the sense of content and process. Instead of the use of the conjunction “*but*,” it is the use of the word “*and*” that illustrates a view of *how* the leadership is conceptualized. An example is *leading and listening*, or *leading and also hearing*. The word “*and*” offers a powerful example of qualities of mindful leadership, joining two concepts that are not often paired together.

### Critical Assumptions

Mindful leadership is articulated differently by the various authors who have conceptualized its essence. The belief that mindfulness is part of mindful leadership is foundational, yet differentiated by its many qualities. Some definitions are more related to business, educational, or medical concepts, and others are more aligned with mindfulness practices. The critical assumptions of mindful leadership are therefore varied, without a common or centrally agreed upon single definition. Although increasing in its publications, the assumption that mindful leadership is universally accepted or understood is not true; conceptually, it remains under construction.

---

## Introduction

This chapter is written to convey the conceptual and theoretical background of mindfulness, acknowledging that it is practiced experientially. Imagine reading about riding a bike, its history, bike construction, and perhaps the feel of riding, or a description of where riding takes place. As detailed as this might be, it still does not allow for the understanding of what it feels like to ride. The same is true with a description of contemplative practice of mindfulness. In choosing to offer an insight to this ancient practice, the following is offered as an invitation for a voluntary mindful moment:

*Let's take a few moments to settle in, and be fully present, letting go of outside or inside distractions, and just taking this time to make friends with quiet, resting in awareness of the present moment. Perhaps you could whisper to yourself, "Here, here" as acknowledgment that you are truly here in this moment. See if you can approach this practice with an open and curious mind, and see how that feels to you. As you notice your mind interrupting the quiet, just note what your mind is bringing to your attention, and return to present moment, all without judgment or criticism, perhaps watching your breath as it enters and leaves your body. Note the rhythm of your own breathing, breathing in and breathing out. Feel your feet on the ground and just be aware of being grounded to the earth. Sit in this awareness and be*

---

*ready to return to your reading of the chapter, perhaps noting what you noticed, sensed, felt, or observed from taking this mindful pause.*

The intention of this chapter is to document the development of mindfulness practice with a focus on the dynamics that have led to the conceptualization of mindful leadership. It is further intended to be constructed in such a way as to engender a mindful approach to its narrative, hoping to embrace the concepts of a contemplative telling of the story behind its growth. To be fair to its meaning, it is important to not convey a strictly conceptual view of what is decidedly experiential in practice. Mindfulness practice has been articulated as a *way of being*. One metaphor, used to describe and articulate its essence, is to align the concepts with air.

Air is ubiquitous, and it surrounds people who might be unaware of its presence unless they are outside on a windy day, or they are having trouble with breathing. Leadership is like air in this sense; leadership is everywhere, in both formal and informal roles. People might witness leadership without thinking about it, until there is an aspect that either so moves or so troubles them that they begin to think about its impact on them personally, or the impact on the organization or work unit. It is when people are fully present with leadership that they begin to understand its impact. Consider for example that when adults are asked to describe examples of “good leadership” they have experienced; many will mention their parents as opposed to historical figures or others from their work environment. As people describe leadership in this capacity, they share the *way of being* that they witnessed from their own parents. The examples shared are not about a bottom line of organizational triumph, but instead, stories of the ways in which their parents exemplified quality leadership, what they stood for, believed in, and enacted through those values; hence, it was their way of being.

Because mindful leadership has a variety of explanations and definitions, and is often referenced by the qualities of leaders projecting a means of being “mindful” at work, it can also be understood by a visualization of construction. Mindful leadership has, as its foundation, the ancient practice of meditation. Consider the growth over time and the application to personal or organizational life; this growth engenders the building of many levels with new construction appearing as new visions emerge. In some iterations of construction, the building is radically different, and in others, it is an addition or wing. The construction of mindful leadership also exemplifies disparate views of the *what* and the *how* of leadership if it is to be considered mindful.

---

## **The Origins of Mindful Leadership**

Descriptions of mindful leadership have increased since the first publication in 1989 when Ellen Langer wrote of the leadership of Napoleon’s invasion of Russia and military opposition to Kutuzov, in her book, *Mindfulness*. Langer described the chess

game of advancing during winter in Russia and Napoleon's ultimate withdrawal. Ellen portrayed the choices of Kutuzov in standing firm to this attack with an analysis and categorization of mindfulness. She offered,

In the character of Kutuzov we can find portrayed the key qualities of a mindful state of being: (1). Creation of new categories; (2). Openness to new information; and (3). Awareness of more than one perspective. (p. 62)

Langer distinguished the strategies employed by Napoleon as mindless and those of Kutuzov as mindful. Langer reviewed the qualities of being mindful with its benefits to the workplace. She articulated, "For employer and employee alike, mindfulness may increase flexibility, productivity, innovation, leadership ability, and productivity" (p. 133). While not using the term mindful leadership, Langer described examples from the business world where mindfulness allowed for transparency that was equated with a type of clarity in understanding and being aware.

Publications of mindfulness have increased exponentially (Brown & Ryan, 2003) with peer-reviewed papers about mindful leadership surfacing in 2009. In articulating mindful leadership, various authors have chosen to describe the traits of the leaders seen as being more mindful than others. Some authors have focused on the stress as antecedents for mindfulness while others reported on the barrage of constant connectivity and media to interrupt productivity and the capacity to perform the tasks at hand in the workplace. Mindfulness articles span several distinctive categories of psychology, medicine, neurobiology, and business-related fields. Being more mindful, than not, generally refers to being fully present and aware; both are attitudinal foundations of mindfulness practice as described by Kabat-Zinn (2009). Other reviewers have described the organizations as being more mindful than mindless or operating by default. To that end, mindful leadership is like the air; it is everywhere, and although aspects of it may be invisible, it is ultimately experienced by everybody, whether in subtle or dramatic ways.

## Mindful Leadership in Business

Boyatzis and McKee (2005) described the importance of resonating and renewing to build after the numerous challenges and sacrifices that leaders face, and instead offering mindfulness, hope, and compassion as foundational to that renewal. While they do not use the term *mindful leader*, they aligned the practice of mindfulness to that of leadership, as in their suggestions of being awake, aware, and attentive at work (p. 116). Boyatzis and McKee viewed mindfulness as a practice to help with the shutting down or defensiveness that is often present in a leader's role. They shared, "Being open to learning, especially learning from failures, takes courage. And living mindfully requires resilience" (p. 117).

Boyatzis and McKee depicted mindfulness as a means of knowing what is happening and being able to respond to it, directly in opposition of leaders who

either close out or shut down what is happening. Finally, they suggested finding time to reflect, and find mental space for the issues that arise, all supported by mindfulness.

Carroll (2007) revealed a definition of mindfulness that was designed to inspire leaders to bring out the best that they had to offer while doing the same for those they were leading. In this sense, he outlined ten principles that he specified as part of what he deemed, “leading from the inside out” (p. 17). He continued, “Mindful leadership teaches that this instinct to inspire the best in others is completely natural- utterly human- and is at the very heart of being a leader” (p. 18). In addition to explaining the *what* of leadership, Carroll moved to describing the *how*,

Typically when we think of leading, we think of guiding and instructing others, pointing the way, setting direction. And surely, these activities are what leaders do. Yet, for the mindful leader, leading from the inside out requires a primary act- a fundamental human gesture that must take place first and foremost, before any leader can guide or direct or point the way. According to the tradition of the mindful leader, a leader must first open- step beyond the boundaries of what is familiar and routine and directly touch the very people and environment he or she intends to inspire. Leading requires that we first open to the world around us. (pp. 19–20)

Carroll advocated for practicing mindfulness, to be at peace with stillness, and allow for insights. His understanding of the stress of leaders can be found in his advice, “Treat adverse circumstances as your teacher” (p. 209). Finally, he explained the differences in traditional and mindful leadership, “In the tradition of the mindful leader, rather than leading with will, power, and ambition, we lead and inspire one another with openness, intelligence, and vulnerability” (p. 52).

Sethi (2009) articulated the real challenge of moving qualities of meditation to the office and actual world experiences. As such, he advocated for the integration of mindfulness practices for the teaching of leadership. His view is based on a decade of teaching leadership in the corporate world with his assessment that senior executives do not have the answers to the complexities they are witnessing, which are often seen or understood at the middle and lower levels. Sethi viewed mindfulness-based leadership as a solution because of its tendency to open up minds for new information. He offered that mindfulness “is a whole new way of leading, working, and living, and it requires us all to unlearn old ways” (p. 11). Sethi described focus, awareness, and living in the moment, as the three mindfulness qualities that are aligned with mindful leadership.

Gonzalez (2012) described the prevalence of stress and 24/7 connectivity as reasons to pursue the study of mindfulness; its reported health benefits provided another layer of support for the practice of mindfulness. Gonzalez related three areas that are improved with meditation: concentration and achieving focus, clarity in noticing what is arising, and equanimity in accepting what is happening without overreacting.

Marturano (2014) shared, “A mindful leader embodies leadership presence by cultivating focus, clarity, creativity, and compassion in the service of others” (p. 11). Focus was about being fully present as opposed to being distracted; clarity is about

being able to see both the events around oneself and those that are internal to self with more accuracy; creativity allows the brain to slow down so that better ideas may emerge; and compassion is about recognizing suffering with the decision to want to do something about it (pp. 35–40). Marturano defined a mindful leader by traits, “non-judgmental, open-minded, open-hearted, self-aware, patient, humble, trusting, collaborative, and compassionate” (p. 176).

Vich (2015) articulated the core variables of mindful leadership, offering the differences among it and other leadership models, suggesting the challenges of the emergence of mindful leadership theory. As such, he referenced the stress inherent in organizations and concepts such as awareness, being mindful as opposed to mindless, and the coping mechanisms of mindfulness practice. Vich discussed the many challenges of contemporary organizations, including the preponderance of mind wandering, mindlessness, overall stress, and the impact on resilience. He offered guidance in this explanation,

Mindful leadership, which can be explained as a mutual relationship between the leaders and followers influenced by the leader’s mindfulness seems to be a possible next step of mindfulness research on the workplace. First of all, the researchers should examine variables which have been already examined on an individual level, particularly job satisfaction, job engagement, burnout and turnover intentions. Secondly researchers need to take into account clear differentiation from other already existing leadership approaches. (p. 42)

Ehrlich (2017) traced the result of technology where leaders may be working harder while paying less attention. For example, he related that Microsoft managers were interrupted an average of 10–30 times per hour, with considerable time to be able to return to the work that was interrupted. He listed the numerous examples of organizations teaching their employees mindfulness to assist in being mindful at work. He quoted Fortune 500 companies that are conducting mindfulness research and documenting the following: (1) focus, decision-making, memory, creativity, and learning; (2) communication, collaboration, and productivity; (3) emotional intelligence, well-being, and internal and client relationships; (4) job satisfaction and engagement; and (5) reduced stress, absenteeism, and turnover (p. 234). His conceptualization of mindful leadership is that it helps with inspiring, connecting, and being present. Ehrlich offered a view of mindful leaders as appearing to have more hope, resiliency, and optimism, with their employees demonstrating higher job satisfaction and job performance, higher engagement, and well-being (p. 240).

Lesser (2019) shared the seven practices of a mindful leader that colleagues at Google, where he was coaching engineers on leadership and team building, were working on. The seven practices included,

**Investigate:** *Love the work-* acknowledge and cultivate inspiration; *Do the work-* a regular meditation and mindfulness practice; *Don’t be an expert-* Step into wonder and vulnerability; *Connect to your pain-* pain comes with being human.

**Connect:** *Connect to the pain of others-* Embody a connection to all humanity; *Depend on others-* Let go of a false sense of independence.

**Integrate:** *Keep making it simpler-* Let go of a scarcity mindset. (pp. 25–26)

## Mindful Leadership: Library Science

Beverage et al. (2014) offered a conception of mindful leadership as it related to the librarianship by stating,

Mindful leadership is the connection between the brain and leadership and focuses on being in the moment and paying attention. Studying the act of paying attention and focus as a neuroscientific phenomenon bridges emerging knowledge about human intelligence, and is a framework that supports leadership that is mindful (i.e., thoughtful and attentive of the nature and nurture of intelligence in influencing others toward achievement of goals). (p. 23–24)

Beverage et al. described the numerous challenges evident to the field of librarians with regard to digital and electronic resources, and their recommendations as to how a library leader may include mindfulness at work, including qualities such as practicing and reflecting, cultivating awareness, listening, and keeping the mission and vision alive for staff (p. 30).

## Mindful Leadership: Medicine

Rishel (2015) reviewed the importance of resilience and mindful leadership in oncology nursing. She advocated for the training of mindfulness practices, “If oncology nurses at all organizational levels are to be authentic leaders in their practice, they must be offered skills that will help them to achieve this goal” (p. 199). She further called upon oncology nurses to be leaders for the patients and families they serve, as she explained,

Developing mindfulness will enable oncology nurses to be fully present with patients and families, more aware of themselves and their impact on others, and increasingly sensitive to the reactions of patients, families, and colleagues in stressful situations. Mindful oncology nurse leaders will be more effective in motivating patients, families, and others to achieve shared goals. (p. 199)

Levey and Levey (2019) conceptualized mindful leadership for its ability to offer organizational and personal resilience in a world that is often described as volatile, uncertain, complex, and ambiguous (VUCA). They asked a compelling question about the inception of mindfulness in organizations,

Could it be that the global surge of interest in mindfulness and resiliency reflects a wise and evolutionary impulse perfectly adapted and responsive to meeting the challenges and realizing the opportunities of the VUCA world in which we live and serve as dedicated health caring providers and practitioners? (p. 739)

Levey and Levey offered a conception of the uncertainties that a VUCA world presents and the responses that leaders did not feel capable to lead these efforts (p. 742). Hence, leading businesses with usual business norms are correlated with how “distressed, exhausted frustrated, overwhelmed, vulnerable, unhappy, and

unsustainable their default life-work styles are” (p. 742). Levey and Levey further articulated the example from the United Kingdom in which mindful leadership, resilience, and life balance were promoted. Named simply as *Here*, this example of a mindful approach changed the ways that physicians and healthcare providers presented as a *way of being* with their patients, resulting in changes in the way that practitioners cared for themselves and others (p. 744).

Horton and Epstein (2020), physicians themselves, described the role of mindfulness in attending to the challenges that physicians face, offering views of how mindfulness can increase the well-being of patients. They wrote about the complexities of the medical organization, one that they described as being “rooted in system dysfunction” in a chapter named *Mindful Leadership* (p. 51). Consider this description of the duality of benefits that mindfulness provides,

Mindfulness is a practice and a habit, a higher-order emotional and cognitive skill, deceptive in its apparent simplicity. It is also an antidote to organizational cultures that encourage harsh self-appraisal, quick and efficient cognitive closure, and a learning structure that exposes us to constant, reflexive judgment. Mindfulness embodies qualities valued by the most visionary and effective leaders- attentiveness, focus, and curiosity in the face of difficult circumstances; seeing problems in new ways; and being present and available. (p. 52).

Horton and Epstein called for nonjudgment, moment-to-moment awareness, and open listening with an intention to listen instead of responding and offered a full explanation,

Leading mindfully asks us to be aware of the difference between really listening and just going through the motions, momentarily putting our own agendas aside and directing our attention towards being present, without anticipating or exerting influence on the direction of the conversation. (p. 54)

Horton and Epstein called upon physicians and healthcare executives to develop a habit of mindfulness practice, develop the skills of listening with tolerance, even when they do not know what to say, cultivate emotional self-awareness to better manage words and actions, truly feel and recognize one’s own pain for growth and insight, and witness the suffering of others as a marker of the shared human experience (p. 57).

## **Mindful Leadership: Education**

Brown and Olson (2015) wrote a book for educational leaders in which they outlined qualities and characteristics of mindful leaders; their impetus is rooted in the continual urgency and stress of the school leaders and the benefits and alignment of mindfulness to address the same. Their advocacy for mindfulness centers on its myriad health benefits and the relationship of mindfulness traits to effective school leadership. While they do not use the term mindful leadership, per se, these authors related the traits of a mindful school leader. Brown and Olson related traits of being

well focused, with mindful listening, speaking from the heart, and being fully present. They summarized, “Finally, and perhaps most critical in terms of our views of leadership, we believe employing mindfulness practices helps educational leaders develop the most important attribute of all: the capacity to connect with themselves and others” (pp. 31–32).

Wells (2016) defined a mindful leader by traits and qualities that they demonstrate, offering that mindful leaders are engaged and interested in the people of the organization, with a high degree of attention and empathy (p. 8). She represented how mindfulness could address both the personal and professional lives of educational leaders, addressing the stress levels while also serving to increase the effectiveness of leadership skills. She further outlined the qualities of attention as being: caring, concern for, acceptance, and without judgment or criticism. Her outline of attention included noticing, listening, being with, observing, and mindful awareness (p. 9). She summarized the nuances of her definition,

Mindful leadership, as defined in this book, is the integration of constructs of mindfulness practice, with emotional, social, and resonant leadership, informed by the research from neuroscience. Mindful leadership embraces the interconnectedness and interdependence of mindful practice. Thus, the *practice* of mindful practice benefits the person in the moment, and it has as impact that is possible in the practice of leadership. With practice, the cultivation of the qualities inherent in the constructs such as acceptance, awareness and being fully present; listening, trust, patience, nonreactivity, non-judgment, compassion and self-compassion can be developed. It is a cycle of growth, all possible from being in the moment on purpose, practicing awareness and attention without judgment or criticism. (p. 118)

Wells developed this definition by referencing Kabat-Zinn (2009) for providing the anchors of attitudinal foundation of mindfulness that included nonjudging, patience, trust, and acceptance. She further defined mindful leaders by the traits they exhibit; descriptors are listed below in bold print, with the continuum of opposites of that quality,

**Acceptance**, instead of being unaware or seeing the reality of the situation, or blaming others. **Awareness**, instead of being preoccupied or distracted, or refusing to accept reality. **Being fully present**, instead of regretting the past, or worrying about tomorrow. **Compassion**, instead of not caring or listening to someone in need, or judging or criticizing. **Letting Go**, instead of not caring enough to be interested, or holding on. **Listening**, instead of disregarding, or interrupting to tell your story. **Patience**, instead of not observing or being aware of a situation, or reacting with an angry outburst. **Trust**, instead of having a disbelief of disregard, or acting with duplicity. (p. 129)

---

## Conclusion and Reflections

The options for increasing mindful leadership are everywhere, like the air that is not seen, but always present. Some of the options represent a world of overwork and overwhelm. Consider, for example, the challenges of constant or permanent

connectivity with the Internet. People's work lives are a major source of stress where the workday hours are blurred, interrupted by the sound of new text messages arriving. As mentioned in this writing, VUCA, or volatility, uncertainty, complexity, and ambiguity, in this world impacts major organizations, and personal lives, all in flux for change.

Mindful leadership depends on what is referred to as soft skills, areas such as self-regulation, social skills, empathy, and self-management and regulation, qualities that are continuing to rise in literature about effective leadership (Marques, 2013). Goleman (2013) related the hard case for soft skills in which he cited the importance of empathy, self-awareness, listening, and resilience (pp. 235–236).

Mindfulness is equated with numerous health benefits. Goleman and Davidson (2017) reported the “emergence of neuroscience's evidence that our experiences shape our brains, a platform suggesting our theory that as meditation trains the mind, it reshapes the brain” (p. 17). They further added,

Many reports boil down to the ways a short daily dose of meditation alters our biology and emotional life for the better. This news, gone viral, has drawn millions worldwide to find a slot in their daily routine for meditation. (p. 17)

Consider the eloquence of a view of a more esthetic perspective of leadership as articulated by English and Ehrich (2020) in which they revealed,

It is argued, here, that the identity of a leader is best understood as an aesthetic construct, something which is characteristic of many aesthetic words such as beauty or even the word art itself. Moreover, as with many aesthetic words, leadership remains elusive to precise translation. It is not so much described, but felt. (p. 2).

English and Ehrich provided numerous examples of this esthetic view of leadership that correlate with that of a mindful leader, while not using the words *mindfully* or *mindful leader*. These authors referenced the issue and importance of identity, “. . . identity is always dynamic, fluid, emotional and rooted in exchange. Leadership and identity have yet to be deciphered from empirical, scientific studies” (English & Ehrich, p. 3).

English and Ehrich provided a conception of the esthetics and the arts as it relates to the preparation of school leaders,

The dominant approach to formal school leadership preparation in many universities tends to be narrow and based primarily on technical skill development. The language of business and management is pervasive in such training and thus limited. Over the last ten years or more there has been a growing recognition of the place of the arts in leadership and management development. (pp. 17–18)

While these authors have not advocated for mindfulness, per se the alignment of conceptions of understanding the reality of the work of the educational leaders, their lives at work, provide for an intersection of mindful leadership with this art form of leadership. It is the use of this art form that translates beautifully as a way of being to create a presence

that is dynamic, fluid, and responsive to what is often referred to as the “slings and arrows of life” that are present in the day-to-day operations of an educational leader.

What are the next additions to the construction of mindful leadership? Vich (2015) offered a possibility, “Mindful leadership, which can be explained as a mutual relationship between the leader and follower influenced by leader’s mindfulness, seems to be a possible next step of mindfulness research on the workplace” (p. 42).

Is it possible the mindful leadership can help with the constant state of preoccupation and distraction that people feel, the sense of overwhelm, busyness, inability to even hear what is being said in the present moment, the anxiety, and over-involvement that pervades the workplace as well as personal lives? The research on the workplace points to some interesting examples of its potential. The narrative from Good et al. (2016) provided some roadmaps for continuing this journey of discovery as they described their framework,

The framework identifies how mindfulness influences attention, with downstream effects on functional domains of cognition, behavior, and physiology. Ultimately these domains impact key workplace outcomes, including performance, relationships, and well-being. Considerations of the evidence on mindfulness at work stimulates important questions and challenges key assumptions within management science, generating an agenda for future research. (p. 115)

Perhaps, mindful leadership and mindful leaders will play a major role in this construction of a new vision of leading, one that is about growth through practice by listening to the whispers of quiet, stillness, and reflection. Wells (2016) provided a description of mindful leadership where leaders would emphasize “listening instead of talking, being instead of doing, hearing instead of telling, being in the moment instead of distracted thinking, stillness instead of busyness, and compassionate understanding instead of judging” (p. 119). In this description, the art of mindful leadership would include being fully present, empathic, and resilient, qualities that serve the leader and the people in the organization.

### Abstract

This chapter explores the presence of two distinctive sociological perspectives regarding educational leadership which are often portrayed as a binary or a dualism. On one side is the historical and dominant view known as “leader centric.” The other side has been called “leader relational” or constructivist (Eacott S, Evers CW, *New directions in educational leadership theory*. Routledge, New York, 2016; Offermann LR, *Relational leadership: creating effective leadership with diverse staff*. In: Uhl-Bien M, Ospina SM (eds) *Advancing relational leadership research: a dialogue among perspectives*. Information Age Publishing, Charlotte, pp 361–380, 2012). Intellectual practitioners and some academic leaders sometimes speak of these differences as sharply at odds with one another, even intractable.

For example, Emirbayer (1997) saw the intellectual divide as

rational-actor and norm-based models, diverse holisms and structuralisms, and statistical ‘variable’ analyses—all of them beholden to the idea that it is entities that come first and

F. W. English (ed.), *The Palgrave Handbook of Educational Leadership and Management Discourse*, [https://doi.org/10.1007/978-3-030-99097-8\\_115](https://doi.org/10.1007/978-3-030-99097-8_115)

relations among them only subsequently—hold sway throughout much of the discipline. But increasingly, researchers are searching for viable analytic alternatives, approaches that reverse these basic assumptions and depict social reality instead in dynamic, continuous, and processual terms. (p. 281)

Ospina and Uhl-Bien (2012) observed that “learning and sharing across perspectives is still rare in the leadership field as a whole” (p. 8). This chapter highlights the conceptual and ontological differences in the traditional mainstream views and theories in leadership compared to what is called *critical leadership studies (CLS)* and it also acknowledges that “premature paradigmatic closure in the field has privileged the entity perspective as ‘the legitimate’ type of leadership scholarship” (Ospina SM, Uhl-Bien M, Introduction – mapping the terrain: convergence and divergence around relational leadership. In: Uhl-Bien M, Ospina SM (eds) *Advancing relational leadership research: a dialogue among perspectives*. Information Age Publishing, Charlotte, pp xix–xivii, 2012, p. 9).

Finally, the research of Michael Mann (2003) and his sociological work on social power within the critical leadership studies field is advanced as a theoretical bridge which connects the two rival perspectives and argues that they occupy a common ontology and two points on a single continuum instead of being considered as incommensurate theories.

Leader centric · Leader relational · The unschooled mind · Myth of individual achievement · Entitism · Theory movement · Myth of individual achievement · Critical leadership studies · Theory of social power · Rank societies · Social stratification · Civilization · The social cage · Coercive power

### The Field of Memory

The leadership field has historically been anchored in the centrism of a focus on the singular individual leader. When looking at a military campaign, a political conflict, a labor dispute, or a religious movement, it is the leader or leaders who stand out. These are the people that other people follow. It has been quite natural then for observers, biographers, journalists, researchers, and scholars to attribute success or failure to the habits, traits, beliefs, behaviors, attributes or intelligence, physical strength, personal character, and charisma of a single person, *the leader* to explain events and history.

Portraits of leaders from the arts and humanities, which for centuries had nourished the imaginations and aspirations of future leaders in many fields, eventually gave way to the more mundane tasks involved in running the schools. One of the earliest academic leaders to spell out the actual work tasks of *administration* was Elwood P. Cubberley who first wrote *Public School Administration* in 1916 with revisions in 1922 and 1929.

Cubberley (1929) indicated that there were four essential areas of concentration which comprised the nature of the school superintendent’s work. They were: (1) *the superintendent as an organizer*; (2) *the superintendent as an administrator*; (3) *the*

*superintendent as supervisor*; and (4) *the superintendent as a community leader*. From each of these came specific tasks such as:

- To exercise general control over school organization
- The school plant
- Courses of study
- Classification of students, textbooks, and supplies
- Curriculum reorganization
- Defining the work of teachers and principals
- Selection and pay of staff

The main task of administration, according to Cubberley (1929), was “in some way, reach down through all the complicated machinery of school organization and administration and vitalize the work of teachers. His (sic) larger grasp of the problems should in some way find expression in the daily work of teachers and pupils if his highest mission as a superintendent is to be fulfilled” (p. 219).

As far as the individual was concerned, Cubberley (1929) gave this advice which one would not find in any textbook in leadership preparation in contemporary times.

The man (sic) who would be a superintendent of schools—the educational leader of a city—must be clean, both in person and mind; he must be temperate, both in speech and act; he must be honest and square, and able to look men straight in the eye; and he must be possessed of a high sense of personal honor. He needs a good time-sense to enable him to save time and to transact business with dispatch, and a good sense of proportion to enable him to see things in their proper place and relationship. He must have the manners and courtesy of a gentleman, without being flabby or weak. He must not be affected by a desire to stand in the community limelight, or to talk unnecessarily about his own accomplishments. He must avoid oracularism [acting like an oracle], the solemnity and dignity of an owl, and the not uncommon tendency to lay down the law. A good sense of humor will be found a means of saving grace here, and will many times keep him from taking himself too serious. (p. 228)

Cubberley (1929) also spoke to the qualities of leadership required of the superintendent when he warned, “He (sic) must learn to lead by reason of his larger knowledge and his contagious enthusiasm, rather than to drive by reason of his superior power” (p. 228).

This type of early textbook for school leaders is still around in modern form. It is not based on any theoretical model or even systematic research. There are still a few contemporary examples in education as for example Russ Thompson’s (2016) *Fall Down, Stand Up* based on his 14 years as a high school principal in Los Angeles. Former military leaders also provide practice-based experience as wisdom with L. David MarQuet’s, a former attack submarine captain (2012) *Turn the Ship Around* whose subtitle is “A true story of turning followers into leaders” (book cover quote). The reader is promised “The payoff: a workplace where everyone is around you is taking responsibility for their actions, where people are healthier and happier, where everyone is a leader” (inside cover).

The business field is replete with these examples of advice without the benefit of research, theory, or objective peer review. John Wareham (1991) wrote *The Anatomy of a Great Executive* based on his years as a consultant. His book promises to explain “The seven fallacies that account for 80 percent of misjudgments about people,” as well as “The four crucial blind spots that lead to ruinous mishires and mis-promotions” (book cover) among other things.

Another example from the business world is Alex Malley’s (2015) *The Naked CEO* which promises the reader “. . .the power to shape your future. With the intriguing stories and outstanding advice, this book puts the knowledge and insights of a successful CEO right in your pocket” (book cover). Finally, there is Brene Brown’s (2018) *Dare to Lead*, a popular *New York Times* best seller. Brown is billed as a research professor but there is precious little research cited in her book. It is filled with catchy-phrases such as “the rumble tool: the square squad” (p. 22) and “You can’t get to courage without rumbling with vulnerability. Embrace the suck” (p. 10).

Finally, there are books of factoids about leaders. One recent one is Charles Phillips (2015) *50 Leaders Who Changed History*. This book identifies a formulaic key to each person such as Simon Bolivar, Eva Peron, Mother Teresa, Fidel Castro, and Steve Jobs called “Leadership Analysis” presented in a color-coded call box. In each box are short descriptors for *Leader Type, Key Qualities, Likeminded Leaders, and Fact*. There are 16 types of leaders including such descriptors as revolutionary, paternalistic, reformer, innovator, unifier, talent-promoter, and those (p. 9) which are sorted by whether or not they were included in *arts and culture; military; politics and society; or religion*.

The line between *the field of memory* and *the field of presence* becomes a bit blurry at times. In the popular mind, what Gardner (1995) called “the unschooled mind,” a person who has the sophistication in worldly affairs and complex relationships of the mind of a 5-year-old child, needs simple and straightforward explanations. The “unschooled mind” is not a less intelligent mind, only one lacking in understanding that would normally occur with increased formal schooling. The enduring popularity of *Bible stories* and *fairy tales* is due to their simplicity and lack of subtlety. The mass appeal of comic book heroes and heroines in films testify to their robustness and continuation in adult life.

There probably will not come a time when simple stories about leaders and their accomplishments will cease to fascinate humans. In this sense, leadership stories are transcendent and they serve to reinforce virtues and values humans need to survive and prosper. What has occurred, however, is that in scholarly circles, such simplified visions have often revealed an inability to provide deeper meanings and more sophisticated understandings of leaders and leadership. They are sometimes referred to as “management light” or “kitsch” (Samier, 2005.)

### **The Field of Presence**

Wilkinson and Kemmis (2016) summarize the dominant mindset regarding leadership studies today when they remarked, “. . .in current Anglophone nations, leadership practice (and the scholarship which underpins it) is dominated by managerialist

notions of leading as a technicist activity whose primary imperative is to render educational sites and the systems which support them, more efficient and accountable” (p. 37).

The *field of presence* remains dominated by “leader centric” versions, because “. . . premature paradigmatic closure in the field has privileged the entity perspective as ‘the legitimate type of leadership scholarship’” (Ospina & Uhl-Bien, 2012, p. 9). In this approach, individual leaders are cut and diced by the methods used to analyze them. There are portraits of leaders framed in various lenses of empiricism in largely behavioral models, which tend to be quantitative in nature.

Even when research investigates leader beliefs, attitudes, perceptions, and their choices or preferences, quantitative and qualitative renderings remain leader centric. This same trend continues even when the whole human being as leader is revealed in some depth as in such exemplary ethnographies such as Wolcott’s (1973) *The Man in the Principal’s Office*, Larry Cuban’s (1976) or Sara Lawrence Lightfoot’s (1983) *The Good High School*.

With the theoretical break brought by educational administration’s dissident professors in the mid-twentieth century who started what later became known as “the theory movement” based on an ideology of science expounded by the Vienna Circle (see Griffiths, 1959; Halpin, 1966), the field’s intellectual leaders worked hard to reframe not only the knowledge base and more robust (qua quantitative) research, but the way one imagined educational administration/leadership should be conceptualized. No longer were former practitioners regaling students with their “war stories” adequate. The dissidents wanted nothing less than to reimagine and remake educational administration into a respectable social science with all of the trappings of such a science (Culbertson, 1988, 1995; Hills, 1968). Remnants of the theory movement still remain firmly in the mainstream, but the idea of the discipline becoming a science has been labeled by some as the futile search for the Holy Grail. Despite the disappointments for the creation of an educational management science, Lakomski and Evers (2017) have refounded such a belief by insisting that the area of cognitive neuroscience has the potential to enable the field to establish a true scientific footing (Evers & Lakomski, 2016).

### **The Field of Concomitance**

Educational administration/leadership has a long history of borrowing concepts, techniques, philosophical assumptions, as well as work routines from a broad array of related or even unrelated fields or areas of study. The field has long been infatuated with business or industrial management ideas, agendas, and outright fads (see Lee Iacocca, 2007, *Where Have all the Leaders Gone?*).

The major discipline which arguably has had the most profound intellectual influence on educational leadership/administration has been sociology. Eacott (2015) has provided some explanation for this phenomenon when he observed, “Disciplines with greater internal heterodoxy (e.g. sociology) are more open than those with stronger identity defining research traditions” (p. 142). He then went on to comment, “The desire to be scientific—in the traditional sense—and of value to practice is a limitation of educational administration” (p. 142).

Two sociological perspectives on leadership, *the leader centric* with its long and historical manifestations into portraits, poems, songs, and near universal cultural mythologies (Campbell, 2008), as well as biographies and other heroic testimonials, satisfy a yearning for human certitude against the unknown (nescience as framed by Thomas Carlyle, 1935) and the need for heroes as models to engage in political and cultural struggles of all sorts, juxtaposed against a sociology of networks instead of individuals as *leader relationally* are often presented as a binary choice (see Alvesson & Sveningsson, 2012). The heroic and singular leader holds a formidable presence in the popular mind and retains a dominant trope in academic textbooks in educational leadership with such titles as Theoharis and Brooks (2012) *What Every Principal Needs to Know To Create Equitable and Excellent Schools*; Glasman and Glasman's (2007) *The Expert School Leader: Accelerating Accountability*; Sergiovanni and Green's (2015) *The Principalship: A Reflective Practice Perspective*; Ubben, Hughes, and Norris' (2001) *The Principal: Creative Leadership for Effective Schools* among many others.

### **Discontinuities and Ruptures**

The leader relational view represents a rupture in how leadership is defined and enacted. It shifts authority away from a static leader-follower relationship to a much more fluid and ill-defined one when leaders and followers exchange roles, though this possibility is diminished in bureaucratic organizations with rigidly defined hierarchical roles enforced with an authoritative and often legally restricted chain of command.

Joyce Fletcher (2012) summarizes the impact of gender on implementing a model of relational leadership to the different cultural socializing practices for men and women that are ruptured in moving away from leader-centric models to relational ones. Men are socialized to deny certain relational skills because they may be perceived as weak or emotionally needy. Women, on the other hand, are rewarded for using them. They employ them “naturally” and often without attribution or recognition. One result is that the total social structure honors an achievement ethic that appears to be based on independence and self-reliance, when the collaborative glue that is necessary to attain such achievements goes unnoticed and devalued. Fletcher (2012) then comments that the “myth of individual achievement” floats on the unrecognized interdependence of everyone.

The basic rupture within leadership studies occurs along the fault lines of what has been called *CLS* or critical leadership studies. Collinson (2012) indicates that the term *critical leadership studies* “comprises a variety of approaches informed by an eclectic set of premises, frameworks and ideas. . . critical studies do not constitute a unified set of ideas, perspectives or a single community of practice” (p. 181). Collinson (2012) opines the plurality of newer theories may be drawn from such perspectives as “structuralism, labor process theory and critical realism, to feminism, post-structural, deconstructionism, literary criticism, postcolonial theory, cultural studies, environmentalism, and psychoanalysis” (p. 181).

### Critical Assumptions

Ospina and Uhl-Bien (2012) observe that “Entity (leader centric) and constructivist perspectives on leadership are separated by a profound divide in philosophical understanding—in the deep meanings—regarding what constitutes the nature of leadership and the research enterprise around it” (p. 1). These two perspectives rest on different assumptions. The ontology of leader centrism is that it is *discovered* because an “emphasis on leaders as sovereign individuals trains the lens on personal attributes and agency, while silencing or marginalizing the critical role that varying contextual conditions (local, national and international) play in change and change processes” (Wilkinson & Kemmis, 2016, p. 37).

The traditional leader-centric binary rests on the historic and long-standing “leader-follower” dyad that privileges the leader with some kind of “presence” that followers lack. The disparity is built into the binary with the result of the perpetuation of those “heroic approaches to leadership that are not only unrealistic but also damaging to those such as school principals who are grappling with checklists and performative standards of practice based on those models as the essence of their day-to-day work” (Niesche, 2014, p. 85). At this moment in time, there are mostly theoretical texts that deal with the *leader relational* view in ways which would match in volume or clarity the leader-centric mental monolithic that remains dominate in the field. Niesche (2014) also makes a persuasive case that the concepts such as distributed leadership, democratic leadership, collaborative, dispersed, parallel, situational, or shared models, or even transformational leadership do not shed the foundational leader/follower binary.

The assumptions undergirding the *leader relational* view are that leadership is a social construct which emanates from a relational process in which clear boundaries between leaders and followers do not exist. Rather, they are fluid and contextually defined because individuals and collectives are mutually embedded in each other. Leadership is therefore constructed and can take on a life of its own, i.e., become reified. In the *leader relational* model, the ontological nature of reality is that it is created by humans interacting with one another. It is not observed “out there” but constructed inter-relationally and it is the interaction within those relationships which is the unit of analysis and not the singular “leader.”

Michael Mann’s (2003) theory of social power is the proposed theoretical bridge which may have the elasticity and capacity to dissolve the apparent binary between *leader centric* and *leader relational* views of leadership. Undergirding Mann’s analysis of social power is his assumption that “societies are constituted of multiple overlapping and intersecting sociospatial networks of power” (p. 1). Similarly he argues that “societies are not unitary” (p. 1) and what flows from this claim is he asserts that there are no totalities, no unitary entities, and no social system itself. He posits that there is no social structure that constrains humans. From this perspective, he disputes “sociological orthodoxies such as systems theory, Marxism, structuralism, structural functionalism, normative functionalism, multidimensional theory, evolutionism, diffusionism, and action theory” because they all assume that

something called *society* (italics the chapter author's) represents an "unproblematic, unitary totality" (p. 2).

---

## Introduction

Leadership's root word is the noun *leader*. It is singular. About 1300, *ledere* was derived from the Middle English *leden* meaning *to guide* (Barnhart, 1995, p. 425). The practice of describing a leader has hoary precedents in the ancient literary works of the past. Perhaps one of the most famous was Plutarch's *The Lives of the Noble Grecians and Romans* most likely written in the second century, A.D. (Lamberton, 2001). The Plutarchian portraits of Greek and Roman leaders have been firmly implanted in the Western mind. They were given personalities and near immortality because of William Shakespeare and his genius for portraying the inner human being struggling with near universal moral issues.

When it came to Plutarch, Shakespeare not only "...lifted the narratives of his four Roman plays, plus a bit of *A Midsummer's Night Dream*... [but] most important he assumed Plutarch's ethical approach to character" (Whittemore, 1988, p. 12). Bloom (1998) noted that "Shakespeare's works have been termed the secular Scripture, or more simply the fixed center of the Western canon" (p. 3). The colloquies of Hamlet, Othello, Falstaff, King Lear, and MacBeth lay convincing portraits of singular leaders struggling with events of their days, paradoxes, and deep moral dilemmas. From Shakespeare, we learn that leaders are lonely, their lives are complex, and their problems rarely one dimensional.

It could be argued that Shakespeare's Elizabethan theatrical portrayals of leaders have continued to exert a dominance in thinking about leaders and leadership that have not been substantially altered over many centuries. For example, in Howard Gardner's (1995) *Leading Minds: An Anatomy of Leadership* published almost two thousand years following Plutarch, Gardner attributed to those we call leaders to their proclivity to "achieve effectiveness chiefly through the stories they relate" (p. 9).

Despite shifting the fulcrum of separating a leader from a follower to the communication of stories, Gardner's definition of a leader remains firmly in the individualistic mode linking back to Plutarch. Here is Gardner's definition (1995) "persons who, by word and/or personal example, markedly influence the behaviors, thoughts and/or feelings of a significant number of their fellow human beings (here termed *followers* [italics original] or *audience members* [italics original]). The leaders' voices affected their worlds, and ultimately, our world" (pp. 8-9).

## The Evolutionary Social Power Theory of Michael Mann

Michael Mann is a British-born sociologist. A graduate of Oxford, he subsequently served as an academic at Cambridge, the University of Essex, and the London School of Economics before becoming a professor at UCLA (University of

California at Los Angeles) in 1987. He was elected Corresponding Fellow of the British Academy in 2015. His primary scholarship has been an investigation of the sources of social power and his initial book *The Sources of Social Power* first published in 1987 had been reprinted ten times through 2003.

A close reading of *The Sources of Social Power* would reveal that Mann's work would be grouped within the definition of *critical studies of leadership (CSL)*. His foundational premise is that "Societies are constituted of multiple overlapping and intersecting sociospatial networks of power" (p. 1). His definition of power is "the ability to pursue and attain goals through mastery of one's environment" (p. 6). There are two additional aspects of social power he cites. The first emanates from Max Weber (1968) who indicates that power is the concept that one person can exercise their will despite pushback from others. A second aspect of power comes from Parsons (1960) "whereby persons in cooperation can enhance their joint power over third parties or over nature" (1960, 199–225 as cited in Mann, 2003, p. 6). These two forms of power, *distributive* and *collective*, are joined by *exploitative* and *functional* power though all "operate simultaneously and are intertwined" (Mann, 2003, p. 6).

As this intertwining takes form and shape in an organization, there is a natural drift towards *distributive power* emanating from the need for supervision and coordination. When this happens, those at the top exercise or have hegemony over the totality of the organization, "and it prevents those at the bottom from sharing in this control. It enables those at the top to set in motion machinery for implementing collective goals" (Mann, 2003, p. 7). The newly acquired control is buttressed by the institutionalization of laws and social rules as a kind of standard operating procedures for the collectivity or organization. The result is social stratification which in turn also becomes institutionalized. Mann (2003) defines social stratification as "...the overall creation and distribution of power in society. It is the central structure of societies because in its dual collective and distributive aspects it is the means whereby human beings achieve their goals in society" (p. 10).

Mann (2003) asserts that in the evolution of the human species, there are distinctive stages, each with a peculiar form of social power. As societies become more complex with greater differentiation among roles and functions together with hierarchies of power and privilege, their form of leadership is impacted. With Mann's theory of social power as the major narrative, it can be seen how leadership models begin relationally, but end with more and more well-defined leader centralism. Leadership roles evolve as each society reacts to environmental and political pressures and constraints.

---

## The Stages of Social/Political Development

Mann (2003) has identified seven stages (see Fig. 1) of socio/political development which have led to the creation of a permanent leader-centric organization where after certain external challenges to a human collectivity, there is movement towards more centralized permanent, coercive power. Beginning with a near egalitarian society, social groups may move towards the identification of ranks

Level of Social Stratification	Characteristics	Leadership Type	Description
1. Egalitarian societies	There are some differences in the social hierarchy based on gender and age, but they are not institutionalized	Relational	No one is allowed to have involuntary authoritarian control over others
2. Rank societies	Certain members have more prestige than others. But this is conferred only by the entire collectivity. Legitimate power can only be individualized by permission from the total group. Even if heredity is honored the collectivity can withdraw a leader's authority.	Relational	Leaders occupy provisional roles and in those roles they do not possess coercive power over individuals who may be resistant or hesitant to it
2.1 Relative rank societies	While persons and lineage groups may be ranked, there is no specific or absolute highest point on the scale. Rank maybe contested at times.	Relational leadership remains dominant	Leaders can be identified and they may stand out, but there is no ultimate positioning as there is no identifiable ceiling
2.2 Absolute rank societies	There is the development of an uncontested, highest rank and all other ranks are allayed to it. A ceremonial center appears devoted to religion.	Leader centric & with trappings of leader relational	The emergence of a permanent leader and positioning of that leader in relation to a ceiling which is established and known.
	<b>THE ESCAPE ROUTE BEGINS TO CLOSE</b>		<b>THE EMERGENCE OF SOCIAL CAGING</b>
3. The State	A specific ensemble of institutions and attendant personnel embodied in a political center which develops and extends to a specific geographical area and rule making that is reinforced by physical violence. War making requires the apparatus of the state.	Leader centric & trappings of leader relational- <b>discernable social caging occurring</b>	Leader decisions do not have the force of law, but only collective authority derived from smaller social groups (clans, tribes) support. The leader's authority is solidified in wartime.
4. Stratification	Movement towards the creation of a permanent and institutionalized power over the life chances of its inhabitants. Its control over the life chances of others may be backed by physical force.	Leader centric & trappings of leader relational/ <b>accelerating social caging underway</b>	While leaders exercise power it is not unitary. While stratification is going on, the leader cannot create a state which is independent of him/her self and have it survive beyond 1-2 generations.
5. Civilization	The presence of three social institutions: a ceremonial center, writing and the city. When these are combined there is a notable advance in the power over nature.	Leader centric with near total social caging- <b>social cage development is permanent</b>	Leaders access permanent coercive and centralized authority within fixed settlements of territorialized power that are more or less coercive and centralized.

**Fig. 1** Stages and characteristics of Michael Mann’s social stratification and type of corresponding leadership adaption towards social caging. (FILE: Figure 1 Social stratification and leadership, adapted from Mann 2003, pp. 1–33)

which at first are quite fluid but become rigid and fixed. Once a human collectivity moves from an absolute rank society, “. . .from this centralized institution onward to the state is only a step” (p. 37).

The next progression involves *stratification* eventually sliding into something called *civilization*. The last stage of *civilization* is described as “the containment of human beings behind clear, fixed, confined behind social and territorial boundaries” (Mann, 2003, p. 38). The term civilization contains a lot of nugatory emotional and cultural baggage. In fact, Mann (2003) confesses, “We can never exactly define what we mean by *civilization*. The word has too much resonance, and the prehistoric and historic record is too varied” (p. 73). The evolution of Mann’s stages is the result of a

specific kind of social compacting. Mann refers to it as the progression of the stages caused by pressures and choices which lead to *the social cage*.

The considered opinion of some examining in an expansive passage of time was that the development of “civilization” as sketched out in Mann’s historical progression was viewed by him and others as abnormal, a relatively rare event because many humans simply refused to move beyond relative social ranking. Piggott (1965) estimated that within a 5000-year period in Western Asia, there were “probably under ten” examples of civilizations emerging.

The reason that there were only ten civilizations was “the inseparability of functionality and exploitation. . .The decisive features of these ecologies and of human reactions to them was *the closing of the escape route*” (p. 75). The closing of the way back from civilization in Mann’s evolutionary model occurred because, “fixed settlement traps people into living with each other, cooperating, and devising more complex forms of social organization. The metaphor of a cage is appropriate” (p. 42). Such a closing made it nearly impossible to avoid civilization and along with it “social stratification, and the state” (p. 75). The alchemy of these three evolutionary movements was the creation of permanent, coercive social power.

Mann (2003) also indicates that the progression he sketches out, from egalitarian to civilization, does not always follow the exact order in which he presents them indicating that sometimes they may devolve or become cyclical (p. 67). Most human groups at the relative rank level refused to advance any further. They were unwilling to bestow the kind of coercive power that could be employed against them. “In noncivilized societies escape from the social cage was possible. Authority was freely conferred, but recoverable; power, permanent and coercive, was unattainable” (Mann, 2003, p. 39).

One of the factors that pushes human groups to move towards denser more compact societies is the propensity to engage in warfare. “First, war is ubiquitous to organized social life, even if not universal. . .In a quantitative study only four out of fifty primitive peoples did not routinely engage in warfare” (Mann, 2003, p. 48). As social rankings advanced, the intensity of warfare greatly increased as social groups employed more lethal means of killing.

---

## What Mann’s Model Demonstrates

What Mann’s evolutionary model shows is that in the development of coercive social power, leadership was almost purely relational before the absolute rank stage when it became progressively centralized. As a result of social caging, the later stages of social power become lodged in a solitary ruler of a permanent rank, most normally a monarch, whether it be a pharaoh, a king or queen, or an emperor. From this perspective, Alvesson and Sveningsson (2012) correctly observe that, “Leadership is thus not given (as contingent upon a managerial position), but rather it is a process outcome. It is not what shapes the outcome of situations; it is shaped by and can better be seen as an emergent outcome of situations” (p. 212).

Mann's evolutionary model dissolves the apparent binary between leader centrism and leader relational perspectives regarding leadership. The model also incorporates the observation that a "leader" is a social construct produced through relationships and those relationships are interdependent. The relationships also constitute a field made up of individuals and collectives. Individuals are derivative of relational processes. There are no hard and fast lines between leaders and non-leaders, especially in the early stages of the evolutionary process, and that leadership is coproduced in the space between individuals.

The dominance of leader-centric theories is only maintained by ignoring the evolutionary development of leadership itself. All leadership begins as relational and can remain relational unless the external situation or environment (social caging being one) requires a change. By envisioning leader relational and leader centrism as two points on a single continuum, the apparent incommensurability between these two visions of leadership is erased.

Also in discussions about the essential differences between leader-centric and leader-relational perspectives, the utilization of Mann's evolutionary model of social power, a different perspective, is proffered to explain some of them. For example, the relational model as a social construction fits the first two stages of Mann's model. Leadership is a social construct among members of the same social group. However, when ranking leads to stratification and civilization, entitism aptly describes the demarcation lines between leaders and followers.

---

## Some Contemporary Issues

Understanding that leader centrism and leader relational views are points on a common evolutionary continuum does not prohibit dilemmas in selection of which approach is more relevant or better for specific situations. Ways to dilute the creation and implementation of a coercive leader-centric role by moving towards leadership which can be called democratic (see Woods, 2005) distributive (see Youngs & Evans, 2021), parallel, situational, shared, or other hybridized forms that disperse unilateral coercive authority across more roles in modern bureaucracy are nearly ubiquitous (see Gronn, 2012). These models spread out duties and with it the delegated authority to undertake them. Most do not also erase entitism, i.e., there is still an identifiable and separate *leader*. Even in some of the CLS (critical leadership studies) texts, there still remains evidence of entitism (Dolan, 2020).

Perhaps one of the issues which emerges is in the case of hierarchical organization roles in modern bureaucracies. In this context, roles exist prior to being filled by a "leader." Whether or not a person could actually get anyone to follow them outside the bureaucracy is irrelevant. The bureaucracy has identified some roles as superior and others subordinate. There is no "emergence" of a leader. A leadership role exists without anyone being in it. When a person occupies such a role, they are by definition a "leader." Those who are subordinate to superior roles are by definition "followers." The line between the two (leader-follower) can be drawn and specified.

There is no mystery or doubt about the existence of such a line of demarcation in a bureaucracy.

However in real life, even in well-defined bureaucracies, there may be a different set of relationships than those specified in organizational charts. The “real” leaders may not be the ones who occupy the officially sanctioned leadership positions. Some followers may have more influence on the opinions of other followers than the officially appointed bureaucratic leaders. And it may be true that even with duly appointed persons to occupy leadership positions, the organization may have no leadership. It takes more than an incumbent in a leadership role to actually possess and practice leadership.

What Mann’s evolutionary model of the development of coercive social power shows is that in the beginning of human social relationships, there is either very little, if any, such centralization of authority and a deliberate consensus among those impacted to avoid creating such a centralized structure. Relational leadership approaches either show an avoidance of acquiring coercive power or a decision not to create it. Relational approaches are about decentering single persons of supreme power. Relational leadership practices do not view power as something to be acquired and applied in static situations, but instead as a much more fluid concept which is that “it generates particular types of knowledge and certain types of behaviours” (Niesche & Gowlett, 2016, p. 69).

---

## Conclusions and Reflections

Michael Mann’s concept of *the social cage* as the external causative agency for the development of types of leadership is firmly rooted in a relational sociology that posits that leaders are created by the circumstances and relationships in which they live. Leaders do not create those conditions. The conditions create the leadership. From this perspective, *power* is not something that leaders own or can bank. Rather, power is the product of the relationships between persons being squeezed in the *social cage*. An accelerant to such *caging* is the making of war.

It is understandable that as humans born into a social structure that is already at the evolutionary apex would fail to see or understand how a social structure has undergone formative changes over extended time periods. If all one sees is a summative all powerful king or president with near permanent and unchallenged coercive authority, how to envision an ontological reality as anything but this final stage of *the social cage* is unimaginable. Relationships in this stage, and especially in bureaucratic organizations, are centered in entitism. Leadership is visible, definable, hierarchical, and individualistic. What appears as “real” is the presence of an individual leader and so academic study of leadership concentrates on the skills, habits, attitude, perceptions, traits, beliefs, and actions of the lone leader figure. These studies have been the most prevalent kind in the leadership field since Elwood Cubberley (1929) described them in one of the first textbooks in the discipline. They remain the dominant trope into present times.

What Michael Mann's evolutionary theory of social power contributes to the study and understanding of leadership is to demonstrate that it is a dynamic unfolding properly understood as one of continuous adaptation to emergent social forces and conditions. Leadership is one outcome of those forces.

### Abstract

Ongoing debates over the relationship between leadership and administration, especially in the field of education, raise a new question of alienation and bureaucratization first introduced at the dawn of capitalism by the pioneer sociologists Karl Marx and Max Weber. The traditional notion of alienation as the separation of the worker from the object of his or her labor and from the production process itself finds new meaning in the proletarianization of the modern educational leader, a worker with little or no control over the work process due not to subjugation from above, but in Weberian terms, to bureaucratization from below. What this chapter explores are the lessons to be learned from Marx and Weber for the restructuring of educational leadership in such a way as to advance the freedom, both positive and negative, as well as the sense of responsibility for one and all necessary to democratize, to domesticate capitalism.

### Keywords

Bureaucracy · Alienation · Charisma · Disenchantment · Leadership and administration · Rationalization · Property ownership · Value pluralism · Proletarianization · Predicates

### The Field of Memory

By the end of the nineteenth century productive forces in Europe and the USA had become in the eyes of Karl Marx and Max Weber forces of destruction and social alienation, Weber's "iron cage" of bureaucratization the cause and effect of Marx's self-alienation. While for Marx the powerful critique of capitalism and his call for "the dictatorship of the proletariat" (Marx, 1852) would fall into the hands of Lenin and devolve into Stalinism, communism losing its roots in democracy; in Weber's case his "iron cage" would seem preferable today to the anarchistic individualism of neoliberalism.

### The Field of Presence

In our own time, the thought and philosophy of Karl Mark is making something of a rebound in so-called Neo-Marxism, to distinguish it from Vulgar Marxism, its reduction to "historical materialism." Weber's search for an "ideal-type of bureaucracy" (Elwell, 1999, p. 1) and with it for a new rational order, one rooted not in overconsumption but in a kind of religious asceticism, remains as, if not more, relevant today than in his own time, when the modern public and with it "the revolt of the masses" was just coming into its own (Gasset, 1930).

### The Field of Concomitance

Weber's disenchantment of the world – its movement away from an overarching deism to a so-called "value pluralism" in which conflicting claims have no final arbiter – began, on the one hand, to offer a solution to abject bureaucracy. However, the mathematization of all knowledge and experience, and with it the elevation of valorization over labor control, makes it concomitant with Marx's notion of alienation. According to one organizational scientist, "even when the enabling functions of bureaucracy is salient to employees, bureaucracy will be experienced simultaneously as alienating" (Adler, 2012, p. 257).

### Discontinuities and Ruptures

While the alienation of the worker from the objects of his or her labor was a reality of the modern capitalist system, it was ultimately viewed by Marx as an expedient means to the destruction of the state and the rule of the people, they, the people, owning the means of production, not the state, as in the case, for example, of the Soviet Union. For Weber, alienation stemmed from the same causes but was not temporary, it was permanent, enshrined in bureaucracy and rationalization, the rise of instrumental reason.

### Critical Assumptions

Viewing educational leadership as a form of labor – a higher one, yet one no less subject to the dialectical forces of alienation and bureaucratization – the paper alleges that in the absence of self-control and other-awareness, the educational leader as worker has little or no control over the work process. In such a case, writes David Held, “individuals are divided against each other by competition and possession; and men and women are in danger of losing their capacity to be universal and free in all the spheres of life” (Held, 1980, p. 237). Today the kind and degree of educational leadership is determined by the kind and degree of capitalism, a productive mechanism that has changed dramatically since the time of Karl Marx and Max Weber, in some cases for the better, that is, for a greater alignment with democratic ideals (spelled out here), and in some cases for the worse. It has a complex reality, one calling for greater understanding and articulation by educational leaders first and foremost. For the labor process, as understood by Marx and Weber, is both ontological and sociological, determining “both the basic structure of human existence and society’s basic patterns” (p. 240). At the heart of the universalization of the proletariat lies the proletarianization of all labor, the key not so much to overcoming as to turning to human benefit Marx’s utopia of a classless society, eliminating the twin forces of alienation and bureaucratization. For Michel Foucault there were no a priori truths. Everything was considered in “remanence,” the magnetization of any given thought or event by its environment, its true nature. So, that which is socially and historically constructed is that which is left behind, the material with which we have to work, our tools for the creation of value and meaning.

---

### Introduction

The old canard “the more things change, the more they remain the same” describes the transformation yet relative stasis in the forms and patterns of educational leadership since Tyack and Hansot first identified them a generation ago in *Managers of Virtue: Public School Leadership in America 1820–1980*. *Managers of Virtue* (1982) was an extended critique of the “Educational Trust,” a corporate model of US school governance “predicated,” they wrote, “on the expertise of the school executive and on reform elites who would select and support them” (Tyack & Hansot, 1982, p. 141) Today no less than in 1980, the challenges not only to public school leadership but to the American common school idea remain remarkably the same. Principals now as then complain of the financial burdens of “retrenchment,” onerous new forms of “accountability,” their declining public status, the bureaucratization of school management, and the intrusion of “politics” into their work. In a recent national study of public-school principals (N: 1206), to the survey question “What are the major challenges that you face as a school principal?” US respondents cited in order of exasperation “being asked to do more for less money”; “lack of community support”; “pressures from above for NCLB compliance and scores” and

“changing the instructional culture to data-driven decision-making”; “time to complete administrative requirements and provide instructional leadership concurrently”; and over and over again simply “overwhelmed” (Wise, 2014).

Notwithstanding current allegations that the 2002 No Child Left Behind legislation and subsequent ISLLC standards have created a “second wave of scientific management in educational administration,” it remains as true today as it did at the close of the twentieth century that most Colleges of Education serve up administrators-in-training “a potpourri of theory, concepts, and ideas – unrelated to one another and rarely useful in either understanding schools or managing them” (Brooks & Miles, 2008, p. 109; Mulkeen & Cooper, 1989, p. 12). In 1987, the National Commission on Excellence in Educational Administration recommended “continued and increased involvement with the private sector,” business, industry, and educational leaders “participating jointly in management training programs” (pp. 33 & 35). As another one of its key recommendations, the commission proposed the establishment of a National Policy Board on Educational Administration (NPBEA), a representative board of national organizations the function of which would be to “conduct periodic national reviews of preparation for educational administrators and professors” (p. 28) and in the process contribute toward the development of a standardized and centralized knowledge base, including certification standards, for the professional education and training of school leaders.

Not immaterially, in an early statement from the *Economic and Philosophical Manuscripts* (1844), Marx identified the alienation of the worker in precisely these terms, “not only that his labour becomes an object, an *external* existence, but that it exists *outside him*, independently, as something alien to him, and that it becomes a power on its own confronting him” (Marx, as cited in Elster, 1994, p. 102). For Weber, who was not a strict Marxist, the machinery of bureaucracy and with it “rationalization” was nevertheless a major cause of alienation in just this sense of the term. And Weber’s solution (?) – the infusion of politics, partisan ones, into bureaucracy, something precluded by communism, which was essentially apolitical in nature. This and re-enchantment, the re-introduction of religiosity, lay at the heart of de-bureaucratization (or maybe re-bureaucratization), not as the ascendancy of this religion or that, but in the Deweyan sense as the power to “unify interests and energies” and to “direct action and generate the heat of emotion and the light of intelligence” (Dewey, 1934, pp. 50–52). It was America’s bard of heroic self-assertion, Walt Whitman, who in 1876 made this stipulation: “Not that half only, Individualism, which isolates. There is another half, which is Adhesiveness or Love, that fuses, ties, and aggregates, making the races comrades, and fraternizing them all.” And this was the quid pro quo: “Both are to be vitalized by Religion, breathing into the proud, material issues, the breath of life. For I say at the core of Democracy, finally, is the Religious element” (Whitman, 2010, p. 24). To the parenthetical notion of re-bureaucratization, what this chapter explores are the lessons to be learned from Marx and Weber for the restructuring of educational leadership in such a way as to advance the freedom, both positive and negative, as well as the sense of responsibility for one and all necessary to democratize, to domesticate capitalism. Toward this end the chapter offers a

number of predicates for a theory of democracy, necessary yet insufficient conditions – with a view toward identifying the insufficiencies.

---

## Marx on Alienation

As Michel Foucault put it at the centennial of the first English edition of *Capital: A Critique of Political Economy*, “Marx is not just the author of the *Communist Manifesto* or *Das Kapital*, [he has] established an endless possibility of discourse” (as cited in Peters, 2001, p. 37). As we approach the bicentennial of his work, it may be important to take just such a post-structuralist view, an aesthetic one, of such key concepts as alienation or what Marx also called estrangement. Jacques Derrida, the progenitor of deconstruction and a great admirer of Marx, echoes Foucault: “It will always be a fault not to read and reread and discuss Marx and to go beyond scholarly ‘reading’ or ‘discussion’. It will be more and more a fault, a failing of theoretical, philosophical, political responsibility” (Derrida, 1994, p. 13). Drawing in part on *Capital*, but primarily on his *Economic and Philosophical Manuscripts of 1844*, the goal here is not only to bring Marx into the present, but to identify the significance of his work for educational leadership and ultimately for its de-alienation. The focus here is on the commodification of the average educational leader under the conditions of modern capitalism, but also on the ways he or she may serve as *an instrument* of commodification, commercializing the workers under them in a form of duplicitous alienation. For under modern industry, workers are separated both from the objects of their production and the production process itself.

Again, bringing the past into the present, no one may have said it better than the great art critic and political philosopher, Marx’s contemporary, John Ruskin.

We have much studied and much perfected, of late, the great civilized invention of the division of labor; only we give it a false name. It is not, truly speaking, the labor that is divided; but the men: — Divided into mere segments of men — broken into small fragments and crumbs of life; so that all the little piece of intelligence that is left in a man is not enough to make a pin, or a nail, but exhausts itself in making the point of a pin, or the head of a nail (Ruskin, 1851–53, p. 94).

The shift from craftsmanship – a form of labor rooted in the master and apprentice relationship, one in which the apprentice learns what it takes to make a *whole* pin or a *whole* nail from start to finish, thereby becoming a master himself or herself – the shift from craftsmanship to specialized labor was felt not only in industry but in education and schooling as well, a culture of professionalism leading to the dominance of this narrow expertise or that, the functional equivalent of parts manufacturing. The result is a “mutual alienation” that, as Arnold Toynbee once observed, “is bad for both parties [experts and nonexperts] and bad for society.” Daisaku Ikeda, in a dialogue with Toynbee, concurs: “Today, as learning reaches higher levels, it tends to become so departmentalized that the uninitiated find it incomprehensible. To solve the difficulty, it is now essential for learning to follow the reverse course; that

is, it must become generalized instead of specialized and inclusive instead of divided” (Toynbee & Ikeda, 1976, p. 77). Departmentalization has given rise to a sense of personal inadequacy leading to new dependencies on expert guidance and judgment. Symbols of professional authority, including the number of technical aids in an office, conspicuous displays of professional certification and attainment, the number of articles and books on a vita, the income and lifestyle of a successful practitioner, and symbols designed to reinforce the lay public’s consciousness of its inferiority and dependence, are ubiquitous. What appears as another form of alienation to the common worker, to the school teacher, for example, feels like empowerment to the former, to the educational leader, a professional class no less departmentalized and divided against itself, however.

Operating as neo-capitalists, educational leaders and administrators are no less subject to estrangement than their working-class counterparts. What they hold in common is a market system that dictates the kind and degree of their work. The former are *not* free agents. “Capitalism subjects every individual capitalist,” writes Marx, “to the immanent laws of capitalist production as external coercive laws” (as cited in Small, 2005, p. 28). What are those laws? For if the appropriation of one’s labor by its products is what amounts to alienation, one’s labor becoming “an object, an *external* existence a power on its own confronting him,” how, according to Marx, does that system operate? As a superstructure resting on an economic foundation, what are its defining features? Marx spends three long volumes of his authoritative work, *Capital*, on this subject. In summary, the laws of production to which every capitalist is subject, include the following:

1. Capitalist command over labor power and labor itself
2. The separation of the worker from his means of production, “the starting-point of capitalist production” (Marx, 1975, p. 570)
3. Mechanization – “The life-long specialty of handling one and the same tool, now becomes the life-long specialty of serving one and the same machine” (p. 422)
4. The mass production and circulation of commodities and with them money and profit, money “the universally recognized embodiment of all wealth” (p. 143)
5. A process of continuous reproduction, one that “converts every capital into capitalized surplus-value,” which describes the rate of return, i.e., the amount raised through sale of the product minus the cost of its production (Eastman, 1932, p. 148). But it is more than that. “This incessant reproduction,” writes Marx in *Capital*, Volume 2, “this perpetuation of the proletarian labourer, is an indispensable condition of capitalist production” (p. 149).

The extent to which the social relations of educational leadership reflect these laws of capitalist production calls into question another Marxist preoccupation: property ownership, public and private alike. Describing private property as both “the product, the result, the necessary consequence, of alienated labor” and “the *means* by which labor alienates itself,” Marx would become the world’s greatest proponent of propertylessness, public and private alike. It was the key to classlessness. Educational leaders, it may be argued, are simultaneously property owners and

propertyless workers. In the latter form, as a propertyless worker, he/she becomes, in Marx's terms, "an ever cheaper commodity the more commodities he creates" (Marx, 1844, pp. 9 & 2). Propertied – with ultimate power and authority – he or she runs the danger of not only alienating themselves but all of those working under them.

A purely administrative consciousness enforces what Blase, Anderson, and Dungan (1995) call power-over approaches to leadership, which "emphasize control and manipulation of others' behavior, thoughts, and values. In contrast, power-with approaches to leadership focus," they say, "on the development of collegiality, reciprocity, equality, and mutuality with others" (Blase et al., p. 2; Dunlap & Goldman, 1991; Kreisberg, 1992). Participatory decision-making, shared leadership, and the concept of the leader as "servant" run counter to concepts of management and public administration that draw on analogies to military-style command and control or to scientific management. What follows is a set of indicators for what leadership looks like once it has departed from administration (and vice versa), becoming, as Max Weber would say, bureaucratic, another form of estrangement.

---

## Weber on Bureaucratization

Enamored by the Protestant Reformation – Martin Luther in his egalitarianism calling for "the priesthood of all believers" – Weber went so far as to identify a Protestant Work Ethic, one identifying hard work, regardless of the kind and degree, with religious salvation (Ciano, 2020). But he was also a product of the eighteenth-century scientific revolution, of Cartesian Dualism, the rationalism of "I think, therefore I am," *Cogito ergo sum*. The rise of thought over emotion became an important part of what Weber would describe as rationalization, the capitulation of reason to mathematical logic. Bureaucratization and rationalization went hand-in-hand in the emergent capitalist world, one in which work was desacralized; and life in general disenchanting, leading to the "iron cage" of a bureaucratized way of life, one in which the "technical and economic conditions of machine production determine the lives of all individuals who are born into this mechanism with irresistible force" (Weber, as cited in Spicer, 2015, p. 33). While the bureaucratic form of organization – "social rules becoming reified objectifications commanding directions" (Held, 1980, p. 66) – may have, on the one hand, invited new and higher forms of efficiency, it was nevertheless in this very sense that it was "formally," said Weber, "the most rational known means of exercising authority *over* human beings" (Spicer, p. 33). Religiously speaking, it was the historic descent of Lutheranism into Calvinism, from the human-friendly God of the New Testament to the ascetic God of the Old – "a transcendental being, beyond the reach of human understanding," any hope of salvation interdicted by predestination and, worse, by innate depravity – that for Weber gave rise to the "extreme inhumanity" of the modern world (Weber, 1958, pp. 103–104). The individual loss of self-control over one's destiny, an ancient Judeo-Christian credo, found its secular incarnation in bureaucracy, the individual bureaucrat himself or herself simply a cog in the machine.

Which brings us back to the historic divide between educational administration understood as the management of predetermined outcomes and educational leadership understood as a metaphysic of the relations of self and society, self and other, transcending (if it does not transcend) the boundaries of any one nation state. If and how and when the twain shall ever meet remains an open question but one worth exploring, English and Papa (2015) for one, taking up the cudgels three years ago. While citing approvingly sentiments like those of former US Army General Colin Powell that “leadership is the act of accomplishing more than the science of management says is possible,” they also caution against setting up a “false dichotomy” between leadership and management (p. 22; Brown, Noble, & Papa, 2009). The two exist or should exist instead in something like a dialectical relationship – thesis (leadership) and antithesis (administration) combining to produce a higher synthesis. “While management,” they argue, “is essential to operationalize leadership, leadership is essential to changing forms of management” (p. 22). Historically this amounts to something of a revelation, however. As Tyack and Hansot (1982) and others have pointed out, in the foundational years, 1890–1930, “no other lay group had as much an impact on public education as did businessmen,” their language, techniques, and ideology infusing a new “science” of educational administration (p. 110). What they write of this new class of administrative progressives sounds oddly familiar today. It is worth quoting in full:

In seeking to depoliticize education, in moving the regulation upward and inward in urban and state bureaucracies, in basing legitimation for new authority on scientific expertise, the new managers in education were following patterns of action and thought pioneered in the corporate sector of business and in the politically influential professional and trade organizations (p. 108).

Instrumental in the supply of these new school managers – the superintendent as a business executive – was Elwood P. Cubberley, founder of the Department of Education at Stanford and one of the fathers of the social efficiency movement in education. To increase “social efficiency,” schools need to “give up,” in his words, “the exceedingly democratic idea that all are equal, and that our society is devoid of classes . . . and to begin a specialization of effort along many new lines in an attempt to adapt the school to the needs of these many classes in the city life” (Cubberley, as cited in Tyack & Hansot, p. 128). What many years later revisionist historians like Joel Spring would identify as “sorting machines” and others more recently as “today’s accountability movement” – a combination of business and management principles, measurement standards with grade-level scales, data-driven decision-making, and detailed record keeping – remain after all these years the rule rather than the exception in the educational world (Spring 1988; Bogotch, 2015, p. 6).

But there is the other side of the story, the spontaneous emergence with the “educational trust” of so-called humanists and social meliorists (Kliebard, 1986), the leading exponents of which, contra-Cubberley, were Lester Frank Ward, John Dewey, and George C. Counts. At a meeting in 1935 of the Department of Superintendence of the National Educational Association (NEA), Dewey exhorted educational administrators to lead cooperatively, inviting teachers, parents, and the local

community to take, in his words, “an active and cooperative share in developing the plan of education” (Dewey, as cited in Simpson & Stack, 2010, p. 131). He warned superintendents of the dangers of mistaking the practical, mechanical nature of their tasks with their intellectual and moral responsibilities as educators. And he left them with a question: “Is it the social function of the school to perpetuate existing conditions or to take part in their transformation?” If the focus of the school was to be the growth and development of the student and hence of the larger society, the choice, Dewey argued, was obvious. “He will realize that public education is essentially education of the public: directly, through teachers and students in the school; indirectly, through communicating to others his own ideals and standards, inspiring others with the enthusiasm of himself and his staff for the function of intelligence and character in the transformation of society” (p. 133).

By these lights, good school administration, however crucial, was simply “a special phase,” in his words, of a more “inclusive and fundamental problem: What movement of social forces, economic, political, religious, cultural shall the schools take to be the controlling aims and methods, and with which forces shall the school align itself?” (Dewey, as cited in Boydston, 2008, p. 412). To Count’s question in 1932, “Dare the Schools Build a New Social Order?,” Dewey’s answer was a resounding yes (Counts, 1932). What the schools needed was a new type of school officer-principal-superintendent, one, wrote Dewey, “who is thoroughly acquainted with civic and political problems, and whose view goes beyond that of conventional subject matter and methods of teaching” to embrace a more all-inclusive notion of “the good” but also to stand up fearlessly against the enemies of democracy, no matter what the personal cost (Dewey, as cited in Boydston, 2008, p. 71).

With these vital differences in mind, historical as well as contemporary, between educational leaders and administrators, what follows is a brief look at how they manifest themselves in day-to-day actions. When it comes to exercising one’s responsibilities, including the need to meet certain state and federal demands for academic achievement, Philip Woods identifies two contrasting approaches. “The first is met with management and is focused on getting people to commit themselves to working in ways consistent with organizational requirements and powerful interests in the wider socioeconomic system.” The second approach is more concerned with what Woods calls “the human need for a re-enchantment of labour, imbuing work with a sense of meaning, worth and validity rooted in enduring truths and values concerning human living” (Woods, as cited in English and Papa, p. 24). And there is still another interesting comparison, a related one. Take the Native American spirit of potlatch, where leadership is measured and defined by the degree of “conspicuous distribution” – he or she who gives away the most the fastest coming out ironically on the top of the heap (LaDuke, 1997, p. 28). Contrast this with conspicuous consumption and the goal of accumulation, the heart of the capitalist ethic. To *homo economicus*, to greed and animosity, educational leaders oppose self-abnegating love, care, and cooperation. They are not in the business of administration, whether top down or bottom up, but in the throes of leadership, a perpetual state of becoming in which one is a learning organization bound only by the self-imposed limits of his or her own curiosity and imagination. As Barnard

reminds us, “It is a matter of art rather than science, and is aesthetic rather than logical. For this reason, it is recognized rather than described and is known by its effects rather than by analysis” (Barnard, 1938, 1968, p. 235).

---

## **Alienation and Bureaucracy in Concomitance**

Weber’s disenchantment of the world – its movement away from an overarching yet disestablished deism to a so-called “value pluralism” in which conflicting claims have no final arbiter – began, on the one hand, to offer a solution to abject bureaucracy. However, the mathematization of all knowledge and experience, and with it the elevation of valorization over labor control, makes it concomitant with Marx’s notion of alienation. According to one organizational scientist, “even when the enabling functions of bureaucracy is salient to employees, bureaucracy will be experienced simultaneously as alienating” (Adler, 2012, p. 257). Both Marx and Weber, as political economists, as sociologists, and as philosophers, were ultimately about raising human consciousness, raising awareness of the kind and degree of ownership, private and public, and its implications for creating the social democratic societies they had in mind, and not just property ownership. All forms of ownership whether in part or in whole were in question, none with perhaps greater consequence for democracy than the ownership, or lack thereof, of one’s work. While part ownership in the work process is something that can be “bequeathed” by its managers, full ownership is not; it is something that needs to be *won* equally and by all, including administrators, who too, as Marx and Weber point out, are subject to alienation.

Educational leaders have a special responsibility here. The bureaucracies they inhabit, whether at the school level, the district level, and the state or the federal level, all have at least five elements in common, any one of which has the potential to promote great alienation, both individual and organizational.

- Hierarchy of authority
- Impersonality
- Written rules of conduct
- Promotion based on achievement
- Specialized division of labor
- Efficiency (Elwell, 1999, p. 1)

Organizational leaders up and down these hierarchies need to personalize, to humanize their relations not only with each other but with all the people working under them; they need to move from colonizing rules and regulations to consensual agreements among and between all individuals, in the case of schools, including students and their parents and members of the local community; they need to give every worker full control of the work process, full ownership of both the means and ends of production, the success or failure of their work, not its efficiency or lack thereof, the criteria for granting or denying promotion; but this also means abdicating the power of promotion and transferring it into the control, a results-oriented one,

of all workers, leaders, and nonleaders alike. In their organizational oversight, educational leaders need to become architects in the vein of Joel Sanders, who has said, “I love beautiful things, but I’m not interested in form for its own sake. What counts is human experience and human interaction, and how form facilitates that” (as cited in Tingley, 2020, 52).

To the concomitance here of Marx’s economic materialism and Weber’s super-structuralism:

Weber’s views about the inescapable rationalization and bureaucratization of the world have some obvious similarities to Marx’s notion of alienation. Both men agree that modern methods of organization have tremendously increased the effectiveness and efficiency of production and organization and have allowed an unprecedented domination of man over the world of nature. They also agree that the new world of rationalized efficiency has turned into a monster that threatens to dehumanize its creators (Coser, 1977, p. 232)

Marx’s solution to this state of affairs – communism, not as the state-owned means of production, but as an “association” in which, according to the *Communist Manifesto*, “the free development of each is the condition for the free development of all” (Marx, as cited in Rubel, 1983, p. 104) – was not that far removed from Weber’s solution – the infusion of politics and de-rationalization, of “charisma,” a prerequisite for “communal organization,” into bureaucracy. Charismatic leadership – one that lacks a “definite sphere of authority and of competence” (Weber, as cited in Parsons, 1947, p. 360), is “foreign to all rules,” is case specific and nonroutine, operating in the here and now – such a form of leadership was Weber’s answer to disenchantment, putting moral and social considerations ahead of narrowly economic ones, especially around profitability (pp. 360 & 361). The big question how to normalize this?, how to put charismatic leadership “on a stable everyday basis” (p. 364), oxymoronically, to routinize nonroutine forms of leadership? enter politics and value pluralism. The politicization of bureaucracy, “allowing for the expression and protection of a broader range of conflicting values” (Spicer, 2015, p. 25), would help shelter charismatic leadership from its cooptation by traditional, rationalistic administration. At the same time, the possibility of its conversion from an exception to the rule to the rule itself would entail, ironically, a “process of traditionalism” (Weber, as cited in Parsons, 1947, p. 364) and ultimately of “legalization” (365), accountability, which was no less important (indeed the sine qua non of such leadership), hiding behind all the red tape of any bureaucracy. For Marx this was part and parcel of the need of every individual that he “strives not to remain something he has become, but is in the absolute movement of becoming” (Marx, as cited in Elster, 1994, p. 83).

---

## Predicates for a Theory of Democracy

Democracy, the home of politics and value pluralism, is itself in a state of becoming. The lack of common agreement over the true nature of democracy, not simply as a form of government but as a way of life, is in this light a positive one, providing opportunities for its greater growth and development. To take it a step further,

“democracy,” as Dewey once wrote, “is neither a form of government nor a social expediency, but a metaphysic of the relation of man and his experience to nature” (Dewey, as cited in Rorty, 1998, pp. 18–19). All the more reason try to identify some of its conditionalities. These so-called predicates, necessary yet insufficient conditions, can point the way forward, reminding educational leaders, whether charismatic or not, of the work to be done and their many related responsibilities. Some of the insufficiencies, when converted to necessities, become themselves insufficient, insufficient without a certain necessity in the case, for example, of number 4 below, the rule of law.

1. Rule of law: This includes legally constituted social, cultural, and economic rights (e.g., the right to work and to a living wage).

*Insufficient without:* an understanding of the responsibilities that go with these rights; trial by a jury of peers and the presumption of innocence; the right to appeal

2. The right to vote in regular local, state, and national elections, including rights of referendum and recall.

*Insufficient without:* corruption-free voter registration; civic education and engagement; an informed public; viable choices; confidentiality; safety measures

3. A plurality of competing forces responsible for defining the common good and for fixing the identity of the community. “If the people are to rule, it is necessary to determine who belongs to the people” (Mouffe, 2005, p. 43).

*Insufficient without:* freedom of speech and assembly; safeguards to protect individual rights and the whole concept of the dignity of the individual; minority rights and action safety nets against a tyrannical majority; public acknowledgment of the necessity of diversity; an ethic of self-determination

4. A robust civic life and empowered nongovernmental organizations to support and guide informal, decentralized decision-making.

*Insufficient without:* rule of law; coordinated versus autonomous decentralization; broad educational efforts aimed at demystifying the work and job requirements of any bureaucracy; an equally robust political life of local, state, and federally elected officials; the awareness that at one level, in a democracy, all people are public officials

5. Critical reading, writing, and oral literacy, including informational and scientific literacy; in general, the democratization of knowledge, pure and applied.

*Insufficient without:* equal access to free and open educational channels; a shared understanding of what entails critical reading; an acknowledgment of the legitimacy of indigenous knowledge; raising fundamental epistemological questions around how we know what we know, its social and historical construction

6. The moral aims and forces of social sympathy, cooperation, and association.

*Insufficient without:* the existence of public spaces where people can formally and informally interact; putting an end to residential and other forms of class, racial, and ethnic segregation; rules of civil discourse and engagement; a society organized around the imperatives of dialogue and leadership; an alternative economic system

7. Vertical opportunities for individual advancement within a horizontal, socialized organizational culture, as an effective source of noncorporate power and control (Goodwyn, 1978).

*Insufficient without:* a better understanding of what such opportunities imply, their markers, and what they may invoke at the horizontal level; the democratization of opportunity and a common interest in individual growth and development; a countervailing animus against power and control written into the Constitution

The articulation of these and other predicates for a true democracy, one that can help obviate the two main concerns of Marx and Weber, alienation and bureaucracy, needs to become first and foremost the work of educational leaders, especially those devoted to societal change, society being the sea in which schools, including all teachers and students, swim.

---

## Conclusions and Reflections

While societal change may be the ultimate goal, for Marx and Weber the individual and their self-realization was the common denominator, the medium through which societies had to act. However, by the late nineteenth, early twentieth century, with the submergence of the individual in a mass, faceless society, we have the so-called “release of powers” – mercantilist ones – and with it a new phase of predatory individualism (Dewey, 1927, p. 99). Wants or needs are effectively demands driven in turn by the demands of association, not individualism. In education, the bureaucratization of the individual and with it their alienation finds its expression in the division of labor it upholds, specialization being the bane of free and open discourse. To reach the higher synthesis promised by placing educational leadership and administration in a dialectical relationship – this synthesis becoming the thesis for a new antithesis and with it a new and still higher synthesis; this process leading in turn to the teleology sought by Weber in charismatic leadership – to achieve this effect will entail dramatic changes in the kind and degree of leadership preparation, in the knowledge base required of future leaders.

For the work of the modern school principal or superintendent has never been more complex or more nuanced, requiring the broadest and most inclusive affective no less that cognitive knowledge, skills, and abilities, in addition to that “je ne sais quoi” for which there is no specific book or teaching. Jesse H. Newlon, a former superintendent of schools in Denver, Colorado, and a professor of education and director of the Lincoln School of Teachers College, Columbia, may have said it best in 1933 when he spoke of “the social basis of school administration,” arguing for a strict diet of history and philosophy, the physical and biological sciences, anthropology, sociology, economics, political science, and geography, including a familiarity with “the great classics in these fields” (Newlon, 1934, p. 265). That these classics should include the works of Marx and Weber goes without saying. Tyack and Hansot (1982, p. 203) cite Newlon approvingly as a powerful corrective to the administrative progressivism plaguing the education of the US school executive then and now.

### Abstract

This chapter provides a conceptual history of the practice and study of grassroots leadership. It includes an analysis of the contrasts between grassroots leaders and leaders in roles of authority. The vital role that productive nonviolent conflict has in creating social and institutional change is discussed, as is the fact that school leadership programs would benefit from an enhanced focus on an understanding of conflict. Attention is given to the importance of trust in grassroots leadership, and the notion that trust in institutions can be increased through engagement with grassroots movements and organizations. Consideration is given to the nature of power and the effects of its distribution among dominant and subdominant groups. The chapter includes an analysis of extant theories of leadership that have enjoyed the attention of researchers and practitioners in recent decades and that share qualities with grassroots leadership. Consideration is given to those elements of grassroots leadership that can be

transferred to educational leadership. The chapter concludes with reflections on the path of current trends in grassroots leadership and where new directions or discontinuities might emerge.

### Keywords

Grassroots leadership · Inclusive leadership · Collective action · Community organizing · Equity · Social activism · Social justice · Trust · Alternative leadership approaches · Leadership development · Conflict · Confrontation

### The Field of Memory

As a result of the influences from, if not even the past dependence on fields as diverse as anthropology, ethnic studies, history, law, sociology, and political science, educational leadership preparation has only recently extended its focus to include community agency and the school's place in society as part of its role in educating students. The awakening to this added responsibility has thrust the topics of social justice and community advocacy into the field of leadership development and its supporting literature. As systemic injustice and inequity have become more difficult to deny or ignore, such issues are receiving considerable attention in leadership preparation programs.

### The Field of Presence

Although a generation of aspiring educational leaders was introduced to the concept of viewing organizations through a political frame (Bolman & Deal, 2017), school leaders are only now beginning to embrace the strategies of collective action and community organizing. Those who do are in a better position to develop and engage grassroots leaders in building support for initiatives, confronting existing systemic inequities, and bringing meaningful reform to schools. The study of power relationships in the fields of organizational studies and social psychology teaches that there is an alternative to the legal and coercive power traditionally associated with formal organizations such as school districts. Addressing the contrast between the power typically exercised through formal organizations with nonorganizational leadership, English wrote that the nonorganizational leader

bases his or her authority on moral conviction and a cause, such as Gandhi's leadership in the movement in South Africa and India to secure independence from Great Britain, or Martin Luther King, Jr.'s leadership in the American Civil Rights Movement. In those cases, the focus of leadership is communal, centered on a cause and fueled by an idea that binds the participants together (2008, p. 15).

### The Field of Concomitance

Recognizing the benefits if not outright need to incorporate research into practice, educational leadership has increasingly been influenced by organizational theory, sociology, and behavioral psychology. Mainstream political parties once dismissed Saul Alinsky's strategies of collective action and community organizing. They are now much more representative of views of the political left and reform-minded educational

leaders and academics. Conflict avoidance is the least effective strategy educational leaders can pursue to create systemic improvements; conflict avoidance results not only in short-term flight from conflict, but it also produces a flight from change.

### **Discontinuities and Ruptures which form the Different Viewpoints of this Area or Field**

Grassroots leaders long ago perceived the value of amplifying their message through print and visual media, the arts, and political theatre. The recent emergence of social media has led to advances in the extent to which grassroots movements can both gain influence and shape their public image (Chalmers & Shotton, 2016; Dessewffy & Nagy, 2016; Tye, Leong, Tan, Tan, & Khoo, 2018).

Critical theories, including critical feminist theory and critical race theory, provide a lens for examining grassroots leadership that represents a significant departure from the past. These approaches involve an analysis of the role of those who may pose a subdominant population *within* the broader subdominant community. They can lead to a greater appreciation of leaders who participated in grassroots leadership through strategies such as networking, developing consciousness, or organizing, rather than through more traditional leadership roles such as holding office or serving as a spokesperson (Bernal, 1998).

### **Critical Assumptions or Presupposition**

The following describes the significant assumptions that guide the content of this chapter.

First, conflict is often viewed negatively by educational leaders; instead, it should be viewed as a potential springboard for substantive change and improvement, particularly for students who have experienced injustice and bias. As has been asserted elsewhere, “diverging viewpoints handled effectively can expand perspectives and actually serve to spur innovation” (Hughes & Davidson, 2020a, p. 3).

Second, trust is essential for leaders, whether or not they are in a formal role of authority. Whereas educational leaders seek to build trust *after* they have been appointed to a position, grassroots leaders must first earn trust before they are capable of wielding influence (English & Ehrich, 2012). The critical lesson for educational leaders should be that meaningful change is dependent upon earned relational trust. Willie, Willard, and Ridini point out that “When confidence and trust occur simultaneously, there is mutual respect between dominant and subdominant people of power” (2008, p. 102). Shirley cites research findings that grassroots leadership through community organizing produces higher levels of trust between schools and community members (Shirley, 2009, p. 177).

Third, leadership and influence can come from many people and groups, not just from those in positions of authority (Foster, 1986; Harris, 2011; Hartley, 2007; Schultz & Galbraith, 1993). Leithwood, Harris, and Hopkins concluded that “School leadership has a greater influence on schools and students when it is widely distributed” (2008, p. 27). Hartley provides two explanations for the trend to distributed leadership: “the failure of the ‘charismatic hero’ associated with transformational leadership; and second, the greater complexity of the tasks which now beset school leaders” (2007, p. 206).

## Introduction

This chapter will analyze the study of grassroots leadership in practice, beginning with labor and civil rights movements of the early twentieth century. It will address what it means to be a grassroots leader, how grassroots leaders are distinguished from leaders in roles of authority, and how assumptions regarding grassroots leadership have evolved. The importance of a cause (typically an injustice) that captures the passions of followers will be integrated with theories of leadership that may reflect elements of grassroots leadership (authentic leadership, servant leadership, transformational leadership, distributive leadership, etc.), and aspects of grassroots leadership that can be transferred to educational leadership. It will conclude with reflections on how current trends in grassroots leadership may lead and where new directions or discontinuities might emerge.

---

## What It Means to be a Grassroots Leader

Willie et al. (2008) assert that, in order to understand grassroots leadership, one must understand the notion of power, along with the capacity of dominant and subdominant groups to wield power. Power is seen as “the capacity to coerce or persuade people to act in specific ways” (2008, p. 7). Both dominant and subdominant groups are needed for a well-ordered society, and each serves a role that complements the other. Social benefits accrue when these groups recognize their dependency and effectively negotiate these relationships. Willie and colleagues describe the give-and-take of this power-wielding relationship as follows:

Dominant people of power try to advance the goals and objectives of a community or collective by serving others in a generous way, giving more of their time, talent, and treasure than they are required to give. Subdominant people of power attempt to advance the goals and objectives of a community or collective by sacrificing on behalf of others in a magnanimous way that involves taking less than they are entitled to receive. (2008, p. 98)

A second element that helps to define grassroots leadership is that of collective action through community organizing. Shirley (2009) points to Saul Alinsky’s work in immigrant neighborhoods in the 1930s and the work of the Industrial Areas Foundation (*Industrial Areas Foundation*, n.d.) as examples of ways in which community organizing could produce effective grassroots-inspired change. Notes Shirley,

The emphasis by community organizers is not on an individual’s *human* capital, nor even on his or her *social* capital, but more on the development of *political* capital to change power relationships in a community, city, or state to empower the marginalized and disenfranchised. (Shirley, 2009, p. 174)

Community organizing involves grassroots leaders engaging with other community members and individuals in authority who can help bring improvements to communities. Shirley relates that “grassroots organizers generally prefer activating community

actors to develop ‘civic capacity’ to solve local problems” (2009, p. 180). Grassroots movements are organized around a cause or an injustice, which serve to clarify the values and principles of those who are inspired to participate. Without a shared purpose or issue, there would be no movement and no one to lead. Miller writes that

the major things that distinguish community organizing from other approaches to social change are its focus on power, the large-scale and continued involvement of people from the base, a continuing focus on leadership development, and the strategic role played by the professional organizer. (Miller, 2009, p. 44)

Varying examples of what constitutes a grassroots leader can be considered. There is the example of Medgar Evers, who in 1946 on his 21st birthday led a group of World War II veterans to face down violence in an attempt to exercise their right to vote (Dittmer, 1994). There is the example of Rosa Parks and other Black women of Montgomery, Alabama, who refused to yield their seats to white passengers, as well as pastors including Martin Luther King, Jr. and Ralph Abernathy who led the Montgomery bus boycott following the arrest of Rosa Parks (Willie, 2008). There is the example of countless volunteer community activists throughout the world who marshal and organize individuals and groups to engage with representatives of agencies or entities that hold some degree of power over peoples’ lives. There is the example of a faculty member who emerges through a formal organization to advocate for a cause of interest to other faculty members (Kezar, Bertram Gallant, & Lester, 2011). There is the “Tea Party” movement, fueled by racial resentment, that emerged following the election of President Obama in 2008 (Arceneaux & Nicholson, 2012). There are the youthful gun control activists who demanded and achieved a degree of legislative action following the killing of 17 people at Marjory Stoneman Douglas High School in 2018 (Brezenski, 2018). There is the example of the Black Lives Matter movement, that in 2020, has forced the USA to face the reality that “Too many citizens prefer to cling to brutal and unjust systems than to give up political power, the perceived benefits of white supremacy and an exploitive economic system” (Alexander, 2020, p. 1).

In their exhaustive case study of grassroots leadership, Willie et al. (2008) conclude that while the characteristics of grassroots leaders can continuously change, there are some common characteristics that emerge. Emotional intelligence and a strong sense of empathy are qualities common to most grassroots leaders. Effective grassroots leaders prefer to resolve conflict through education and negotiation rather than coercion. Society benefits when grassroots leaders pursue both strategies intended to enhance individuals’ lives and improve the community. When leaders are successful in building diverse alliances and coalitions, this increases the likelihood of successful collective action. Leaders’ use of data to frame and contextualize issues serves to mobilize community support for an issue. Successful grassroots leaders, “with the aid of the media, used personal experiences to provide a context for the public at large to understand harmful social problems” (Willie et al., 2008, p. 191).

English and Ehrich (2012) developed an original model of grassroots leadership describing approaches to change achieved through reform or refinement involving

either conflict or consensus. This model casts grassroots leadership in a manner that represents a discontinuity from the past and challenges traditional approaches toward educational leadership in graduate preparation programs. Their model involves a quadrant involving two methods to change (conflict and consent) along one axis, and two categories of change (reform and refinement) along the other axis. They view grassroots leaders as possessing four qualities: lack of a formal organizational or community role, concern related to the need for improvement or change, lack of institutional power, and focus on a cause. They advocate a perspective on leadership that “gains its inspiration from grassroots leadership that upholds the traditions and values of democracy and social justice” (2012, p. 100) and that exposes students of leadership to elements of grassroots leadership, including those which involve conflict or confrontation.

In their study of grassroots leaders, Creyton and Ehrich (2009) noted the extent to which leaders from a broad array of social sectors were motivated by the values and beliefs that guided their leadership activities. Grassroots leaders, generally speaking, are in their leadership roles because of a passion for a cause or an issue, often driven by a desire to correct an injustice or inequity. Similar motivations have been found to drive the work of recognized leaders in formal educational roles (Davidson & Hughes, 2019).

Bernal’s oral history of Latinas who were involved in grassroots leadership of school boycotts in 1968 known as the East Los Angeles School Blowouts identified five dimensions of grassroots leadership: networking, organizing, developing consciousness, holding elected or appointed office, or serving as a spokesperson (Bernal, 1998). These boycotts came to involve over ten thousand students and ultimately gained the support of Senator Robert Kennedy. Bernal asserts that traditional paradigms of leadership, which tend to favor those who serve in formal appointed or elective office or as spokespersons, fail to capture the leadership contributions of those who lead through the important grassroots functions of networking, organizing, and developing consciousness. Though the women in Bernal’s study also served as spokespersons and held office, they viewed these leadership dimensions as less influential than their efforts to organize through planning and attending events, developing consciousness by helping others gain awareness of injustices, or networking with others to build a base of support. She concludes that

there is something faulty in previous leadership paradigms that have not allowed us to acknowledge Chicanas as leaders in the 1968 Blowouts, the Chicano Movement, and in other grassroots movements. A cooperative leadership paradigm allows us to address the erroneous absence of Chicanas as participants and leaders in history and contemporary life. (Bernal, 1998, p. 136)

Kezar approaches the question of defining grassroots leadership by defining the “bottom-up” efforts of leaders on postsecondary campuses to navigate campus culture and power dynamics (2011; Kezar et al., 2011). Tactics used in these settings include strategies such as creating intellectual opportunities for debating issues of interest, offering professional development to raise consciousness and a sense of

vision, capitalizing on coursework and curricula to bring attention to issues, mentoring students, participating in search committees in an effort to hire issue-conscious colleagues, securing funding to support targeted issues, using data to tell a story, taking advantage of existing networks, and developing partnerships with stakeholders external to the institution. Citing Meyerson (2008), Kezar situates the tactics of college faculty and staff as tempered grassroots leadership operating below the radar until opportunity knocks (Kezar et al., 2011, p. 147).

---

## How Grassroots Leaders are Distinguished From Leaders in Roles of Authority

A fundamental distinction between leaders in roles of authority and grassroots leaders has to do with differing views of conflict. Where school leaders often feel unprepared to address conflict and may be inclined to avoid it to protect the status quo (English & Ehrich, 2012; Hughes & Davidson, 2020a), avoiding conflict is not an option for the grassroots leader if change is to be achieved. While Swain has argued that the last few decades have brought a more consensus-oriented perspective to community organizing (Swain, 2001), recent worldwide protest movements, in solidarity with Americans protesting police brutality, have seemed to support the conclusion that significant societal change can only come through protest and outrage. English and Ehrich conclude that, depending on the particular context, nonviolent conflict has a legitimate role in bringing about change, yet is likely the change strategy that receives the least attention in leadership preparation programs (2012).

A second fundamental difference between those in formal leadership roles and grassroots leaders relates to trust. Grassroots leaders wield little influence unless they have a broad base of trust. In contrast, those in formal leadership roles may exercise authority even in the absence of trust. English and Ehrich argue that “grassroots leaders must build trust before any action is possible, whereas in formal organizations leaders may assume a position and then look to build trust” (2012, p. 89). Collective action within grassroots movements tends to build trust as like-minded individuals solidify their connectedness in pursuit of principles or a cause. Just as school leaders who are more likely to share decision-making authority are also more likely to enjoy high levels of trust (Bryk & Schneider, 2002; Smeed, Kimber, Millwater, & Ehrich, 2009; Tschannen-Moran, 2014, 2017), there is research evidence related to community-based organizations supporting the notion that there is a positive correlation between community organizing and higher levels of trust between schools and community members (Shirley, 2009). Note English and Ehrich, “Trust is the essential glue to creating a cohesive community action organization from scratch and to sustain it over time” (2012, p. 89).

A third difference between grassroots and institutional leaders lies in their respective reliance on the distribution of leadership. Since grassroots leaders generally gain influence through their dedication to a movement or cause, they often tend

to view theirs as one voice among many and lay claim to no special place of privilege or authority. Institutionally appointed leaders, in contrast, are conferred a position of influence and power simply by virtue of being authority figures and are inclined to overvalue their expertise. Notes Shirley, “Educators often overstate technical considerations in educational change that advantage their own status and knowledge and minimize political and cultural factors that parents and community members seek to bring to their relationships with schools” (2009, p. 182). To picture the distinction between grassroots and institutional leaders, consider the example of Rosa Parks. Mrs. Parks was one of many Black women who refused to relinquish their seats on the Montgomery bus system to white people. The community’s overwhelming response to her subsequent arrest provides insights into Mrs. Parks’ leadership qualities. Charles Willie wrote that

the communitywide response by Blacks to the arrest of Mrs. Parks was probably due to several happenings in the past: the increasing number of black women verbally and physically abused by white bus drivers, the love and respect that all had for Mrs. Parks, and her extraordinary voluntary service to the NAACP as secretary and overseer of its youth organization. (2008, p. 24)

Smeed et al. (2009) provided an analysis that is helpful for thinking about political influence as viewed through the lens of grassroots leadership, by drawing a contrast between pluralists, elitists, and corporatists. Pluralists see power as being widely distributed, with groups competing around decisions and outcomes. Elitists divide society into those who rule and those who are ruled. Corporatists “champion tripartite decision-making” (Smeed et al., 2009, p. 29) between government, business interests, and worker interests. Although recent years have brought recognition to the importance of shared authority to education leadership, school leaders can learn a great deal from grassroots leaders’ focus on the democratization of decision-making and distribution of leadership.

---

## **How Assumptions Regarding Grassroots Leadership have Evolved**

Earlier in this chapter, several examples of grassroots leaders were cited. The examples included activists of the US civil rights era such as Medgar Evers, who was murdered in 1963 for his advocacy for civil rights for blacks, and Rosa Parks, whose refusal to relinquish her seat led to the successful Montgomery bus boycott, as well as contemporary activists including advocates for gun control and those involved in the Black Lives Matter movement. Scholars of grassroots leadership have documented both confrontational and more conciliatory approaches that served to educate and advocate while producing results ranging from the incremental to the unprecedented.

Sixty years ago, Augusto Boal created a process of participatory theatre in which the audience members could engage during a performance and propose a different storyline, which would then be carried out by the actors (Boal, 2006;

Schaedler, 2010). Authors have described how participatory theatre can serve to constitute an “artful disruption of power dynamics [that] transforms citizens into change agents” (Burns, Mukisa, Sanyu, & Muwanguzi, 2017, p. 352). The use of forum theatre effectively provides a relatively safe setting through which participants can tell previously untold stories of injustices. Similarly, *Jana Sanskriti*, a cultural and political theatre movement (Mills, 2009), has been described as a grassroots effort in India which involves “oppositional practices that present participants in rural Bengal with a significant space for self-organization” (Mohan, 2004, p. 179) to bring attention to women’s issues. “Building trust in community outreach calls for a response to immediate felt needs — coupled with a long-range vision of transformation that includes everyone” (Burns et al., 2017, p. 359). Mohan speaks of the importance of bringing together symbolic interactionism and historical sociology to spur grassroots change (2004). The benefits of theatrical media relate to

the value that learning, imagination, and human interaction hold for people whose days are filled with mundane and individual struggles to survive a challenging environment and for those who have historically been beneficiaries of a power that violates human life in myriad ways. (Mohan, 2004, p. 210)

Asserting that their book on grassroots leadership “opens a new chapter” (Willie et al., 2008, p. 18) on the subject, Willie et al. argue that “the most effective leaders of grassroots movements are people who have experienced life in communities of both dominant and subdominant people” (2008, p. 18). This notion that good grassroots leaders are individuals who are capable of working at the margins of both dominant and subdominant groups, empathizing with the needs and concerns of each, is certainly not embraced as a universal truth within contemporary grassroots movements. Instead, there increasingly appears to be a belief that social injustices are meaningfully confronted only when individuals in power have been forced to a reckoning as the result of mass outrage, conflict, or protest.

Willie and colleagues (2008) conclude that while grassroots leaders tend to focus on horizontal linkages and relationships among local stakeholders, those linkages that involve aligning vertically with potential allies outside the local community may be essential to achieve success. “Making alliances and building coalitions” (Willie et al., 2008, p. 16) both horizontally and vertically are necessary to produce societal change. Efforts in this area are most fruitful when initiated early in a change initiative. Willie and colleagues note that “dialogue is most efficacious when it is introduced during the planning stage of social change rather than after a decisive conclusion has been made” (Willie et al., 2008, p. 103).

Twenty years ago, Swain (2001) described an ongoing shift away from confrontational approaches and toward more consensus-oriented tactics beginning in the 1980s, a change which he attributed in part to rising representation of Blacks in the middle class, diminished segregation in housing, the lifting of school desegregation orders, increasing prosperity, and increasing acceptance of diversity. Weary of

hoping for change through consensus, and driven by rising concerns in the present day about economic inequality, social injustice, the murder of Black men at the hands of police officers, and systemic racism, contemporary grassroots leaders appear to be embracing the notion that social change will only come about through tactics that include productive conflict.

As an alternative to productive conflict, some grassroots movements have sometimes cast protest votes that represent a commitment to principle, but nonetheless amount to a futile and counterproductive choice. The history of third-party presidential candidates in the U.S. represents such a choice. When their efforts at collaboration with like-minded groups have proven to be unfruitful, grassroots leaders sometimes abandon efforts at engagement or coalition-building. Rather than accept a role that would constitute a junior partnership in a broader governing coalition, some grassroots movements pursue purity over compromise. The outcome can then be entirely contrary to the group's interests. In 2000 and 2016, the candidacies of Green Party candidates Ralph Nader and Jill Stein, respectively, plausibly delivered electoral victories to George W. Bush and Donald Trump. No one could reasonably argue that these two presidents' views aligned with the Green Party platform. Other actions that grassroots movements may pursue that are akin to a third-party vote, though perhaps not as damaging, include abandonment of the cause, withdrawal from negotiation, and silent protest.

Changes that are currently afoot in the USA give weight to the argument that where conciliatory approaches have proven to be ineffective over time, grassroots movements must resort to confrontation and productive conflict to achieve desired ends. Less than two weeks after a black man named George Floyd died in the custody of a Minneapolis police officer who kneeled on his neck for nearly nine minutes, grassroots expressions of outrage and broad-based demands for law enforcement reforms led to calls to "defund the police" (Rushin & Michalski, 2019) as well as the destruction and removal of Confederate monuments across the USA (Fisher, 2020). On June 27, 2020, Princeton University's trustees, stating that his "racist thinking and policies make him an inappropriate namesake for a school or college" (President Eisgruber's Message to Community on Removal of Woodrow Wilson Name from Public Policy School and Wilson College, 2020), voted to remove Woodrow Wilson's name from the school's facilities. This action by the trustees appeared to support the effectiveness of the tactics of conflict and confrontation, as notably, the trustees had declined to do so just four years earlier after activists had occupied the President's office in protest. By June 28, 2020, the Mississippi legislature voted to replace the state flag, the last in the nation to feature the Confederate battle emblem (Shammas, 2020). Financial considerations and pressures from donors and investors likely played a substantial role in these decisions. It is presumed that social changes still unfolding may lend greater support to this argument about the effectiveness of tactics involving conflict. Given America's history related to racial injustice, it is also conceivable that a substantial backlash of opposition to the above changes may yet come.

---

## The Importance of a Cause to Create a Movement

As has been pointed out throughout this chapter, a cause is central to producing grassroots movements and grassroots leadership. The cause can focus on a long-simmering injustice, and, increasingly, movements can be sparked by widely circulated video documenting a horrifying act of violence carried out by vigilantes or law enforcement authorities. Absent a shared cause or issue, grassroots leadership would not exist.

Grassroots movements “grow out of need” (Willie et al., 2008, p. 171). Political and social movements that produced progress in basic civil rights in the United States happened because the pernicious effects of segregation and discrimination which profoundly affected the livelihoods of entire communities could no longer be tolerated. The struggle to address these wrongs by providing fair access to education, housing, voting, and equal protection under the law persists to this day. In his “Letter From Birmingham Jail,” Martin Luther King Jr. captured the pain of countless injustices to help readers to grasp this particular cause:

When you have seen hate-filled policemen curse, kick, brutalize, and even kill your black brothers and sisters with impunity . . . never quite knowing what to expect next, and are plagued with inner fears and outer resentments; when you are forever fighting a degenerating sense of ‘nobodiness’ then you will understand why we find it difficult to wait (King, 1963).

It is a tragedy and an example of collective moral failure that Dr. King’s words sound as relevant today as they did three-quarters of a century ago. Castagno wrote, “Each of us, individually and collectively, needs to be held accountable for the role we play in maintaining and reinforcing injustice” (2014, p. 12).

---

## Elements of Grassroots Leadership that can be Transferred to Educational Leadership

One of the reasons why there is merit in examining grassroots leadership is that such an examination can shed light on those attributes and qualities of grassroots leaders that enable them to gain influence, despite their lack of role authority. This could help produce educational leadership that is more “effectual and trustworthy” (English & Ehrich, 2012, p. 86) than leadership that is tied to position or rank. English and Ehrich (2012) point out that, absent leadership skills or qualities, grassroots leaders would have no followers because they possess no formal role with the accompanying power that produces ready followership. They note that “much can be gained by being aware of the tactics and strategies used by grassroots leaders who depend on influence as opposed to power” (2012, pp. 86–87).

While extant theories of leadership provide quite useful guidance for leaders and those involved in leadership preparation programs, there is merit in giving particular attention to those theoretical dimensions that overlap with theories of grassroots leadership. Some examples of these areas of overlap are cited here. Transformational

leadership models point to the importance of building capacity in others, a strategy which is ultimately dependent on the relational trust that is so essential for grassroots leaders. Greenleaf's (2002) views of servant leaders as those who are attentive to the needs of others, and who, through being alert to such requirements, become followers themselves, evoke the grassroots leader's dependence on influence and trust over power and authority. Grassroots leadership's focus on civic responsibility and community engagement is also reflected in models of authentic leadership, defined by Begley as

a genuine kind of leadership –a hopeful, open-ended, visionary and creative response to social circumstances, as opposed to the more traditional dualistic portrayal of management and leadership practices characteristic of now obsolete and superseded research literature on effective principal practices. (2003, p. 1)

Distributive leadership's focus on collective wisdom and shared authority reflects the grassroots leader's focus on the democratization of decision-making and distribution of leadership.

The lessons from grassroots leadership cited earlier in this chapter regarding conflict, trust, and shared power and influence are all relevant to school leadership.

- As has been noted previously, productive nonviolent conflict has a legitimate role in creating social and institutional change, and school leaders would benefit from an improved focus on conflict in leadership preparation programs (English & Ehrich, 2012; Hughes & Davidson, 2020a, b).
- Trust “binds organizational participants to one another” (Tschannen-Moran, 2014, p. 18) and, as reported by Shirley, school-community trust can be an outcome of effective grassroots leadership (2009, p. 177).
- Shared power reflects an implicit recognition that true power lies in a common vision, collective wisdom, and a joint cause. Influence gained through authentic actions intended to correct an injustice produces genuine moral authority that far surpasses the authority associated with position.

The moral leadership that is reflected in grassroots leadership points to the need for a substantial shift in leadership preparation programs toward issues of equity and social justice. This chapter has provided examples of leaders driven by a commitment to address an injustice. Leadership coursework must be carefully scrutinized to ensure that essential conversations on historical and contemporary injustices are not crowded out by overly technocratic content (Crow, Day, & Møller, 2017). Leadership preparation programs have a role to play in developing leaders that are ready and willing to challenge existing injustices. Shirley writes that,

The consequences of neglectful policies and values injurious to children spill over into schools and communities on a daily basis and suggest that educators have a civic responsibility, as part of their vocation, to remedy the most egregious forms of social injustice that afflict the most vulnerable members of their schools and communities. (Shirley, 2009, p. 182)

School leaders are being tested today as never before, as they cope with the effects of the global pandemic that has required school closures and an abrupt transition to universal online schooling. Given all of the challenges they face, including and beyond a global pandemic, their ability to address these challenges will require a significant expansion of their already-extensive engagement with their communities. As Shirley notes, they will need novel approaches

to network not only with one another but also to reach out to community members to confront common problems, to share expertise, and to slowly but surely transform schools from islands of bureaucracy to centers of civic engagement. The interdependent relationship between democracy and education may remain fractious and demanding, but it also remains indispensable. (Shirley, 2009, p. 183)

---

## Conclusions and Recommendations

The future of grassroots leadership worldwide will undoubtedly depend on leaders' abilities to garner the attention of western media, while successfully overcoming the potential for such media to exploit and appropriate such figures. Malala Yousafzai of Pakistan rose in prominence and influence following the attempt to murder her because of her message about girls' access to schooling and because of media interest in her narrative, but despite the unquestionable value of this message, her rise in influence was not free from criticism (Ryder, 2015). Likewise, Greta Thunberg, who went from skipping school and holding a sign reading "School Strike for Climate" in 2018 to be Time magazine's "Person of the Year" in 2019 (Alter, Haynes, & Worland, 2019), gained a worldwide audience with her message about the need to address climate change, but she too faced caustic criticism. While operating on a much smaller scale, even local grassroots leaders depend upon the media to amplify their message.

Predicting the future of grassroots leadership during a time of significant social upheaval and change is a perilous exercise. If present examples of successful grassroots leadership are representative of what is to come, then it is reasonable to anticipate that grassroots movements will employ more confrontational and uncompromising tactics. We will need school leaders who are equipped to effectively understand and engage with those with conflicting views.

As noted earlier in this chapter, in 2016, Princeton University's trustees rejected a proposal to remove the name of an avowed racist from school facilities; four years later, they supported the proposal. In 2001, two-thirds of Mississippi's voters chose to continue use of a state flag bearing an image of the Confederate battle emblem, an emblem first officially embraced by post-Reconstruction white supremacists nearly 30 years after the end of the Civil War. In the summer of 2020, the state of Mississippi elected to eliminate the image from the flag. In both of these examples, it is likely that the potential loss of significant financial investments may have provided the inspiration, which may lead to more sophisticated and creative ways to pressure businesses and mobilize supporters. While both examples may ultimately

be more symbolic than substantive, the fact that these long-sought changes took place at all will likely provide inspiration for future grassroots movements.

## Abstract

Educational leadership studies often portray schools as homogeneous professional communities that automatically and willingly endorse the leadership of school principals. For this reason, leadership preparation programs usually include a static set of administrative, technical, and financial skills necessary to operate schools and prompt followers (in-school stakeholders) to engage in actions toward pre-determined goals. However, schools are not usually homogeneous communities, but rather they involve informal social groups who potentially have different expectations about the traits and behaviors of school principals. This also suggests that there can be different evaluations about the leadership of the same school principal. In other words, competencies acquired in leadership preparation programs can transform school principals into leaders only in the eyes of social groups whose expectations are met through those competencies. At this point, it should be noted that formal authority does not always bring about leadership and that school principals must get the endorsement of followers to attain leadership status. To be

more precise, leadership in schools is co-constructed by school principals and followers rather than being granted by formal authority. Accordingly, relational competencies are needed to create an (if not the) appropriate context through relationship building for the construction of leadership. The preparation of educational leaders is solely not the work of ensuring school principals are equipped with the skills they need for their formal roles. They should first gain the relational skills that can help with the approval of their leadership by social groups in schools possibly carrying rather different leadership expectations.

Prototypicality · Leadership categorization theory · Group identification · Leadership prototypes · Leadership effectiveness · Leadership preparation · Relational skills

**The Field of Memory**

The study of leadership used to be through the study of traits of leaders. In the past leadership studies were centered on leaders not followers. The assumption that “leaders are born, not made” epitomizes the main focus of leadership studies in the past.

**The Field of Presence**

Taking a glance at the relevant literature, the role of followers - in-school stakeholders in this case - in the construction of educational leadership has been elaborated to some extent. Or at least they are depicted as individuals to be persuaded by school principals, as designated (or partial) leaders, to reach predetermined goals rather than fully passive recipients of leaders’ or organizations’ actions. It can be argued that the more the traits and behaviors of school principals meet the expectations of followers, the more probable they become successful in their persuasion attempts.

**The Field of Concomitance**

The notion of prototype lies at the core of categorization theory in psychology. Categorization theory defines conceptual categories in terms of a certain artifact or the most central member of a category instead of unique features of overall members. The more an entity is deemed as a prototype of a category, the more common features it shares with other members of that category and the less with the members of opposite categories (Rosch, Mervis, Gray, Johnson, & Boyes-Braem, 1976). In addition to this, prototypes represent the attitudes, beliefs, and behaviors that best define social groups, which place them at the core of group identification, and self-categorization theory. Self-categorization theory is a theory in social psychology that describes how and when individuals define themselves as individuals and as part of group entities and studies the influence of this variability in self-perception (“I” to “we”) for understandings of behavior and mind (Turner & Reynolds, 2011).

### **Discontinuities and Ruptures**

Even though, the effects of followers in the approval and evaluation of the leadership of designated leaders have been supported by empirical studies in the related literature (e.g., Platow, Haslam, Foddy, & Grace, 2003; Rast, Hogg, & van Knippenberg, 2018), educational leadership studies still mostly hold the assumption that school principals, as designated leaders, automatically become leaders when they are appointed to schools. Furthermore, leadership preparation programs are predominantly developed for the acquisition of skills necessary for formal roles rather than competencies that are required for the co-construction of leadership by school principals and followers.

### **Critical Assumptions**

It is highly probable that there exist informal social groups in schools with different expectations about traits and behaviors of school principals. For this reason, the leadership of school principals should not be expected to be unanimously and unwaveringly endorsed by followers (in-school stakeholders). Moreover, different informal social groups tend to make different evaluations about the same school principal for the same reason. Accordingly, leadership preparation programs aiming the acquisition of contextless one-size-fits-all type competencies necessary for enacting formal roles and operating schools should not always be expected to turn school principals into leaders. In addition to such competencies, leadership preparation programs should include relational competencies that can enable school principals to construct leadership together with followers through relationship building.

---

## **Introduction**

Allegedly, leadership is the most captivating subject for the educational administration community. The focus of educational leadership research, like general leadership studies, was mostly on the traits that a leader “must have.” The origins of this focus can be traced back to a well-known old maxim: “the leaders are born, not made.” That was partially true though. Innate traits, such as intelligence, can give some individuals advantage over others. What is more, culture adds many traits to individuals through social interactions. Howbeit, neither is leading a context-free activity nor are leaders universal biological and cultural products who can freely navigate through contexts independent of unique and ever-changing aspects of these contexts (Conger, 2004).

Schools are the main contexts of the educational leadership. The hierarchical structure of schools gives school principals formal authority over teachers and school activities. On the other hand, the technical side of teaching and learning is highly linked to the rapport between teachers and learners and creates autonomous spheres within classrooms (Orton & Weick, 1990). The formal authority turns school principals into designated leaders (or partial leaders). The existence of teachers working within their autonomous spheres requires complete leaders who can both run daily

activities of schools in an organized manner and encourage teachers to participate in school works. These works mainly include administrative and instructional tasks, such as school improvement projects, curriculum development, textbook selection, professional development programs, assessments of student learning, supplementary programs for students, extracurricular school activities, Parent-Teacher Association, and the like (Harris, 2005). School principals must acquire necessary skills to become complete leaders (English, 2007). These skills are usually determined by ministries/departments of education or professional administrative associations. Even they are sometimes dictated as standards, which has led to the homogenization of university curricula about educational leadership and the involvement of for-profit organizations in leadership preparation. Furthermore, leadership programs offered by these organizations generally involve a static set of administrative, technical, and financial skills (assumed to be) necessary to operate schools and prompt school stakeholders to realize the predetermined goals (English, 2003). They mostly overlook an important aspect of leadership: educational leadership is about not only the leader but also the interactions with followers in schools (English, 2007).

In school settings, the term follower mainly represents in-school stakeholders, such as teachers, parents, and students. They are not merely passive recipients of school principals' actions, but rather they act in a self-determining fashion. They can choose to enthusiastically support their principals or stay silent by neither participating nor objecting to (their) decisions. Followers significantly differ in terms of approving and evaluating the leadership of school principals (Brown, 2018). Followers often have different expectations of what kind of traits leaders should have and how they should behave. The more the traits and behaviors of school principals align with the expectations of followers, the easier they can get their endorsement and the less their mistakes are noticed. This suggests that even followers in culturally uniform schools are not always supposed to react to their principals' actions in the same manner, which requires school principals to construct their leadership together with different follower groups with different expectations (Coyle & Foti, 2015).

It can be observed that the focus of leadership development is shifting from prescribed leadership skills to the co-construction of leadership by school principals and followers. This entails the examination of what kind of expectations followers have in their minds about traits and behaviors of school principals and which factors are influential in shaping these expectations. Undoubtedly, diversifying expectations of followers give rise to varying leadership ratings for the same principals, which also leads to consequences about the preparation processes of educational leaders. The following sections elaborate on the theoretical background of the effects of followers in leadership construction and the current situation in schools.

## **The Role of Prototypicality in Leadership**

The role of followers in leader–follower interactions can be portrayed by using the notion of prototype. The notion of prototype lies at the core of categorization theory in psychology. It refers to the most central member of a conceptual category, such as

leader and follower (Rosch et al., 1976). Categorization theory defines conceptual categories in terms of a certain artifact or the most central member of a category instead of general features. The more an entity is deemed as a prototype of a category, the more common features it shares with other members of that category and the less with the members of opposite categories. People tend to find prototypes attractive, which renders them potentially effective in a wide range of issues ranging from friend choice to leadership (Rosch et al., 1976).

A developmental parallel to categorization theory in psychology has occurred in leadership studies. In this direction, implicit leadership theories were developed to depict the influence of followers in the leadership process. Implicit leadership theories involve a set of theories aiming to explain the effects of mental representations held by followers that ensure discerning leaders from non-leaders (Lord & Hall, 2003). These theories posit that individuals construct mental representations of their environments through which they interpret the world and control their own behaviors. According to these theories, members of a group have implicit expectations and assumptions about personal traits and behaviors that a leader must possess. These expectations and assumptions are dubbed as leader prototypes, and they play a key role in followers' approval and evaluation of a leader (Medvedeff & Lord, 2007). Leader prototypes lie at the core of leader categorization theory, one of the implicit leadership theories. According to leader categorization theory, prototypes can help individuals make distinctions between leader and non-leader categories and create expectations about the traits and behaviors of leaders. Perceiving individuals as leaders is basically making categorizations by examining their appropriateness to existing mental categories (leader/non-leader or leader/follower). In its simplest form, the theory implicates identification of an individual's appropriateness to the leadership category based on the prototypes held by followers (Foti, Fraser, & Lord, 1982).

According to leadership categorization theory, leadership perception of followers can be shaped by two processes. The first one is determining the fit between traits and behaviors of a potential leader and followers' leader prototypes, that is, the recognition of a leader by followers. Good fit usually gives rise to high leadership ratings whereas poor fit to lower ratings. The second process is the inference of the leadership from the events and effects incurred from the actions of a potential leader. The more traits and behaviors of potential leaders are associated with the good performance, the more probable they can be deemed as prototypical. In sum, in both cases followers play the dominant role in building leadership perceptions. Potential leaders can have a chance to attain a (or "the") leadership status if their traits and behaviors are perceived as appropriate for leadership by the followers (Lord & Hall, 2003).

Leadership categorization theory postulates that the position of a potential leader in the authority hierarchy and informal groups in an organization can shape leadership perceptions of followers. To illustrate, thanks to their hierarchical status and authority, school principals can be accepted as leaders easier than teachers can do (Lord & Hall, 2003). On the other hand, the existence of informal groups in a school complexifies the process of the endorsement of a school principal as a leader. Members of a social group usually regard one of them as more effective, trustworthy, and charismatic than members of other groups, and their unfair behaviors draw

relatively less reactions. Particularly in schools, where informal groups are highly effective, school principals being perceived as “one of us” rather than “one of them” can facilitate their endorsement as leaders. This situation, on the other hand, might render some individuals disadvantageous due to their inborn traits. Those who can reach school principalship positions must engage in struggles in which their small mistakes are harshly criticized, and achievements and success are underestimated (Platow et al., 2003).

Like leadership endorsement, group identification and culture are influential in evaluating the effectiveness of school principals. In a group with a specific culture, leaders exhibiting traits and behaviors consistent with leadership prototypes of this group’s members are usually evaluated more positively when group identification is strong (Turner & Reynolds, 2011). Group identification leads to shared perceptions about what characteristics and behaviors should be found in a leadership prototype that will enable that group to achieve its goals (van Knippenberg, 2000). Moreover, it provides the internalization of group interests by the members. In this way, members see group interests as their own and use similar criteria in their leader evaluations. In light of these discussions, it is possible to state that prototypical leaders are individuals with appropriate and desirable characteristics and behaviors. They have also gained the members’ confidence regarding the belief that they can protect the group’s interests in the best way. While this situation requires non-prototypical leaders to gain the trust of followers through group-oriented actions such as self-sacrifice and benevolence, it offers prototypical leaders the chance to be perceived as effective without engaging in such actions (van Knippenberg, 2011). In a school accommodating diverse groups with different leadership prototypes, the consistence of the school principal’s traits and behaviors with leadership prototypes of groups may vary, which may lead to different evaluations about the leadership of the same person (Rast et al., 2018).

In summation, as pinpointed by leader categorization theory, followers’ leadership prototypes mainly include expectations about leaders’ inborn traits, such as gender and race, and perceived behaviors. This fact primarily necessitates the elaboration of leader prototypes and their effects on evaluating leadership effectiveness. Then, why leadership prototypes mostly invalidate leadership preparation programs based on standardized skills and entail an approach based on leader–follower interactions need to be analyzed.

---

## **Leader Prototypes and Leader Effectiveness in Educational Organizations**

Taking a closer look at the educational leadership literature, it can be seen that schools are mostly dealt with as if they were homogeneous professional communities (Wieczorek & Manard, 2018; Young, Madsen, & Young, 2010). In these studies, the majority of administrators and teachers are regarded as they share the same cultural background (Swartz, 2003; Walker & Dimmock, 2002) and ready to receive contextless homogeneous leadership practices and prescriptions (Mertkan, Arsan,

Inal Cavlan, & Onurkan Aliusta, 2017). In this respect, educational leadership is generally portrayed as if leaders (mostly school principals) and their followers (teachers, parents, and students) were members of a single formal group and informal social groups in schools had low or no effect on the endorsement of the leadership of school principals (Dimmock & Walker, 2005).

However, schools do not consist of only formal groups such as administrators, teachers, parents, and students. Physical and demographic factors, such as socioeconomic status, gender, race, ethnicity, religion, and sexual orientation, transform contemporary schools into heterogeneous communities and an interaction area of many informal groups with distinctive cultures (Dimmock & Walker, 2005). This fact implies that social groups in schools have their unique cultures and identities; therefore, they can hold different leadership prototypes. Social identities of culturally different groups and their collective experiences related to these identities may lead them to make their own “good leader” descriptions different from that of the dominant social group in a society. Without doubt, it is inevitable that the dominant culture in the society can affect the leadership perceptions of social groups in the school; however, as the marginalization levels increase, it can be expected that the leadership prototypes of culturally different groups will also differ (Chin, 2013). Here marginalization refers to culturally different groups’ exclusion from access to and participation in the dominant culture in terms of opportunities, resources, and rights (Collins, 1989).

Another enduring setback in the field of educational leadership, aside from the previously divulged one, is arguably the researchers’ and field members’ tendency to predicate that school principals - as legally authorized persons - are automatically leaders in the eyes of followers (in-school stakeholders) despite the probability that many school principals are not seen as leaders by followers (Alvesson, 2020; Fidan, Ayyıldız, & Kurt, 2021). This indeed is a rather fallacious thinking and an act since leadership is to be taken to a great degree as a matter of follower decisions and selections. Leadership is co-constructed by school principals and followers through a series of interactions of which frequency and duration are largely determined by followers’ leader prototypes (Bogotch, Bauer, & Su-Keene, 2019). On that note, questioning whether the school principal or any “candidate” to be a leader actually becomes and remains as “the” leader for the followers is vital. This situation shadows forth a couple of core elements of educational leadership, which can be enlisted as: (1) legitimacy of power does not always bring about leadership, (2) leadership is indeed a subject and at times even a struggle for being acquiesced by the followers, and (3) the struggle comes forward in varying extents based upon the prototypes that followers have in their minds. This also suggests that school principals are “doomed” to be subjected to continuous tests by followers to check if and/or what extent they fit with their expectations. This conveys that leadership is an “awarded title” at the end of a process of appraisal carried out by different follower groups and they may not approve the leadership of a principal equally (Dimmock & Walker, 2005).

The spotted delusions (homogeneity of school communities and automatically approved leadership of school principals) in the field of educational administration,

which are identified in the above paragraphs, signalize two critical strands of educational leadership: the first one is the existence of informal follower groups in a school and the other is the similarities and differences between their expectations from leaders. In this regard, it is vital to lay out the two types of schools. (1) The first type includes schools with multiple leadership prototypes. In these schools, strong group identifications and different leadership prototypes exist despite the effects of the dominant culture on the in-school social dynamics. (2) The second type includes schools with a dominant leadership prototype. In these schools, leader prototypes are shaped with the effects of the dominant culture still with the existence of in-school social groups and informal in- and out-group relationships.

### **Schools with Multiple Leadership Prototypes**

It is indeed understood that there are schools in numerous parts of the world in which informal social groups with strong group identification may hold their own leader prototypes despite the effects of the dominant culture of the society. Leader prototypes are closely related with group identification as group members tend to approve leaders who represent the group's values, interests, and beliefs. Therefore, the stronger the group identification becomes, the more probable the members support leaders who embody the group identification rather than that of the organization (schools in this case) (Turner & Reynolds, 2011; van Knippenberg, 2011).

In-group leader prototypes alter under the influence of sociocultural environment at macro and micro levels. Macro-level environment includes statewide or nationwide cultural and social changes that influence the relationships between in-school groups. Micro-level environment involves changes resulting from contingent elements (e.g., the quality of relationships between groups, actions of school principals, and the features of tasks) of the institutions. With the intent of concretizing the state of affairs of the first group of schools, where social groups have different leader prototypes in defiance of the effects of the mainstream culture, it can be accentuated that these schools are the ones where group membership and group identification are more influential and important than school membership and school identification for followers (Turner & Reynolds, 2011). In these schools, individuals whose traits and behaviors are relatively more consistent with the leader prototypes of the group members are more likely to be seen as leaders. This would mean there might be the development of a multitude of prototypes by groups in schools with heterogeneous populations and thusly individuals can become leaders as long as they prove themselves as close to as the prototypes of these groups reflecting the values and norms of the groups and to the extent that they epitomize the group members' social identities. Groups choose their leaders among the members that can best preserve, serve for, and represent their collective identities and who can be their "one of us" (Thomas, Martin, & Riggio, 2013).

Due to this fact, it is highly likely that informal leaders emerge from each group with strong group identification along with the designated leader, namely, the school principal. In such situations, group members have different in-group and

out-group leadership categorizations, which give rise to different leadership prototypes for informal leaders and school principals (Neubert & Taggar, 2004). When groups are marginalized by the school administration or relationships between groups become tense, the in-group leadership prototypes get more prominent than out-group prototypes. This suggests more intergroup discriminations and lower leadership ratings for school principals. In this case, there is a negative correlation between the endorsement of in-group informal leaders and out-group designated leaders. While in-group leaders' approval ratings ascend, those of out-group leaders descend (Waldzus, Mummendey, & Wenzel, 2005). School principals are still endorsed by the members of the different groups to some extent even in tense situations. Withal, the co-construction of leadership in schools through leader–follower interactions turns into a complicated process in the event that members of a group regard the endorsement of the leadership of a school principal besides their natural leader as a deviation from group norms (Waldzus, Mummendey, Wenzel, & Weber, 2003).

To illustrate, Amit and Bar-Lev (2013) state that multiple leadership prototypes and thus multiple informal leaders can be seen in multicultural organizations in which culturally different groups operate in the same settings. Furthermore, it was found in a study by Dugan, Komives, and Segar (2009) with college and university students in the USA that racial discriminations in the past are effective in the construction of leader prototypes in educational organizations. They confirmed that Black students have leadership prototypes emphasizing collective identity more than those of other students. Leadership prototypes of Black students stress the values of consciousness of self, citizenship, and change more than those of other students (Dugan et al., 2009). A weak group has developed cooperative leadership practices as a means of struggling against discriminations. This can also be attributed to the other Black members of schools, i.e., teachers relating it to their leader prototypes for the school principal (Dugan et al., 2009). In minority schools, individuals being seen as leaders provided they do not share the language, ethnicity, or religious background of the members is almost out of question. This is relevant to the fact that the school itself constitutes “a subgroup of the society” and organizational membership indeed is impactful in shaping followers' leadership prototypes and determining the leader in a collective fashion. All of these result from in-group prototypicality, which is related to the sum of qualities that social groups would like to find in the(ir) leader and hence cannot be realized by individuals merely via following a predetermined and prescribed rules pertaining to traits or behaviors so as to be able to come to the fore (Haslam, Reicher, & Platow, 2011).

It should be noted with caution that prototypes are not rigid stereotypes and are inclined to change through interactions between social groups. Meaningful interactions between a social group and school context (school principal and other groups) have the potential to yield positive results even though there are tense relationships among groups. Particularly, this process is facilitated when there is a consensus on the statuses of leadership prototypes of the school principal and informal leaders (Tajfel & Turner, 1979). This is because holding different leadership prototypes does not always mean to have a discriminatory stance against others. It can only produce

discriminatory actions when these actions are justified by individual values, beliefs, and ideologies. Additionally, complexity alleviates the power of in-group leadership prototypes. Should the composition of a group become heterogeneous and group identity involves relatively more features, group members become more tolerant of the school principal (Waldzus et al., 2003). At this point Eagly and Chin (2010) remark that leaders have become more dependent on followers for effective performance as the complexity of their tasks has escalated. This development has given rise to increased leader–follower interactions and followers’ undertaking some of the traits and behaviors of leaders. In the same manner, demographic changes and complexifying group compositions have led changes in expectations about leader traits and behaviors (Eagly & Chin, 2010).

### **Schools with a Dominant Leadership Prototype**

In the majority of schools, school administrators and in-school stakeholders are mostly the members of the mainstream culture in a society. Undoubtedly, their leadership prototypes are constructed and refined over time under the influence of the dominant culture of the society in which, and more importantly for which, schools operate. In most cases, school principals, as designated leaders, are the end results of that culture and as a matter of fact entities that represent that very culture at the same time being agents aiding in sustaining the codes of this culture. That culture does steer the approbation mechanism of the followers, and this is true for many cases especially in the schools in which the majority of members identify themselves more with the school than their groups (Maxcy, 1998). This may grow into a deeper issue especially at lower levels where teachers and school principals are expected, by parents and other members of the society, to set examples with their traits and behaviors for youngsters. In these instances, status beliefs are worth mentioning. Status beliefs refer to “widely shared cultural beliefs that people who belong to one social group are more esteemed and competent than those who belong to another social group” (Ridgeway & Erickson, 2000, p. 580).

Ridgeway (2001) divulges status beliefs with reference to groups’ social status in the society that is connected to factors like gender, sexual orientation, race, ethnicity, educational and socioeconomic background, and profession. In status beliefs, cultural assumptions about the position of a social group in reference to the others are legitimized through judgments on the differences among the competence levels of the members of these groups. This in time causes status beliefs to evolve into stereotypical thinking that argues some groups are more pressing and competent than the others. It is also crucial to note that group identities and group status are socially constructed convictions and thereupon are subject to change in time and they can also differ from one society to another. For instance, the intersection of physical traits, such as race, sexual orientation and gender, can give rise to a favorable situation for White heterosexual males. This can give them an advantageous position in the attainment of leadership status (deLeon & Brunner, 2013; Ridgeway, 2003). Furthermore, it is clear that the maneuver of stereotyping does not

always come into view in the form of stereotyping of weak or minority groups by dominant groups. Self-stereotyping, e.g., of females, persons of color, LGBTQIA+ individuals, and handicapped people may also be compelling, which results in attributing leadership (qualities) to individuals representing the dominant culture. This implies that these groups tend to evaluate White heterosexual male leaders more positively than the leaders belonging to their own groups (Festekjian, Tram, Murray, Sy, & Huynh, 2014; Morton, 2017; Toh & Leonardelli, 2012).

In this regard, individuals generally do not have prototypes suitable for non-traditional leaders, such as women and minority group members. Such leaders are included in different categories, and evaluations about them are conducted in accordance with these categories. Followers have difficulty in approving the leadership of school principals who have non-prototypical traits and behaviors. The behaviors of these people are less approved by their followers and consequently they are evaluated as ineffective or less effective leaders than the prototypical ones (Helgstrand & Stuhlmacher, 1999). For example, in countries like Turkey where the majority of the citizens are Muslims it is almost inconceivable that a gay school principal is acknowledged by followers given that Islam prohibits homosexuality and teaching professionals are regarded as role models for the whole society (Köse & Demir, 2014). In a similar vein, educational workplaces have most often been defined as environments where the vast majority of workers (teachers as followers) are women yet where not a proportionate share of school principalship positions has been attained by these women and in which females are underrepresented in promoted posts, across all education phases. On the other hand, this usually does not lead to any crucial differences in the endorsement of school principals in terms of gender (Schein, Mueller, Lituchy, & Liu, 1996).

As concerns how prototypes are shaped in the minds of followers in schools, one of the vitally essential statements to be made is that whatever is in the eye of the beholder, viz., the follower when it comes to evaluating the leadership of school principals with their traits and behaviors, this procedure becomes wholly an outcome, a product of the culture regardless of the fact that it is (also) the subculture of the group that the follower belongs to or the prevailing one that surrounds the school in and outside. With a view to mitigating the case with the schools particularly from the followers' perspective, indulging in the agenda of group members, that is to say followers, can be a good starting point; however, "we cannot know the extent to which each prototypical attribute individually contributes to the outcomes, or which prototypical attributes are most relevant for recognizing someone as a leader" (Tavares, Sobral, Goldszmidt, & Araújo, 2018, p. 2).

Nonetheless, it is obvious that a fair number of parameters do affect leadership development in educational contexts just like in others. A striking point to be made here is also about the matching between leader traits and behaviors and follower expectations that come after evaluations of followers against their prototypes and that complement their evaluations. Specifically, despite the fact that school principals, with their congenital traits, fall in line with the leader prototypes of the followers, they may still need to do whatever is expected from them to be called a leader (Koopman et al., 1999) and followers generally would like to see intelligent,

trustworthy, inspirational, autonomous, procedural, face saver, non-autocratic and modest individuals as their leaders (Brodbeck et al., 2000; Ng, Nguyen, Wong, & Choy, 2015) almost all of which can easily turn into widely accepted qualities for an educational leader as well. It is undeniable that characteristics from birth can be highly enticing among the other effective factors checked against prototypes. Therefore, school principals can become rather disadvantaged by virtue of their hereditary qualities like ethnicity, race, gender, and sexual orientation and they may find themselves struggling toward compensating for their smallest mistake or justifying whatever they do (Platow et al., 2003) as they stand outside the margins of the well-defined circle of “effective leadership” of the hegemonic or dominant groups.

---

## Leader Prototypes and Leadership Preparation

The preparation of educational leaders, i.e., transforming school principals into complete leaders, has traditionally been reckoned as a matter of meeting predetermined standard competencies necessary for operating a school. The fact that schools predominantly function in educational systems reduces the school principalship into a layer within bureaucratic hierarchies and requires them to encumber legal duties regarding the operation of schools. This generally puts meeting legal standards at the nexus of preparation programs. Every country has its own traditions about the preparation of educational leaders. For instance, in some countries, like the USA, the preparation of educational leaders has historically been a formal training offered as university programs (English, 2012). On the other hand, some countries like Turkey have no tradition of formal leadership training. Instead, short-termed in-service training programs of which content is determined by the Ministry of National Education of Turkey are offered to school principals (Aslan & Karip, 2014). In a global scale, standardized skills necessary to operate schools and lead teachers had been among topics of hot debates in leadership preparation issues since the 1990s, but the turning point was the first Interstate School Leaders Licensure Consortium (ISLLC) adopted by the National Policy Board for Educational Administration in 1996. ISLLC was revised in 2008. It mainly consists of what a school principal must do so as to be an educational leader (ISLLC, 2008). Although this incident took place in the USA, it has had global effects. For instance, MOE 2013 professional standards for the school principals, similar to ISLLC, were issued by the Ministry of Education of China (Liu, Xu, Grant, Strong, & Fang, 2017). In Turkey, the necessity of widely accepted documented competencies and standards has widely garnered support among academics and the Ministry executives (Aslan & Karip, 2014).

The ISLLC form of standardization policy, which aimed at reshaping the school principalship and directing leadership practices to certain areas, such as student outcomes, has gained momentum worldwide. School principals are expected to have certain patterns of behavioral skills in order to attain certain student outcomes. Indicators based on behavioral observation and student outcomes are used as a main criterion for determining whether a school principal is a leader or not

(Murphy, 2015). These policies are so powerful that they impact university programs worldwide. Contextless one-size-fits-all type leadership skills have become the benchmark for educational leadership preparation programs and scientific studies (English, 2006). To illustrate, the below quote hints the inferred impact of standardization policies:

“More than ever in today’s climate of heightened expectations, principals are in the hot seat to improve teaching and learning. They need to be educational visionaries, instructional and curriculum leaders, assessment experts, disciplinarians, community builders, public relations and communications experts, budget analysts, facility managers, special programs administrators, as well as guardians of various legal, contractual, and policy mandates and initiatives. They are expected to serve the often-conflicting needs and interests of parents, teachers, students, district office officials, unions, and state and federal agencies, and they need to be sensitive to the widening range of student needs” (Davis, Darling-Hammond, LaPointe, & Meyerson, 2005, p. 1).

In a similar fashion, Hallinger (2010) pins down the requirements of effective leadership as the work of and working toward improving the existing conditions to create unity in values and endeavors within and across school. Undoubtedly, it is impossible to deny the noteworthiness of these general statements about leadership effectiveness. However, neither are schools machine-like organizations running like clockwork, nor in-school stakeholders uniform individuals. The acquisition of standardized competencies that the formal role entails does not transform principals into leaders (Fletcher, 2012). Such leadership assumptions are grounded on the idea that there is a general leadership prototype for school principals, which is independent from the context of each school. This leads to two major weaknesses. The first one is that they ignore the role and place of constructing the leadership before enacting it. The second one is that they largely overlook the possibility of the existence of various informal groups with different leadership prototypes (English, 2006; Lumby & English, 2009).

At this point, Smith (1998) claims that mental representations like prototypes should be regarded as dynamic context-sensitive states instead of static entities. This point of view implies that leadership is a dynamic contextual process constructed by the interaction of a variety of factors, such as culture, the community that a school operates in, tasks, histories of informal groups in a school, and personal traits and behaviors of leaders and followers. This point of view also suggests a shift from static models of prototype-based leadership to dynamic models of leadership perceptions that can change over time and across contexts while retaining some properties of prototypes (Lord, Brown, Harvey, & Hall, 2001). In this context, school principals must work with a wide variety of informal groups in schools to construct leadership (Lumby & English, 2009). This is because there can be slight differences between the leader prototypes of social groups even in schools where all followers share the same culture. To cite an example, even though there usually exists a consensus on inborn traits and basic behaviors of leaders between sexes, females and males may attach different levels of momentousness to certain traits and behaviors. Females’ leader prototypes emphasize interpersonal sensitivity more than

those of males whereas males' ideal leader categories tend to be more forgiving to antiprototypical traits, such as authoritarianism than those of females (Brown, 2018).

The possibility of the existence of prototypical differences requires the leadership preparation to go beyond the acquisition of predetermined standardized competencies that the principalship role entails and include relational competencies. This is because leadership development is actually about the development and use of relational competencies to cultivate the commitment of social groups in schools. Relational competencies involve the establishment of efficient and sustainable work relationships with a variety of individuals and groups in and outside the school across different leadership tasks. Relational competencies address the actions that are fundamental for establishing mutually beneficial, egalitarian, and enduring relationships between interdependent social groups and the school principal (Fletcher, 2012). As the prototypes are stored in memory as dynamic and flexible structures that are reconstructed according to contextual differences rather than static and rigid structures, establishing high-quality relationships can potentially transform leadership prototypes by dramatically altering the context (Epitropaki & Martin, 2004). For instance, national and group cultures shape the basic traits and behaviors expected from a leader through values and norms. School principals participate in this process by bringing their goals, norms, and emotions into the context. Followers are not passive recipients; their values and goals are influential in shaping the expectations from school principals. Moreover the features of task to be undertaken dictate goals and give rise to new emotional states in school principals and followers like tension, excitement, or unhappiness. When these contextual factors interact with the behaviors of school principals and followers, a new context arises with a new web of relationships that creates specific expectations about traits and behaviors a leader must have, such as intelligence, extroversion, and pretentiousness (Bolton & English, 2010; Lord et al., 2001).

In this context, it is possible to claim that rather than current traits or behaviors of school principals or standardized competencies necessary for their formal roles, the process of leadership aiming to reshape leadership perceptions of school principals and followers through relationship building becomes more prominent. A school principal and social groups in a school can enable the reconstruction of leadership prototypes through building a common understanding regarding the relationships existing in the school. In line with this very insight into the matter, Uhl-Bien (2006) regards leadership as a process of social construction. According to her, leadership is a process of social impact fostering evolving social order and change. In fact, all the social realities in an organization are mutually dependent and endure through relational circumstances (Uhl-Bien, 2006). As Uhl-Bien and Ospina (2012) manifest, individuals, together with social groups in a school, can exist thanks to their being in relationships with the others. This translates to the idea that the school principal, as a designated leader, and the school context are interrelated social constructions. They generate leadership through a set of ongoing cultural and social processes. The key term to share herein is communication. Leadership prototypes of social groups are created and changed via communication. That is, a school principal is not a "leader" presented to the followers as a fact because leadership is an outcome of the communication taking place among interdependent groups with different

prototypes (Uhl-Bien, 2006). The communication in question is actually not an expression of something preconceived. Instead, communication is an open process aiming to spotlight what is meaningful. This can be interpreted in the following way: It is not necessary for school principals to convey the aims of standardization and accountability policies or directives of superior organizations, such as ministries, departments, or district administrations, to schools for them to become leaders. Therefore, there needs to be communication, which is egalitarian, reciprocal, and open ended, through which situational meanings and finally leadership prototypes of different social groups are reshaped (Cunliffe & Eriksen, 2011).

The co-construction of leadership by school principals and followers - or the reconstruction of their leadership prototypes - entails analyzing relationships in a school and acquiring necessary skills to construct high-quality relationships, and thus to reach outcomes specific to each school. This puts forward the notion that school principals should carefully analyze intergroup relationships in a school before engaging in relationship building. By doing this, they can produce strategies to enable different social groups in the same school to establish high-quality relationships and work cooperatively. At this point, Hogg, Van Knippenberg, and Rast (2012) purported that intergroup cooperation is an arena where different group identities - and therefore leader prototypes - mostly conflict with each other. Attempts to create an inclusive collective identity that require the imposition of a superordinate prefabricated leadership prototype, like what school principals generally try to do, mostly fail to become a solution to this problem (Hunt, Boal, & Sorenson, 1990). Before determining the leadership practices they will use, school principals should effectively analyze the tense and harmonious relations between the social groups in a school. In case of high intergroup tensions, the cooperation of each group by making sui generis contributions in line with the common goal with equal status can reduce intergroup tensions to a controllable level (Hogg et al., 2012). Therefore, school principals should give equal eminence to the identity of each group and highlight the fact that groups are interdependent. For the groups that have harmonious relationships, building an intergroup collective identity, that is “we,” can produce positive results (Rast et al., 2018).

Correlatively, Fletcher (2012) expresses the construction of leadership through relationship building yields better outcomes as opposed to the imposition of a superordinate prefabricated leadership prototype. There are three components of the construction of leadership through relationship: *skills*, *processes*, and *outcomes*. In order to be able to establish good working relationships, school principals need to possess several relational *skills*, which refer abilities necessary to initiate and sustain relationships like empathy, sensitivity, self-awareness, self-regulation, modesty, resilience, and commitment (Fletcher, 2010). Similarly, Uhl-Bien (2003) states that relational *skills* include interpersonal skills necessary for establishing long-term interpersonal relationships (e.g., trust, respect, equivalence, and mutual interest); communication skills needed for relationship building (e.g., emotional expressivity, social expressivity, and social control); relational self-management skills (e.g., self-correcting behaviors, ability to accept negative feedback, and ability to accept responsibility for failed actions); and relational feedback giving skills (e.g., school principals not refraining from sharing rather sensitive issues that have the potential of dispute when

communicating with social groups in the school). These *skills* can help school principals to gain the trust of social groups and preserve their previously established relations. Underpinning particularly negative issues and failures and sharing them with social groups in a way that they can be knowledgeable about these and moreover inviting them to contribute to the relevant solution processes help eliminate communication barriers on the way to high-quality relationships while reinforcing mutual trust between and among groups. As a result, the preparation of leaders is not only a work of ensuring school principals are equipped with the skills they need for their roles. These individuals should first gain the relational *skills* that can help with the approval of their leadership by social groups in schools who may have rather different leader prototypes (Uhl-Bien, 2003). Since leader prototypes of followers are refined over time as a result of experiences with school principals, they tend to change as the use of relational *skills* intensifies (Lord et al., 2001).

Also, these *skills* can assist school principals in engaging in suitable social interactions that pave the way for the attainment of their goals. Social interactions are critical since they constitute *processes* with which leadership are enacted (Fletcher, 2010). Those interactions being egalitarian, mutual, and cooperative are indicators of effective leadership, because followers are at least as influential as the leader during leadership *processes*. These interactions carry the great potential of stimulating effective *outcomes*, such as collective success and organizational learning. Co-creation of an understanding toward the definition of a right act by the leader and social groups and its dissemination to all parties within the school through positive learning relationships may cause blurring boundaries between the leader and followers. Leadership is created from the relations between interdependent individuals and social groups, namely, co-creation of leadership by the leader and followers can lead to the convergence of the image of “designated leaders” such as school principals and the leader prototypes of social groups (Fletcher, 1999). It should also be noted that three components (*skills*, *processes*, and *outcomes*) highlight general contours of the reconstruction of leadership prototypes that can change according to contextual changes rather than denoting a contextless general leadership prescription (Lord et al., 2001; Lumby & English, 2009).

Accordingly, it is deemed pivotal to design leadership preparation programs that aid leaders in building and maintaining high-quality work relationships with social groups with different leader prototypes. In particular, communication concentrating on mutual interest and interdependence facilitates establishing relatively better-quality relationships in this regard (Maslyn & Uhl-Bien, 2001). To this end, alongside contextless skills necessary for formal roles of school principals, they need to carry context-sensitive relational skills to cater to social groups in schools (Ehrich & English, 2013).

---

## Conclusion and Reflections

Approaching schools as homogeneous communities isolated from the cultural diversity of societies as well as those of the groups that they are embedded in effectuates an inaccurate portrayal of the school contexts in which educational leadership is

constructed. Concordantly, educational leadership studies mostly regard school principals as leaders already endorsed by school communities when they assume their formal roles. Furthermore, leadership preparation programs are predominantly based on standardized competencies that school principals need to undertake in their formal roles. These competencies mainly include knowledge, skills, and abilities necessary to operate schools and persuade followers (in-school stakeholders in this case) to comply with the requirements of standardization and accountability policies and directives of superior organizations.

Nevertheless, schools are open to the effects of the cultural diversity of societies they operate in. The primary consequence of this fact is that formal authorities of school principals are not always adequate to turn them into leaders since the expectations of followers from school principals diversify as the number of informal social groups in schools increase. The existence of informal groups with different leadership prototypes in a school gives rise to different effectiveness ratings for the leadership of the same school principal. Leadership preparation programs based on standardized competencies necessary for formal roles do not guarantee transforming school principals into leaders.

Conversely, the probability of the existence of different informal groups with different leadership prototypes propels school principals and followers to work together to co-construct leadership. This can only be succeeded through restructuring followers' leadership prototypes. The alteration of the school context via establishing long-termed relationships based on trust in schools can change the expectations of followers and reshape their leadership prototypes.

The dynamic nature of prototypes provides school principals and followers with opportunities to co-construct leadership even in relatively tense school contexts. This has some consequences for the leadership preparation, because merely relying on contextless one-size-fits-all type competencies that aim to prepare school principals for their formal roles does not always turn them into leaders nor enable their schools to be successful. It is time for leadership preparation programs to be imbued with these new realities.

## Abstract

In this chapter, charisma is traced conceptually in a genealogical exploration. From its origins in antiquity, charisma is followed through contrasting iterations by Weber and a range of organization-studies and psychology scholars through to its arrival in the field of educational leadership as an integral element of transformational leadership. There, dominant, it disappeared, swallowed whole by the model it underpinned. Further discredited by its associations with “hero” leadership and rendered irrelevant in increasingly bureaucratized schools, it has only recently started to return to relevance as a conceptual lens. Startling

reconceptualizations in the field of organization studies reposition charisma as sublimated homoerotic desire in a compulsorily heteronormative organizational context. This signals, perhaps, not so much a new direction for the field of educational leadership, but rather the potential of charisma to bear radical new interpretations for the foreseeable future.

**The Field of Memory**

Charisma is held in the field of memory in the following ways; first, as a quasi-supernatural and exceedingly rare quality, in the manner conceptualized by Weber (1947/2012). Second, charisma is remembered as a vital part of transformational leadership (Burns, 1978/2010), which dominated the fields of practice and research in education from the 1990s to the 2000s (Gunter, 2012). Third, and related, the field recalls that charisma operationalized the discredited heroic leadership, which started as an integral part of the original conceptualization of transformational leadership (Burns, 1978/2010), but came to be interpreted negatively as a development of it, as the logical conclusion of its moral and intellectual elevation of the leader (Allix, 2000).

**The Field of Presence**

The contemporary dominance of distributed and system leadership has marginalized the explicit and normative elements of the role of charisma in educational leadership, owing to widespread acceptance of its conceptual insufficiency as a mechanism to achieve sustained educational change. It is consequently coming through a period during which it had largely lost the field's attention as an object of study.

**The Field of Concomitance**

From psychology and organization studies comes the idea that charisma is mundane and, reducible to a contested number of measurable psychological traits and behaviors, learnable (Conger & Kanungo, 1987). This framing contributed to the particular configuration of transformational leadership as a conceptual and normatively practical model. The relative absence of charisma from the contemporary field has opened the doors to radical new conceptualizations, most notably from organization studies, where charisma in leadership has been argued to consist of sublimated homoerotic desire (Harding, Lee, Ford, & Learmonth, 2011).

**Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field**

Charisma has undergone a series of massive shifts in meaning, from quasi-supernatural and seldom found (Weber, 1947/2012), through mundane and

learnable (Conger & Kanungo, 1987) and subsumed into transformational leadership (Burns, 1978/2010), finally to homoerotic desire (Harding et al., 2011), although this latter has not reached the field of educational, only organizational leadership. Such shifts have multiple reasons, including mutual paradigmatic incomprehension. This is evidenced in the following excerpt, in which Weber's sociological insights are filtered through a psychological lens: "Weber (1947/2012) argued that CLs [Charismatic Leaders] have a special gift, which appears from his writings to be a *specific and unique personality syndrome*" (House & Howell, 1992: 86, emphasis added).

### **Critical Assumptions or Presuppositions**

It is assumed that the field knows what charisma is and its significance in leadership. However, it has not been defined in a way that has endured, which demonstrates the deficiency in this assumption and the malleability of the concept. Nobody can say for certain what charisma is, although each attempt makes at least some claim to authoritativeness.

---

## **Introduction**

The aims of this chapter are to trace the development of charisma in educational leadership and leading from its origins in ancient Greece through to new conceptualizations in the adjunct field of organization studies, which has driven most of the insights into charisma over the last 50 years. First, a sketch of the ontological problem with charismatic leadership is presented. Second, key developments in the evolution of the concept of charisma are outlined, with reference to the epistemological influence of the protagonist field. This genealogy takes into account the most important sociological as well as psychological contributions to charisma's conceptual development. In this chapter, however, it is argued that sociological insights concerning charisma, whether they be early ones from Weber or later ones (e.g., Harding et al., 2011), have largely passed the field of education by. When charisma became tainted with the sins of heroic leadership, education as a field did not have the intellectual or genealogical resources to draw upon to reconfigure charisma, but rather preferred to marginalize it as an object of research and as a conceptual lens. The chapter shows how charisma is now reentering the field of education, primarily through practitioners' own accounts and empirical reports of leadership practice.

---

## **The Problem with Charisma**

It borders on being a trope of academic writing to observe that definitions of a phenomenon are contested. This does not prevent its special applicability to charisma, a concept which has shifted substantively as it has been taken up in one field after another. Indeed, examples of charisma were noted or inferred from historical, even classical accounts before there were academic fields of study (English, 2019).

Charisma is therefore unusually suited to the genealogical treatment which is the methodological focus and contribution of this collection.

In many ways, the ongoing search for ontological certainty regarding charisma resembles the similar, parallel one regarding leadership more generally, whose existence is simultaneously necessary and deniable. Leadership is necessary to explain, often post hoc, the mechanism by which social events were observed to have taken place and by which power was observed, or felt, to have operated between social actors. It is deniable because the leadership mechanism itself, like definitions of charisma, is slippery, mutable, and likely plural. In order to make sense, it is therefore often accompanied by an adjective (e.g., distributed leadership), or by a noun functioning as an adjective (e.g., system leadership). This requirement for semantic supplementation begs valid questions concerning first, the need to call anything leadership *tout court* at all, since the semantic meat is in the adjective, and second, the consequent conceptual vacuity of that word leadership itself (Eacott, 2015).

Charisma, too, is necessary and deniable. It is necessary to account for the unquestionable thrill that one might feel in a charged room whose occupants' rapt focus is on one person. It is deniable in the sense that each new iteration rarely builds upon, but rather is often antithetical to former ones.

Charismatic leadership is consequently an eel in a greased tin, doubly slippery; an enigma as a subset of a mystery, onto which may be projected contemporaneously significant societal concerns and beliefs with relatively little chance of refutation.

This genealogy is anchored in the field of education: it locates the concept of charisma historically and discursively in order to illuminate usages, possibilities, and limitations in that field particularly: this distinguishes it from other, recent explorations (e.g., English, 2019).

---

## The Roots of Charisma

The Oxford Etymological Dictionary states that the word "charisma" comes from the Greek *khárisma*, meaning "gift of God's grace." It derives from *kharizesthai*, to show favor, which was formed from *kháris*, or favor (Onions, Friedrichsen, & Burchfield, 1966, p. 164).

Charisma's object and purposes have therefore been definitionally unspecified from the outset, an ambiguity which, for Burns (1978/2010), has "enabled it to be captured by scholars in different disciplines and applied to a variety of situations" (p. 243). Nonetheless, it was first attributed to political leaders in ancient Greece. English (2019), for instance, writes that the historical biographer Plutarch described Pericles' (495–429 B.C.) "'thundering and lightening' when he harangued the people, and of his wielding a dreadful thunderbolt in his tongue" (Plutarch/Clough, 1960 in English, 2019). This example illuminates immediately the methodological challenges in identifying charisma; here, it is inferred from Pericles' oratory skill – an undoubted gift, but one which is at odds with other, later constructions of charisma, as this chapter will demonstrate. Weber (1947/2012) points out other early charismatic leaders, including beserkers and shamans, as well as later individuals such as the founder of Mormonism, Joseph Smith, and the leader of the Bavarian communist movement, Kurt Eisner. It is

notable that right from charisma's earliest elucidations, it is not constructed as necessarily positive; Weber (1947/2012) notes the possibility that Smith "was a very sophisticated type of deliberate swindler" (p. 359) but urges the sociologist to refrain from judgment. Throughout this chapter, it is shown how each major branch of thought concerning charisma has dealt with its "darker side" (Calás, 1993: 313).

---

## The Trunk: The Major Conceptualizations of Charisma in Leadership

### Weberian Charisma

Weber developed his conceptualization of charisma throughout his career (see, e.g., Eisenstadt, 1968; Weber, 1922, 1947/2012). In Weber's 1947 book, "The Theory of Social and Economic Organization" (republished in 2012, and largely reprised in the 1968 collection of his works by Eisenstadt), he described charisma as

a certain quality of an individual personality by virtue of which he is set apart from ordinary men and treated as endowed with supernatural, superhuman, or at least specifically exceptional powers or qualities. These are such as are not accessible to the ordinary person, but are regarded as of divine origin or as exemplary, and on the basis of them the individual concerned is treated as a leader. (pp. 358–359)

The basis for charismatic legitimacy is "the duty of those who have been called to a charismatic mission [i.e., followers] to recognize its quality and to act accordingly" (p. 359). This calling is motivated by what Eisenstadt (1968) calls the charismatic property; this produces a recognition which "is thought to be the connection of a person to the central feature of the universe or the force within the universe" (English, 2019).

For Weber, therefore, charismatic authority is always extraordinary and sometimes spiritual, and so cannot be sustained in organizations that tend toward the bureaucratic, such as schools. This is partly because unlike in schools, there is no differentiation of follower in a charisma-led group, "no such thing as 'appointment' or 'dismissal', no career, no promotion. There is only a 'call' at the insistence of the leader on the basis of the charismatic qualification of those he summons. There is no hierarchy. . ." (1947/2012, p. 360), and neither are there rules; the charismatic leader governs by revelation. This means that charisma must be "routinized" or transmogrified into one of the other two forms of authority identified by Weber (1947/2012), that is, "traditionalized or rationalized" (p. 364). In schools, for reasons set out below, routinization has meant rationalization, or bureaucratization.

### Charisma, Psychologized

The turn to psychology-informed constructions of leadership in the 1980s was irreconcilable with the Weberian view of charisma that its proponents constructed, which, according to Calás (1993), purposively omitted charismatic routinization in order to

foreground charisma's "*wildest* aspects" and thereby to create a "suspicion of charisma" (p. 306). This, for Calás (1993), provided the conceptual grounds necessary "for maintaining conventional notions of management – based on bureaucratic authority – as the only legitimate form of organizational leadership, despite claims to the contrary" (p. 306). It also provided a methodological rationale for "psychologizing 'charismatic leadership'" (p. 313), that is to say, privileging a conceptualization that highlights an individual's behaviors and traits, with interactions between a leader and follower(s) being interpersonal rather than relational. In other words, and following Crevani (2015), such leadership draws on an "entity perspective" (p. 193). This is where individuals interact in a manner constructed as leading and following but are fundamentally unchanged by that interaction. They are "treated as stable entities that have different roles and the impact the leader has on the follower is a function of the quality of the relation between the two" (p. 194). That is not to say that behaviors cannot be modified: indeed, any improvement in the outcomes of that leaderful encounter depends on such amendments. However, it is a matter of a stable entity changing behaviors rather than a reflexive and mutable entity co-constructing new identities – and hence practices – dialogically and interdependently with the social world. This latter process is redolent with unpredictability and messiness, whereas as Calás (1993) notes, reducing charisma to measurable, psychological attributes is motivated by a desire to control it.

Such an epistemological foundation means that sentences such as the following are typical of this body of literature: "without a systematic conceptual framework, researchers often have found it difficult to define and operationalize charisma and to identify the variables that influence its development (Willner, 1984)" (Conger & Kanungo, 1987, p. 637). In this framing, it is assumed that it is reasonable and achievable to identify metrics for measuring charisma; it is mundane rather than extraordinary; it may and even should be learned.

This normativity derives in part from the influence of a further major contributor to the development of the field of leadership: organization studies. This field is dominated by a functionalism that works to make capitalism work (better) and so instrumentalized charisma to this end. Psychologists were often also, or later became organizational-leadership scholars – Bruce Avolio is typical in this respect; his PhD (Avolio, 1982) was in psychology and explored age stereotypes in interview evaluation contexts. Conger (1999) made this relationship explicit:

As I look back over the evolution of the fields of charismatic and transformational leadership in organizational settings, it appears that a significant portion of the interest has been shaped by a small group of scholars . . . [who] have most likely been influenced by larger forces – the primary one being the globally competitive business environment. (Conger, 1999: 147)

These changes in field location are important because they help to explain the shift in conceptualizations of charisma from supernatural to mundane and commodifiable. As Conger and Kanungo put it, "If a deeper understanding of charismatic leadership within organizations is to be obtained, it is important to strip the aura of mysticism from charisma and to deal with it strictly as a behavioural

process” (1987: 639). Arguably, Conger and Kanungo do not mean “deeper” here, but rather “measurable”; psychology requires that attributes and phenomena be rendered as observable and measurable variables that may be associated with individuals. Further, whatever is measurable is susceptible to being purposively increased through interventions. In other words, it becomes learnable. So, charisma’s field shift from sociology to psychology simultaneously individualized and demystified it, making it acquirable and providing the intellectual warrant for a burgeoning leadership industry, where suppliers promise to enhance customers’ charisma on a consultancy or other transactional basis.

Early contributions from this field therefore sought to arrive first at a series of testable hypotheses concerning charisma (House, 1976), then at a list of psychologically amenable charismatic behaviors and qualities. Conger and Kanungo (1987), for instance, suggested that the charismatic leader is, *inter alia*, “essentially opposed to status quo and strives to change it,” “expert in using unconventional means to transcend the existing order,” and “transforms people to share the radical changes advocated” (p. 641). Bass (1990a) was one of several further scholars who attempted to refine or amend this list, either empirically or through literature review (see, e.g., House & Howell, 1992). Bass characterized charismatic leaders as being, *inter alia*, more enthusiastic, more tolerant of ambiguity, more self-actualized, less accepting of authority, and less defensive than leaders without charisma. Further qualities include high self-possession and self-esteem, as well as being generous, honest, open, and concerned for others. They are sensitive to followers’ needs, articulate, risk-taking, confident, determined, morally righteous, and idealistic. However, such attempts were simply trait and behaviorist theorizing repackaged for a new age, an approach which had been discounted owing to “the fact that no single pattern of behavior will be effective in all situations” (Stogdill, 1975) and empirical findings that

leadership is not a matter of . . . the mere possession of some combination of traits. It appears rather to be a working relationship among members of a group, in which the leader acquires status through active participation and demonstration of his (sic) capacity for carrying coöperative tasks through to completion. (Stogdill, 1948: 66)

By 1989, Conger had come to agree with Stogdill, writing that “charisma is a relational phenomenon . . . Such dynamics are not easily duplicated à la cookbook style” (Conger, 1989: 160). Instead, Conger proposed four *Stages in Charismatic Leadership*, comprising scoping the present and envisioning an alternative; articulating this and motivating followership; building trust through example and self-sacrifice; and operationalizing the vision. Nonetheless, and although she was referring to Bass’ (1990a) literature review, Calás’ (1993) characterization applies equally across most of the field when she wrote that

Charisma becomes a few psychological attributes that could be attached to certain people. This reduction ends up by naming as “charisma” only a particular set of “leader” and “follower” attributes derived mostly from questionnaire-based self-report studies and from laboratory experiments using students as subjects. Even when acknowledging the

interpersonal nature of charisma, the reviewed studies focus mostly on personal attributes of “the leader” or “the follower” rather than on their *assumed emerging relationships* (emphasis in original). (Calás, 1993: 312–313)

Calás (1993) notes that a further consequence of the psychologization of charisma is the attribution of its demonstrably negative features or manifestations to pathologies evinced by “*particular individuals and their followers*” (p. 313, emphasis in original). This releases charisma from conceptual culpability; its mediation by personality traits implies that charisma is not wrong; the wrong people are sometimes doing it (see, e.g., House & Howell, 1992). There is also evidence that negative manifestations of charismatic leadership were simply ignored:

While charisma’s advocates saw it as a remarkable form of leadership, they were also aware that charisma had revealed a frightening dark side throughout history. Nonetheless, most of us focused our attention on the positive face of charisma. (Conger, 1999: 149)

The specters of Hitler and Stalin haunted charisma’s study in its move to the fields of psychology and organization studies, contributing to charisma’s conceptual neutering and only partial examination. In summary, charisma had crossed over to become a mainstream concern, but in a form that was a pale and wan imitation of the fuller Weberian conceptualization. Importantly, all this debate was taking place within organization studies and so impacted little and only indirectly on the field of educational-leadership studies.

---

## Charisma in Early Educational Leading

That is not to say that charisma was indiscernible in the field of educational-leadership *practice*, particularly post hoc. Grace (1995) described the late nineteenth-century “headmaster tradition” in England as follows:

At its most influential, the mystique of headship was constituted by personal charisma, moral, and frequently religious, authority, impressive scholarship, the capacity to “master” all other members of the school, indefatigable energy and a sense of mission or vocation in the role. The headmaster tradition as a cultural and ideological construct was a resource which could empower even those headteachers who failed to realize all of its characteristics. (Grace, 1995: 10)

This evokes MacIntyre’s (2013) notion of the identity-forming function of the leader “character,” pre-figuring and enabling possibilities for agency that exceed the initial dispositions of the role-holder (see also Courtney & McGinity, 2020a). Here, charisma is integral to how the idealized role of headmaster is perceived, conjuring it in the eyes of followers through their expectation of encountering it. Significantly, Grace does not define charisma, leaving the reader to infer its nature. However, as a central feature of an ideal type, it may be deduced to be more extraordinary than mundane.

## Charisma as Integral to, Yet Concealed Within Transformational Leadership

Charisma entered the field of educational-leadership research and scholarship significantly as an integral, yet implicit element of the model known as transformational leadership. Indeed, Conger (1999) “felt that charismatic leadership was the most exemplary form that transformational leaders could assume (p. 149). Transformational leadership, elucidated powerfully in Burns’ (1978/2010) book, “Leadership,” was taken up and mediated not only through psychology departments but also through business schools, with its advocates, or entrepreneurs, often having a background in both fields (see Bass, 1990b; Bass & Avolio, 1990; Conger, 1999), just as had been the case with charisma scholars. Burns himself was disillusioned with charisma, claiming that “it is impossible to restore the word to analytic duty” (1978/2010: 244). He preferred the term heroic leadership, which was not adopted in subsequent formulations of transformational leadership (but see “we don’t need another hero” section below). Instead, charisma was re-articulated as idealized influence, one of ultimately four constituent characteristics, along with individualized consideration, intellectual stimulation, and inspirational motivation (see, e.g., Bass & Avolio, 1990). Psychologized and anonymized, charisma nonetheless forms “the bedrock of transformational leadership” (English, 2019: 23), as can be seen from Bass and Avolio’s (1990) elucidation:

**Idealised Influence:** This is strong among leaders who have a vision and sense of mission; who gain respect, trust, and confidence; and who acquire strong individual identification from followers. [These] leaders ... are able to obtain the required extra effort from followers to achieve optimal levels of development and performance.

**Individually Considerate:** Leaders ... diagnose followers’ needs and attend to them individually. They also delegate, coach, advise, and provide feedback for ... personal development ... They raise the needs and confidence levels of followers to take on greater levels of responsibility ... [including] for their personal development. ...

**Intellectually Stimulating:** Leaders ... foster creativity, and ... use intuition as well as more formal logic to solve problems. ... Followers become more effective problem solvers with or without the leader’s facilitation. They become more innovative. ...

**Inspirational:** Leaders give pep talks, increase optimism and enthusiasm, and communicate their visions of attainable futures with fluency and confidence ... which stimulates the energy to accomplish higher levels of performance and development. (Bass & Avolio, 1990: 22)

Missing from the extract above is many scholars’ focus on morality as a key ingredient of transformational leadership. Burns’ (1978/2010) claimed that “Transforming leaders ‘raise’ their followers up through levels of morality” (p. 426). Many others since have followed his lead (see, e.g., Mulla & Krishnan, 2011). However, the following clause of Burns’ quote is instructive, and hints at the complexity of bald assertions concerning the elevated moral status of transformational leaders. Burns goes on to write, “though insufficient attention to means can corrupt the ends” (p. 426). Here is an acknowledgment of transformational leadership’s dark side, arguably imported from charismatic leadership. In a similar way to what had been attempted with

charismatic leadership (Conger & Kamungo, 1998), scholars sought to differentiate between what they called “authentic” transformational leadership, which represented only the aspects aligned with morals constructed as positive or socially oriented. This was established in opposition to inauthentic, or “pseudo-transformational leadership” (Bass & Steidlmeier, 1999: 211), whose moral grounding is weak and/or self-centered.

Transformational leadership was imported into the field of education, where it was taken up enthusiastically and promulgated by key figures in the school improvement and school effectiveness tradition, such as Leithwood (e.g., Leithwood & Jantzi, 1990, 2005) and Hallinger (e.g., Hallinger, 1992). The model’s spread owed much to its seeming universality. As Conger (1999) notes,

the contributions of contingency theorists (e.g. Friedler, 1967; Vroom & Yetton, 1973) to our understanding of leadership would little impact upon this body of research. Transformational leadership was applicable to most situations. (Conger, 1999: 149)

Transformational leadership consequently was strongly associated with the school improvement field during a period when nation states were increasingly focused on improving their education systems. For instance, in the UK, the New Labour government (1997–2010) seized upon transformational leadership as a key mechanism to achieve wider education reform. Headteachers would be trained through a central state-approved organization, the National College for School Leadership, in the techniques and dispositions of transformational leadership. New Labour sought thereby to transform headteachers into believers who would proselytize, “to rework headship through increasing status for the local delivery of reform” (Gunter, 2012: 114–115). Transformational leadership consequently became discursively mandatory,

constructed and promoted as the means of suturing together a vast array of interventions in the curriculum, staffing, lesson planning and assessment, and to evidence success or be accountable for failure. (Gunter, 2012: 5)

This example is located in England, but transformational leadership was promoted globally for distinctive reasons that might have spoken to, or invoked local contexts, yet produced the effect of universality predicted by Conger (1999). Example locations in the global south where transformational leadership has been enthusiastically promulgated include South Africa (Singh & Lokotsch, 2005), China (Liu, 2018), Indonesia (Damanik & Aldridge, 2017), and Malaysia (Selamat, Nordin, & Adnan, 2013).

Charismatic leadership has therefore been injected into the heart of education systems internationally, influencing national policies and professionals’ practices and identities. However, it has done so from within the larger, more palatable model of transformational leadership, which has arguably distracted from a direct focus on the role of charisma in educational leadership. Where critique has taken place, it has often differed from attempts in the organization-studies literature to compartmentalize the “good” and “bad” forms of the model. Allix (2000), for instance, problematizes fundamentally the idea that “leaders have some sort of monopoly on moral truth, knowledge and wisdom, which they exploit to draw followers up to their

own perceived ethical standards” (p. 15). The issue is not the location of the moral destination (i.e., good/bad; socially/personally oriented) but the very claim to any sort of moral superiority. Allix also directly addresses the charismatic element of transformational leadership, arguing that its location (often) in hierarchical superordinates, its appeal to followers’ emotions and “habituated followership” (p. 17) and its lack of safeguards mean that it

collapses into a *transactional process of emotionally charged ideological exchange*, with all of the possible physical repercussions that this entails; and which implies a pattern of social relations structured not for education, but for *domination*. (Allix, 2000: 18, emphasis in original)

As a result of the dominance of transformational leadership globally, charisma in educational leadership became ubiquitous, yet unnamed. On those occasions when charisma did reveal itself explicitly in policy and practice, it failed, as will be described in the following section.

---

## The Branches and Leaves of Charismatic Leadership

### De-charismatization: We Don’t Need Another Hero

As outlined above, the embedding of transformational leadership as a normative model in research and practice idealized new, charismatic identities and inhibited alternatives. As Conger (1999) notes:

To be transformational was to be a leader. To be purely transactional was to be the calculating manager. The heroic leader had returned – reminiscent of the days of “great man” theories – with a humanistic twist given the transformational leader’s strong orientation towards the development of others. (Conger, 1999: 149)

The discursive privileging of heroic leadership in research resonated with policy makers internationally but particularly in the west (Goodson & Anstead, 1998) who were focused on leaders and leadership as a mechanism to achieve policy goals (Gunter, 2012). The aim was to produce transformational leaders, but clearly normal distribution applied to the results, whereby the most “successful” would be more obviously heroic. A new cadre of hero headteachers, or principals, was consequently created. These exemplified the charismatic ideal and, importantly, were extremely successful in their local context. Their practice was reduced to traits and promoted in the school-effectiveness field as normatively achievable (McEwan, 2003). Ball (2011) characterized them as “the hero innovator – Sir this and Dame that, the lone transformers of deficient schools, who bring their vision *and charisma* to bear to raise standards and rescue poorly served students” (p. 50, emphasis added).

In the United States, these were known as turnaround principals, whose creation was prompted by the No Child Left Behind Act of 2001. A few elucidations of this model

were expansive and power-relation focused; Papa and English (2011), for instance, focus on the requirement for socially just activist leadership to achieve turnaround. However, most more closely resemble the leader constructed in Meyers and Hambrick Hitt's (2017) review of the literature. Their list of traits includes items that would fit in a list from earlier, psychological constructs of charismatic leadership, including "belief that positive change can and must happen"; "strong moral mission"; determination or courage"; "competitiveness"; and "willingness to disrupt complacency" (p. 52).

In England, the equivalent was "superheads" (i.e., headteachers), who were a part of the evolution of the New Labour strategy to enhance school leaders' pay and prestige in return for greater accountability against standards-aligned targets. In 2000, the *Financial Times* reported that the then education secretary, David Blunkett, announced "that a pilot scheme would see 10 so-called superheads 'with a proven track record' paid up to £100,000 each to oversee between three and five struggling schools" (Kelly, 2000) under the "Fresh Start" scheme. Perryman (2002) describes the arrival of a superhead in the school where she was conducting research:

A new Superhead was appointed in a blaze of publicity, with items on the local television news and regular press updates on his progress, largely focused around his salary of £70,000 per year. . . . With little more than six weeks preparation time, after which the largely disgruntled student body came back to chaos and a staff of teachers they did not know, the school was bound to fail. . . . (Perryman, 2002: 47)

The superhead left after 6 months, "one of three Superheads nationwide who resigned that month, the title lost its credibility, and subsequent advertisements for their replacement did not include the term" (p. 48). Another superhead was ill prepared for the gang battles that characterized life in his new school: "Rumours that Friedag had lost his grip began circulating earlier this year . . . One of these said Friedag had been found hiding under his desk during the gang clashes" (Bright, 2003: 3). Charisma in this context was clearly seldom transferable.

Narratives internationally shifted from headship or principalship requiring a single, heroic leader to being "a job too big for one" (Grubb & Flessa, 2006), thereby providing the rationale for the development of distributed leadership, which has become the new normative model in its various forms, for example, teacher leadership (Fitzgerald & Gunter, 2008) and system leadership (Courtney & McGinity, 2020b). Barthe (2003) exemplifies this paradigm shift in his challenge to principals to "become not 'heroes' but 'hero makers'" (p. 63). Charisma, it seemed, had first animated and then terminated transformational leadership.

## **De-charmatization: The Bureaucratization of Schools**

A further feature working to diminish the role of charisma in educational leadership is the bureaucratization of schools.

This has come about owing to the spread of New Public Management (NPM) from the 1980s, characterized by transparent budgeting, with outputs rather than

inputs costed and measured by quantitative performance indicators; the construction of organizations as contract-based, whose members are incentivizable; and the introduction of market principles concerning provider entry and exit (Dunleavy & Hood, 1994). NPM was operationalized through managerialism, which ideologizes the manager's "right to manage" according to these principles and so constructs schools as bureaucracies. From a Weberian perspective at least, it therefore follows that charismatic leadership is unlikely to be most relevant or useful form, since a rules-based order is antithetical to charismatic authority:

Formally concrete judgments are newly created from case to case and are originally regarded as divine judgments and revelations . . . these are imposed on the authority of revolution by oracles, or of the leader's own will, and are recognized by the members of the religious, military, or party group, because they come from such a source. Recognition is a duty. (Weber, 1947/2012, p. 361)

The product of these de-charismatizing factors is a relative silence concerning charisma in key educational-leadership research texts from the turn of the millennium in the global north and an even greater silence concerning its normativity. The last article to be published in the highly ranked journal, *Educational Management, Administration & Leadership* with the phrase "charismatic leadership" in its title saw it as a deficiency (Morris, 2000). Bush's (2003) influential book, *Theories of Educational Leadership and Management* devotes only ten lines to charismatic leadership, within a slightly longer section called "personal power" (p. 99).

## Re-charismatization: In Politics

Schools and society cannot be disentangled (Apple, 2013). Charismatic political leaders proliferate with, *inter alia*, Donald Trump until 2021 in the USA, Justin Trudeau in Canada, and Imran Khan in Pakistan. At the time of writing, the Prime Minister of the United Kingdom is the charismatic Boris Johnson, who adheres consciously or otherwise to a Weberian construction of charisma. His disdain for the rule of law, evidenced in his attempted illegal proroguing of parliament (Bowcott, 2019), can be argued to exemplify the Weberian charismatic leader's analogous rejection of any law-based system in favor of personal dictat: "There is no system of formal rules, of abstract legal principles, and hence no process of judicial decision oriented to them" (Weber, 1947/2012: 361). Seemingly bizarre episodes whereby Johnson persuades benefactors to pay for holidays (BBC, 2021a) or home decorations (BBC, 2021b) make sense in the context of the Weberian observation that "What is despised . . . is traditional or rational everyday economizing, the attainment of a regular income by continuous economic activity devoted to this end. Support by gifts, sometimes on a grand scale involving foundations, even by bribery and grand-scale honoraria, or by begging, constitute the strictly voluntary type of support" (Weber, 1947/2012: 362) which, for Weber, is indicative of charismatic authority.

Whatever the reasons for this notable rise in charismatic political leadership internationally, discourses and discursive conditions spread, such that its re-appearance in education was inevitable, as the next section demonstrates.

### Re-charismatization: In Education Practice

Texts written by (recently) practicing educational leaders are more reflective of the charisma-inflected zeitgeist than the charisma-denying field of research. For example, a former headteacher made famous by his participation in a reality-television show, *Educating Greater Manchester* (Channel 4, 2021), later coauthored a book titled, *The Leadership Factor: The Seven Characteristics of Exceptional Leaders* (Povey & McInerney, 2019). The third of these seven is charisma, which Povey summarizes as follows:

In the end, the crucial skill of charisma is knowing your message and having the **presence**, **warmth** and **power** to get it across to the room. Begin with the basics: **smile**, **use superlatives**, and **emphasise the key words**. But most of all, be ready to present authentically and in a way that recognises where the listeners are, as well as getting across your key message concisely. (Povey & McInerney, 2019: 88, emphasis in original)

This extract reveals how, in order to reclaim charisma from the discredited hero discourse, Povey and McInerney have drawn upon and hugely simplified some of the ideas from the psychology and organization studies era. The most important of these is that charisma is learnable. Its appearance here signifies its role in what Gunter (2012) called the “leadership industry” (p. 5), where educational leadership is reduced to behaviors that can be learned. This exemplifies a wider tendency in the educational-leadership field to privilege psychological over sociological insights.

### Re-charismatization: In Education Research

There are indications in research reports of empirical studies that a sort of Weberian charismatic authority is evident in the field. Weber (1947/2012, p. 361) notes, “Bureaucratic authority is specifically rational in the sense of being bound to intellectually analysable rules; while charismatic authority is specifically irrational in the sense of being foreign to all rules.” For instance, in their article, Courtney and Gunter (2015) identify the arbitrariness with which superficially rational rules are applied by headteachers, as well as the vagueness of their composition, seemingly so as to prevent teachers from ever being certain that they were acting within the rules and so render themselves sanctionable. One headteacher, “Paul,” has staff fulfill common performance-management objectives, one of which “is about contribution to the vision” (p. 409). Paul, of course, is the sole arbiter of whether the teacher has achieved this, and he is also the embodiment of the vision. The target therefore requires staff’s obeisance to him. Courtney and Gunter do not theorize this episode,

or others, using charismatic leadership as a lens, perhaps owing to its having fallen out of use as an intellectual resource for the field. More recently, however, new conceptualizations of educational leadership have drawn explicitly on charismatic leadership. For instance, Courtney and McGinity (2021) present their case-study interview data as scripted drama, rendering the CEO of the multi-academy trust (CMO) explicitly as Jesus-like in order to foreground the charismatic mechanism underpinning his leadership.

## Re-charismatization: Beyond Education

In the field of organization studies, charisma is undergoing a new shift. Harding et al. (2011) use Queer Theory to argue that:

The leader's charisma arises from an irresistible sexual attractiveness that evokes a homoerotic desire whose libidinal energies can be diverted towards the achievement of organizational goals. Managers' understanding of leadership presumes that followers will be so overcome by an erotic desire to be possessed by the leader that they will forget their own objectives and fall in with the leader's "vision". They will, in theory, see only what the leader wants them to see and they will thus, in theory, become controllable. (Harding et al., 2011: 941)

As of June 2021, this chapter had received 155 citations in Google Scholar, almost all of which are from scholars in the organization studies field. It is not useful to speculate what impact, if any, this reconceptualization will have on thinking about charisma in educational leadership, but it raises important questions concerning the vitality of the theories currently in use there. Charisma has not yet been defined definitively and so continues to generate new and creative thinking.

---

## Conclusion and Reflections

Charisma in leadership is a shape-shifter; its articulation changes radically from one generation to the next, yet each articulation is susceptible to a spurious certainty. Thinking beyond the obvious contrasts between the Weberian and psychological interpretations, other distinctions are evident. For Bourdieu (1990), charisma is merely symbolic capital, mis-recognized and mis-attributed by those who follow its bearers for reasons they cannot quite pinpoint, but which are actually simply the multiple ways in which the "leader" dominates the game in play. But this interpretation misses the almost visceral, and definitely emotional, appeal of the charismatic leader. English's (2019) definition captures this: he writes that it is "a powerful but temporary emotional bond between individuals who normally share a common condition or hardship. Charisma . . . tap[s] into the deepest yearnings, values, prejudices and fears of a social group and bring[s] them together to forge a common change agenda [which] may involve positive or negative means and ends" (p. 27).

But this interpretation misses the way in which charisma influences differentially; not everybody in the social group succumbs in the same way. Harding et al.'s (2011) conceptualization provides a partial answer to this; if charisma is about desire, then it is subject to the same vagaries concerning its object as in other areas of life. We do not all desire the same person, or in the same way. Charisma is consequently particularly suited to a genealogical exploration; its conceptual twists and turns reflect the anxieties and wishes of the age; it can bear almost any interpretation, none of which can be refuted, only rejected.

## Abstract

Parallel leadership, a conceptualized model of educational leadership for contemporary, collaborative educational organizations, is underpinned by the concepts of mutualism, shared beliefs and values, and allowance for individual expression. Importantly, it is in recognition of the relational nature between the principal (leadership team) and the teacher leaders (formal and informal). It is founded on a belief that leadership in educational organizations is first and foremost to focus on the interrelationships of multiple and complex mixes of people in school communities on a daily basis. Integral to the research and development of this leadership approach has been the focus of leadership for whole school improvement responding to the continual rapid changes in societal behavior and expectations and the discontinuous nature of that change. Regardless of ever-changing educational landscapes, the core of this approach has been sustained because of the enabling processes that respect the contributions and aspirations of the people

Leadership · Parallel leadership · Teacher leadership · Collaborative cultures · Capacity building · Professional learning community · System-school alignment · Visionary action

**The Field of Memory**

Traditionally, the principal has been viewed as “the” leader of an educational organization (specifically school) and all leadership responsibility is attributed to the one individual voice. It has been not uncommon to hear the generally accepted mantra highlighting the success of the organization as solely the outcome of the leader. Furthermore, the perceived success or otherwise of such leadership has often been reported as a result of the personal traits of the individual. In such situations, a lack of change, or ability to change in response to contemporary conditions, has been viewed as a paralysis of the organization where nothing happens until the individual leader “says or acts” accordingly. Too often, the social and intellectual capitals of an organization are lost in the transition awaiting the appointment of a new leader. Moreover, the wider collect of individuals, that is, principally the teachers, are left rudderless until the next *coxswain* is in place.

**The Field of Presence**

Heightened levels of teacher professionalism, changes in professional practice in education, and the movement toward more collaborative cultures have changed the nature of the teaching profession. Educational organizations are now more commonly focused on “success” brought about by an overall capacity for leadership development across the multiple perspectives of the contemporary, complex organization that is specifically *school*. An overarching concept underpinning parallel leadership is that leadership is the capacity of an educational organization wherein the principal (and in some cases, the leadership team) is the metastrategic leader in partnership with teacher leaders as leaders of pedagogical praxis. Teacher leaders of either formal or informal positions are those of the profession who influentially demonstrate the qualities of leading self and leading others.

**The Field of Concomitance**

This chapter has acknowledged the work of many researchers who drew on concepts of management theory (Handy, 1996; Heenan & Bennis, 1999; Lakomski, 1999, 2005; Senge, 1997). That body of work is replete with terms such as distributed leadership, co-leadership, partnership, community of leaders, and social systems of thinking. Furthermore, Ogawa and Bossert (1995) worked with the concept of leadership as an organization-wide quality. Senge’s social systems of thinking with

adaptation to the concepts of organizational learning have influenced the transformation of schools and educational systems to be more flexible, adaptive, and productive, requiring different approaches to leadership in meeting the needs of contemporary learners.

### **Discontinuities and Ruptures**

This chapter acknowledges the ever-increasing complexity of educational organizations charged with expectations and the responsibilities of providing equity of opportunities for all learners. Increasingly, organizational leadership is perceived as not the sole province of the principal, nor the leadership team alone. Teachers have the capacity for leading pedagogical transformation through innovative knowledge creation and critical evaluation in meeting the needs of the contemporary learner. Moreover, schools and systems are recognized as interrelated agents in sharing the co-construction of leadership and management of education.

### **Critical Assumptions or Presumptions**

This chapter is based on a view of leadership that is built on collaborative action shared by formal and informal positions within an organization. Meaningful work and effective organizational cultures as meaningful workplaces are socially constructed realities. Integral to this reality is the imperative that processes for collaborative action must be strategically, deliberately, and focally designed and enacted. The success of a shared meaningfulness is based on the collective intelligence of the professional community. Ultimately, the reality of individual professionalism and collective responsibility forms the basis for sustainable capacity building. The parallel leadership model builds on movement away from the focus on the principal as “the” leader of an educational organization toward providing a more inclusive conception of leadership acknowledging the potential of some teachers as leaders in partnership. The teacher is no longer isolated to their classroom, and the teaching profession is no longer considered as just a vocation.

---

## **Introduction**

Parallel leadership was first presented by Crowther, Hann, and McMaster (2001), Crowther, Kaagan, Ferguson, and Hann (2002), and Andrews and Crowther (2002). The initial impetus for capturing the essence of this leadership approach arose from a study that focused on leadership for successful school reform (Cuttance, 2000) and the emerging understanding of the importance of teacher leadership in whole school improvement processes. Based on role theory, it was important for the Leadership Research International research team at the University of Southern Queensland (LRI\_USQ) to understand the functions of teacher leaders and the principal in enhancing school outcomes for successful school improvement. It was this relationship that was conceptualized as parallel. This chapter focuses on the initial conceptual development and the resultant longitudinal research and further development of parallel leadership.

---

## Exploring the Concept: Initial Explanation

The initial focus was *leadership for successful school reform* and focused on literature that reconceptualized educational leadership. This meant moving away from the sole focus on principalship toward providing a more inclusive conception of leadership. Many researchers (Handy, 1996; Heenan & Bennis, 1999; Lakomski, 1999, 2005; Senge, 1997) used terms like distributed leadership, co-leadership, partnership, community of leaders, and social systems of thinking. However, Ogawa and Bossert (1995) were informing the concept of leadership as an organization-wide quality and Limerick, Cunnington, and Crowther (1998) were presenting role-based leadership. This research resonated with the USQ Leadership Research Institute's senior researcher Crowther, who reported this research in a 1997 article *Teachers as Leaders – an exploratory framework* (Crowther & Olsen, 1997).

Further informing research came from literature associated with professional learning communities and educational leadership (Hord, 1997; King & Newmann, 2000, 2001; Newmann & Wehlage, 1995). This literature opened the conversation for the LRI\_USQ research team in relation to *sustaining school improvement* through concepts of authentic pedagogy, professional learning, and capacity building and noted distributed leadership as an important contributing factor. Australian research (Cuttance, 2001) on school effectiveness supported the findings of the Center on Organization and Restructuring of Schools as reported by Newmann and Wehlage (1995) but added four areas of importance for innovation that led to enhanced and sustained school outcomes. These areas were a focus on pedagogy, a whole school approach (holistic), an active professional learning community, and a form of role-based distributed leadership that “engaged teachers exercising pedagogical leadership and principals exercising strategic leadership” (Andrews & Crowther, 2002, p. 153), previously emphasized by Andrews and Lewis (2000). In addition, the work of Silins and Mulford (2002) and Katzenmeyer and Moller (2001) acknowledged the emergence of leadership roles and functions of classroom leaders in substantive reform.

---

## Research on Leadership for Sustainable Improvement

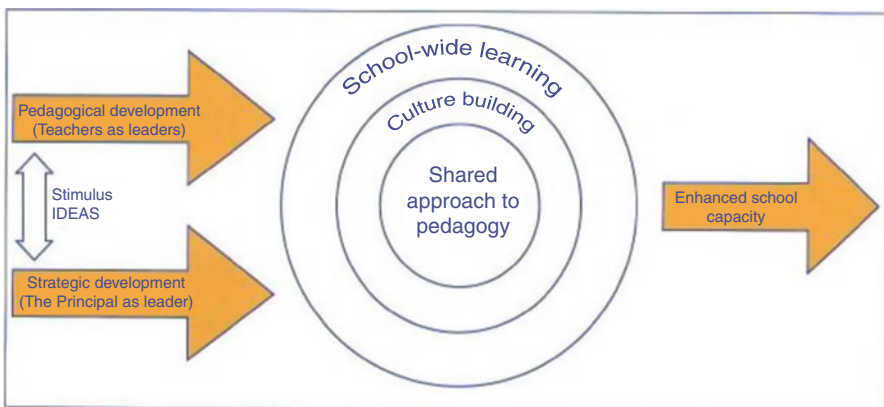

The early stages of the LRI\_USQ research reported by Crowther, Andrews, Dawson, and Lewis (2001) focused on the conceptualization of a teacher leadership framework and an emerging understanding of the relationship between teacher leaders and the principal. This concept evolved as the trusting and mutualistic relationship that Crowther, Andrews, et al. (2001) termed parallel leadership and was subsequently published by Crowther et al. (2002) and Andrews and Crowther (2002). As was noted, parallel leadership:

- (a) Is evidenced differently in different contexts;
- (b) Reflects different personal qualities of the educators;

- (c) Evidences mutual trust, respect, and shared goals; and
- (d) Allows for individual expression.

Crowther, Hann, and McMaster's (2001) initial conceptualization is presented in Fig. 1. The initial conceptualization of parallel leadership was spurred by the need to change the narrative of school improvement to one that acknowledges the importance of people working together and developing capacity for creating, implementing, and critiquing their work in context. That is, the principal leader's role is focused on strategic leadership, and teacher leaders' roles are focused on pedagogical leadership. Teacher leadership focused on pedagogical leadership was defined as "behaviour that facilitates principled pedagogical action towards whole school success. It derives from the distinctive power of teaching to shape meaning for children, youth, and adults. It contributes to enhanced quality of community life in the long term" (Crowther, 2002, p. 169).

The definition of parallel leadership was defined as: "a process of teacher leaders and their principals engaging in collective action to build capacity. It embodies mutualism, shared purpose and respect for individual expression and contribution" (Crowther, 2002, p. 169). As reported by Andrews and Crowther (2002, p. 155), the development of parallelism facilitates an environment that enables innovation emerging as the result of a trusting relationship within the professional community resulting in a culture where members of the community take collective responsibility for school outcomes. Figure 1 represents the interrelationship between leadership action and the enactment of processes that result in enhanced school outcomes. These three interacting processes are: school wide professional learning, school wide culture building, and a school wide approach to pedagogy. Furthermore, a doctoral study by Lewis (2004) illuminated these related processes of knowledge creation that reflected the distinctiveness of each school context.

**Fig. 1** Parallel leadership and enhanced school outcomes. (Source: Crowther, Hann et al., 2001, p. 141) Printed with permission from the Australian Government

Research reported in *Developing Teacher Leaders, 2nd Edition* (Crowther, Ferguson, & Hann, 2009) was the result of a longitudinal study engaging schools in Australia. This research, supported by the Australian Research Council, explored the implications of parallel leadership for classroom practice. The participants’ schools engaged with the LRI\_USQ research and development team in a school improvement project (Innovative Designs for Enhancing Achievements in Schools – IDEAS) (<https://lri.usq.edu.au/work-with-us/school-improvement-model-ideas/>). This project involved schools in *journeys of self-discovery* where teacher leaders and principals engaged in whole school processes for the achievement of enhanced school outcomes. What emerged as clarified understandings was the way in which collective action developed intellectual and social capacities for enhancing school outcomes as depicted in Fig. 2 and later explored further by two doctoral studies.

The doctoral works of Conway (2008), *Collective Intelligence in schools: An exploration of teacher engagement in the making of significant new meaning*, and of Morgan (2008), *The principal in a process of school revitalisation: A meta-strategic role*, further explored the processes of capacity building adding value to the concept of parallelism as it applies to leadership in schools of acknowledged success. Conway’s research on collective intelligence encapsulated the power of teacher leaders within a professional community creating new understandings of relevant practice. Teachers engaged in knowledge-generating experiences led to identification of particular characteristics associated with professional learning processes for successful meaning-making; no less the capacity for engagement in collective and reflective practices in knowledge creation and teacher leadership, “described as a state of autopoiesis or self-productive sustainability . . . subject to constant scrutiny

**Fig. 2** Successful school revitalization: The IDEAS way. (Source: Crowther, Andrews, and Cuttance (2004). ARC -SPIRT Grant Report)

and development of rigorous, culturally relevant professional learning processes” (p. 214).

Morgan’s work developed a further understanding of the role of the principal (distinct but interrelated) in whole school improvement processes. The initial understanding articulated by Crowther et al. (2002) and further developed in Crowther et al. (2009) outlined the Role of the Principal, initially for developing teacher leadership and for school improvement. The Metastrategic functions were outlined by Crowther et al. (2009) as:

1. Envisioning inspiring futures
2. Aligning key institutional elements, that is visionary goals, expectations, infrastructures, pedagogical processes, and professional learning
3. Enabling teacher leadership
4. Building synergistic alliances
5. Culture building and identity generation (adapted from Crowther et al., 2009, p. 71)

In acknowledging the importance of developing teacher leadership, Morgan (2008) recognized that principals who were effective in enabling this form of leadership demonstrated seven enabling practices:

1. Communicate strategic intent – making a clear statement of purpose for improvement and one in which teachers see value and in particular a moral purpose (later developed by Conway & Andrews, 2016)
2. Incorporate the aspirations and views of others – the visionary action is not just the province of the principal – rather based on shared beliefs and values
3. Pose difficult to answer questions – this promotes an open-ended inquiry to which teachers can respond
4. Make space for individual innovation – encouraging potentially powerful ideas
5. Know when to step back – akin to providing space, the principal encourages others to lead
6. Create opportunities from perceived difficulties – this encourages risk taking, developing a no blame environment and high level of relational trust (previously reported by Bryk & Schneider, 2002)
7. Build on achievements to create a culture of success – emphasize the positives, build on successes however small – develop meaningful culture building

The importance of enabling culture building processes was emphasized in doctoral studies by Dawson (2010), *Becoming a teacher leader: A grounded theory study* and Petersen (2016), *When the sleeping giant awakes: The lived experiences of teacher leaders and implications for schools and education systems*. Dawson’s study emphasized the need for principals to be proactive in establishing safe and innovative cultures through acknowledgment of the importance of the distinctive roles of teacher leaders and the principal leader in improvement processes. This form of leadership would become a norm in the professional lives of teachers. Further,

principals needed to establish structures to enable internal networking and as such drawing on teacher leaders' expertise to enhance teaching and learning through collaborative action. Petersen's work followed up with many of the teacher leaders Dawson had interviewed, as well as others. She focused on their lived experience since taking on leading school improvement. Her outcomes indicated that where parallel leadership existed, these teacher leaders had remained within the school and had continued to contribute to improvement processes. However, for others, the parallel leadership experience was not a reality. This resulted in some leaving to pursue other opportunities, while those that remained either retreated to the classroom or continued to unsuccessfully influence within their school – they were left *Battle-scared*.

The next phase of the LRI\_USQ research (2008–2010) focused on leadership for capacity building. The research was reported in Andrews and the LRI Research Team (2009), *A Research Report on the Implementation of the IDEAS Project in Victoria, 2004–2008*, and Crowther (2011).

*From school improvement to sustained capacity: A parallel leadership pathway.* Motivated by a focus on sustainability, the LRI research team revisited schools that had engaged with IDEAS and backward mapped observed and participant shared action to uncover the factors that had contributed to schools who reported sustained success (see research design in Crowther, 2011, p. 180). A focus of studies on leadership for school improvement moved to thinking about sustainability of successes. Informing literature on capacity building (CB) influenced studies of the LRI\_USQ research team, particularly that of Newmann and Wehlage (1995) and Senge (1990) as previously cited, together with:

- (a) Mitchell and Sackney's (2001) study that indicated CB happens when personal, interpersonal, and organizational development intersect.
- (b) D. Hargreaves (2001) related that CB was generated by high levels of social and intellectual capital as well as leverage strategies.
- (c) Hopkins and Jackson (2003) indicated the need for CB processes to be in place and dispersed leadership is fundamental for this to happen.
- (d) Fullan (2005) reported successful CB depends on system-wide supports, leadership networks and incentives.
- (e) A. Hargreaves and Fink (2006) stated that sustainable CB in schools depends on values associated with global sustainability and quality of life.

Further exploration of informing leadership literature related to CB (see Crowther, 2011, pp. 67) included Pont et al. (2008, cited in Crowther, 2011) who stated that, "global interest in middle management is spreading and teachers are taking on an increasingly wide range of roles and responsibilities for leading and managing schools" (p. 10). However, as noted by Crowther (2011), "much remains unknown as is known about the machinations of school-based leadership as a distributed quality" (p. 11), even though others (Harris, 2004; Mulford, 2007) had reported on the importance of distributed leadership. Lambert (2007) acknowledged the importance of distributed leadership for CB and noted that "leadership in

different phases of capacity development requires different functions” (p. 316). These phases she described as instructive, transitional, and high capacity. However, further research by the LRI\_USQ found that the *different phases* in capacity development are under researched, as reflected by Hallinger and Heck (2010a), “Leaders must be able to adapt their strategies to changing conditions at different stages in the journey of school improvement” (p. 106), and that there could be a reciprocal effect between school-based leadership and school-based CB by a range of mutualistic interactive relationships.

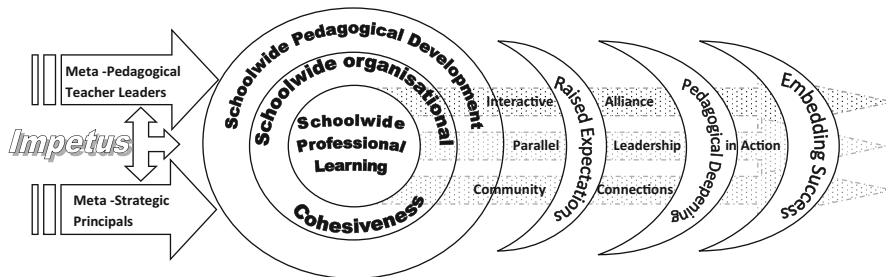

Informed by this research, the LRI\_USQ research team carried out a mixed methods study including in-depth case studies of schools that had completed the IDEAS school improvement project (Crowther, 2011, pp. 172–179). The LRI research team conceptualized the findings from the research in a CB process model (the COSMIC model) which consists of six interrelated dynamics (adapted from Crowther, 2011, p. 18):

1. Committing to school improvement – making a whole school process for improvement a priority
2. Organizational diagnosis and coherence – understanding the degree of coherence (alignment) of all contributing elements to improvement
3. Seeking new heights – developing an aspirational vision for the future and a schoolwide pedagogical framework that links the school’s aspirational goals to the work of teachers in the classroom
4. Micropedagogical deepening – engages teachers individually and collectively to enhance teacher quality outcomes by developing strategies that enhance student learning needs
5. Invoking reaction – disseminating and refining pedagogical and organizational knowledge through networking, transformational learning, and professional advocacy
6. Consolidating success – ensures processes of organizational, cultural, and professional learning strategies are in place

As the capacity building model emerged, the constructs of meta-pedagogical teacher leadership, meta-strategic principalship, and parallel leadership revealed new and clarified meaning, resulting in a revised model for leadership as captured in Fig. 3. What emerged was the understanding of the action of teacher leaders and principals in raising expectations, deepening pedagogical capacity, and embedding school success. Parallel leadership is the thread of the CB-Model wherein each dynamic provides a foundation for the other.

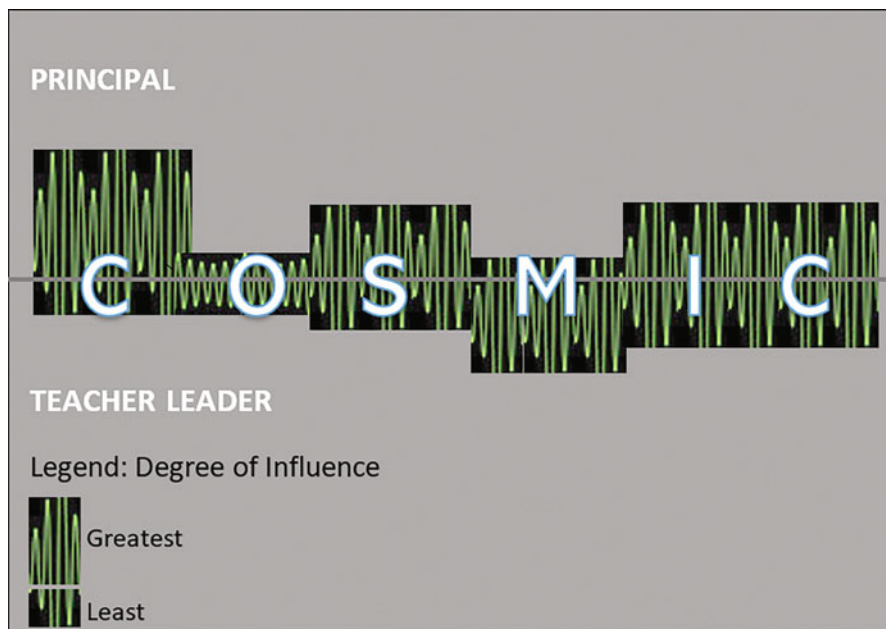

The CB model asserts that each school is unique, as the diagnosis (see dynamic 2) that is uncovered provides a basis for improvement and each school is responsible for its own improvement plan. Other references to the dynamics have been published by Petersen and Conway (2011), Conway (2014), and Andrews and Abawi (2017).

Of further interest in the research was the leadership component of a school’s capacity building (CB) potential. The LRI team captured the interactivity of leadership in a model for CB which indicates the relative importance of principals and

**Creating and Sustaining School Success through Parallel Leadership**

**Fig. 3** Creating and sustaining school success through parallel leadership. (Source: Andrews & the USQ-LRI Research Team (2009, p. 7)

**Fig. 4** Interrelated collective leadership responsibility for capacity building: The synthesizer effect. (Adapted from Crowther, 2011, p. 165)

teacher leaders in the school’s capacity building process. Figure 4 presents a visual image of the interrelated collective leadership responsibility for capacity building for creating and sustaining organizational success.

The LRI team concluded that capacity building in schools requires a whole school approach with a collective commitment to achieving priority goals and the alignment of whole school structures and processes to these goals. However, the success and sustainability of the successes require a form of distributed leadership that

recognizes the equal importance of leadership within the school, both teacher leaders and their principals who have distinctive roles within school improvement processes.

Quickly following was a replicated research study in the Sydney CEO System report (Andrews, Crowther, Morgan, & O'Neill, 2012). Of particular interest in this study were the outcomes related to impetus for school successes left unclear in the previous findings captured in Fig. 4. The Sydney system research highlighted three forces that provided impetus for action:

- (i) Systemic support – primarily from the central office executive, including expert system supervisors and consultants in leadership, curriculum, and pedagogy. The CEO provided resources, accountability systems, and opportunities for networking. Further, the role of regional consultants who provided important sounding boards and high-quality advice for school leaders were exploring new school program priorities and/or examining the practical value of specific programs for their schools.
- (ii) A school improvement process – a proven school improvement strategy (in this instance IDEAS), for pursuing enhanced school success over a period of three or more years and sustaining that success into the future
- (iii) High aspirations and expectations – a culture of “We can achieve more if we set our sights high and increase our internal alignment and cohesiveness,” using the leadership of principals, deputy principals and teacher leaders

---

## Parallel Leadership: Current Status

Parallel leadership has come a long way since its initial conceptualization by the LRI researchers in the early 2000s. It is no longer built on just the two distinct leadership roles of the principal and the teacher leaders, respectively, whereupon the visual image of *parallel* means two straight lines on a plane that do not intersect. Increasing evidence gathered through the long-term research and development of the Leadership Research International (LRI) team has strengthened the concept. The combined strengths of clarity of role description, interlaced with varying forms of distributed leadership, together with the overwhelming evidence of relational leadership, now form a robust state of leadership in schools of success. It is the leadership model required for a collective intelligence in schools with the understanding that “Collective Intelligence in schools is when a discerning community develops capacity to continuously create and advance new ways of thinking and acting in concert and with acumen toward enhancing student achievement” (Conway, 2008, p. 238).

The IDEAS project which engages a school in revitalization processes for whole school success has been the basis of an accumulated body of data as it has been co-developed and collected in schools in conjunction with the external LRI facilitators. A strong body of evidence has continued to emerge with the adoption of the IDEAS project in hundreds of schools across Australia in various educational state and independent systems. Several research projects have captured the parallel

leadership concept both directly and indirectly – of more recent prominence are the respective reports to the Canberra-Goulburn Catholic Schools system (2015–2016) (Andrews, Conway, & Smith, 2017) and the Sydney Catholic Schools system (2017–2018) (Conway & Andrews, 2019). For this chapter with an explicit focus on the development of the parallel leadership concept, the leadership perspective in each of these two research reports has been extrapolated and outlined in the following two sections. In doing so, it must be appreciated that some background to each of the studies is unavoidable to highlight the key leadership perspectives.

---

## System-School Alignment

Building on the Sydney system research project (Andrews et al., 2012), research conducted in partnership with several Canberra-Goulburn Catholic Schools (Andrews et al., 2017) focused on the research question: How do school leaders use their contextually created SWP© and metathinking about organizational process to respond to school priority areas and respond authentically to system and government requirements?

An outline of this research is key to understanding the development of the concept of parallel leadership specifically in relation to the interdependent nature of the strength of the in-school alignment and the reciprocal relationship of trust between the principal and the system personnel for system-school alignment.

Several schools of the Canberra-Goulburn Catholic Diocese had engaged with the IDEAS project and after some 4–7 years were then keen to engage with the joint research team of the System and the USQ-LRI. These schools had to have demonstrated success in all four components of the IDEAS project as follows: (1) a longitudinal strategy for managing processes of implementing their own school priorities, that is, a deliberate focus on the five phases of the project – initiating, discovering, envisioning, actioning, and sustaining – engaging the professional work of teachers, both pedagogically and in relation to leadership; (2) development and alignment of key variables focused on a school's potential to enhance its outcomes – leadership and strategic management capability, internal and external stakeholder support, infrastructural designs, pedagogical practices, and professional learning mechanisms; (3) evidence of a 3-dimensional pedagogical (3-D.P©) approach encompassing the development of personal gifts and talents, concrete collaborative activities to develop school wide pedagogical understanding, and involving classroom applications of the SWP© and testing of the SWP© against globally authoritative pedagogical theories; and (4) leadership of a parallel nature conceptualized as “a process whereby teacher leaders and their principals engage in collective action for purposes of schoolwide development and revitalization to enhance the school's ‘capacity’” (Crowther et al., 2002, 2009).

The research design involved the tracking of evidence of improvement as guided by the researchers' definition for success: “‘School success’ is defined as enhanced school achievements in agreed high priority goal areas, based on documented evidence of those achievements and teachers' expressed confidence in their school's

capacity to sustain and extend those achievements into the future” (Andrews et al., 2009, p. 4). The two-year data collection involved group discussions with the principal, other relevant leadership personnel and identified teacher leaders of the school improvement process, together with a collection of artifacts and relevant school-based documentation as it pertained to their evidence of success in achieving their priority areas for improvement. The researchers also engaged with the relevant system personnel for each school, identified in this system as the System Support Officer (SSO) for the school. A similar data collection approach was used involving discussions with the SSO and the principal and collection of relevant artifacts and documentation pertaining to the school’s adherence to the system requirements.

Individual school case studies were compiled and then used in an across-case thematic analysis which gave rise to the emergence of an internal-school alignment and system-school alignment model and the relationship between the two (see Fig. 5).

The in-school alignment component was seen to be highly dependent on the development of trusting relationships between the principal and teacher leaders who in concert had developed teacher capacity for ongoing improvement while focusing on the school priority areas for improvement. This realization was a major development in strengthening the concept of parallel leadership – shared contextual knowledge, confidence in sharing practice, and realization that improvement is a continual process. This was evidence of principals and teacher leaders simultaneously working in mutual agreement toward attainment of school priority areas for improvement of their school’s success, each with their specific goals pertaining to their roles, but in ways that enabled a clear focus of collective responsibility (encompassing of the range of varying role descriptions) for alignment of all key variables for school success.

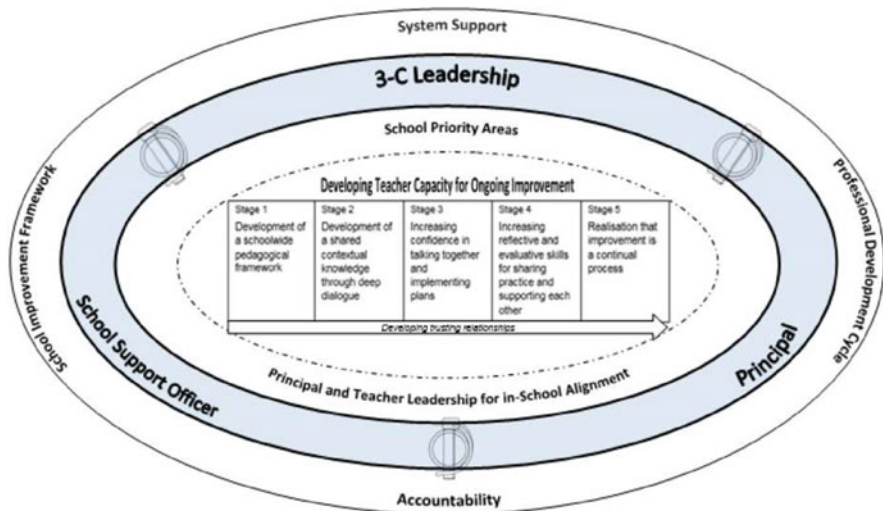

Fig. 5 3-C Leadership for system-school alignment. (Source: Andrews et al., 2017, p. 44)

The System-School alignment component added a richness to the concept of parallel leadership which built on the strength of the in-school alignment. One might say that the principal had the backing of the in-school alignment strength to then more confidently be able to respond to the system requirements. This was clearly evidenced by the explicit nature of the schools' ways of responding to the system requirements relevant to their context – the implementation of their Schoolwide Pedagogical frameworks provided firm foundations upon which to demonstrate their successes aligned to the system frameworks. Key to the success of this concrete evidence was the relationship between the principal and the system personnel of each school. Each was respectful of the other's role, but more confidently able to trustfully share the contextual knowledge of both school and system needs. It was concluded that “cognitive consensus is defined as the engagement in collective thinking to develop agreed goals” (Andrews et al., 2017, p. 9) which also added value to the concept of parallel leadership with, “leadership for system-school alignment conceptualised as an interrelated action between the principal and relevant system-school support personnel. Leadership provides the linchpin for System-School alignment and is actioned through 3-C's of leadership – Collaborative, Contextual, Collegial” (p. 9). The 3-C's represented the way in which leadership was enacted and is defined as:

Collaborative – working with others who share a common language to jointly achieve a shared purpose.

Contextual – tailored support sensitive to individual needs, organizational complexity, and cultural nuances.

Collegial – reciprocal relationship based on mutual trust, empathy, and appreciative perception. (Andrews et al., 2017, p. 40)

---

## **The Effective School Leader in Action.**

Key to strengthening the concept of parallel leadership is how principals and their leadership teams understand who they are, where they are and what is required in their current position of responsibility, both in relation to their school and the system to which their school belongs. Hallinger and Heck (2010b) asserted that while leadership is a catalyst for school improvement, there are three ways of qualifying this claim – leadership styles and strategies need to be highly contextualized; the school's culture influences the [leadership] capacity for educational improvement and collaborative [school] leadership, as opposed to leadership from the principal alone is an imperative (p. 107). In addition, Andrews et al. (2017) added that “alignment between systems and schools is dependent upon the relationship between the principals and system support officers” (pp. 8–9).

Research conducted in partnership with several schools of the Eastern Region of the Sydney Catholic Schools system (Conway & Andrews, 2019) focused on exploring if supportive evidence existed for the contention of Hallinger and Heck (2010a) and Andrews et al. (2017). Several principals of schools that were identified

by the system as being “schools of success” in improving student outcomes were invited to participate in the research project. The system determined success by a collation of data in response to the system’s expectations. This study then engaged with the principals, their leadership teams, and the relevant system personnel who had a direct relationship with the schools and their school improvement agendas.

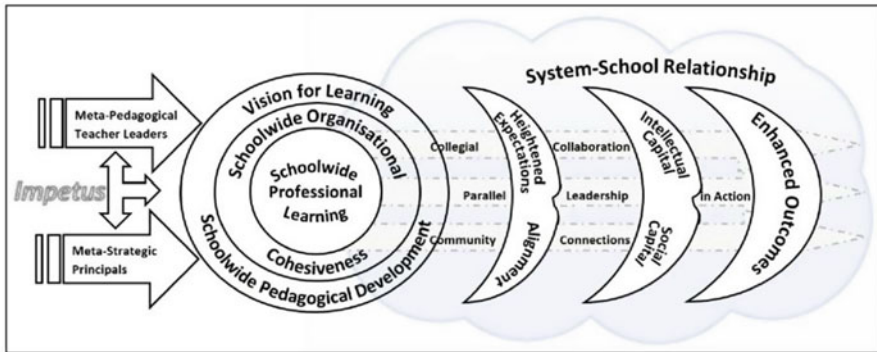

Evidence from this research study revealed a strong connection between the identified successful school factor and the genuine collaborative leadership of the principals both within their school community and with the system. In particular, the principals highlighted the importance of knowing their context and contributing to the building of a healthy trusting culture. The researchers concluded that while roles, structures, and procedures are essential pillars for ensuring organizational behavior both within-school and in system-school relationships, key to leadership success was the meta-thinking and action of the principal, that is, the “the principal’s visionary commitment to action” (Conway & Andrews, 2019, p. 56). Inherent in this complex concept is the principal’s ability to manoeuvre and manage the dynamics of interrelationships, most particularly that of the staff within-school, and in concert with system support personnel for system-school alignment. This study conclusively reported that it is “the collective responsibility of leaders to develop an organisational culture of collaborative leadership . . . with a clearly defined and mutually agreed visionary commitment to action” (p. 61).

Overall, the Sydney research report (Conway & Andrews, 2019) supported the “linchpin” relationship (Andrews et al., 2017) and further enhanced this relationship between the principal and system personnel when the “Principal’s Commitment to Action” is realized (Conway & Andrews, 2019, p. 6). This research report concluded that, “The emergent finding of this study on effective leadership for school improvement is that principals and their leadership teams, together with their system support, have collective responsibility for school improvement” (p. 7), thus further adding evidence of the concept of parallel leadership but moving it from just inside schools to inside and outside with the system.

---

## The Maturing of Parallel Leadership

Working with schools and their leadership teams in educational systems is a reminder of the complexity of systems, as applied to their expectations of the schools, and in response to the broader context of societal expectations of education. However, each school operates in an economic, socio-cultural, and political context (Hallinger, 2018) and that level of complexity, while acknowledged, is often under-reported. Principals need to build trusting internal relationships, together with system leaders and support personnel – the 3-C’s of leadership (Andrews et al., 2017). Both internally and externally, each performs and is accountable for specified roles; however, the relationship is only sustainable if an organizational culture within the school and between schools and the system genuinely respects trusting relationships and a clear vision for the priority goals of the school which are reflective of both the system and the school needs. Figure 6 is a visual representation of the

**Fig. 6** Parallel leadership model for organizational alignment

complex and multifaceted nature of the current parallel leadership model highlighting the increasing prominence of relationships and visionary action integral to the sustainable success of educational organizations.

The “impetus” for initiating a leadership approach that will guide the process of organizational alignment has to emerge from within the context in recognition of the contemporary and futuristic needs of the community. Carriage of the process in support of capacity building for development and ongoing improvement calls on and highlights the roles, responsibilities, and interrelationship of the formally appointed leader (i.e., the meta-strategic principal) together with the combination of formally and informally recognized personnel leading the enactment of the core business (i.e., the meta-pedagogical teacher leaders). Individual and collective responsibility for the process of building capacity for success is a concerted effort of ongoing knowledge creation (the Vision for Learning supported by Schoolwide Pedagogical Development), in a cohesive culture (Schoolwide Organizational Cohesiveness) with a strategic approach to value-added professional learning (Schoolwide Professional Learning). This “within-school” capacity for ongoing improvement of the organization’s priority goals (Parallel Leadership in Action) then provides a strong foundation for the principal’s “commitment to the visionary action” in a collaborative, collegial, and connected manner in partnership with external support personnel of the larger system (system-school relationship).

Parallel leadership, while initially conceived as a construct for collaboration within a school between the principal and teacher leaders, has emerged as a powerhouse of collaborative leadership with collective responsibility for enabling the development and implementation of a range of skill sets and emotional intelligence levels in situ. Fundamentally, parallel leadership is the act of “leading together [with] a clearly defined and mutually agreed visionary commitment to action, [requiring] all concerned to enact the collective responsibility of participation and evaluation for continual success” (Conway & Andrews, 2019, p. 61). Thus, the conclusive

realization that processes for acknowledging and building relationships of trust both within the school and between the school and the system must be aligned.

---

## Conclusion and Reflections

The concept of parallel leadership was initially based on role theory situated within social systems theory and leadership as an organizational quality. While the concept is still embraced, it has been enhanced through an understanding of the dynamics of the interplay between principals and teacher leaders as it applies to capacity building for success within-schools. However, in acknowledging that the relationship between the school and the system in which the school resides is an important element of sustainability of improvement initiatives, the leadership relationship is an imperative beyond the earlier definition for parallel leadership. Long-term partnership with hundreds of schools across multiple systems, reinforced by several research projects, has added value to the concept of parallel leadership as the key approach to genuine collaborative culture building and ultimate agreed success as discerned by the collective in situ. The new conceptualization that emerges is:

Parallel Leadership is a multifaceted relationship developed between those who have defined leadership roles and those who emerge as leaders, together leading improvement with a clearly defined and mutually agreed visionary commitment to action, both within the school and between the school and the system. The relationship is built on action that is collaborative, collegial, and contextual.

Integral to the concept of this multifaceted, interrelational, leadership model is the ongoing interaction of the meta-strategy of the principal and the meta-pedagogy of the teacher leaders. The principal leads with a commitment to visionary action enabling the capacity building potential for social, intellectual, and organizational capital of the organization, and in concert, the teacher leaders forefront the importance of the meta-pedagogical knowledge and action heightening their part in the building of social and intellectual capitals. Thus, parallel leadership is an organizational model that can be enacted within a system when acknowledgment is given to the collegial collaboration and community connections specific to the school context in relationship with the system requirements.

It is not beyond reason that just as many of the earlier principles upon which the emergent model of parallel leadership was conceived were drawn from the field of business and management, this model might be applicable to other organizations in providing their service to community. Current aspirational improvements to local, national, and international socio-cultural, economic, and political conditions beckon enlightened leadership and networking of communities. Explicit interdependency of the social, organizational, and intellectual capacity-building potential of an organization calls for new ways of harmonized thinking and acting. Herein lies a proposal

for organizational alignment with a reciprocal transfer of knowledge from one field (the service industry, specifically education in this proposal) to another (business and management).

## Abstract

Educational leadership in the United States has borrowed from many fields and engaged multiple paradigms. Throughout American history, government and business have had a unique, direct, and lasting impact on public school operations. Government domination and the resulting excessive compliance of recent years have created a seismic shift in this relationship and lead to leadership stagnation. Additionally, business has become a direct competitor in the form of private charter organizations and further strengthened its influence on instruction and operations through mandates to employ research-based and market-ready deliverables. Schools and their leaders have been increasingly forced into a continuing compliance reality. It has become safer for many to abandon who they set out to be as a leader in favor of adopting “experienced” leadership styles, whether they are even effective or right for the times. This chapter embraces the helplessness and resulting lifelessness promoted through excessive standardization. It examines the continuing reanimation of outlived leadership styles that likely continue to

exist today primarily because of the stagnation fostered by outside intrusions into schools. Organized as a “top-ten” list, the chapter considers multiple outlived administrative styles. It delves into the underlying weaknesses of the individual expired leadership styles and then addresses implications, including why their failure to expire peacefully is less than desirable for leadership realities we face today and can expect in the future.

Standardization · Stagnation · Outdated leadership · Status quo · Compliance · Discrimination · Equity · Leadership training · Connoisseurship · Conflict

**The Field of Memory**

Human history has afforded us with an abundance of leadership philosophies and attempts at implementing them. Though American educational history is infinitesimal by comparison, there are already numerous leadership ideologies, mentalities, and practices that no longer meet with favor – at least openly – within professional circles. Among others, these could be considered to include an insistence on favoring the latest trends advanced by other disciplines, awarding privileged positions including nepotism, or a point of view that the *boss* is always right.

**The Field of Presence**

Schools are subject to significant internal and external pressures (Miller, 2018). Leadership efforts are not immune to these challenges or their influences. Therein, the field of presence could be considered transitory or, at the very least, *in flux*. Thought leaders in education and influencers of business and military trends such as Bernard Bass have more frequently emphasized collaborative approaches, including distributed leadership and even transformational leadership processes (Bass, 2003). Related to this, motivational considerations and capacity development are regularly heralded as critical elements of successful leadership. While *standards-based* approaches are still actively incorporated in training and practice, in contrast, emerging voices have reinvigorated the argument that leaders are at their best when they are reflexive, holistic, and multi-perspectival in thought and practice (English & Ehrich, 2016).

**The Field of Concomitance**

Education is heavily influenced by various sources, in part because education provides a vital contribution and makes a critical connection to virtually any field of study or profession. The mutual influence between parties is to be expected and extends to the sharing of leadership philosophies as well. That said, business and organizational psychology impacts are particularly evident in educational leadership circles, with inputs from communication arts, along with sociological and anthropological disciplines, also yielding significant influence. Equity considerations and attention to social justice concerns have direct ties to the social sciences. In contrast,

planning, personnel, and organizational theory applications are more directly aligned with business and organizational psychology.

### **Discontinuities and Ruptures From the Different Viewpoints of this Area or Field**

Multiple sources have shaped educational leadership teachings and practices at multiple levels over the years. Much of this influence has been positive and evolutionary. However, these interactions' resulting complexity has also introduced conflict to the educational profession and has also been known to spur opposing viewpoints, approaches, and priorities within organizations. These discontinuities have impacted leaders' perceptions of their professional efficacy and made them aware of external pressures originating from social, community, business, religious, and governmental origins. According to Hughes and Davidson (2020), educators need to become more assertive in standing up to domination from external sources.

Examples of these challenges and resulting discontinuities include leaderships' regular call to supply a guiding *vision*, which could just as likely represent the organization having already bought into one or a series of government mandates. Related to this orientation is how educators have regularly been called upon to adapt and innovate despite having been placed in a mode of compliance for the past two decades (Popham, 2005). Stable leadership is often associated with the ability to reframe situations and challenges (Bolman & Deal, 2013), though federal legislation and established educational norms emphasize fidelity to one-size-fits-all solutions instead and critical thinking is often actually discouraged (Hughes et al., 2019).

Finally, there is the matter of growing cultural conflict throughout the nation and really around the world (Hughes, 2019). Administrators generally lack the training to deal with conflict – in general (Hughes & Davidson, 2020). They also have a growing need for assistance to deal with sensitive social, cultural, and social media issues that make their way into schools (Hughes, 2019). In as much as national training standards do not elevate conflict-focused training to a level of importance, and leaders are often forced to acquiesce to challenging demands because of compliance pressures, the ability to lead through internal conflicts, let alone social justice and equity issues, is not typically nurtured in school leaders (Hughes, 2019). Instead, training and standard setting tend to be tied to what appeared to work in the past. Therein old ideas, methods, and practices tend to linger as a result.

### **Critical Assumptions or Presupposition**

Education has borrowed extensively from many fields and paradigms during American history. Of all the fields and influences education has had to draw from, it could be argued that government and business (Hargreaves & Fink, 2003) have exercised the most significant leverage on the management of their operations – and have also consistently been the most highly critical of the outcomes resulting from their guidance, intrusion, and indirect control.

While business and government's dominion over education has only continued to expand, so too has the scope, frequency, and complexity of the externally triggered leadership challenges administrators face (Fullan & Kirtman, 2019; Hughes, 2014, 2019; Miller, 2018). Often, the conflict embedded within these challenges is tied to cultural problems that disrupt American society's very fiber (Hughes, 2019; Hughes, Ononuju, & Okoli, 2020). Lacking the training to deal with these expanding disruptions, school leaders are often dependent upon one-size-fits-all remedies (Fullan, 2014) that satisfy government expectations but rarely provide satisfactory solutions that eliminate the building strife.

This ongoing conflict makes organizational change impractical and unlikely, if not impossible (Fullan, 2014). According to Evans (1996, p. 5), "organizational change – not just in schools, but in institutions of all kind – is riddled with paradox. We study it in ever greater depth, but we practice it with continuing clumsiness." Paradoxically, the escalating conflict and compliance appear to have only led to increased adherence to standardization as a "fail-safe" option in many instances. The resulting recycling of past approaches that may have met with at least limited success during different times could be responsible for residual leadership approaches waking from a sleepy slumber during desperate times where even those trained for leadership positions are opting to stay clear of them.

---

## Introduction

Years ago, we talked about "leadership," then the byword became "morale," then it was "motivation," then "communication," then "culture," then "quality," then "excellence," then "chaos," then back again to "leadership." Along the way we were buffeted about by the buzzwords "zero defect," "management by objectives," "quality circles," "TQM" (total quality management), "paradigm shift," and "re-engineering." (Farson, 1996, p. 12)

As Farson clearly intimated and certainly holds true to this very day, leadership and management paradigms rapidly come and go. Still, many refuse to die off entirely and outright disappear. Much like zombies, which are prevalent if not even chic personifications of the undead, some educational leadership notions cling to a near lifeless existence only to reemerge at some later point in time. This inability to disappear makes zombie forms of leadership stand out from "dinosaurs," which do actually go away. As is suggested by the title of this chapter, the symbolic notion that there may be elements of *the undead* walking among today's educational leaders is tied here to the organizational stagnation often seemingly suffered due to excessive standardization and compliance.

Years ago, Richard DuFour (1997), Robert Evans (1996), Phillip Schlechty (1990, 2001, 2009), and Michael Fullan (2014) were among the prominent educational thought leaders of their time. Each identified ways sustainable organizational change is best addressed at a cultural level capable of engaging personal attitudes

and psychological dispositions. Therein, administrator training was increasingly recommended to follow a *strategic-systemic* perspective more than *rational-structural* approaches by the leading scholars of the day (Evans, 1996).

Despite widespread support for this strategic-systemic perspective in the 1990s, business interests and government interference quickly aligned with one another, therein strengthening the prioritization of compliance and accountability during the past 20 plus years. Instead of settling into an effective human resource-centered approach to leadership (Bolman & Deal, 2013), the *business* of compliance leadership encourages educators to turn back to familiar though often outdated styles that may be obsolete in design and a “safe” option for momentary survival.

According to Bass and Bass (2008), there are hundreds of leadership definitions to draw from. This chapter adopts the point of view that scholarship and practice have combined to identify preferable forms of school leadership, which training programs are then expected to nurture in accordance with standards and best practice. These approaches typically strive to cultivate trusting relationships through morally centered leadership focused on serving others and inspiring educators to invest in being their best (Davidson & Hughes, 2019, 2020; English & Ehrich, 2016; Evans, 1996; Fullan, 2014; Hughes & Davidson, 2020; Petersen, 2002; Schelcty, 2001). Though these characteristics are more consistent with who fledgling administrators set out to be (Hughes et al., 2019), there is the dimming reality of stagnation often linked to outside domination and an emphasis on compliance ahead of leadership (Hughes & Davidson, 2020; Popham, 2005).

Rather than completing yet another accounting of the reasons for or against standardization, this chapter’s outstanding balance will concern itself with some of the unintended leadership realities believed to result from excessive compliance and resulting stagnation. In total, ten outlived and outdated “zombie” forms of leadership will be forwarded for examination. This top-ten list will be tied to scholarly work and observation concerning K12 interactions and will be presented in a “countdown” fashion ending with the least desirable of all the zombie forms of leadership being submitted for consideration.

As a point of departure, let us establish this starting point to consider each of the ten zombie incarnations.

For some, leadership is a set of competences: a list of capabilities that can be listed and checked on development programs and standard frameworks that are linked to qualifications, licensure and performance evaluations. Others see that the coherence of leadership concerns how these competences hang together in a meaningful way . . . Leadership is also about influence, movement, and change: it is about how the dots flow on a journey of development and transformation from point in time to another. (Hargreaves & Harris, 2015, p. 35)

Originating from the point of view that leadership truly is about connecting the dots and about creating future leaders more than isolated competencies, there are three groupings of zombie leaders that will be presented. Starting out, numbers 8–10 share a common bond having to do with maintaining the status quo. Numbers 5–7

are largely personality-centered entities, whereas numbers 1–4 are “perspective-challenged” and consistently demonstrate an inexplicable propensity to ignore the more significant realities in an increasingly complex world.

One final general comment that appears to apply to most if not every zombie form of leadership to be detailed is the tendency for them to rely on their natural zombie leanings and follow a path of least resistance instead of adapting to new demands and new challenges in what to them may seem to be an unproven manner. These are educational fixtures who do what they do with little thought of change in their approach. This reality is very likely what got them where they are and is keeping them there as well.

---

## Status Quo-Oriented Zombies

This section relates insights concerning *The Musical Conductor*, *The Myth of Isolationism*, and *The Black Hat*. Each of these status quo loving remnants from days gone by will be described in detail individually including the reasons they are out of place and so outdated. Each will be considered from a combination of practical as well as theoretical vantage points. The theoretical foundations will be tied to Bass and Bass, among other sources on leadership. In each instance, there is an attempt to link the practical considerations directly to K12 leadership situations.

**10. The Musical Conductor:** Philip Schlechty (2001) spoke to the #10 ranked zombie’s reality when he compared musical conductors’ leadership styles to jazz musicians in *Shaking Up the Schoolhouse: How to Support and Sustain Educational Innovation*. The musical conductor is as much a manager as they are a leader. Tying into ideas outlined in the *Bass Handbook of Leadership* (Bass & Bass, 2008), both management and leadership are needed to promote achievement. However, these designated leaders are the people who adopt and embrace more of a task orientation than a relations orientation, which tends to align them more vigorously to management.

When comparing and contrasting leadership and management, Bass and Bass (2008) introduced a third variable that administrators need to face – that being change. It can indeed be argued that the conductor interprets the patterns and structures that have already been put to print – but does that interpretation advance change? In contrast and as Schlechty (2001) interpreted, the jazz musicians, too, are about interpretation, as well as innovation, relationships, collaboration, and all sorts of more modern “leader-like” behaviors.

There is more to these differences than mere symbolism – and there are reasons the conductor is viewed as a zombie. According to Bass and Bass (2008), change needs to come from either a relationship or a task perspective. The jazz performer could be better equipped to deal with change and nurturing others as they inspire others through the relationships they establish. Additional reflection on the preferred point of origin responsible for promoting change would seem to suggest that

acceptance and investment in an effort or a cause tend to be far more relational and more sustainable when it is.

In the K12 setting, this is further supported by a viewpoint that adaptation is more successful when coming from a collaborative “relational” undertaking than looking for innovation through old documents and abandoned practices. A connoisseur-type leader (English & Ehrich, 2016) would be better equipped to size up the broader situation and the scope of the challenges that lay before them. Where the conductor strives to deliver the same performance day in and day out, the jazz musician is all about blending the many influences – and doing so at the moment. Whereas the conductor would be expected to delegate roles and responsibilities in traditional top-down settings, the alternative collaborative approach would focus on inspiring performers to stand up and contribute. There are stark differences between the more passive “buy-in” at best approach promoted by the zombie figure and the more inspired “investment approach” fostered by a more vibrant leader (Hughes, 2020).

**9. The Myth of Isolationism:** These are those K12 administrators who stress that since “it did not happen in the school” on their watch, it is not their responsibility to deal with “those” things. That approach and overall disposition may have worked 10 or 20 years ago, but today’s world is a very different place and moves at a much more vigorous pace. Digital technology and worldwide access have combined to bring us into an “around the clock” reality that does not allow us to overlook matters. Some continue to insist that only events on site during school hours can impact organizations, settings, and stakeholders we are responsible to.

Hughes and Davidson (2020) observed that educators tend to share a viewpoint that aligns both symbolically and literally with being able to close the door to their classroom and do what they will. So, the underlying instincts found with this breed of zombie trace back to former classroom teachers’ earliest experiences and can be considered both familiar and deeply ingrained.

According to Bass and Bass (2008), two very present though often competing leadership influences are trait theory and situationism. They indicated that leadership is usually based on a combination of individual differences and situational differences – though they acknowledged situations often alter leadership styles.

Based on their work, the status quo approach and the more trait-oriented approach work better with mechanistic organizations and realities. In contrast, organic organizations and circumstances are more readily aligned with more situationally attuned responses and leadership (Bass & Bass, 2008). The fact is that schools moving along a positive trajectory are far more organic and continuously evolving today than they were 20 years ago when this isolationist approach was alive and well and not expected to become a twenty-first-century zombie. The effort to isolate and live in the past is a telltale sign that this brand of zombie is holding down an administrative position somewhere.

**8. The Black Hat:** To many, this incarnation on the Zombie Leadership List takes on the appearance of a “good cop-bad cop” situation as the more highly positioned leadership figure frequently empowers a zealous subordinate to carry out the more visible and unpleasant parts of their duties on their behalf. In so doing, while

receiving a clear line of authority, the subordinate also typically inherits the stigma associated with these activities. In theory, they serve as the shield or the black hat for their superior.

“Authority is not power” (Bass & Bass, 2008, p. 355). In the eyes of Bass and Bass (2008, p. 353), “authority is the legitimate right to exercise power” with the added caveat that belief in that authority is dependent on followers witnessing and experiencing the benefits of leadership actions. Responsibility is a related concept and one that says that the leader is behaving in an accountable manner (Bass and Bass, 2008). The ramifications of failing to act accountably are often negative. Berkovich and Eyal (2017) documented how administrators negatively charged behaviors and positions taken by administrators to promote negative emotions and perceptions among subordinates.

The problem with the black hat goes beyond direct impact on affect. According to Bass and Bass, it further complicates and blurs the scope of power and legitimate authority, which can lead to conflict. In the case of the black hat operating within the K12 setting, instead of the true leader choosing to be accountable, they opt instead to take a power approach to authority and allow their deputy to play the “I can make you do it” card. While the black hat zombie can collect what appears at first to be victories, they are instead sucking the life out of the organization’s vitality and will to persevere under the regime in place at the time.

---

## Personality-Driven Zombies

This section relates insights concerning *The Hero Leader*, *The Parliamentarian*, and *The Cheerleader*. These personality-driven examples of the walking dead will be described in detail and again collectively when considering why they are out of place and so outdated. Each of these personality-driven zombie remnants from days gone by will be described in detail individually including reasons they are out of place and so obsolete. The theoretical foundations will be tied to Bass and Bass, among other sources on leadership. In each instance, there is an attempt to connect the practical considerations directly to K12 leadership situations.

**7. The Hero Leader:** The hero leader is often considered much in the same mold as the charismatic leader. Originally tied to a form of divine grace long ago, and then recognized based on qualities demonstrated in battle (Bass & Bass, 2008), this has become a form of zombie leadership which has been in place for hundreds if not even thousands of years. While this has long been a widely celebrated symbol of leadership, there are reasons why the general approach it represents would be considered outdated, including its tendency to generate unrealistic expectations of those in charge (Walton, 2007).

In a world that increasingly appears to function better employing collaborative activity, the hero is who they are because of others’ belief that the hero is uniquely able to overcome undesirable obstacles (Bass & Bass, 2008). Whereas it has been offered that these types of leaders might be in a position to inspire the development of transformational leadership in followers, Collins (2001) and

others have been critical of this approach since the organization too often regresses because these agents of administration do not invest in the development of others. It is often said that when they leave, whether for positive or negative reasons, nothing in the form of well-established leadership is left to carry the organization forward.

Understandably, those leadership team members who are in the middle of change efforts might appear to be invested in their undertaking. Still, Bass and Bass (2008) also represent that those who are not close enough to the sphere of influence may not feel empowered or involved. Potentially, in the K12 setting, there would be a reason to expect widespread and passive “buy-in” to initiatives (Hughes, 2020) as opposed to more direct investment, which according to Hughes and Davidson (2020) is more supportive and more sustainable as well.

If not also fate, a final twist of logic is that they appear transformational because of their charismatic or historically “divine” or most capable appearance. If they were “level-five leaders” described by Collins (2001) and committed to transformational, there would be a far clearer and more substantial reason to celebrate their leadership than basing it on appearances. To be viewed as transformational because they are considered to be charismatic or divine or “most capable” clearly seems to be a case of mistaken identity.

**6. The Parliamentarian:** This incarnation is considered the rule-centric leader who is generally concerned with operating within a pre-determined order – even at the cost of progress. An example that has presented itself within the K12 work setting would be a reasonably common effort during contract negotiations where the first order of business becomes confirming strict rules concerning who can talk and when and time limits for caucusing. In an actual work setting, that approach was followed 2 years later by a practice where ongoing communication and exchanges of communication took place ahead of the actual bargaining “session.” In the former instance, little progress was made with the parties on hand, and external mediation was recommended. In the latter example, in the same setting but different district leadership, the contract with two bargaining groups was completed in a total of 15 min of the formal meeting. Appearances and outcomes strongly suggest that the rule-keeping priority did little to promote the locality referenced progress.

There are those in prominent roles who gravitate toward rules and reasons. Bass and Bass (2008) referred to an idea called “cognitive complexity” which has to do with personnel’s ability to sort through challenging concepts and also related an ability to be persuasive. While Bass and Bass linked this ability to promotion in many organizations, the rules making and rules following involved were not considered the norm. The maneuvering tied to the deliberate application of regulations has been seen as having a value at the organizational level, but less so at an interpersonal level.

When it comes to the research on this form of potential interdiction through rules, a lot depends on the purpose linked to any given effort. Bass and Bass (2008) indicated that most leaders fall somewhere on a continuum between being directive and participative. When “the rules” are in place for participative leaders, they can be as limiting as in the just cited example. When they are put in place by directive

authorities, the “rules” can be more restrictive. What makes this approach outdated is the deliberate use of structures or rules to limit others for advantage and gain. It is not an approach, nor is it a priority that a lot of subordinate employees value.

**5. The Cheerleader:** It has been asserted that in some sense, being able to put a positive spin on most things can come across as being an impressive and desirable quality (Mabry, 2005). While society is undoubtedly inundated with “spin,” this variation of the zombie lineage is, however, often associated with the concept of a *laissez-faire* “leader” or someone who prefers to project a view of “smooth sailing” ahead – as a perpetual way of doing business and avoiding challenges and ensuing conflict. In the K12 setting’s real-life workings, this type of zombie behavior is often observed when administrators maintain a near totally disengaged presence, all the while vociferously suggesting a full understanding of a situation and total confidence in the people who are doing the work. According to Hughes, Bechtler, Cruz-Szabo, Hafner, Ortiz, Piel, Quiroz, and Robbins (2020), teachers noticed this type of behavior frequently when their building administrators regularly put distance between themselves and special education concerns. In other instances, these titled administrators are known to urge their subordinates not to come forward with problems unless they are prepared to offer a solution as well.

Within their handbook, Bass and Bass (2008) offered additional insights tied to leadership stress and efforts to avoid it that appear to speak to this form of out-of-date leadership. Referencing the idea of “role overload” where leaders attempt to present themselves as competent by relying on perceptions and organizational trappings, Bass and Bass (2008, p. 819) reported that a *laissez-faire* or “do nothing” approach is often easier for the moment and removes the stressed party from the responsibility of making potentially faulty decisions. As they also pointed out, this approach “looks” like it works in many larger organizations and has been viewed as being a successful though not “effective” form of leadership (Bass & Bass, 2008, p. 822).

As mentioned, dealing with conflict is essential for robust and effective leadership that may not be afforded by assorted zombie incarnations. Conflict is on the rise across society and within schools (Hughes, 2014, 2019; Miller, 2018). Whether one is talking about avoiding the everyday challenges tied to special education issues (Hughes et al., 2020) or other stress-producing interactions, this conflict-avoidant approach to administration is commonly observed (Hughes & Davidson, 2020). It provides aspiring leaders with a very lifeless example to model after.

---

## Perspective-Challenged Zombies

This section relates insights concerning the Big Data Metaphor, The Toolbox, the Titled Leader, and The Marginalizing Leader. Each will be considered from a combination of practical K12 leadership and theoretical vantage points including reasons they are out of place and so outdated.

**4. The Big Data Metaphor:** Data use is certainly important and has earned additional attention and appreciation within education during the past 20 years. The use of data in and of itself does not make a leader a zombie leader. That said, the

reason big data is part of the zombie countdown and, additionally, is this far down the list is due to the frequent overemphasis and regular misguided overreliance that is often experienced within educational organizations. When mega-data use becomes such an overriding determinant of practically “everything” that administrators and governing boards even go so far as to surrender their roles in goal development – things have likely gone too far.

Educators well versed in data analysis and data use know the difference between reliability issues and validity issues. According to Bass and Bass (2008), it is not enough to define terminology, including reliability and validity. It is far more critical to recognize the limitations of psychometrics and not become so enamored with efforts to beef up reliability that we forget to question the validity of the data we are focusing on. Added to this problem is the lack of deeper understanding most educators have concerning data. Despite this deficit, it is the norm for leadership in the K12 setting to organize data retreats where the “data drives” the decisions being made – despite the data being delved into by people with minimal understanding of validity issues as they are spoon-fed the information they are working with.

Added to the lack of understanding is the fact that the stakes connected to big data are enormous. This leadership zombie can do a lot of damage both in terms of the types of decisions that are supported and also in terms of the way mega-data shuts down other initiatives and viable forms of leadership. As Bass and Bass (2008, p. 554) noted, the use of data can be at odds with leadership forms such as servant leadership because of the way numbers come to be emphasized ahead of insights that would otherwise be shared by people. Even too much of a good thing is not a good thing, which applies to data use that exceeds its useful purpose.

Finally, according to Schildkam, Poortman, Ebbeler, and Pieters (2019), the past decade has seen inappropriate data use that distorts our direction, encourages improper testing practices and student responses, and relates to an excessive emphasis on data-driven practices. Backing the importance of value, they advocate data-informed decision-making, which augments professional knowledge and decision-making practices. This more holistic and insightful approach not only represents a healthier perspective; it also sets their thinking apart from the toolbox mentality that is the #3 zombie form of leadership.

**3. The Toolbox:** This is a prevalent concept and a trendy undead member of the zombie leadership cadre. Much like #4 and concerning data, tools or skills are essential in the right place and the right measure. There is even value in using the term symbolically as authors, including Gupton (2010), have advanced *The Instructional Leadership Toolbox* as a handbook for improving practice. Overreliance on data can create an imbalance concerning what leaders attempt to address or how they go about it. Overemphasis on the “tools” loses sight of the inner workings that pull practical skills together and tend to overvalue isolated approaches and efforts. This difficulty is not so far removed from criticisms that are often leveled toward the overly dominant role standards play in administrator training these days (English & Ehrich, 2016). It propagates the possibility of both the development and the deployment of the wrong skills to the unfair situation. Tied to this is the cheerleader-like invalid assumption that if the standards are addressed on paper,

then all the tools are in place for the team, training program, or approach called upon to make a difference. Sadly, people stop looking at the viability of “the solution” itself because they become so enamored with the subparts that have been collected, and they assume they will automatically work.

According to Bass and Bass (2008), approaches like this one run the risk of personally distancing one’s self from challenges in favor of adopting the viewpoint that matters in question which are perhaps beyond the scope of one’s ability or responsibility (which is harmonious with our #9 Isolation zombie). As much as the toolbox concept is valued, there is evidence that many of the most important tools are not even being included in the approved collection. Practicing administrators have gone on record indicating that they have not sufficiently been trained to address conflict or special education, incorporate critical thinking in their efforts, nor schooled in how to effectively hire new members of their educational team (Hughes, 2014, 2019; Hughes et al., 2019, 2020).

In the K12 setting, the toolbox zombie tends to categorize things. Just like the parliamentarian believes that there is a rule to guide every type of situation or challenge, this zombie tends to do what is expected, to fidelity, utilizing the researched and approved approach that has been decided already – whether it works or not. Again, as Bass and Bass suggested, it may not be prudent to expect a more holistic viewpoint from this type of administrator. In a conflict or crisis, they would potentially be less likely to adapt to the specific needs of the situation and instead employ the default approved approach – all without making a strong attempt to figure out what potential deviations might be in need of additional consideration. In the K12 setting, these are members of a group who see delegating as an iconic tool – and overlook the importance of influence and inspiration that would be capable of creating new leaders likely better versed ineffective practices than they possess in their zombie tool kit.

**2. The Titled Leader:** This is the zombie that identifies with its designated title ahead of anything else, including its duties or responsibilities. In the K12 setting, educators are increasingly learning that leadership comes from places other than “the top” or titled positions (Hughes & Davidson, 2020). This representative of the undead struggles to recognize this emerging distinction and, even more so, fails to utilize the growing amount of talent and passion that could be available to them. According to Bass and Bass (2008), leadership is universal. Though they discussed the need for leadership, note its importance, and discuss followers’ role in fairly conventional terms, they also made particular note concerning “leader-centric” viewpoints. In but a few words, this is the vantage point that holds that the leader is the center of attention, whether talking symbolically, as a source of attribution, or the manager of group activities. The titled leadership zombie comes from the leader-centric point of view.

Bass and Bass (2008, pp. 20–21) identified additional points of view, including “leadership as an effect” as well as “leadership as a relationship” in addition to other diverse roles that are not “about” the person holding the title. These more differentiated viewpoints are more consistent with distributed leadership and servant

leadership, which are livelier and more inclusive forms of leadership. The added benefit of these more modern leadership approaches is, once again, the way they focus on the development of future leaders. The #7 hero leader zombies tend to be focused on their own success and not others' growth. Similarly, while titled leaders may be attuned to who may follow in their role, their attention is often more directly linked to succession considerations than development steps that can inspire and involve multiple future leaders.

**1. The Marginalizing Leader:** This final entry onto the Zombie Leadership List earns its distinction and holds its position because it represents a collection of both deliberate and what some might describe as unintentional "ignorance-based" biases. Borrowing from other entries including Isolationism (if I didn't see it, it didn't happen) along with the smooth sailing "head in the sand" tendencies of the cheerleader, this placeholder is closely aligned with the infamy of titled leadership in as much as its membership consistently values the wrong qualities particularly when identifying desirable leadership qualities. These are the people who become concerned with almost anything instead of understanding and addressing issues such as race and disability (Harry & Klinger, 2010).

The list of marginalized groups is extensive and, among others, includes biases based on racial, gender, religious, and sexual orientation grounds. Put another way, leadership that refuses to recognize and address discrimination in any shape or form, whether it occurs during scheduled school hours or not, is the end-all expired undead form of leadership that anchors the Zombie Leadership List. While a good many of these actors could point to affirmative action and other written statements that appear to honor equity, Bass and Bass (2008) identified sometimes remaining subtle – sometimes not so subtle – biases that are upheld by those in this group who hold leadership titles.

This form of zombie borrows from other defective zombie gene pools. Zombie #10 emerges in the appearance of providing order to a world that would otherwise be said to be chaotic. Zombies #9 and #8 combine to use another actor or "black hat" to provide isolation and coverage for these leaders who "would do something" if they weren't so busy attending to almost anything else. More than maintaining the status quo, we often see these zombies portrayed as #7 heroes who not only act as champions for other causes but pretend to be staunch advocates for the very issues involved with marginalization. Relying on #6 parliamentary type "rules" and espousing their overriding support for law and order, they act as #5 cheerleaders for a version of the truth that best suits THEIR causes. And their perspective is both faulty and jaded as they are known to #4 misrepresent data and act as though the #3 subparts matter more than the whole. They flaunt their #2 title and do everything they can to KEEP their position instead of fulfilling their responsibilities. Whereas a few of these zombies have common genetics, this is the zombie supreme because it draws from each of the other forms and the unquestionable damage it inflicts. Whether this is a school administrator or the state or national political figure they may be emulating, this #1 zombie leader is a remnant from an ugly past that does not play a useful role in today's society.

---

## Implications

Philip Schlechty (2009, p. 3) reported, “there is general agreement that the schools of America must be improved. There is, however, less agreement about what needs to be done to improve them.” Though the *strategic-systemic* paradigm appears to be more *life-like* and consistent with the recent literature on educational leadership, the rational-structural approach has persisted and netted multiple victories despite its penchant in the end for creating structure embracing zombies.

Adding to the challenge of educational leadership is the fact that these trends and the abandonment of proactive processes are systemic. The primary responsibilities for governing boards have long been policy development and hiring the chief executive to carry it out. They no longer craft policy. They typically approve purchased language that is written by attorneys to reflect what the legislatures have decided for them in advance. Schools need to be improved (Schlechty, 2009), but how will they be enhanced by making them *leadership-proof* just as bureaucrats have worked to make the classroom *teacher-proof*?

It is troubling enough to know that outdated leadership styles continue to take up space and interfere with other more attuned administrators’ development. The implications of continued zombie existence are more significant than most may perceive. Effective education is vital and does not take place without highly effective leadership. The type of leadership that is called for is that which is evolving and not well-served by holding on to the past. Along with the very recent tensions surrounding pandemic, administrators have long been called on to address equity concerns including special education and social justice reforms. Administrators who avoid the challenges that are coming (Hughes, 2014, 2019; Miller, 2018) by defaulting into zombie practices are not only failing to embrace the future – they are taking education backward and leaving it open to even more calls for accountability and compliance.

---

## Conclusions and Reflections

Schools need to be improved, and they need to meet the needs of learners with increasingly diverse learning, racial, sexual, religious, and political profiles. The status quo, personality-driven, and limited perspective forms of leadership established long ago and became the standardized forms of leadership no longer meet educational or societal needs. Often, however, they continue to stand out in response to excessive stagnation created through standardization. As pointed out by Hargreaves and Fink (2003), standardization does not align well or do exceptionally well with serving diversity and changing conditions. Instead of insisting on standardization, and taking the leadership roles away from administrators, boards, and classroom teachers, we need to free ourselves from external domination and our primary emphasis on accountability first – people second. To fail to do so will only perpetuate zombie forms of leadership.

We need to ensure we invest in the people’s capacity in our organizations (Fullan, Rincon-Gallardo, & Hargreaves, 2015), rather than turning them into the *undead*.

Zombies are considered chick in many places, though the term truly does not represent an effective form of leadership. We need to focus on hiring the right people, establishing a credible and trusting adaptive and nurturing leadership style, and support everyone's ability to work through the complex and changing circumstances that are on the way (Hughes & Davidson, 2020). If, in the end, it is our administrators' job to manage the status quo, then perhaps and even quite likely much of this is overstated. On the other hand, within a point of view which holds that our administrators are leaders who grow beyond the basic standards, then it should be clear that we need to breathe life into them beyond the minimum requirements referenced in our training, licensing, and performance standards which have not done enough to replace zombie leaders with healthy and vibrant ones.

## Abstract

What is *called into being* as “leadership” is what is intelligible as leadership through norms and “truths” at the time. It is not just based on the intent or characteristics of the leader, but on how subjects of the “truths” of the leader are constituted and hence conduct themselves. Leadership and context are connected and hence socially constructed. In fact, traditional, views of “universal” leadership traits as possessed by the leader do not help us explain or understand what has happened in Australia during the last 2 years of the pandemic, seen by most as a crisis in leadership. Having presided over closed international borders and a majority of closed internal borders and lockdowns for most of 2020/2021 the federal government provided heavily interventionist

wages support for most businesses and workers in that time. Given the closure of international borders, and the priority given to suppression of the virus, the coordinated test, trace, and isolate practices delivered in each state were largely effective. With 90% of people double-dose vaccinated across the country in November 2021 and 9 days into the Omicron variant, the international borders and most state borders opened completely or with exemptions available. The Prime Minister “declared his aspiration to get the government out of people’s lives . . . [becoming] a government in name only . . .” (Felk, 2022). Infections, and deaths skyrocketed and the test, trace, and isolate regime broke down in most places with long queues and people waiting for days for results. The new *pushing through* and *moving forward* “truths” were a major change in how leadership of the pandemic was now presented. By understanding leadership as deploying techniques of governmentality, how most people are asked to reconstitute themselves as “responsible” individuals who now valued their freedoms above social obligations of protecting others from the virus can be examined. In the new narratives of “leadership,” deaths are less important than hospitalizations and managing health systems. The resurgence of the priority of the economy shows a swing from one extreme of zero-suppression of the virus to the other, described by some as the “let it rip” strategy with one of the highest rises in daily cases and deaths in the world. The health/freedom/economy paradox remains and it is uncertain if the government can “strike the most effective response to it” (Grattan, 2022). By understanding leadership as techniques of governmentality where narratives attempt to tell “truths” for a period of time that constitute people in certain ways according to rationalities of governing, how construction of compliance or not and “leadership” or not through norms of intelligibility happens can be apprehended and therefore imagine something better. “*Living with Covid*” might be a better balance between more distanced *pushing through*, *moving forward*, and *taking individual responsibility* alongside social obligations and restrictions on freedoms that prioritizes living in addition to the economy.

**The Field of Memory**

In much of the leadership literature, ways of thinking about leadership are limited to Western models (Bush, 2007) with the impact being that our thinking is dominated by managerialist notions of leading, whose primary imperative is to render educational sites and the systems that support them, more efficient and accountable (Gunter, 2012). The study of leadership originally explored what personal traits leaders possessed (Stogdill, 1948, 1974a). Trait theories were often termed “great-man” theories identifying leadership as something of an exception. When the theories were challenged, the research navigated toward

being more situational, with the shift to identifying traits as situationally dependent (Hersey & Blanchard, 1988). The complexity of situation and trait has led to many forms of adjectival “leadership,” which struggle to describe the presence or not of leadership.

### **The Field of Presence**

Thomson, Gunter, and Blackmore (2014) argue that when one examines what is on offer to new or experienced school leaders, in relation to learning about educational leadership, there seems to be presented “a single best way to do leading and leadership, and to be a leader” (p. viii). Dominant discourses of educational leadership structure leadership as “a delivery disposition” (Eacott, 2011, p. 52), which strengthens the emphasis on the leader to inspire and influence individuals “towards the purpose of serving policy” (Atkinson, 2004 p. 111), which is becoming significantly similar across nations. Alvesson and Sveningsson (2003) assert that while most people seem to have little doubt that “leadership” is a “real” phenomenon, important and necessary for organizations, “few acknowledge problems with confusing a socially constructed label with an assumed empirical reality” (Eacott, 2015, p. 35). Leadership tends to be positioned “at the front or input end of the explanatory template normally used to account for the flow of action . . . leaders are conventionally constructed as causal agents” (Gronn, 2003, p. 278).

### **The Field of Concomitance**

Western models of leadership are individualized and rely largely on assumptions of the actor’s intention to lead as the sole criteria of “leadership.” An ever-expanding range of Western models of leadership and management are traversing the globe and “finding their way into traditional cultures” (Wallace & Poulson, 2003, p. 130) since neoliberal-influenced assumptions are made that the purpose and context of leading is the same throughout the world. However, as Harris and Jones (2015) argue, context matters significantly in regard to the preparation and training of school leaders in different countries (p. 311) and in their everyday practices. In current times, with an increasing level of “policy borrowing” internationally (Lingard, 2010), assumptions are made that “ready-made” improvement pathways exist “for weaker education systems to simply follow” (Harris & Jones, 2015, p. 313) and that there is one style of leadership that “works” everywhere.

### **Discontinuities and Ruptures**

Decontextualizing leadership extracts “the practice of leadership from the social space in which it occurs” (Eacott, 2011, p. 56). Dimmock and Walker (2005) argue that educational leadership and culture has mainly been focused on as separate entities, with relatively little consideration to their interrelationship yet being intelligible as a “leader” is not guaranteed by the intention or the behavior of the leader. Since being a “leader” is performative (Peck & Dickinson, 2009) it matters how constraints and norms operate in each moment of interaction and therefore leadership is a culturally and contextually bounded process. Ignoring this offers a piecemeal approach and impedes our understanding of it.

### Critical Assumptions

The advancement of leadership practice is dominated by managerialist discourses, which do not question the ends employed but seek to improve individual action and influence described as “performance.” In discourses of educational administration, there is a proliferation of types of “leadership” through an assortment of adjectives, yet minimal critique or problematizing of the label of “leadership” itself (Eacott, 2015). There is then, an *a posteriori* identification and labeling of “leadership” at the same time as an *a priori* assumption that “leadership” exists. Eacott asks: to what extent is leadership “present in a context in which it was already decided that ‘leadership’ existed” – are we *revealing* or *constructing* “leadership”? (2015, p. 38).

### Introduction

Over 50 years ago, Bennis (1959) argued that “the concept of leadership continues to elude us . . . with its slipperiness and complexity” (Eacott, 2017, p. 18). Stogdill (1974b) claimed that there are almost as many definitions of leadership as there are people who define it. The most common source of ideas about leadership seems to be through “regular usage in the ordinary language of the everyday” (Eacott, 2017, p. 18) including social media, television, and newspapers. As Eacott emphasizes, leadership, if it exists, is essentially “a social practice” and “defined moment-by-moment” in interactions (2011, p. 56). The reciprocal interaction between leadership and culture also creates a context-specific meaning to the phenomenon of leadership (Dimmock & Walker, 2005), which contributes to the social construction of “leadership.”

There are two integrated parts to the social construction of leadership – how leadership is conceived from the view of the “leader” and how it is understood and interpreted by those observing or engaged with it. The first part is dominant through individualistic assumptions about the idea of leadership traits and characteristics separated from context. Eacott (2013, p. 93) points out that leadership researchers, policy makers, and practitioners in Western cultures have constructed the epistemic label of “leadership” without acknowledging that the post-event identification of leadership may be a result of the *a priori* assumption that it exists. This means that scholarship pays far more attention to the description of who leaders are, and what they have done post-event, than developing the kinds of explanations, which can inform our understanding of how leadership is enacted and received. Limiting ourselves to the first dominant aspect means there is a neo-trait or neo-behavior abstraction of leadership where “the context in both space and time remains on the periphery” (Eacott, 2013, p. 95). Terms such as *leaders* and *leadership* dominate policy discourses to position those in leadership positions as expected to *transform* and *deliver* mandated outcomes but “also establish that the outcomes are a result of the ‘leadership’ enacted” (Rogers, 2017, p. 112). Traditional ideas about “leadership” are usually preoccupied with an emphasis on traits and characteristics of the “leader” within a set of assumptions that “leaders” stand out through being exceptional (Gronn, 2003).

By focusing on the second aspect of the social construction of leadership, through exploring the discursive practices of leadership (Thomson, Hall, & Jones, 2013) the focus can be on the complex set of circumstances through which reception is framed

and “leadership” is spoken *into existence*. Leaders have a key role in shaping the normative frameworks and since subjectivity is framed through multiple sets of simultaneously operating norms, it provides a moment for a concoction of norms to shape understandings, which are unstable and messy. Tingle (2018) highlights that as a society there is a focus on personal qualities and character of the leader “rather than those around them” (pp. 4–5), yet “. . . leaders only get to lead if they have followers whom they can persuade to follow. So she suggests that it is often what followers want that determines whether leaders get to emerge at all (p. 2). Determining “what followers want” is not straightforward. There is a dominance of the “strongman” “leader who succeeds or fails alone” (p. 6) resulting in fragmented communities with people who “don’t think they are being heard” (pp. 9–10).

In this chapter, I explore recent events in Australia as part of the COVID-19 pandemic. I explore the second part of the social construction of leadership through how narratives are created and modified within two contrasting examples of “strongman” leadership, and the associated subject constitution that appears to “go along with it” or not. The contrasting “truths” reflect differing histories and circumstances in perceived majority views, which is important in understanding how leadership is constructed and “received” in each case. This chapter argues that understanding leadership as deploying techniques of governmentality (Niesche, 2014) helps us understand how leadership is established, not by imposing force, but by employing tactics, practices, and mechanisms (Niesche, 2011) to *speak into existence* leadership that seeks to “arrange things in such a way that . . . such and such ends are achieved” (Foucault, 1991, p. 95). Employing techniques of governmentality center on

constituting the terms of social discourse . . . [which] direct each member of society to seek to adjust his or her own behavior . . . Individuals are not as much compelled by force but influenced to produce themselves as proper members of the society or risk being socially isolated (Foucault, 1977, 1994b, 2009) (Stanisevski, 2011, p. 62).

In the chapter I explore firstly the tools I use to examine “leadership” of the pandemic in Australia as described by various media, which includes Foucault’s notions of governmentality, power, and local truth regimes as well as Butler’s concepts of intelligibility, which allows examination of the mentalities of how leadership is understood (Gillies, 2013, p. 66). I then employ these concepts to understand the social construction of leadership in the context of Australia in 2021/2022 in the COVID-19 pandemic. Foucault’s understanding of governmentality used in this argument, “increases our awareness of the role of construction and the constructed . . . and [how we] accept these constructions as facts of nature or universal categories” (Gordon, 2000, p. xxiv).

---

## Governmentality

In many senses, what is intelligible as leadership, at its core, is about control so that “such and such ends are achieved” (Foucault, 1991, p. 95). Foucault argues that those who try to control and limit freedom of others “have at their disposal certain

instruments” that take different forms and “vary greatly in intensity depending on society” (1994a, p. 300). Deployment of these “instruments” as “leadership” can be seen as techniques of governmentality (Niesche, 2014). With this perspective, it can be understood that it is not a relation of obedience between governor and governed or “a subjection or a blanket acceptance” (Foucault, 2002, pp. 455–456) but it is moderated through interpellation (Gillies, 2013). The term *interpellation* was introduced by Louis Althusser (1918–1990) to explain the way in which ideas get into our heads and have an effect on our lives, having such a hold on us that are our own. The narratives and rationalities offered by the leader “call out” to people, offering an identity, which they are encouraged to accept. One is not forced to accept, but encouraged to *accept* them through a largely invisible, but consensual process that is taken for granted. The process of interpellation works best when it is invisible, when individuals accept cultural notions as though they are obvious, or natural, when it seems natural. At best, interpellation works when individuals give no thought to being interpellated in the first place. Gillies (2013, p. 71) argues that “lead” can be substituted for “govern” to see the relevance of governmentality to analysis of leadership. “Leadership” is valorized in common everyday language and heavily populated with heroic images in “[m]odern business and media discourse” (Gillies, 2013, p. 73), normalizing its importance for “effectiveness” but hiding the key mechanisms or instruments by which it occurs.

---

## Power

Leadership “power” is a product of these relationships created through different rationalities. Foucault’s particular understanding of power is in how it is *exercised* in “power relations” rather than possessed (Gillies, 2013, p. 26), which supports an analysis of the network of relations rather than the traditional approach of looking at leadership through “simplistic behaviours and traits of individuals” (Niesche, 2014, pp. 144–145). The struggle over meaning is central to an understanding of leadership (Nabers, 2010) so that leadership is intimately involved in the representation of universal and dominant ways of seeing the world in which the leader communicates “particular meanings of the social as universals” (p. 937). In competition with other social logics, it is an outcome of struggle and power.

Meanings are constituted by discursive practices in which some become hegemonic and dominate the field. The “power” of leadership depends on the “leader’s” “ability to present his/her own particular worldview as compatible with the communal aims” (p. 938). This works best in situations of crisis, when previous political logics are questioned and more people open themselves up to different discourses, which may occur in succession as a succession of different rationalities (Gordon, 2000, p. xxiii). Such hegemonic struggles occur discursively, encouraging acceptance and “universal significance” (Nabers, 2010, p. 940), calling leadership into being. The struggle over meaning establishes what Gore (1993) refers to as a local *regime of truth*. Gore (1993) modifies Foucault’s use of regime of truth at “a more microscopic or local level” (p. 50) arguing that society can be conceived at “a more

local level whereby discourses and practices can contain a local politics of truth” (p. 56). What is most relevant here is that Gore (1993) emphasizes that it is not being proposed that it *is* a regime of truth but that it is helpful to examine what is happening *as* a regime of truth.

---

## Truth Regimes

A regime of truth is “the strategic field within which truth is produced and becomes a tactical element in the functioning of a certain number of power relations” (Lorenzini, 2015, p. 3). Regimes of truth do not rest on any logic or evidence but have the form:

“if it is true, then I will submit; it is true, *therefore* I submit”. This ‘therefore’ that links the ‘it is true’ to the ‘I submit’ gives the truth the right to say “you are forced to accept me because I am the truth.” (Foucault, 2014, pp. 94–95)

Every regime of truth determines the obligations of the individuals who are implicated in it and thus that they must “accept – explicitly or not, consciously or not – the specific ‘therefore’ that links the ‘it is true’ and the ‘I submit’” (Lorenzini, 2015, p. 5). Acceptance of “I submit” takes the form of a subjection or of a subjectivation, since every regime of truth asks of the individuals who are implicated in it, *a specific self-constitution*. There is always a specific subject associated with a given regime of truth for as long as he or she accepts the *therefore* that links “it is true” and the “I submit.” As a tool, viewing what is said *as* a regime of truth, enables us to understand how acceptance of the narrative means that people feel they are to “tell the truth” in order for a mechanism of power to govern (or lead) him or her. Contesting the subjectivity is “not an easy task . . . [since the mechanisms of power give] the impression that there is no real choice to be made” (Cremonesi, Irrera, Lorenzini, & Tazzioli, 2016, p. 72).

---

## Intelligibility

The cultural or contextual connection with leadership also means that the *intelligibility* (Butler, 1990/2006, 1993, 1997) of leadership is “constrained and conditioned by what is available for me to do within the culture” (Olsen & Worsham, 2004, p. 345). What is identified as “leadership” has therefore a *context of reception* as well as agency, where, depending on context, certain things are recognized as “leadership” according to current norms. People are “persuaded to follow particular norms because they hold out a promise of recognisability . . . regulated by a need to fit in” (Gowlett et al., 2015, p. 155). People make sense of what a “leader” is doing by being positioned within various discourses or narrative frames spoken by the leader. Discursive practices draw boundaries around what is accepted and valued in society, thus shaping what is seen and considered as “culturally intelligible.” People are

“interpellated (brought into being as subjects) against this backdrop of intelligibility” (Gowlett et al., 2015, p. 155).

Western models of leadership are individualized and rely largely on assumptions of the actor’s intention to lead as the sole criteria of “leadership.” According to Butler, agency is constrained by culture – “what I can do is, to a certain extent, conditioned by what is available for me to do within the culture” (p. 345). To be interpreted as *intelligible*, the subject must, to some degree, internalize and rely upon the social norms, which are reinforced, repeatedly, when the subject is called upon as a “leader” and thus recognized. The constitution of leadership of a leader is actually “an artefact of its performative constitution” (Youdell, 2006, p. 515) even though the leader *appears to pre-exist* this constitution. In interpreting who is intelligible as a leader, in any given context, what is thought to be “leadership” may not be recognized as such by those witnessing the “performance.” While, change can occur through mis-performance, which pushes the bounds of intelligibility (Butler, 1997), not every mis-performance challenges change. Over time, intelligibilities appear as traits or innate or fixed qualities, which are attributed as belonging to the person (Butler, 1993). People are “interpellated (brought into being as subjects who are leaders or followers) against this backdrop of intelligibility” (Gowlett et al., 2015, p. 155). With an approach to leadership as techniques of governmentality, Niesche and Gowlett (2015, p. 382) suggest that methods of inquiry might capture leadership practice as it happens rather than looking for *best* practice and prescription. For this chapter, I use the opportunity to look at “leadership” in the current pandemic in Australia, via newspaper coverage which constructs “leadership.”

---

## Australia As a Case for Inquiry

### The Background

The first confirmed case in Australia of Coronavirus was on 25 January 2020 in Victoria (a state in Australia) with a man who returned from Wuhan in China. In March 2020 the Australian government declared a human biosecurity emergency, and established the National Cabinet as a process for states, territories, and the federal government to communicate and make joint decisions. Australian international borders were closed to all nonresidents on 20 March. States and Territories closed their borders to varying degrees and for varying times in response to localized outbreaks. Social distancing rules were introduced on 21 March and “non-essential” services (hotels, clubs) starting to be closed. The first wave of Covid infections peaked and then started falling in April 2020. A second wave of infections emerged in May and June 2020 and was much deadlier than the first wave. Victoria underwent a second lockdown, which lasted 4 months, ending at the end of October 2020.

The nationwide vaccination program began in February 2021. Having identified a phased rollout, which prioritized the vulnerable in aged care, it ran behind schedule with hundreds of elderly residents dying, resulting in lockdowns across states. The

Delta variant emerged in June 2021 in Sydney followed by lockdowns in most major cities from July 2021. The plan to keep infection numbers low through vaccination had a slow start with the Prime Minister describing the vaccine rollout as “not a race” (Murphy, 2021) which was an attempt to disguise the federal government’s lack of planning and ineffective management. On 28 November 2021, NSW Health confirmed two returned travelers tested positive for the new Omicron Covid-19 variant. The National Cabinet had set a 90% double-dose vaccination rate as part of the National plan for post-Covid. Australia was one of few countries to pursue a zero-COVID suppression strategy until late 2021 where there were strict controls on international arrivals and response to local outbreaks with lockdowns and exhaustive testing and contact tracing of domestic clusters. Regardless of the identification of Omicron, international borders opened and many states (except Western Australia (WA)) opened internal borders in preparation for Christmas.

Once international and internal borders opened, there were rapidly rising infection rates and requirements for testing before travel, which meant that there was much more testing and tracing resulting in long queues for PCR testing.

As infection numbers soared, the public response was near panic. People rushed to get tested. As demand for tests exploded, and the test, trace, isolate and quarantine system fell apart, there was no well-thought-through or resourced system to replace it. The foundation of the regulated Covid-19 response of the past two years disappeared within weeks. (Kitney, 2022)

The Prime Minister, convening National Cabinet, made three broad changes to deal with the increasing infection rate and the consequent issues with hospitals and business supply chains, which were crippled through workers becoming ill or in isolation. The *first* step was to shift the goalposts on testing, tracing, and isolating by redefining “close contact” and eliminating the “casual contact” category, primarily aimed at reducing PCR testing queues. The impact put asymptomatic but exposed and potentially infected people back to work, which accelerated the spread of the virus. The *second* step on 30 December was to reduce the isolation period for those who passed the tougher “close contact” test from 14 days to 7 days (10 days in South Australia). The *third* decision was to encourage the use of rapid antigen tests (RATs), which were in short supply for most of the public, and subject to significant price variations. While the UK government ordered rapid antigen tests from manufacturers in January 2021 and distributed them free from April 2021, Australia resisted making a decision for most of 2021, eventually implementing “a 2-tier scheme . . . for the identified poor and not for others,” deciding not to make rapid antigen tests free for everyone (Duckett, 2022). Despite months of the Prime Minister claiming that he needed to “unshackle Australians from the yoke of (his) government’s oppressive regulations . . . border controls, movement restrictions, mask mandates, QR codes and free vaccination delivered Australia one of the lowest death rates and unemployment rates in the world” (Denniss, 2022).

From December 2021, government as it was known for most of 2020/21 disappeared, coinciding with a rapid increase in infections. On 24 January Australia recorded 58 deaths from COVID-19 bringing the pandemic death toll for

2022 to more than 900 (Withers, 2022c) and the total since the start of the pandemic in 2020 to 3225 (Department of Health, 2022). Since the opening of borders in December, Australia's weekly new cases per million people, has followed the rapidly increasing trajectory of France being the world's worst (Ritchie et al., 2022). While rapidly decreasing after 26 January, it is still above the USA, UK, and Germany.

Before the Omicron variant outbreak began in December, Australia's strict lockdowns and border closures had kept daily Covid cases to under 5000. Daily cases have surged to over 100,000 and while this may be a peak, daily deaths will keep rising for some time due to a lag in people becoming seriously sick (Coch, 2022). The *new death rate* lags behind the number of new cases.

## Trajectory of Changing Narratives

What is evident across the trajectory of the pandemic in Australia is the changing narrative of the rationality of governing or leading. Initially, the Prime Minister's narrative justified heavily regulated control of what people could do and where they could go. With the opening of borders in December 2021 and moves to *live with* COVID, the narratives changed to government "getting out of people's lives" (Martin, 2022).

Scott Morrison has stressed for months that governments of all persuasions needed to extricate themselves from the lives of Australians as we all learnt to *live with Covid*. The idea was simple. Once most of the population was vaccinated, let the virus run freely in the community with limited restrictions on people's movements. (Martin, 2022 emphasis added)

"Government," which has been central to Australia's largely successful management of the pandemic, appeared now *in retreat*. The Prime Minister switched "the mantle of responsibility from government to individuals and the free market" stressing that "Australians now needed to make their own choices about their own health and their own lives" (MacIntyre, 2022). People must take "personal responsibility" (Tamer, 2021), with "the onus on individuals to choose to take protective actions as opposed to a "culture of control and mandates"" (Tamer, 2021). He declared that "we're not going back to lockdowns . . . [or] going back to shutting down people's lives. We're going forward to *live with* this virus." (Tamer, 2021 emphasis added). *Living with* the virus did not acknowledge the true per capita rate of those *dying* from it. Despite infections surging across the country, the Prime Minister argued that "Australia must push through . . . Australia *can keep moving forward . . . keeping Australia open and pushing through*" (Ore, 2022 emphasis added). *Pushing through* and *moving forward* meant "monitoring those symptoms" and "people managing their exposure to the virus" while keeping the "economy going" (Morrison, 2022). The Federal opposition leader described it as "a "let it rip" approach" (Ore, 2022). Instead of rushing to expand capacity, state and federal governments restricted access to testing, by narrowing the definitions of who is eligible for a test and what the definition is for "close contact."

## Western Australia “bucking” the Trend

With the increased rate of infections in eastern states, WA announced that its borders would remain closed for an indefinite time, despite initially promising to open on 5 February 2022. Just as WA was to reach a 90% vaccination rate for those aged 12 and over, to be double-dosed, McGowan argued that Omicron had changed things. A booster dose was now required and hence he delayed the border opening “until at least 80 percent of the population is triple-dose vaccinated [with booster] . . . not expected until at least May.” The decision is now at odds with the federal narrative of *pushing through, moving forward, and let it rip*. Yet McGowan’s border decisions throughout the pandemic have tended to be extremely popular within his state (Withers, 2022a). Despite the WA state government’s popularity, the nation, according to the media, is divided (Withers, 2022a). While WA is continuing the process that was used for zero-suppression of the virus, it faces pressure from media, business, and families wanting to enter the state. There is also a suggestion in the conservative media of *alignment with dictatorships* by suggesting that countries with little spread of COVID-19 through their communities (North Korea, China and Turkmenistan) all “impose either communist or totalitarian dictatorships on the people” (Jones, 2022). The Prime Minister is noticeably silent on the WA position, as he faces a significant drop in a poll (conducted on January 11–15), which is prior to the federal election in May 2022 (Coch, 2022).

## The Death Rates

Withers (2022b) highlights that although Covid was always going to entail some death, the Prime Minister’s narratives about *pushing through* and *moving forward* are silent about “what the acceptable death toll actually *was*” and “it’s hard to shake the feeling that the federal government didn’t really care how many.” On 24 January the Deputy Prime Minister claimed on national radio that “people are not dying” from COVID-19. While Barnaby Joyce promptly apologized, his “gaffe was clearly a bungled attempt to deliver one of the government’s talking points: that our death toll remains relatively low by world standards” (Withers, 2022c) to deflect from the fact that Australia’s new case numbers per one million are now among the highest in the world *per capita*.

it points to the flaw in the government’s general argument that not *that* many people are dying . . . [it] is the logical extension of the claim that these hundreds of deaths aren’t worthy of much thought, and are *secondary to reopening the economy*. (Withers, 2022c emphasis added)

There is an overwhelming sense in the media that the death rate is a casualty of returning to *normality* (Bermingham, Lewis, & Iannella, 2022). The Federal government narratives are also significantly *colonial* by being silent about low indigenous vaccination rates and the implications for vulnerable populations in opening

borders. Indigenous people were among the groups initially prioritized in the national plan but there is now a “huge gap” between rates for the general population and Indigenous Australians (Allam & Knaus, 2021). De Kruijff (2022) identifies that Perth’s (capital of WA) has a COVID-19 vaccination rate for Aboriginal and Torres Strait Islander people, which is the worst of all capital cities in Australia at 57.28%. The WA Department of Health has recognized the “responsibility to protect and safeguard Aboriginal people and communities” and may be a factor in borders remaining closed.

## Different Mentalities of Governing

Morrison claimed that Omicron was “manageable” prior to Premiers’ opening most of the state borders, against the advice of epidemiologists (Kohler, 2022). However, there is little evidence of planning for the increase in COVID cases with the demand for tests exploding, resulting in the test, trace, and isolate systems developed over 2 years, falling apart (Kitney, 2022). The Prime Minister’s “promise to get government out of people’s lives and give back their freedom” (Kitney, 2022) is an attempt to cover up lack of planning and perceived care by appealing to a “truth” that prioritizes the economy. Morrison anticipated that opening up to “live with Covid-19” would come with “a rush of business and consumer confidence, which would generate a positive political mood and favour the Coalition” (Kitney, 2022). Instead with the surge in Omicron infections, people are more anxious and worried and not going out. The claims to be *pushing through* and *moving forward* without acknowledging the huge increase in infections and deaths *per capita* creates a dilemma. For people to feel they are to “tell the truth” about *pushing through*, *moving forward*, and *taking responsibility* for not infecting others they have a dilemma about how to be a consumer in the economy while protecting themselves and their family from increased transmission. The “truth” of a federal government “in retreat” does not connect to daily lives for most people, who are searching for rapid antigen tests, no longer being notified as close contacts, and realizing the promised protection of vaccination is not enough.

Kohler (2022) points to the thrust of neoliberalism coming to dominate again in federal government narratives. In the early days of the pandemic “[g]overnments of all political beliefs followed the advice of the experts and implemented tough policies aimed at achieving zero spread of the virus” (Kitney, 2022).

As governments imposed tight anti-Covid controls, poured vast sums of public money into the economy to keep it from collapsing, and accrued significant levels of debt, there was a growing sense on the right that there had to be an aggressive counterattack to begin reversing these changes as soon as was possible. (Kitney, 2022)

Scott Morrison’s “promise to get government out of people’s lives and give back their freedom” is a clarification that the initial interventionist approaches by government are no longer the norm and “now (is the) time for governments to . . . step back” (Kohler, 2022). In the eagerness to deflect blame for significantly increased

infections and deaths as well as poor planning, the Prime Minister acts like “nothing could have been done differently” (Withers, 2022c). The Prime Minister is deploying the narratives of Thatcher and Reagan to declare there is “no alternative” and that “government is not the solution, but the problem” (Kohler, 2022). The continuing border closure in WA, is at odds with the federal government, showing that there *is* an alternative and government does offer a solution. Government responsible for a zero-COVID suppression strategy is no longer intelligible as leadership of the country for most of the eastern part of Australia. Morrison has read decreasing compliance with the former invasive social restrictions of the eastern states as a governability issue that can be addressed with new narratives of “freedom” and “getting out of people’s lives” so they can spend and support the economy. Living *with* the virus is “remaking our sense of the difference between civil and uncivil, considerate and inconsiderate, benign and dangerous . . . [it is changing] our sense of obligation to one another” (Bongiorno, 2022).

Understanding leadership requires more than the intent of the leader, but also intelligibility of the idea of “leadership.” Individuals are interpellated through narratives of “truth,” which leaders attempt to use to control and limit what people do to meet the ends desired, but the narratives need to connect to experiences and the everyday lives of each person for them to be able to *tell the truth* to be governed in the way intended. Telling the truth in response to techniques of governmentality requires an understanding of how interpellation happens. Dolan (2020) indicates that in regard to leadership, it may be that the perspective of paradox/dilemma is presented to “talk” to a fragmented community. The traditional idea of leadership as about leaders and their intent assumes a largely harmonious community. The Prime Minister had an opportunity to connect his “truth” to the everyday experiences of people by acknowledging the health/freedom/economy paradox present in the pandemic and highlighted by events of December/January with rapidly rising infections and death rates that were not mitigated by the double-dose vaccination requirements. The possibilities for thinking with paradox – and the simultaneity and interrelatedness of its opposing sides – are evident in the example of “leadership” during the Australian pandemic through their absence. Leadership *comes into being* by being intelligible within paradox if it is acknowledged and spoken to. “Leadership” is constructed in context through different ways of viewing the world in different places largely as a result of the interrelationships formed through interpellation of subjects within discourses or narratives. Identifying paradoxes provides insights into the “competing forces that haunt and contradict the simplistic positivist accounts that inform contemporary . . . policy” and leadership notions (Dolan, 2020, p. x). When subjectivity is taken into account and a fragmented community is apprehended in its paradox, it might be possible to go beyond simplified accounts of “leadership.” In a speech to the National Press Club on 1 February, the Prime Minister attempted “a mea culpa for his mistakes during the pandemic that he acknowledges prompted Australians to question his leadership” (Minear, 2022). Thinking that “some form of contrition was needed to address the level of community anger being directed his way” (Benson, 2022), he admitted to mistakes made by his government during the pandemic but refused to personally

apologize, preferring to reflect on the pace of the vaccine rollout and being too optimistic (Malcolm, 2022). He acknowledged that he could have militarized the vaccine rollout earlier, and been less optimistic about people having a great summer (Benson, 2022). His tone was that there was no need to panic and certainly not to “put everything you have all worked so hard for . . . at risk” by voting for opposition parties in the May election (Minear, 2022). He failed to represent the health/freedom/economy paradox present in the pandemic in ways that connected to everyday lives, choosing to reaffirm the priority of the economy and jobs from a more distanced view.

---

## Conclusion and Reflections

The exercise of leadership in these times is problematic. This chapter moves away from the familiar and orthodox in leadership literature, which views leadership as traits or characteristics of “successful” leaders to try to understand the social construction of leadership “power.” The chapter sits within the challenge to see “leadership” in the context of crisis, revealing paradoxes for leading (Dolan, 2018, 2020). This chapter looked at the pandemic in Australia 2020–2021 in a questioning way to examine how leadership is socially constructed in different contexts. Insights from this situation can inform others thinking about leadership in other contexts and sites.

Throughout the pandemic health/freedom/economy paradoxes have formed at the margins of the narratives of “truth” from the Prime Minister, largely unrepresented as choices and unconnected to everyday lives. His recent new “truths” talk about *getting through, moving forward*, and the priority of the economy and freedom at a time when the rate of infections per capita is only second to France as the highest in the world. The recent WA reversal of its anticipated border opening, highlighted this dilemma of community health and the economy, in a rare acknowledgment that it is not the either/or certainty described by the new “truths” of the Prime Minister. The silence on the per capita death rate holds open the paradox of individual freedom versus social obligation and the mentalities of governing that constitute people. Our capacity to discern and name what is being “seen” as leadership depends on the norms that frame recognition, moment by moment in context. Butler’s interpretation of performativity and intelligibility adds to an understanding of leadership *in* culture through providing tools to reflect on how cultural norms can impact how leadership is “seen.”

As is pointed out in *The Conversation*, the future trajectory of the pandemic in Australia might include a royal commission into Australia’s pandemic response because it is gaining support across the political spectrum (Grattan, 2022). There is much agreement in the media that “Australia’s journey through the Omicron outbreak has not been managed effectively” and it needs to be understood better to plan for future pandemics, which most people think is certain. Most of people have not yet “learned to live with the disruption of Omicron, or as yet to strike the most effective response to it” (Grattan, 2022).

In COVID's early days in Australia, deaths were very much front and centre in public attention. Now, despite a highly vaccinated population and a less lethal variant of the virus, the substantial death numbers are higher than the narrative of late 2021 led us to anticipate. (Grattan, 2022)

Many experts believe Covid will eventually be endemic rather than epidemic because the underlying factors driving the disease will change through increased population immunity either through vaccines or infection, and also through continuing mask wearing, hand hygiene, and social distancing (Mateu, 2022). It will remain part of our lives as influenza does but because statistics are reported most people are reminded of the cost. Prior to being endemic, however, the proportion of cases that are asymptomatic or mild has increased, and the global infection detection rate has declined from 20% to 5% with perhaps 80–90% of infections as asymptomatic (Murray, 2022) and perhaps not detected. While it is predicted that for a few months after March 2022 there should be low levels of virus transmission, eventually immunity, whether infection or vaccination derived, will wane, creating opportunities for continued transmission, especially in winter in Australia (Murray, 2022). The health/freedom/economy paradox remains with us and the question of whether we can “strike the most effective response to it” (Grattan, 2022), which will recognise a better balance between more distanced *pushing through, moving forward, and taking individual responsibility* alongside social obligations and restrictions on freedoms, is still a struggle and a question for all leaders. It might help to understand leadership as techniques of governmentality where narratives attempt to tell “truths” for a period of time that constitute people in certain ways, thereby constructing compliance or not and “leadership” or not through norms of intelligibility.

## Abstract

This chapter examines the evolution of thinking in the field of educational administration/leadership. A field is a site of practice in a contested social space. Bourdieu (*Practical reason*. Stanford: Stanford University Press, 1988) indicates that a field contains *doxa*, that is, knowledge, ideas, processes, outlooks, procedural shortcuts, assumptions with an approved set of linguistic words and ideas. Over time the *doxa* of a field undergo changes. The reasons for the change may relate to significant new discoveries, which lead to replacements and shifts among the *doxa*. In other cases, political influence may be behind such changes. The distinctions between Foucault's three enunciative fields are never hard and

fast. The reason is that a “field” is a fluid social space, one in which there is no final authority to determine or define its “true” nature. A “field” therefore is a social space of constant struggle and uneasy peace. The shifting nature of the field of educational administration/leadership is examined in this chapter highlighting some of the major “turnings” that have endured.

### Keywords

Field · Doxa · Scientific management · Aesthetics · Accountability · Managerialism · Qualitative research · The theory movement · Paradigm · A “turning” · Cognitive aesthetics · Management by objectives · Total quality management · Leadership · Somaesthetics · Connoisseurship · “Whole person” · Leading beautifully

### The Field of Memory

For centuries leaders in the West were described and studied in the arts and humanities. There were no “scientific” studies available since the social sciences are a relatively recent phenomenon in higher education. With some notable exceptions, leaders in past centuries who come to us in written texts were almost uniformly male and heroic. Writers describing and comparing leaders found different yardsticks to conduct their analyses and draw conclusions or didactic lessons from them, but they were nearly always presented as “whole” characters. It was acceptable and even admirable if their inner thoughts were also part of an inclusive reality of leading.

Arguably at the base was *The Iliad* of Homer. Since over half of this epic poem is actually dialogue (Alexander, 2015, p. xxii), readers can derive glimpses of the characters’ motivations for their actions between themselves and others. It should be clear that making judgments about the connections between speech and action is highly and often distinctly cultural. Leaders in these foundational Western texts are situationally placed and presented holistically by their authors. Other classic texts were Plutarch’s *Parallel Lives*, Seutonius’ *Twelve Caesars*, Machiavelli’s *The Prince*, Vasari’s *Lives of Painters, Sculptors and Architects*, and, of course, the tragedies of Shakespeare.

However, these classics in the Western canon were erased with the widespread adoption of scientific management of Frederick Taylor and later the positivism of the Vienna Circle as nonscientific. The result trashed the study of the whole person because emotions, beliefs, and aspirations of the human were excluded. Biography was one of the remaining fields where the full humanity of a leader could be studied for as Barber (1985) observed about US Presidents,

Every story of Presidential decision-making is really two stories: An outer one in which a rational man [sic] calculates and an inner one in which an emotional man feels. The two are forever connected. Any real President is one whole man and his deeds reflect his wholeness. (p. 4)

While the attitude of many academics in educational leadership remains resistant to reopening the debate regarding the classics and whatever they may have any value to inform us about leadership, there is a growing awareness that traditional vocational textbooks in the field leave out what Johnson (1996) has indicated, “[that leadership] is also an inherently humanistic concern where ambiguities, contextuality, and normativity require the interpretive methods and devices of history, literature, and philosophy (among others)” (pp. 13–14).

If leadership is stripped of its dealing with the central moral values of our times in order to pursue a “scientific” study of leadership, T.B. Greenfield (1991) concludes that “it leaves a field that is regrettably and unnecessarily bland and boring” (p. 6). He then goes on to explain:

The difficult and divisive questions, the questions of purpose and morality, the questions arising from the necessary imposition of one person’s will upon another, the questions that challenge the linking of ends and means – all these matters are set aside in a search for a pallid consensus and an illusory effectiveness. (p. 6)

Dealing with moral issues requires that the field return to what is described in an aesthetic or “whole person” perspective. Another is to keep searching for a better science (Lakowski et al., 2017). The line of argument of this chapter is that a vision of an aesthetic approach offers an alternative that may be more promising.

The field of memory contains the early rejection of classic humanistic texts, which for generations were inspirational and instructive in dealing with leadership issues in education, especially the moral issues. It also is centered on the many versions of science that seemed so promising and have all but petered out in the quest for a science of management because “no science, social or physical, can tell us what is right or wrong” (Hodgkinson, 1978, p. 146).

### **The Field of Presence**

Educational leadership is an applied field. It has few pure concepts regarding leadership that are not transplants borrowed from other disciplines. The field of presence in educational administration/leadership is bordered by ideas, concepts, or practices that those in positions of influence and power determine to be the most important and/or relevant to good practice. It is difficult to precisely define the borders because of the phenomenon that past practices are often renamed and reinvented to become reconnected to the present. Thus, some of the tenets of scientific management are renamed and reinserted into contemporary thinking. The “one best way” of the former becomes the “best practice” of the latter as one example. This transformation has been called by Pattison (1997) “neo-Taylorism” (pp. 22–23).

The dominant ideologies in the current field of presence are not theories of learning or even teaching. Rather they emanate from the ideology of neoliberalism, economics, and certain business concepts and practices such as the remnants of total quality management and the heritage of scientific management. Collectively they can be grouped under the rubric of *managerialism* sometimes also called

accountability (English & Bolton, 2016, p. 100). The philosophical perspective with dominance in educational leadership research is “positivism/behavioral empiricism” (English & Ehrich, 2015, p. 853). Gunter (2002) similarly noted that a combination of empiricism/behaviorism is the dominant outlook in the United Kingdom.

### **The Field of Concomitance**

Almost from the beginning of the serious establishment of departments of educational administration at the university level in the 1920s and 1930s in the United States, the field has been dominated by ideas, concepts, and theories from outside education. The most profound was the doctrine of efficiency as embodied in *scientific management* with tentacles deeply embedded in business and management. These approaches and perspectives remain dominant in educational leadership today. Post *scientific management* concepts continued on only with new titles such as *accountability*, *quality control*, *scaling up*, and *de-skilling the work force*.

In the last century, school leadership/management practitioners went through an infatuation with such business techniques as management by objectives (MBO) (Odiome, 1965). Peter Drucker (1974), a revered business consultant, proffered the view that “management by objectives and self-control may properly be called a *philosophy of management*” (p. 442).

Edward Deming’s (1982) *total quality management (TQM)* had a profound impact on educational leadership thinking, introducing such terms as *constancy of purpose*, *continuous improvement*, *do it right the first time*, *quality built in*, *quality circles*, *the fourteen points*, *quality improvement*, and *zero defects*. Gabor (1990) explains that “. . . in a Deming-oriented process, the goal is to bring workers into statistical control – that is, to have their work be as uniform and predictable as possible” (p. 26).

In turn, with the hero worship of Edward Deming in Japan and later the United States, such Japanese manufacturing terms as *kaizen*, *kamban*, and *warusa-kagen* have attained recognition in education. *Kaizen* has been called “. . . the single most important concept in Japanese management – the key to Japanese competitive success” (Imai, 1986, p. xxix). Essentially, *kaizen* means gradual, systematic improvement within an organization of all people at all levels. *Kamban* refers to the “just in time” system that has reduced the cost of inventories in manufacturing. *Warusa-kagen* refers to things that are not quite correct, but haven’t become problems yet. However, if not addressed such matters could become worse.

Although many other fields and/or disciplines have had an influence on the practice of educational leadership or administration (such as psychology, social psychology, philosophy, and economics to name a few) none has had a more profound impact than sociology and to a lesser extent anthropology, specifically the sociology of organizations and the development of qualitative research methods beginning with ethnography, a historic method of anthropology. The sociology of organizations was spurred by a translation of Max Weber’s bureaucratic theory in 1946 (Gerth & Mills, 1958). A larger body of work in sociology was Talcott Parson’s (1951) *The Social System* and Robert Merton’s (1968) *Social Theory and Social*

*Structure* as well as Blau and Scott's (1962) *Formal organizations: A comparative approach*.

The result has been the nearly universal graduate level course in educational leadership/administration or "Org Theory" as it is commonly known (Hanson, 1979; Owens, 1970). The emphasis of "org theory" has been on organizational structure and social space. The perspective of most "org theory" courses is that they study organizations as wholes and downplay or ignore the individual or the "whole person." Argyris (1972) wryly noted this attribute when he observed, "The 'variable human' seems to be minimally variable and minimally human. Concerning the former there is no place (in the theory) for individual differences. Concerning the latter, feelings, defenses, needs, self-concept, self-esteem, etc. are not included in the theory. The concept of the 'human variable' is only slightly enlarged from economic man [sic] and satisfying man" (p. 33).

While the term *qualitative research* first appeared in the 1970s, the traditions of conducting it can be traced to the seventeenth century and the early 1900s. The basic procedures involved the fields of anthropology, sociology, and ethnography as early anthropologists compiled their field notes (Wanat, 2006). The subjects of ethnographers were usually other human beings living in different contexts. The definition of what has come to be termed qualitative research within the social science disciplines was "the analysis and understanding of the patterned conduct and social processes of society" (Denzin & Lincoln, 1994, p. 6). Today qualitative research is well accepted within the methods of inquiry in educational research, and it usually involves the whole human being or beings in the conduct of inquiry.

### **Discontinuities and Ruptures**

Shifts in thinking within a field have occurred in nearly all professional fields. A "field" is defined here in Bourdieusian terms as a social space, which is in a more or less constant state of tension (English & Bolton, 2016). The reason is that there is no final authoritative source to which to appeal. In some ways a field is much like the internet in that no one owns it. Ideas, concepts, and ideologies must compete for loyalty and dominance from the major players in the field. Three forms of capital enable a particular perspective to attain hegemony: political, social, and economic. Thus, money, political power, and social consensus are and continue to be utilized to advance an individual or a group's power and influence in their field.

Culbertson (1988) indicates that the first textbook in educational administration in the United States was published in 1875, though Mason (2004) has found several earlier books in 1829 and 1832, respectively. According to Mason these early texts were "untouched by theory, comprehensive survey of practices, or controlled experimentation" (p. 17). They were "cookbooks" of thought and classification of tasks.

One of the first major ruptures in the field occurred with the adoption of scientific management and its tenets of cost control and efficiency (Callahan, 1962). The infatuation with Taylorism still exerts a huge influence on the field today. Much of it has morphed into aspects of accountability. Then came the human relations influence and a push for democratic administration.

The second major rupture occurred with “the theory movement”, which led to the founding of the University Council for Educational Administration (UCEA) in the late 1950s. The emphasis behind the establishment of UCEA was a desire to move the field toward a more theoretical foundation based on the social sciences, sociology, psychology, and anthropology. One elusive goal was to create a science of management or administration. The pursuit of this goal has largely been abandoned though Evers and Lakomski (1991) still insist that “we do not need alternatives to science, we need better science” (p. 213). They proposed that the promising alternative is natural science using a coherence theory of epistemic of justification (Evers & Lakomski, 2016).

One of the sharpest ruptures in performing research in educational leadership sprang up over the so-called lack of rigor in applying qualitative research. These were the “quant/qual” debates. The quantitative objections which surfaced were that the objective world “out there” was being misperceived by subjectivist thought, which was unscientific in nature. The researcher’s objective pursuit and interpretation of truth in the world beyond bias was sacrificed with qualitative methods. Only quantitative approaches avoided these traps. Denzin and Lincoln (1994) defined the essence of a qualitative approach to research as combined two prongs: “a commitment to some version of the naturalistic, interpretive approach to its subject matter, and an ongoing critique of the politics and methods of positivism” (p. 4). Whereas in the 1988 *Handbook of Research in Educational Administration* “qualitative research” as an index topic is not even cited, by 1999 in the *Second Handbook of Research on Educational Administration* the topic is cited nine times. By 2010 when Papa and English studied 1027 doctoral dissertations listed in ProQuest in educational leadership completed during the years 2006–2008 they found that based on a review of abstracts, 33% employed quantitative methods, 53% were qualitative, and 12% applied mixed methodology. Two percent were listed as “other.” Qualitative research had become dominant in this time period.

### **Critical Assumptions or Presuppositions**

There are many assumptions and presuppositions, which undergird leadership and management. One is that the world can be best understood or transformed into a logical, rational, and predictable place with the utilization of a scientific perspective. One of the major assumptions of leadership and management is that with the techniques of science applied to managerial practice, organizations such as schools can be improved over time. However, there are other assumptions that challenge that perspective. Pattison (1997), for example, asserts that “management can usefully and credibly be seen as a kind of implicit religion with particular doctrines, rituals, practices and ethics that form a real faith system” (p. 2).

Another critical assumption is that when the “field” is discussed and the major ideas traced to their sources, that the metaphor of a staircase is always present, that is, ideas regarding administration or about leadership are shown as a progression of one model or paradigm at a time. This is the view of theoretical change advanced by Thomas Kuhn (1996) in his widely popular and influential book *The Structure of Scientific Revolutions*. In Kuhn’s world change is linear and occurs when a pre-vailing theory is replaced by a new theory when the weight of the evidence suggests it has become outmoded. Kuhn proffered that this was “normal science.”

An alternative perspective was discussed by Lakatos (1999) who advanced the idea that paradigms usually run parallel with one another and compete with one another. Lakatos advanced the idea of theoretical pluralism and proffered that this perspective is “normal science.” He insisted that Kuhn’s notion of paradigm change was “abnormal science.”

Another assumption which is parallel with the older one is that of social action. The older tradition was that administrative actions work in the external, “out there” world. The emerging perspective is that leadership is constructed. It is a social construction between a leader or leaders and the led. Such a relationship is fluid and contextual.

---

## Introduction

This chapter presents a discussion of the evolution of educational leadership. It traces some of the important ways leadership has been conceptualized as a field of study commencing with portraits of leaders in the ancient world, through to the rise of scientific management prizing the cult of efficiency in the nineteenth and twentieth centuries, to more contemporary times that have not only provided a critique of the domination of a science of leadership but have also put forward alternative perspectives. An alternative perspective that is proffered in this chapter draws upon insights from the humanities and the arts and is located in the field of aesthetics. In the final part of the chapter, a cogent argument is made for an aesthetic framework to restore the “whole person” to the study of leadership, thus valuing the humanistic and artistic dimensions of leaders’ work including their intuition, emotions, passions, and imagination. The concept of connoisseurship, a term borrowed from the arts, is also considered in this section as providing a way of explaining how leaders (and artists) develop their “discerning eye,” which is central to any understanding of human performance.

---

## Portraits of Leaders and Leadership in the Ancient World

A 15,693 word epic poem written around the year 150 BCE arguably marks the formal beginning of a study of leadership in the Western canon. *The Iliad* has enchanted listeners for centuries. Alexander (2015) called *The Iliad* “... a powerful, first-rate story, whose dramatic action is wrapped around such time-tested tropes as insulted love, loss and revenge” (p. xii) *The Iliad* begins in the tenth year of a war between the Greeks and the Trojans. The warriors of *The Iliad* have names familiar to many high school and college students: Achilles, Hector, Paris, Priam, and Helen.

The other feature of *The Iliad* is that its characters are presented in the “round” in that they come to the reader fully formed (Alexander, 2015). They are not sketches but portraits. Both their good features and their flaws are included. The other contemporary aspect of the leaders in *The Iliad* is they interact with one another. They verbally express their thinking. Actions, motivations, and emotions can be discerned and connected. The characters are not simply manikins in department store windows, but real human beings embroiled in a protracted and terrible struggle. The magic of *The Iliad* has charmed readers for centuries. It is said that Alexander

the Great kept a copy under his pillow. Century's leader Heinrich Schliemann actually discovered Troy from his close reading of *The Iliad*.

Other legendary texts dealt with leadership issues and leaders not only in a military venue but in politics and the arts as well. For example, one of the most famous authors of the ancient world was L. Mestrius Plutarchus, or Plutarch as he is more popularly known. Somewhere between AD 105 and AD 115 he wrote *Parallel Lives* or *Dual Lives* (Grant, 1970). In this work, a later source for several of Shakespeare's plays, Plutarch compared the lives of famous Greeks to illustrious Romans. Plutarch thought of himself as a kind of ethical biographer. When he compared his Greeks and Romans he looked for little quirks in their personalities and unwitting telltale verbal cues in their actions and speech. It is from this discerning scrutiny he moved to draw ethical lessons as a kind of didactic. Plutarch's summaries of his famous lives have resonated with leaders through the centuries. At least three US Presidents read Plutarch: Thomas Jefferson, Theodore Roosevelt, and Harry Truman (McCullough, 1992) along with US General George S. Patton (D'Este, 1995).

Another contemporary ancient world biographer of leaders was Gaius Suetonius Tranquillus or Suetonius. In his times Suetonius was described by his contemporaries as *scholasticus* (scholarly) and *eruditissimus* (extremely learned). His field was that of *grammaticus*, "a teacher of literature, one who specialized in the meaning and usage of particular words and the explication of obscure names and references" (Rives, 2007, p. xx). Suetonius' most famous work was *The Twelve Caesars*, written somewhere between AD 107 and 118. Although there is much scandal in this text, Rives (2007) notes that "Suetonius was a serious scholar who had already made his reputation with several major works" (p. xxiv). Whereas Plutarch was interested in approaching leaders through a very fine eye to history and ethical detail, Suetonius took a very different approach. He created "a sort of balance sheet, an analytical framework that would allow for a clear assessment of each emperor's relative success or failure" (Rives, 2007, p. xxxi).

Wilson (2017) summarized the classical Greek notion of leadership, which still resonates in the literature of contemporary times, by noting that one of the characteristics of it is that it is concerned with

what might be called their individual character, temperament or what we today understand as personality. It is also what the leader does, incorporating every moment of every day and every action. It is about the outcomes which leadership is said (and called on) to produce, such as order and obedience. Finally, it is about the underpinning knowledge and virtue which guide the leader in their being and doing. This holistic notion thus incorporates the intellectual, moral and personal attributes of a leader, the full suite of activities in which a leader engages, and the outcomes of those activities. (p. 51)

---

## Portraits of Leaders and Leadership in Renaissance Times

Two of the most famous writers on leaders and leadership in Renaissance times were Giorgio Vasari (1511–1574) and Niccolo Machiavelli (1469–1527). Vasari's most famous work is his *Lives of Painters, Sculptors and Architects* published in 1568.

Vasari was himself a reasonably competent artist and he used his knowledge to critique and rank the artists of his times. In his book were 23 portraits of artists and sculptors, which included Leonardo da Vinci and Michelangelo. Only one of the portraits was a woman, *Madonna Properzia de' Rossi*, sculptor of Bologna.

Like other writers of leaders, Vasari's portraits of the famous artists included "... their personalities and idiosyncrasies formed [around] a particular theme ... These were to be seen as models of instruction" (Jacks, 2006, p. xiii). Vasari also began to insert in his portraits judgments about their lives, which represented moral determinations. Jacks (2006) noted that, "To Renaissance viewers, ... the conduct and the psyche of the artist were inseparable from the meaning that might be drawn from his (sic) work" (p. xiv).

The other great portraitist of the renaissance was Niccolo Machiavelli (1469–1527). Machiavelli was famous in his own time for his satirical, comedic plays. He traveled a great deal and he had many opportunities to observe leaders and their actions. He became a skilled negotiator. In his immortal *The Prince* Machiavelli (1535/1950) modeled his leader after one in real life, Cesare Borgia. The portrait of a leader in *The Prince* is a leader who is ruthless and clear eyed. Machiavelli was most likely the first political scientist of his times. He did not see the challenges as the world should be. Instead he saw it as it was. He indicated that luck had no favorites. Luck could smile on a person without principles as well as on a leader with principles. For a leader to succeed, "he (sic) needed to be bold, daring and audacious, he needed to rise above the base and unworthy pursuit of riches and, above all, he needed to govern in such a way that would bring him glory and honour" (Lee, 2020, p. 388).

---

## **The Nineteenth and Twentieth Centuries: The Decline of Leadership, the Heyday of Scientific Management, and the Rise of School Administration**

The mid-nineteenth century witnessed one of the last of the great landmark books on leadership and the rise of educational administration as an alternative perspective. Thomas Carlyle's *On Heroes and Hero-Worship and the Heroic in History* was published in 1841. By 1935 it had gone through eight reprintings. Both Winston Churchill (Gilbert, 1991) and Mohandas Gandhi (Fischer, 1950) read and were inspired by Carlyle's portraits of great men. Churchill even quoted Carlyle on the floor of the House of Commons. Perhaps it was Carlyle's summary of his judgment about Napoleon that caught Churchill's eye when comparing Hitler to him. "The heavier this Napoleon trampled on the world, holding it tyrannously down, the fiercer would the world's recoil against him be, one day. Injustice pays itself with frightful compound-interest" (Carlyle, 1841/1935, p. 316).

While Carlyle's book was enormously popular and influential in its time, the so-called "great man theory" of leadership has been subjected to derision, debunking, and scorn (Getzels et al., 1968; Jennings, 1960) for among other matters ignoring "great" women with the exception of "Joan of Arc, Elizabeth 1 and Catherine the Great" (Bass and Bass, 2008, p. 49). The important point with

Carlyle's work is that it examined and extolled "whole" people. This tradition from ancient history still continues into contemporary times with only a smattering of similar books in educational administration. In contrast, the continuation of "great men" stories remains very popular in the field of business. The modern business CEO has become the equivalent contemporary of the Machiavellian *Prince*.

One year after Carlyle's book was published in 1841, Potter and Emerson released *The School and The Schoolmaster* in America. In this 552 page practical work, the authors sketched out "education most needed in the United States, the present state of common schools, and the best means of improving them" along with the "duties of parents trustees, inspectors" (facing page).

Texts published after the Potter and Emerson (1842) book and up to the turn of the century, and before the heyday of scientific management, were compendia "... broken down into an almost overwhelming array of didactic specifications for school management" (Mason, 2004, p. 17). A description of one of the books published by Samuel Dutton in 1903 could be aptly applied to nearly all of these early professional books. They were "... an example of professional self-consciousness, neither effete nor exaggerated, but arising out of meticulous notation and classification of the array of tasks involved in running schools" (Mason, 2004, p. 17).

It is hard to understand the impact of scientific management on education and the schools without also acknowledging that this ideology is still with us though morphed into other manifestations. The modern accountability movement, as well as *managerialism*, remains the legacy of Frederick Winslow Taylor, a.k.a. *Taylorism*.

---

## The Rise and Rise of *Scientific Management*

Callahan (1962) identified 1910 as the key date and the occasion a hearing before the Interstate Commerce Commission as the initial rise to national prominence of something called *scientific management*. The case involved a matter of whether the railroads could raise their rates, which was opposed by an argument that they should be denied the increase because they were not managed well. The claim was advanced that if the railroads used *scientific management* they had more than enough money.

The creation of this approach was the brainchild of Frederick Winslow Taylor. Taylor was not only the most famous of the efficiency experts, but also the first national business consultant (Kanigel, 1997). One year later he published his 1911 book *The Principles of Scientific Management*. While Kanigel (1997) documents the birth of scientific management and its meteoric rise in a broad band of public and private enterprises, he also clearly illustrates that there was little that was "scientific" about it. Taylor wasn't testing any theory. Based on procedures of the day all he did was identify through observation and a stop watch the approach or process then on the shop floor or business that produced the most in the shortest amount of time. Taylor was the first efficiency expert to achieve national prominence.

Scientific management swept into education and was advanced by prominent school superintendents and espoused by professors of educational administration who became some of its most fervent advocates (Callahan, 1962).

As would be expected in an age of efficiency, precious little attention was paid to issues of leadership, understanding the development of human potential or concerns, which grappled with psychological motivation. In the idiom of efficiency, a leader was one who could reduce costs and maximize return. One didn't need to peer very deeply into the human psyche because making money was the most important motivator.

---

## **Turnings in the Development of the Field**

The ancient Greeks thought about a “turning” or *strophes* in two ways. The first type of “turning” was *apostrophic*, which signaled a *turning away from*. The second type of “turning” was *catastrophic*, which signaled an *overturning*. The latter is obviously more traumatic (Rapaport, 1989, p. 195).

Following the waning interest in *scientific management*, the academic emphasis within educational administration shifted to democratic administration and later to matters focused on human relations (Campbell et al., 1987). These were *apostrophic* in nature, i.e., a turning away from matters of pure efficiency. However, the next shift in the field was *catastrophic*, that is, an overturning. This “turning” was profound. Culbertson (1995) recalled that in November of 1957 approximately 50 professors met at the University of Chicago for a 3-day seminar. Culbertson (1995) recalled, “. . . the seminar’s central message was that there was a great need to develop theory in the field and to begin building a science of administration. The seminar had an unforeseen impact. It helped spawn what later came to be known as the ‘theory movement’” (p. 34).

The “theory” movement’s intellectual twists and turns spawned an overwhelming emphasis on rationality, an overreliance on quantitative analytics, a push for more advanced and sophisticated statistical procedures, and a dominance of sociological perspectives and models. There was little room for the individual (see Born, 1996). Long before the theory movement had run its course, some of the early founders were commenting on some of its anticipated shortcomings. Halpin (1960) had observed:

Here I shall perform the *coup de grace* which I supposed will alienate me from the camps of both superintendents and scientists. I suggest that if we are to learn how to observe, how to see what is ‘out there,’ we had better avail ourselves of a rich heritage which superintendents and scientists alike have studiously ignored: the heritage of the humanities. (p. 17)

The shortcoming of the impact of the “theory movement” on preparing future educational leaders amounted to, “the endless accumulation of empirical data [which] has not produced an integrated understanding of leadership” (Stogdill 1974, p. vii). Bennis and Nanus (1985) echoed the same sentiments when they

wrote, “thousands of empirical investigations of leadership have been conducted in the last seventy-five years alone, but no clear and unequivocal understanding exists as to what distinguishes leaders from nonleaders” (p. 4).

What is missing from the empirical/structural and empirical models and methods that have long dominated the field was captured 180 years ago by the much maligned Thomas Carlyle (1841/1935):

Science has done much for us; but it is a poor science that would hide from us the great deep sacred infinitude of Nescience [unknown], whither we can never penetrate, on which all science swims as a mere superficial film. This world, after all our science and sciences, is still a miracle; wonderful, inscrutable, *magical* (italics original) and more, to whosoever will *think* (italics original) of it. (p. 10)

The purpose of repositioning a study of leadership in aesthetics as a way to restore the “whole” person is now explored.

---

## **Aesthetics As a Framework to Restore the Individual in a Reconsideration of Leadership**

For at least the last 50 plus years in the field there has been a steady trend to restore the “whole person” in studying leadership. The first forays were advanced in anthropology and sociological ethnography with research-based accounts such as Harry Wolcott’s (1973) ethnography, *The Man in the Principal’s Office*; Larry Cuban’s (1976) *Urban School Chiefs Under Fire*, and Sarah Lawrence Lightfoot’s (1983) *The Good High School*. It is interesting that Wolcott (1995, 1999) refers to his ethnographic fieldwork as a kind of artwork and talks about *the ethnographer-as-artist*.

Shortly after Larry Cuban’s (1976) portraits of school superintendents dealing with issues of school integration, R.H. Brown (1977) sketched out what he referred to as *cognitive aesthetics* in his text *A Poetic for Sociology*. His objective was to reconcile science and art by tapping into “the aesthetic dimension of sociological knowledge” (p. 3).

Brown (1977) outlined five dimensions of a text, which would provide an example of *cognitive aesthetics*. They were as follows:

- *Makes use of varied individual points of view, sometimes borrowing a specific person’s “angle of vision” when it is appropriate*
- *Employs a dramaturgical or theatrical technique of showing and not telling and sometimes momentarily becoming “objective” within this perspective*
- *Engages in generalizations from narratives using critical comments*
- *Assumes a panoramic view of events, presenting a narrative of “simultaneously happenings or sometimes disassociated scenes that a narrator agent could cover only by the use of the most improbable devices”*

- *Discovers, describes “multiple traits and facets of characters (or cultures) under study readily and plausibly without having to work things around to bring any single point of view within discovery range”* (English, 2008, p. 48; Brown, 1977, p. 62)

Using Brown’s notion of cognitive aesthetics pushes out the boundaries of the so-called “scientific” study of leadership. It strikes at the whole idea of a *science of leadership*. Further, it calls into question the adequacy of scientific method to finally peer into the closet of leadership and tell researchers something they do not already know from a dominant behavioristic perspective.

So emboldened by continuing critics of the inability to learn much more about leadership than was already known (Born, 1996; Heilbrunn, 1996), Bass (1981) reviewed and analyzed some 4, 725 studies of leadership and summarized his judgment as “the endless accumulation of empirical data has not produced an integrated understanding of leadership” (p. vii).

In a quest to move away from both a scientific and business model of leadership and to restore the rightful place of the “whole person” in leadership studies, Ehrich and English (2013) and English and Ehrich (2016) drew inspiration and insights from the humanities and the arts as a different entrance point to understand leadership. They were mindful of the saying, ostensibly attributed to Marcel Proust, that “The voyage of discovery lies not in bringing old eyes to new landscapes, but in bringing new eyes to old landscapes” (Conord & Conord, 2002, p. 171). Their first foray led them to explore the metaphor of dance that not only presented them with a new vocabulary to explore leadership but also underscored the significance of kinesthetic and emotional knowledge. The dancer and the dance yielded a venture into somaesthetics (Ehrich & English, 2013), which as Shusterman (2008) averred, resolves the old trap of the mind/body dualism since somaesthetics combines “the critical, ameliorative study of the experience and use of one’s body as a locus of sensory-aesthetic appreciation and the creative self-fashioning” (p. 267).

In their paper, Ehrich and English (2013) constructed a model of leadership as dance which identified three inter-related elements including the context which they described as the “aesthetic space in which the dance is visualized, interpreted and performed” (p. 462), the music which “provides the tempo and . . . provides structure and direction for the dance” (p. 462), and the dance itself, a form of human action that uses “body language . . . to represent knowledge, feelings, ideas and beliefs reflective of the broader culture and context in which the dance has emerged” (p. 462). Central to the metaphor are the dancers who shape and are shaped by the music and the context. So too with leaders who live and work within a social, political, and cultural context that shapes and constrains what they do and how they perform. Both leaders and dancers were viewed as being involved in artistic performance that requires kinesthetic knowledge.

As a means of exploring the parallels between leadership and dance, Ehrich and English (2013) identified a set of perennial tensions that are inherent in both leadership and dance. Two are identified here. The first is the tension between discipline and passion. Discipline refers to a set of rules or techniques that govern

practice and both dance and leadership as performative fields require the mastery of complex skills and techniques. Yet discipline or technique on its own is limited; what is needed for artistic performance and expression is intensity, passion, and emotions. Both discipline and passion are vital and when one dominates the other, it can have a detrimental impact on the overall aesthetic experience.

The second tension is hierarchy versus democracy. In dance companies and in schools, there can be a tension between distributed leadership and hierarchical leadership. A distributed leadership approach would see participants actively participating in decision making and exercising autonomy in their work in contrast to traditional leadership approaches where individual strong leaders (or choreographers), due to their legitimate role position, would be the key decision makers with the positional power to make important decisions impacting on followers (Ehrich & English, 2013). Both in dance and in leadership, “visions of egalitarianism democracy are always in tension with conceptions of strong leadership” (Schutz & Sandy, 2011, in Ehrich & English, 2013, p. 472).

An empirical 3-year investigation by English and Ehrich (2016) enabled them to continue to reimagine the field of leadership. This time, they turned to artists for inspiration and insights regarding how they perceived their work, how they overcame obstacles, and how they became more expert or developed a “discerning eye” in their chosen artistic fields.

English and Ehrich (2016) deliberately commenced their investigation with artists before moving on to educational leaders because of their desire to “bring new eyes” to their work. The interviews with artists and educational leaders in Australia and the United States revealed both similarities and differences. Both groups of participants underscored the importance of relationships with colleagues and clients (for leaders, this included students, parents, and members of the wide community) in facilitating their work, and both referred to the sheer joy inherent in the nature of their work (for leaders joy often equated with seeing happy children who were learning). A point of difference was that the artists were more comfortable with ambiguity than the educational leaders. The artists saw constraints and obstacles as opportunities to create something new and different, while the educational leaders indicated that ambiguity in their work was a source of anxiety and grief.

Based on the artists’ and leaders’ experiences, and insights from gestalt psychology, phenomenology and portraiture, English and Ehrich (2016) developed a set of dimensions of connoisseurship that revealed its core qualities. These dimensions included knowledgeable perception (or the ability to make fine-grain judgments); experience (honed after many years of learning); competence (which embraces both technique and passion); framing (an ability to see how the particulars fit within the larger structure); desire (motivation to create or to act); aesthetic vision (a combination of imagination and agency); cultural awareness and reflexivity (an ability to step outside one’s culture and see it anew); discipline (hard work and the rules that describe a field); and identity (being comfortable in one’s skin) (English & Ehrich, 2016, pp. 14–19).

In arriving at this set of dimensions, the authors were also influenced by the seminal work of Eisner (1985) who describes connoisseurship as “the art of

apperception. It is grounded in the ‘consummatory function’ of aesthetic knowing – the developed ability to experience the subtleties of form” (Eisner, 1985, p. 28). Connoisseurs, then, are persons who are able to not only look but to see, to appreciate, and to discern the subtle and the complex (Eisner, 1979). As Schwandt (1994) says, for connoisseurs, perceiving “is a kind of heightened awareness or educated perception – a particular kind of attention to nuance and detail, to multiple dimensions or aspects – that come from intimate familiarity with the phenomenon being examined” (p. 129). For Ehrich and English, the artists and leaders in their study developed a “discerning eye” over many years of experience and they exhibited several of the core dimensions of connoisseurship including, for example, knowledgeable perception, drive, competence, and motivation that enabled them to develop their fine grain skills and understandings. The study by English and Ehrich revealed that connoisseurship is not a destination but a process that is part of the human journey of learning (English & Ehrich, 2016, p. 214).

More recent work by the authors (Ehrich & English, 2017, 2020; English & Ehrich, 2020) has seen them continuing their pursuit of an aesthetic agenda for leadership. For example, they explored classical composer Franz Schubert’s “Winterreise” as an illustration of the leadership identity journey (Ehrich & English, 2017) and Maria Callas’s life and work as a study of leadership at the intersection of aesthetics, identity, and self (English & Ehrich, 2020). Their ongoing work can be summed up as considering a wide range of leadership actions as aesthetic activities.

The aforementioned discussion has considered an alternative perspective to leadership that moves away from the dominance and limitations of social science models and instrumental approaches that view leadership as a rational and technical activity. The alternative approach considered aesthetics as a useful framework to view the full human being as a person not only with reasoning ability, but one who has passions, emotions, empathy, imagination, and intuition.

---

## Conclusion and Reflections

According to Grint (1995) it is estimated that “. . . approximately every six hours, somewhere someone publishes a paper on leadership in English” (p. 134). At this moment in the development of the field the aesthetics of leadership holds some promise of breaking out of the familiar “old eyes” within a well-traversed field, which has ostensibly been mined so hard that the veins have all but petered out by many long time critics. But “new eyes” may see ore deposits that were already there waiting to be discovered. Schwandt (1994) avers that the kind of narrative that makes up the aesthetic presentation “. . . is not an iconic image or mirror of reality but a poetic, expressive that is a reconstrual or reconstitution of the experience from which it originates. It represents not a scientific way of inquiry but an aesthetic mode of knowing” (p. 129).

It is from this more ancient “whole person” perspective that researchers, writers, critics, and scholars can reopen a more productive and holistic pursuit of leaders centered in performance and beauty, i.e., *leading beautifully* (English & Ehrich,

2016). This approach offers antidotes to what Born (1996) describes as “. . . two disturbing trends where leadership studies and the liberal arts converge. These are: (1) a variety of anti-intellectualism in some leadership circles, and (2) a brand of unreflective communitarianism which celebrates groups and demonizes individuals” (p. 46).

Finally, the approach of conceptualizing leadership in aesthetic terms and within an aesthetic lens does the following:

- It challenges the borders that science has established as inadequate and unable to explain, and in some cases improve leadership practice because science has set limits on what it will examine or consider as legitimate ways of knowing.
- It positions leadership as a product of culture, which is rarely context free or neutral and does not view followers as inferior human beings who must be subservient to leaders, but as human beings capable of leadership in many contexts and at many levels.
- It accepts the full humanity of human action, which includes the irrational, contradictory, pejorative, or even destructive actions. The effects of leadership are not always good or beneficial.
- As an aesthetic activity, leadership is intimately involved with the production and manipulation of symbols to provoke individual or collective action.

Today it is much clearer than ever that leadership is a human artifact and a special kind of human invention, and as Wilson (2017) so cogently observes as a social invention it is “wide open to re-invention” (p. 2). Such reinvention requires the development of an alternative and more open theoretical view than what is usually offered in the typical university-based leadership curricular prescriptions ostensibly centered on preparing better educational leaders. Such curricula are too narrow and limited to come to terms with a serious reinvention of the full potential, which would produce substantive changes in scope or effectiveness in school leadership. That project begins with reimagining the full scope of human motivation, enlightenment, realization and self-actualization, and new borders of development and discovery that are now regnant.

## Abstract

Best practices, masquerading as perfect solutions to educational issues, often lead to simplistic notions of good teaching. The way best practices are communicated to educators and then implemented in classrooms can weaken and derail teacher discernment.

The chapter begins by exploring the foundational concepts of best practice rooted in scientific inquiry that led to concepts of common personhood, political arithmetic, and normality. Then it examines the work of John Dewey noting his arguments against prescribed practice over teacher inquiry and discernment to build connections between what teachers do in the classroom to their beliefs about teaching.

Next, the focus turns to Lortie's apprenticeship of observation and its influence on teacher beliefs. The construct of teacher beliefs is further investigated through the semiotic framework of C.S. Peirce with particular focus on belief fixation and genuine doubt as they relate to best practices.

Beliefs and best practices are then explored using complexity theory and the need for teacher discernment and the ways that fidelity of implementation muddies both best practice and results in flawed belief systems.

The chapter concludes by arguing for practice-based evidence as a way for teachers to strengthen discernment and develop better practices in their own classrooms.

---

**Keywords**

Best practice · Effective practice · Complexity theory · Fidelity · Belief · Genuine doubt · Belief fixation · Evidence-based practice · Practice-based evidence · Adaptive expertise

**The Field of Memory**

The idea of an educational practice that is an absolute good. A practice considered to be an appropriate aim for all teachers in all classrooms. An approach to instruction deemed to be the right practice for assuring that learning happens with certainty. A practice, based on the results of research, that is highly regarded. A practice or technique that teachers should aspire to precisely replicate to ensure outcomes. The idea that teachers should adhere to, adopt, and strive to incorporate certain techniques and procedures with uncritical fidelity to standardize the most efficient practices and eliminate inferior ones. Practices designated as best were often over reliant on quantitative methods and clinical research trials and then generalized to the complexity and diversity of real classrooms. Based on the research findings tied to standardized testing, teacher education was structured to train preservice teachers to adopt certain specific methods of teaching and provide building principals with lists of superior practices against which to audit the quality of teaching.

**The Field of Presence**

Certainty often distorts rather than corroborates the value of research. Classrooms are complex environments where relationships, dynamic conditions, and ever-changing culture challenge one-size-fits-all solutions to create when it comes to optimal learning environments. Best practices continue to dominate educational improvement efforts although the practices often include soft to no supporting criteria in order to monitor fidelity. Disagreements among what is actually best for specific learners and learning environments coupled with uninformed adherence to arbitrarily designated best practices can derail actual improvement. Teachers are asked to get better at doing the same things. Current trends advance arguments for effective teachers who command a wide range of processes along with the cognitive acumen to continually monitor and evaluate what they do based on whether it advances learning for diverse students across a range of learning situations. These decisions, therefore, rest on highly developed skills of discernment.

### **The Field of Concomitance**

The fields of complexity theory, improvement research, and semiotics inform investigations of a best practice mindset. They support the importance of developing teachers as adaptive experts with the confidence and discernment to harness practice-based evidence. These fields of thought reveal that it is up to educators themselves to create conditions and systems that move educational practice in *better* directions while keeping in mind that what counts as success for educators is that they impact all students' experiences in school.

### **Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field**

The need for more scientific and reproducible methods in education has been historically bolstered by citing the fields of medicine and business. The role that evidence in medical research plays and the ways the medical field communicates its research findings are seen as aspirational for educators. Others laud how business leaders and their companies actively seek and replicate practices from more successful businesses to employ as best practice benchmarks to create improved standards for their own companies. While comparisons to what works in medicine and business can generate ideas for educational improvement, both enterprises differ in crucial ways when compared to education. General concepts like medical rounds, clinical trials, and evidence-based decision-making, for example, do not translate in their entirety to educational contexts and cannot be shoehorned into the overlapping contexts of education that interact and influence one another in nonlinear ways. These approaches cannot and should not be carbon copied by educators.

### **Critical Assumptions**

The assumption that best practices actually exist and translate perfectly from clinical trials to the dynamic complexity of classrooms. It is assumed that teachers implement a practice with maximum fidelity. The assumption that classrooms are homogeneous environments where practices can be replicated. The assumption that getting better at doing the same things leads to improvement. The assumption that practices can be dictated and are not impacted by the beliefs that teachers hold. The assumption that practices researched in the twentieth-century classrooms meet the needs of twenty-first-century learners. The assumption that best practices enhance teacher decision-making.

---

## **Introduction**

The purposes of this chapter are to explore the development and impact of best practices on teacher beliefs and actions and to highlight the negative influences they can have on teacher judgment. The chapter employs a semiotic framework to examine belief fixation and genuine doubt to argue for teachers as adaptive experts and discerning practitioners who employ practice-based evidence to select *better* practices to address the complexity of real-world classrooms.

## Chapter Content: Best Practice and Common Personhood

The concept of “best practices” is neither new, modern, nor attributable to current ideals of professional growth. At its core, the idea of a best practice in education, or any other field for that matter, is that a certain practice is an “unqualified good” to be adopted for its ability to improve conditions and outcomes. The best practice concept can be traced to a quest for certainty that originated in 1667 with the publication of Thomas Sprat’s *The History of the Royal Society for Improving Natural Knowledge*. It was an attempt to harness early methods of inquiry to identify singular, effective responses to human problems to develop and distribute knowledge and expertise. It was a way to identify and package truths that resulted from experimental investigations. The Royal Society believed that by enacting these truths, their members could avoid human arrogance, set aside partisan debate, and reduce guesswork. They viewed these experimentally based practices as indisputable, factual, and right practices that promoted consensus and assured certainty and reliability (Bullough, 2019).

At the same time that the Royal Society sought certainty through modernity and scientific methods, the concept of “political arithmetic” was emerging (Porter, 1986). The goal of political arithmetic was to decree official policy based on as much information as possible about the citizens who the policy would govern in order to make it easier to centralize bureaucracy and promote social engineering. Political arithmetic, the root of modern statistics, theorized that the erratic nature of individual humans could be averaged out to “equalize subjects” so that decisions could be made on a “common personhood.” During the 1600s, the prevailing view was that it made no sense to consider people “if their common personhood was not seen as somehow more significant than their individual differences” (p. 25). Political arithmetic facilitated the identification of commonalities that could be used to make decisions about the average person.

Later, nineteenth-century statisticians promoted the concept of wise political leaders who understood “political economy”; used political arithmetic to understand the structure of human society based on statistical investigations; and could begin to chart the path of social evolution (Porter, 1986, pp. 26–27). To do this, statistical methods were used to reveal averages and dominant types, or what Porter called, “common personhood” (p. 25). Common personhood presented the basis for defining “normalcy,” a pursuit that has guided and fascinated scholars ever since. Having the ability to reveal what was normal meant that “the objective average” could be used to plot the collective destiny. And, in doing so, “the word ‘normal’ [became] one of the most powerful ideological tools” (Hacking, 1990, p. 169). The concept of “normal” ushered in a new kind of “objective knowledge” and created new criteria for what counted as evidence. Statistical laws were used reductively to reveal underlying causes and to both describe and explain events (p.iii). In terms of education, for example, statistics could be used to explain typical needs and normal progressions. Educators could compare a first grade student learning to read to what was typical progress, or quantify the percentage of fourth grade students who were

deficient in mathematics, or identify the students who showed particular proficiency for science. And, they could do it with certainty.

---

## Dewey's Argument Against the Quest for Perfect Certainty

Dewey (1929a) characterized the hunt for certainty as a “quest for a peace which is assured. . . unqualified by risk and the shadow of fear. . . Perfect certainty is what man wants” (pp. 8, 21). Dewey characterized certainty as a dangerous pursuit and drew sharp contrasts between the complexities inherent in human existence and the seductive allure of certainty and objectivity. Humans, in Dewey’s view, should resist trying to control human dilemmas with perfect fit solutions; face complex human questions with courage, humility, and responsibility; and reject inhuman and dispassionate certainty. For Dewey, understanding should be purposeful, effective, and tempered by the humble realization that educational knowledge is always incomplete and imperfect. In his estimation, certainty was only possible in theory, and what was theoretically best for a given situation was in fact only probable in real-world practice. Dewey fought against prescribing practices for teachers to blindly adopt and characterized it as an attempt to separate theory from practice and knowledge from action. Dewey deemed it impossible to discern the likely outcomes of theoretical conclusions by preaching certainty and removing doubt. Theory does not operate in a vacuum nor do all theories apply to all situations. For theory to have value, Dewey argued, it must be observed and investigated as it operates inside of practice. Deep understanding of relevant theories, then, comes from applying particular theories to complex environments like classrooms and seeking to understand both theory and practice through active inquiry. According to Dewey, simply applying prescribed best practices does not develop new knowledge or expertise.

Clearly, Dewey (1929b) saw inherent danger in promoting guaranteed outcomes. Especially troubling for him was the notion that research could be used to reduce educational practice to definite rules, which in his mind was not related to scientific methods but rather showed a “departure from it” (p. 14). He argued that “laws and rules do not yield rules of practice.” Instead, research conclusions were there to promote intentional investigations of the conditions and relationships in schools and classrooms that might otherwise be missed (p. 30). To expect teachers to copy a practice and then strive to precisely reproduce it better overtime was irrational and distorted the premise and muddied the value of research. According to Dewey, research should never be sold to teachers as a promise of certainty, similar to the way retailers use guarantees to sell products. Research should be characterized as a process that “illuminates and liberates” teacher discernment and practice (p. 15) to encourage educators to use theory and research to inform their practices based on specific classroom conditions and particular student needs.

Dewey (1929b) drew a distinction between those who attempt to constrict teachers asking them to enact a list of best practices and those who foster an educational culture that values research for its ability to widen educational scrutiny.

Perfecting practices already commonly used does nothing to improve school operations and should not be viewed as the ultimate goal of quality teaching (p. 54). To put a finer point on his argument, Dewey posed the question “How far do the existing ends, the actual consequences of current practices go, even if perfected?” The important quest for Dewey was not perfecting best practices, but rather committing to the dogged pursuit of *better* practices. He encouraged educators to “devise new means in contradistinction to improved use of means already given” (p. 60). Dewey valued the questions that arose from everyday educational practice. He credited those questions, along with the conditions and actions that raised them, as key to quality investigations that promote continuous improvement of both practices and practitioners. In other words, Dewey encouraged educators to use research to help reveal and challenge the beliefs and assumptions that underlie their classroom practices rather than as a guarantee that certain practices were best.

---

### **Beliefs Formed Through the Apprenticeship of Observation**

Teachers do not always adopt the research-based best practices they read about or learn in workshops (e.g., Devine, Fahie, & MacGillicuddy, 2013; Turner, Christensen, & Meyer, 2009). Rather, teachers teach in ways they *believe* to be best, often ignoring the findings of educational research. The distinction here is critical. Teachers’ beliefs not only determine what they do in the classroom but also influence what they count as evidence that learning has occurred (Moss, 2002, p. 10). The beliefs teachers hold, along with the beliefs that hold them, play an important role in any investigation of educational practice. Best practices were designed to promote certainty and precision in the classroom and regulate the practice of teaching itself often carrying with them an inherent mistrust in the capacity of teachers to grow on the job as they develop better and more effective practices (Brill, 2011).

Some who argue against teachers as discerning experts cast them as flawed from the start since they enter the profession armed with delusions of familiarity based on simplistic views of good teaching. They develop their delusional views over their 12 or more years of experience as students in PreK-12 classrooms. Lortie (1975) called this phenomenon the “apprenticeship of observation.” Throughout preK-12 education, students see their teachers “front stage and center like an audience viewing a play.” As spectators, they watch teaching play out and learn about how to teach indirectly through intuition and imitation. Through this partial view of teaching, they never witness the behind-the-scenes deliberations that go into classroom decision-making. Instead they learn about teaching through osmosis and never recognize or analyze explicit interconnections (p. 62). Since many of the observations probably occurred in more traditional schools and classrooms, the observers witnessed “folkways of teaching” and formed viewpoints embedded in “ready-made recipes for action.” Interpretations of the observed actions did “not require testing or analysis while promising familiar, safe results” (Buchmann, 1987, p. 161). These defective beliefs formed during their apprenticeship of observation continue to exert

unwarranted influence on the choices teachers make in their own classrooms. Teachers' unquestioned beliefs in the merits of what they observed create a foundation so seductive that it often overrides the effects of teacher education (Boyd, Gorham, Justice, & Anderson, 2013). Munby, Russel, and Martin (2001) summed it up by saying "[t]o the uninitiated, teaching unfolds as a set of skills, but to the initiated, teaching depends on, is grounded in, and constitutes knowledge" (p. 895).

Many dispute Lortie's (1975) conclusions as deterministic arguing that the term "apprenticeship of observation" pertains to the general milieu of teaching, rather than specific instances of teaching and learning" (Mewborn & Tyminski, 2006, p. 31). And they strongly disagree with the inference that learning to teach primarily occurs through cultural transmission during one's own schooling. Moreover, twenty-first-century teachers enter their classrooms a half-century beyond Lortie's work making it more probable that they observed process-oriented, constructivist approaches as students and had those practices reinforced in a variety of ways as professional educators (Smagorinsky & Barnes, 2014).

Yet, the apprenticeship of observation cannot be ignored since many teachers continue to unwittingly draw upon it. To overcome its impact, therefore, teachers must recognize and question its influence as well as confront the limits it imposes on their professional knowledge and educational practice (Conner & Vary, 2017; Cook-Sather & Abbot, 2016).

---

## Beliefs Formation and the Fidelity of Implementation

Flawed beliefs about teaching often develop during the pursuit of best practices. Telling teachers that something works and then directing them to enact that something does little to improve teaching practice or lead to professional discernment. After practitioners have best practices identified for them, they are still faced with the challenge of implementing those practices with fidelity. Poorly implemented practices can lead to failure just as easily as poorly designed practices and often produce less predictable results (Dariotis, Bumbarger, Duncan, & Greenberg, 2008; Grow et al., 2009).

Fidelity refers to the ways that a practice is implemented in a real-world setting. Although the process of enacting a practice with fidelity seems simple enough, it is quite complex (Harn, Damico, & Stoolmiller, 2017). Fidelity includes factors such as degree of compliance, adherence to steps, directions, and processes, monitoring actions with integrity, and faithful replication. Some practices are more conducive to fidelity because they are highly structured and have accompanying detailed manuals or lesson plans, but many interventions do not have these features. Others are accompanied by criteria for implementation that are often soft or nonexistent and rarely explained to teachers. Teachers, therefore, are routinely asked to enact a practice without detailed explanations of which aspects they should reproduce with utmost faithfulness and which they might modify. It is extremely rare, therefore, that a practice is implemented with 100% fidelity. Most are shaped by a myriad of modifications resulting in countless diverse outcomes (Durlak & DuPre, 2008).

Teachers who enact practices without monitoring fidelity can become disillusioned by less than desirable outcomes. As a result, they determine the practices to be ineffective and quickly abandon them (The IRIS Center, 2014). Without implementation fidelity, then, teachers are not enacting a best practice, but more likely enacting “something like it” that is neither best nor capable of contributing to improvement (Moss & Brookhart, 2015). These dissatisfying results promote distrust for the next assigned best practice along with the research that supports it. Most troubling is the beliefs about teaching that result from their experience. They are more likely to overvalue the original ways they teach, prize too highly the security of their own beliefs about good teaching, and are less likely to call into question the effectiveness of their own practices to seek what truly works best in their classrooms.

---

### **A Semiotic View of Best Practice, Fixation of Belief, and Genuine Doubt**

Schreiber and Moss (2002) examined teacher beliefs using the semiotic framework of C.S. Peirce (1877; 1931–1958). All humans, they explained, resist doubting their beliefs since the process is both uncomfortable and dissatisfying. Doubting a belief, or even entertaining the notion that a belief is wrong, is painful. Humans hold onto their beliefs, identify with them, and grow comfortable with them. Once established, beliefs are the way that individuals make sense of their world. Beliefs are so strong that they tend to persist in spite of evidence to the contrary. Teachers use their beliefs to establish and stabilize their worldview through a process that Peirce called “fixation of belief” (Schreiber & Moss, 2002, p. 26). Established beliefs are highly resistant to change, and even when they are insufficient or illogical, they can persist. Individuals tend to ignore or dispute evidence – even research evidence – that runs contrary to a belief they hold. For example, even the classroom practice of “round robin reading,” long declared “a disaster” (Sloan & Lotham, 1981, p. 135), can be found in today’s classrooms. Certainty is the enemy of doubt, and Peirce argued that beliefs, and the actions they promote, can only be altered or a new belief created to replace it when an individual enters the state of cognitive dissonance he termed “genuine doubt,” a condition of recognized inadequacy. Best practice, therefore, holds particular danger when Peircian theory is considered since it can promote belief fixation (Schreiber & Moss, 2002).

Schreiber and Moss (2002) applied Peirce’s four sources of belief fixation noting that the first three sources are the nemeses of teacher discernment. The first, *tenacity*, happens when a teacher holds onto a belief, despite evidence to the contrary, to preserve self-identity. Teacher beliefs form a particularly provocative form of personal knowledge that rarely changes even after extensive teacher education. This can explain why some teachers may resist adopting any new practice that is contrary to what they already do.

The second way beliefs become fixed is through *authority*. Well-meaning researchers, teacher educators, and professional consultants often tell teachers what to think and how to teach when they promote the blind adoption of best practice strategies and methods. Peirce argued that when fed a steady diet of what

to think teachers can become “intellectual slaves” who think and believe what they are told to think and believe. In this way, best practices can lead teachers to subordinate their own reasoning and yield instead to authoritative influences. Should a different authority introduce a practice contrary to what the teacher already does, tenacity chimes in encouraging the teacher to ignore the new practice being touted as best.

The third source of belief fixation, *a priori*, happens when individuals refrain from doubting a situation by seeking conceptual coherence to preserve their worldview. Teachers experience regular pendulum swings as textbook companies, researchers, and others promote new and replacement methods. “Yet all of these. . . approaches are sold to teachers as the technique de jour, the best practice. Too often, those best practices become the dogmas of tomorrow that are out of fashion and provoke another round of teacher training in the new and ‘latest’ technique. In other words, each new technique is delivered to teachers as a whole package, *a priori* beliefs included”(p. 27).

These three sources all resolve doubt by further fixating belief. In fairness these sources can be positive forces in life – being told not to jump off a building because it is dangerous should fixate a belief. A person should not have to doubt it or experiment to learn its validity.

The fourth source, *experimentation*, was favored by Peirce and explains the crucial need for teachers to develop as adaptive experts. Experimentation employs skepticism, openness to alternatives, discernment, negotiation, cooperation, and compromise to fix or stabilize beliefs. Teachers profit more when they find their beliefs irritated, doubt those beliefs, hold them up to scrutiny, and change, refute, or replace the beliefs based on evidence. For this, teachers require the precious luxury of time – time to become comfortable with complexities of the teaching learning process and time to gain comfort with genuinely doubting simple solutions (Schreiber & Moss, 2002).

Peirce concluded that it is only when confronted by new experiences or unfamiliar territory outside of individual comfort zones that teachers experience unease about the logic of their structures. Unease and genuine doubt, Peirce declared, are good things, not to be interrupted by canned solutions. Doubt is an uneasy and dissatisfied state from which individuals struggle to free themselves. The “irritation” of that doubt moves individuals to act. They take steps to remove doubt and restore the state of comfort. Peirce labeled this struggle to eliminate doubt and restore the state of belief as *inquiry* (Cunningham et al., 2005), a stance very much akin to inquiry described by Dewey (Dewey & Bentley, 1949).

The crucial inquiry process arising from genuine doubt can only occur via real struggle during real experience. Education, to great disadvantage and by placing too much store in best practices, has assumed that teachers must be told which beliefs are true so that they can acquire isolated bits of knowledge, skills, and techniques. Education must acknowledge the complexity of its systems and recognize teachers as worthy decision-makers able to work with uncertain information and free to use skepticism and reasoning to examine issues in real time. Rather than adopting a best practice, teachers must be supported as adaptive experts who are comfortable with doubt and able to navigate complexity with discernment.

---

## Navigating Complex Educational Systems

The ability to recognize patterns within educational problems and analyze them from complex rather than reductionist perspectives is aided by complexity theory – a diverse collection of research that examines how systems change, develop, learn, and evolve (Mason, 2008; Morrison, 2008; Walby, 2007; Wheatley, 2006). While there is no single definition of complexity theory (Cochran-Smith, Ell, Ludlow, Grudnoff, & Aitken, 2014; Davis, Phelps, & Wells, 2004), the definitions applied to education are especially relevant here. Applying complexity theory to social issues allows researchers and practitioners to examine wholes, relationships, open systems, and environments rather than their isolated parts (Davis & Sumara, 2006). Central to these examinations is the distinction complexity theory draws between complicated and complex systems (Bryne, 1998).

Although both complex and complicated systems have multiple parts and relationships and are difficult to understand at first glance, they are not the same. Some systems are simple, like following a recipe. They include some basic skills, techniques, and vocabulary, but once mastered, following the exact steps yields a high probability of success (Glouberman & Zimmerman, 2002, p. 1). Complicated systems include things like launching a rocket, or the modern automobile engine. Complicated problems contain subsets of simple problems but are not simply reducible to them. Complicated systems can be taken apart and their pieces closely examined to reveal the way the system functions. That is because in complicated systems, the whole is equal to the sum of its parts (Cilliers, 1998). Their complicated nature is connected not only to the problem's scale as in a rocket launch but also to issues of coordination or specialized expertise. Complicated problems, though generalizable, are not simply an assembly of simple components (Glouberman & Zimmerman, 2002).

In complex systems, wholes are much bigger than the mere sum of their parts. The consequence of taking a complex system apart is that the key aspects of how the system works are lost since unexpected outcomes can arise from the dynamic interactions of its parts. These consequences are unpredictable and evolving, yet not arbitrary nor unexplainable (Cochran-Smith et al., 2014). Complex systems include things like bacteria, the brain, and processes like child rearing. They are not completely knowable yet can be approached with measured optimism. For example, parents look forward to raising a child despite uncertainty and complexity (Glouberman & Zimmerman, 2002). Like the process of raising a child, educational systems are in constant states of emergence and self-invention (Haggis, 2008).

---

## It's a Systems Thing, Not a Single Thing

Education at all levels – PreK-12 classrooms, schools, in-service professional learning, university teacher education programs, school-university partnerships, and educational leadership programs – has been increasingly recognized for its complexity (Bullough, 2019; Chang et al., 2019; Cochran-Smith et al., 2014;

Davis, Sumara, & D'Amour, 2012; Jerdborg, 2020; Nielson, Triggs, Clarke, & Collins, 2010; Opfer & Pedder, 2011; Schneider & Sommers, 2006; Waks, 2011). New questions and novel approaches would foster and support educators who embrace approaches, processes, and practices to monitor and enhance learning for all students, including learners not served, underserved, and poorly served by existing systems. It will take more than archiving best practices for educators to let go of dogmas of the past that impede innovation and improvement. Rather than making education more efficient, best practice approaches tend to identify the status quo, define embedded assumptions, and frame reward systems like teacher evaluation and resource allocation. Instead of strengthening the kind of discernment educators need to navigate complex systems, best practices encourage educators to do more of the same, better and better. This quest for certainty cements behavior patterns.

Instead of being subject to “pendulum swings of polarized teaching policies that rest on simplistic ideas of best practices. . . teachers need to know how and when to use a range of practices to accomplish their goals with different students in different contexts” (Darling-Hammond, 2006, p. 304). Effective educators must develop habits of mind that “problematize unrecognized assumptions, implications and consequences” to “foster dissonance and discomfort” with conventional educational practices (American Educational Research Association, 2009, p. 482).

There is a false sense of security related to the idea of best practice. Complexity theory suggests that it is unreasonable to assume that “a full proof set of one-size fits all practices” regardless of the student, content, context, and teacher certain practices are always the best. Furthermore, complex, organic learning environments cannot be improved with simple “add water and stir” solutions (Moss & Brookhart, 2015, p. 17–18). To unquestioningly engage in a best practice without examining its fit for the myriad of conditions operating within complex learning environment means ignoring the diversity of needs and adopting Porter’s (1986) notion of “common personhood.” It flies in the face of crucial reasoning processes that are harnessed through the discomfort of what Peirce termed genuine doubt. It fixates beliefs through *authority*, promoting “trickle down decision making” that is expert rather than practitioner driven (Moss & Brookhart, 2015, p. 17–18).

A best practice orientation fails to recognize educators as adaptive experts who are informed, capable, and able to continuously sharpen their professional knowledge and skills (Hatano & Oura, 2003). Making trustworthy decisions within the complexity of real classrooms, buildings, districts, or universities in real time requires educators who understand the needs of diverse learners, recognize the demands of the content, and consider the influence of context considerations to create “infinite variations of what is best” (Moss & Brookhart, 2015, p. 24). Contemporary learners pose a range of learning situations are contextualized by distinct languages, cultures, identities, and learning approaches. Educators who serve them need deeper knowledge bases than ever before coupled with the intellectual discernment to assess barriers to learning and guide their decisions (Darling-Hammond, 2006). Discernment, the capacity to see the significance of a situation, imagine various possibilities for action, and judge ethically how one should act

promotes systems thinking. It allows teachers to notice the fine-point details to understand the system and know what to focus on and how to appropriately interpret a given context.

---

## **Conclusion and Reflection: Practice-Based Evidence Within a Culture of Discernment**

*“Culture eats strategy for breakfast”* Max Dupree

Implementing a best practice begins something like this – a researcher has an idea and designs an intervention, sets up a study, gathers evidence that it works, schools embrace it, and then assigns teachers to implement it with fidelity. But just because something works in a clinical trial does not ensure that it will work in every classroom. It is “the difference between knowledge that something can work and knowledge of how to actually make it work reliably over diverse contexts and populations” that is important for teachers (Bryk, 2014, p. 469). Seeking to understand the “how” and the “why” promotes teachers as adaptive experts who can use evidence from their classroom practices to monitor and improve what they are doing during the act of teaching (Moss & Brookhart, 2015).

Each child, teacher, classroom, district, and community are different and operate as overlapping systems to produce infinite variations of complexity throughout a school day. Simply adopting a practice doesn’t ensure that it works to improve the conditions of learning for students. The most compelling evidence for the impact of a practice is not handed down from an authority or research study. The evidence needed to discern what is actually working and what is not comes from the students themselves.

An educational culture that over embraces best practice strategies, invariably promotes two fallacies: “the pipeline” and “the empty vessel.” Originated by Lawrence Green (2008) both fallacies are apt to this discussion. Green argues that practitioners are seen as “empty vessels” positioned at the end of a pipeline that “looks upstream” for research that is “rendered increasingly irrelevant to the circumstances of practice by the process of vetting the research before it can qualify for inclusion in systematic reviews and the practice guidelines derived from them. It . . . [is a] one-way conceptualization of translation, dissemination and delivery of research to practitioners. As the empty vessel the practitioner is cast as the recipient of the evidence-based guidelines from research” (p. 20). The research and best practice guidelines that arrive at the end of the pipeline are often a poor fit for the complex conditions of practice (Green, 2001).

The complexity of the classroom is real and ill addressed through best practice solutions that try to sidestep complexity by standardizing the instructional environment to “teacher-proof” it. Instead, education must come to grips with the exceptional demands placed on teachers seeking to advance the learning and potential of diverse, responding to the dynamics of each classroom, and honoring the distinctive features of each school community (Bryk, 2014).

Recent events related to the COVID-19 pandemic heighten the call for educators who can reinvent schools (Darling-Hammond, Edgerton, Truong, & Cookson, Jr, 2020). These teachers must believe in their ability to “innovate within constraints” (Hammerness, Darling-Hammond, & Bransford, 2005, p. 364). For improvements of this caliber, educators cannot look to best practices that were derived from twentieth-century research in classrooms that were teacher, textbook, and test driven (Moss & Brookhart, 2015). Innovative processes that enable in and out of class instruction as seamless conditions of learning will require teachers who can gather evidence during each learning event and use it to improve their practice. That means moving beyond a best practice mindset where a specific set of strategies offer guaranteed solutions to educational issues to creating an educational culture focused on *practice-based evidence* (Bryk, 2014). Teachers will need to be skilled in the pursuit of evidence that is constantly gathered during daily practice locally in schools and classrooms and used to improve learning for students. Too much time has been wasted admiring the replication of certain instructional strategies without enough time devoted to using evidence from what students do, say, make, and write during the lesson in order to learn. This formative evidence tells teachers what is working and what is not in real time for the students in their classrooms (Moss & Brookhart, 2015, 2019). This evidence will help educators discern what is actually working and if certain practices actually improve student learning and overall well-being.

This chapter argues that the concept of best practice continues to be employed far too casually with the potential to mislead and fixate the beliefs teachers hold in ways that encourage them to doubt their own authority and discernment. Teachers who are encouraged to engage more rigorously in inquiry that includes monitoring and improving their own practice informed by practice-based evidence from each lesson are better able discern what practice is “best” for each of their students. This cultural shift cannot happen by adhering to a “best practice” concept that proclaims certain actions as surpassing all others. It is an unwarranted superlative that creates clones, not innovators and promotes compliance rather than discernment.

## Abstract

The hegemonic tendencies of neoliberalism as a political rationality informs a significant segment of the educational leadership literature. From within this field, this chapter draws mainly from authors who provide critique of the marketization of education and the concomitant narrowing of its purposes. While these writings are susceptible to “bulldozer” portrayals of the inevitability of neoliberalism’s global dominance (Larner, 2003), it is argued that, in its subject forming work, neoliberalism may also be usefully characterized as a “specter” – a haunting and insistent presence that becomes constitutively powerful as it insinuates its way into the thoughts and practices of educational leaders. In a shift from this spectral reading to a more tangible and scrutinizable representation, neoliberalism is conceived as a “political rationality” that intertwines with specific “technologies” and “freedoms” of government to make governing thinkable and practical, while judging the conduct of “economized” subjects (Brown, 2015) as reasonable and knowable according to the truth claims it promulgates. These power/knowledge arrangements are given expression in the idealized form of *homo aeconomicus* before attention shifts from the constitutive triumph of neoliberal subjectivity to

the more diverse and localized possibilities held in Foucault's governmentality and in "neoliberalization" as a subject forming process. A "processual" reading of neoliberalism is taken to highlight its variegated, contingent, and inconsistent qualities and, by extension, illuminating how educational leaders might engage in a struggle to occupy different subject positions and to work at and beyond the limits of the currently dominant discursive order. Various theoretical, rhetorical and practical resources – configured as "struggle tactics" – are described and the risks and possibilities of their individual and collective deployment are evaluated.

### Keywords

Neoliberalism · Neoliberalization · Educational leadership · Political rationality · Technologies of government · Governmentality · Power/knowledge · Freedom · Subjectivity · Resistance · Aporia · Agonistic practice

### The Field of Memory

Critique of the post-war Keynesian model of welfare and governance – including its advocacy of a more interventionist role for government in education – helped pave the way for the global expansion of neoliberalism. Broader purposes of education related to democratic participation, active citizenship, and social inclusion were largely subsumed or replaced by the constitutive logics of the market and a focus on the economic advantage to be derived from education and educators.

### The Field of Presence

From the 1980s onwards, the imposition of neoliberalism on education has become increasingly influential and pervasive. Under a marketization insignia, a preference for directing education toward skilling a productive workforce and contributing to wealth in the market economy has been enacted. Educational leaders, as entrepreneurial managers, are deeply implicated in these workings when they submit to its common-sense rationale and to fashioning individuated acts of compliance, performance, and self-promotion.

### The Field of Concomitance

In neoliberal times, a managerialist rationale largely borrowed from the fields of business and organizational studies has become inculcated with the subjectivity of educational leaders. Leaders must embrace the language and processes of free enterprise, respond to calls to be resourceful and agile participants in the education market, and accede to external demands to achieve, compete, and be accountable.

### Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field

The hegemony of neoliberalism is interrupted and confounded by inconstant and differentiated accounts of its historical and geographical presence. A reading founded in the process of neoliberalization exposes variegated, contingent, and

inconsistent qualities that, in turn, allow possibilities for critique and resistance, and for envisioning the counter-rationalities held in other discourses.

### **Critical Assumptions or Presupposition**

Against the treatment of neoliberalism as a worldwide specter, a critically oriented response calls for both a critique of its position of dominance and some support for working with and against the truth claims of its power/knowledge arrangements. This support runs to provision of theoretical, rhetorical, and practical resources for educational leaders and to consideration of the individual and collective efforts that remain accessible, prudent, and feasible.

---

## **Introduction**

This chapter is positioned within a broader catalogue of educational leadership literature concerned with the hegemonic tendencies of neoliberalism as a political rationality and its related capacity to shape the subjectivity of educational leaders. For definitional clarity, “educational leaders,” following Mifsud’s reference in Chapter 15 of this publication, are cast broadly as “practising leaders in present-day educational institutions”. While the use of the term at times extends to emphasizing teaching and learning concerns over neoliberal interests in market participation and competition, this pedagogical emphasis in educational leadership is not expounded in detail (for more comprehensive insights into the history, meaning and demarcation of educational leadership, see ► [Chap. 2, “The Archaeology of Educational Leadership as an Enunciative Field”](#)).

The initial interest of this chapter is in neoliberalism as a *political rationality*. Drawing from Foucault’s (2014) description of the art of government neoliberal rationality is taken to provide both a prescription for rational government and a mode of reason for governing practices. Neoliberalism as a “political rationality“ is subsequently treated not only as a way of making a particular type of government and ways of governing thinkable and practical but also as a power/knowledge pairing that makes the conduct of government, organizations, and subjects possible and knowable according to the truths it promulgates.

The reference in the chapter’s title to “specter” is used quite deliberately in these early sections to convey a concern with the real and extensive effects of a political rationality that carries insistent, haunting, and omnipresent qualities, not generally of the ethereal or disembodied kind, but rather as they apply to the actual and existing practices of neoliberalism. The *specter* of neoliberalism is not, therefore, about the imagined fears or desires of educational leaders or their anticipation – dreaded or otherwise – of what is to come. Rather, it is about the demonic (see Dean, 2017; Kotsko, 2017), ubiquitous, and often beguiling imposition of neoliberalism into the lives and work of educational leaders.

As a governing rationality neoliberalism is taken, after Brown (2015), as “economising” all aspects of political life so that its reach extends to “heretofore non-economic spheres and activities” (p. 21). As one such sphere, education is

positioned as a central cog in economic markets and, in turn, markets are taken to be the solution to perceived problems in education. As a result, educational institutions are “fundamentally transformed” by the market-based principles and practices that guide and enclose their operations (Savage, 2017, pp. 143–144). Educational leaders, in this process of *neoliberalization*, are beckoned to available subjectivities that signal their active participation in the education market and privilege personal qualities such individualism, business savvy, agility, and enterprise.

Significant attention is paid to the hegemonic tendencies of the neoliberal project – what Brown (2015) terms its “stealth revolution” – and the insistent shaping of leaders and their work that marks its dominant influence in educational settings. Accounting for this dominance involves shifting discussion from the rationality or mode of reason for government to the *technologies* that apprehend, shape, and enact this rationality in practice. Technologies that appear to be influential in shaping the subjectivity of leaders are identified in the extant literature and their entwinement with the power/knowledge arrangements held in the rational truth claims of neoliberalism is posited. Among these technologies, freedom, as a practice of government, is subject to extended analysis in order to reveal both seductive and deceptive qualities.

Following this near totalizing account of a worldwide specter and of a process of neoliberalization that appears to both define and confine educational leaders, the theoretical interests of the chapter move to less pervasive and less pessimistic readings. Interest is now directed to testing the epistemological prospects of thinking about the neoliberalization of educational leaders inside of an influential and strident discursive field that proposes their positions and instructs their practice but remains, at the same time, vulnerable to the vagaries and contradictions of local histories, knowledges, and contexts and to practices (or tactics) that depart from expectations of docility and compliance. The aim is to expose what Springer (2012) calls the “processual character” (p. 135) of neoliberalism by opening a critical space adjacent to the vast array of literature that takes neoliberalism as an impenetrable, globally dominant political-economic project.

To help frame this move, references to neoliberalism as a far-reaching rationality give way to the “mentality of rule” as encapsulated in Foucault’s own neologism “governmentality.” While this shift to “neoliberal governmentality” may seem little more than a change in semantics, it also follows a shift in emphasis in Foucault’s work (albeit, at times faint and contradictory) as he develops the nexus between government and rationality by pushing his work from the dimension of power-knowledge to the dimension of the subject and the “purpose of subjectivation” (Foucault, 2014, p. 232) (see also Cornelissen, 2018, p. 145).

The case made for a processual reading of neoliberalism, which forms the balance of this chapter, is not one which refutes the ubiquitous presence of neoliberalism in the lives and work of educational leaders or which plots its grand demise. Rather, it offers a tentative explication of the different possibilities the process of neoliberalization brings to practices of educational leaders and, concomitantly, to subject forming possibilities. The intention, following Brown (2015), is to interpret neoliberalism as “a loose and shifting signifier” (p. 20) by exploiting its variegated, contingent, and inconsistent qualities and its “endlessly unfolding failures and

successes” (Springer, 2012, p. 137). In a more active tone, this approach supports the formulation of a struggle at the frayed edges of neoliberal governmentality and the development of various *struggle tactics* that educational leaders might use. In evaluating the possibilities and risks for leader who choose to take part in this struggle, the chapter concludes with a claim that the tactics for engagement are best and most safely utilized in the caucusing efforts of local coalitions and alliances.

---

## Rationality, technologies, and the “Specter” of Neoliberalism

Treating neoliberalism as a *rationality* draws from Foucault’s (2014) description of the “art of government” as both “a certain way of governing” and “a rationality elaborating the very practice of government” (p. 12). Put another way, neoliberal rationality provides both a prescription for government that makes good sense (i.e., “rational”), as well as a mode of reasoning from which practices of government can be formulated and shaped. In terms of its ubiquitous political presence, neoliberalism invokes Foucault’s notion of power/knowledge in suggesting that, as a coherent rationality, it carries potent claims to truth that order reality and transmit relations of power according to a specific determination of the division between true and false. The success of this neoliberal rationality can be read from the hegemony it now assumes over any other in the discursive landscape and in its tendency “to structure and organise not only the action of rulers, but also the conduct of the ruled” (Dardot and Laval, 2014, p. 4).

Complementing the pervasive and eerie undertones of a “worldwide spectre,” Larner’s (2003) “bulldozer” descriptor of the many readings that highlight the global reach of neoliberalism provides a decisive metaphor of monolithic and irresistible machinery flattening everything in its path. Applying heavy-duty metaphors to neoliberalism should not, however, suggest conspicuous or ostentatious governmental control. Rather, following Harvey (2007), neoliberalism installs a common sense “conceptual apparatus” that can be “taken for granted,” is “not open to question,” and contains “compelling and seductive ideals” that cater to individual desires and the promise of a better society (p. 5). Along more insidious lines, Brown (2015) claims that neoliberalism “settles, nestles and gains affirmation,” so that the process of “neoliberalization is generally more termite-like than lion-like . . . its mode of reason boring in capillary fashion into the trunks and branches of workplaces, schools, public agencies, social and political discourse, and above all, the subject” (pp. 35–36).

In terms of the constitutive effects on educational leaders, the forceful and insistent workings of a neoliberal rationality are, *prima facie*, the realization of the effects of power exerted *on* and *over* them – effects that permeate, characterize, and constitute their subjectivity and work to render them as uniform, submissive, and docile. One manifestation of this figuration of power is the resurrection of *homo aeconomicus* or “economic man,” albeit somewhat transformed from the classic liberal conception of a partner of exchange left alone to fulfill her/his own needs. In neoliberal times, *homo aeconomicus* renders the educational leader as an “eminently governable” subject of interest (Foucault, 2008, p. 270) – a

productive and agile individual, who is entrepreneur of her/himself and who is amenable to contributing to the power of governmental reason shaped according to the market and competition. Thus, the subjectivity of *homo æconomicus* is pegged to the enterprise form. Individuation ensures the conditions of control over conduct and the rationality of the market creates a willing acceptance of “the obligation to maximise one’s life as a kind of enterprise” (Rose, O’Malley, & Valverde, 2006, p. 91). In this way, *homo æconomicus* becomes a depoliticized subject, imbued with her/his own desires and prone to egoistic choices – shaped to meet market demands, but infinitely flexible in adjusting to inevitable shifts in the arts of neoliberal government.

This idealized depiction of *homo æconomicus* functions to signify the constitutive triumph of neoliberal subjectivity over other subject positions in the broader discursive field. As Brown (2015) claims, neoliberalism “in letting the markets decide our present and future . . . wholly abandons the project of individual or collective mastery of existence” (p. 221). Such an observation shifts emphasis away from an abstract reading of rational government and toward an interest in how forms of neoliberal rationality so fully inscribe themselves in the practices of educational leaders. This shift is toward the various concrete practices which are founded upon, and work to enhance, the promulgated truth claims of neoliberalism and which, in turn, give leverage and credibility to certain ways of governing. Thus, while neoliberal rationality renders government as agreeable, intelligible, and reasonable it is these instruments and techniques – the *technologies* – of government that seek to “grasp and shape the reality that rationalities have rendered as an appropriate domain for governmental action” (Brady, 2016).

Barron (2017) posits a virtually “limitless” array of these technologies, including “behavioural routines, organizational procedures, architectural arrangements, institutionalised modes of calculation, inscription and recording” (p. 280). Drawing closer to the focus of this chapter, the relevant literature describes how these technologies are founded and enacted in educational settings. For example:

- Ball and Olmedo (2013) target the individualizing practices of *performativity* showing how they create for educators “a routine of constant reporting and recording of their practice” (p. 90) as they respond to demands to align themselves and their work to targets, performance indicators, and appraisals.
- The neoliberal logic of *self-interest* is, according to Hamann (2009), instrumentalized as a tool for making rational choices and cost-benefit calculations “to the express exclusion of all other values and interests” (p. 38).
- *High stakes testing and auditing* (Lingard & Sellar, 2013), *accountability* (e.g., De Lissovoy, 2016), and *standardization* (e.g., Slater & Griggs, 2015) are mechanisms of the market that confine and enmesh educators in processes of data-driven improvement and benchmarking and in covetous and blameful practices of competition, comparison, and appraisal.
- Many of these technologies are borrowed into education from business and management, with *managerialism* (e.g., Ball, 2003), *standards* (e.g., Higgins & Larner, 2010), and *entrepreneurialism* (e.g., Slater & Griggs, 2015) dotting a

discursive field that makes education into business and takes educational leaders as akin to company executives.

The benign qualities of their programmatic form and operational intent seem to obscure the power relations within which such governmental technologies are framed and constituted. However, Ball and Olmedo (2013) fit these “apparatuses of neoliberalism” with the less furtive disguise of normality, describing “seductive, enthralling and overbearingly necessary” qualities that produce and animate available subjectivities (p. 88). In this reading, the neoliberalization of educational leaders is a process of normalization, as the entwinement of these technologies with the power/knowledge arrangements held in the rational truth claims of neoliberalism fix and mobilize expectations of what is acceptable and legitimate. As these “technologies of power” (Foucault, 1988, p. 18) do their objectifying work, educational leaders enact their subjection as if an obvious and conscious choice and a matter of their own free will. These technologies have their practical manifestation, for example, in the pressing and essential status attached to new work educational leaders are urged to undertake, in the replacement of coercive and prescriptive controls on the leader with more surreptitious tactics of empowerment and “responsibilisation” (see Brown, 2015; Wright, 2012), and in the attachment of their success and survival to principles of self-enterprise and market awareness.

Foucault’s (1982) notion of “dividing practices” (p. 777) is also revealing in showing that this type of normalization divides off and rejects that which is considered aberrant or wrong. This fragmenting of knowledge under neoliberal conditions of “restrictive rationality” (Pignatelli, 2002, p. 165) can be construed as directly influential on the neoliberalization of educational leaders. It warns against the absurdity of thinking otherwise about the organization of education and the dangers of occupying subject positions beyond those specified. This division of practice into right and wrong not only impresses upon educational leaders a confined representation of preferred reality but also creates the conditions within which they quite readily identify with this reality, embrace its modes of “fantasy and enclosure” (De Lissovoy, 2016), and, as if by conscious choice, reproduce the practices that define them. Moreover, these inducements to prescribed ways of being and acting are framed inside of arguably the most deceptive and intermingled of the apparatuses of neoliberalization – *freedom*. It is to freedom as a governmental strategy that the attention of this chapter now shifts.

---

## Neoliberal Governmentality and an Illusory Freedom

As a rationality of government, neoliberalism reflects a particular “mentality of rule” which “rearticulates classic liberal concerns for limited government, economic freedoms and individual responsibility” (Bailey, 2013, p. 816). Positioned as a politics of “not governing too much” (Foucault, 2008, p. 17), this *neoliberal governmentality* is, accordingly, described by Rose et al. (2006) as creating a

“problem space” which is concerned with “new ways of thinking about and seeking to enact the government of freedom” (p. 92). The paradoxical qualities of the phrase “government of freedom” are dissolved in the interpretation, following Foucault (2008) and many others (e.g., Dean, 2010; Rose, 1999) that, in neoliberal times, freedom is not opposed to government but rather becomes a *strategy of governing*. Understood in this way, subjects are required and obliged to adopt a certain set of freedoms that are made possible and shaped within government.

Accordingly, a neoliberal rationality founded in the logics of the market calls for individuals to become autonomous, entrepreneurial, and self-monitoring and self-possessed – calls made in the name of freedom but designed to further the aspirations of government. Moreover, individual acquiescence is, at the same time, mobilized in expectations of a willing contribution to these freedoms. As Kotsko (2017) notes, neoliberalism derives its power by holding to the core principle “market competition is the purest instantiation of human freedom.” Kotsko claims:

The market is the purest democracy, because market outcomes are the spontaneous synthesis of all participants’ free decisions. The more deeply society is shaped by market forces, the freer it will be—and therefore the more legitimate the outcomes will be, because they will be what we all, collectively, chose. (p. 497)

The most accessible freedom available to leaders under conditions of neoliberal governmentality is one that is shaped and illuminated within the constraints of available subjectivities. It is a freedom drawn from a specific form of self-interest that relies on the leader’s active participation in the educational marketplace and on their willingness to make themselves agile, enterprising, and competitive. Gobby (2017) provides an example of this ready involvement when discussing the “risky freedoms” of school principals “under neoliberal devolution of decision-making and responsibility.” He highlights their active participation “in practices of self-formation” as “individual principals self-steer, exercise their freedom and govern themselves and their schools” (p. 277).

Further entreaties to which leaders accede relate to a willingness to be held accountable for their participation in the market and agreement that the success of this participation is properly measured by standardized processes operated from outside of their leadership context. In agreeing to audit, appraisal, and judgment the work of leaders includes communicating the best possible performance of themselves and their institutions as a measure of productivity, authority, and worth. These standardized processes of accountability not only create a field of successes and failures and winners and losers but also illicit feelings of trepidation, resentment, and wariness. They are accountabilities that reward compliance over curiosity and along the way work to allocate and shift the blame to the individual. In what Kotsko (2017) calls “the trap of freedom” the individual is demonized not just for the comparative shortcomings that market metrics reveal about them but for the broader failures of a neoliberalized system. Kotsko concludes that “neoliberalism is the social order that has most thoroughly grounded itself in freedom-as-

blameworthiness, that has most completely entrapped its subjects into the negative sweet spot of freedom” (p. 506).

Neoliberal governmentality is not, therefore, marked by the freedom of a withdrawal or retreat from state control and intervention, but rather by new acts of subterfuge, incentive, and “steering at a distance” (Kickert, 1995 in Ball, 2006, p. 10) and by taking the enclosure of subjectivity as one of its key modes of power. The technologies and institutions of governmental power now develop, conjoin, and operate in the guise of more benign and apolitical processes. They steer the performance of individuals and groups by acts of measurement, appraisal, and comparison – they incite people to govern themselves and posit an “artificially arranged” liberty (Lemke, 2012, p. 45) by championing entrepreneurial and competitive instincts. In short, following Kotsko (2017), they make policies “that effectively create a world full of isolated individuals who yearn to express their freedom through participation in market competition” (p. 500). The constrained freedoms of neoliberal governmentality are a resource of government that implicates educational leaders directly in ruler ambitions. As Bailey (2013) notes, they fold the “mundane and everyday practices and conducts” of individuals “in with the requirements and exigencies of the state” (p. 816). These freedoms also reveal a new marking out of constitutive and constraining powers – an elucidation of a political rationality that shapes leaders and their work “through the coalescence of circumstances of their everyday lives” (Springer, 2012, p. 139).

In looking away from the haunting presence and bulldozer imprint of neoliberalism and toward the possibilities in exploiting its “inconstancy and plasticity” (Brown, 2015, p. 21), freedom might also form a type of conceptual hinge – a fulcrum between the freedom that accompanies the powerful rationality of rule underpinning neoliberal governmentality and the emancipatory possibilities in more contingent, variegated, and precarious readings. In drawing this chapter closer to what Foucault (1984) describes as “the undefined work of freedom” (p. 46), the deterministic and confined portrayal of neoliberalism will now be used as a counterpoint to processes of neoliberalization that are missing, subjugated, or forgotten in more pessimistic readings. To this end, it invites different theoretical perspectives and rhetorical resources that work to illuminate different subjectivities and to make imaginable practices that counter, resist, and push-back the current orthodoxy.

---

## Unsettling Possibilities: The Process of Neoliberalization

The threefold schema of political rationality/technologies of government/constrained freedom appear to form an unholy trinity so impenetrable and so deeply intertwined that it becomes difficult to imagine any other way or any form of resistance to the status quo. Against its promised freedoms, Harvey (2007) captures this feeling of enclosure in claiming the “contemporary condition” is one where “neoliberalism has turned . . . authoritarian, forceful and anti-democratic” (pp. 37–38). Treated as a global specter, crucial questions arise about whether a compelling neoliberal rationality and

its attendant technologies have exhausted the production of other subjectivities and if, therefore, it is any longer possible to think of the educational leader as anything other than a product of imposing outside forces. Rather than take a defeatist position on these questions, the suffocating presence of a dominant neoliberal order is now set against a more contingent and variegated reading based on a *processual* reading of the neoliberalization of the educational leader.

Understanding neoliberalism as a process derives from the field of geography and its interest in uneven global development (Harvey, 2007), “the processual character of space and time” (Springer, 2012, p. 135) and “the problematic of variegation” (Brenner, Peck, & Theodore, 2010, p. 182). Working from this understanding, it becomes more feasible to treat the uptake of neoliberalism in educational settings as uneven, mutable, and inconsistent. The balance of the chapter looks to bring the more unsettled qualities of “neoliberalization” to the “many subject forming strands” (Peck & Tickell, 2002) of a neoliberal rationality. The intention is to use the processual character of neoliberalism to weaken monolithic and totalizing accounts of a coherent global policy logic and to provoke new and discordant ways of imagining educational leaders.

Ideas threaded through critically oriented literature reveal a distinct lack of consensus about how the joined-up tasks of “changing the shape of the thinkable” (Gordon, 1991, p. 8), resisting the neoliberal status quo and understanding the nature, targets, and strategies of any struggle against the current orthodoxy might proceed. Taken collectively, however, critical writings do convey some distinct lines of struggle, fashion some resources for productive participation and call on individual and groups to think deeply about getting involved. Another significant body of literature focusing on the empirical findings of research into educational leadership provides perspectival accounts of actual practices of resistance and explores associated themes of professional risk, the precarity of different subjectivities, and the possibilities held in leaders caucusing around issues in common (e.g., in Dolan, 2020; Heffernan, 2019; Theoharis, 2007; Thomson, 2008). The inductive qualities of these empirical texts are essential to exposing the processual character of neoliberalization and in highlighting the diverse and contingent forms that the process takes when it is actually enacted in educational settings. From local accounts of practice they gather markers of contingency, insufficiency, and variability and allow the imaging of practices of resistance within the subject positions available to educational leaders.

This body of literature forms a backdrop to the more schematic attempts that follow to capture the “struggle tactics” that educational leaders might adopt to gain access to practical ways of resisting, reframing, and refusing the dominant neoliberal rationality.

---

## **Struggle Tactics: Stepping into the Undefined Work of Freedom**

De Lissovoy (2016) shifts attention to freedom not as “a set of formal conditions or rules” but as “an active expression of agency” that might expose the “lie” of domination (p. 168). In subsequent deliberations on power and freedom he

concludes that “the project of critical education may be not only to hammer away slowly at the edifice of the official story but also to find the courage to imagine and build a different society” (p. 169). To this end, I posit a field of contestation brought on by instability and ambiguity in the processes that underpin neoliberal policy discourses. This processual reading of neoliberalism, in breaking from the theoretical enclosure of a vast store of monolithic and omnipresent literature, is attentive “to *both* local peculiarities *and* the generic features of neoliberalism” (Peck & Tickell, 2002, p. 388). In this section, the arrangement of these local peculiarities positions certain leadership practices as tactics directed to questioning, countering, and opposing the propensity to doctrinaire and hegemony in bulldozer readings of neoliberalism. These tactical responses are organized in four broad categories: *rhetorical resources*, *critique*, *counter-conduct*, and *agonistic practice*.

**Rhetorical resources.** Many of the seductions and enticements of neoliberalism reside in a persuasive language that names up the processes and categories of the prevailing logic, often in “neutral and abridged discursive formats like lists, statistics, facts, and how-to manuals” (Nguyen, 2017, p. 1), and describes ways of talking that are logical and sensible in the current reality. In demonstrating its support for the status quo, it is also a language that speaks to a normative truth and must, therefore, “steer clear of contradictions and ambiguities” (Svedberg, 2004). The neologisms, buzzwords, and pseudo-scientific jargons (Ramey, 2015, p. 7) that mark this language convey to educational leaders a deficiency in their own rhetorical resources while, at the same time, suggesting the acquisition of language from beyond their own repertoire will join them to an inner circle of educators who are on-message and well fitted to contemporary trends. To dismiss leaders’ use of the rhetoric of neoliberalism as simply “talking the talk” is to overlook the powerful role of language in maintaining the dominance of a neoliberal rationality in the broader discursive field.

In keeping with the “linguistic turn” in social sciences (see Svedberg, 2004), this is not just a language that describes, observes, and shores-up the neoliberal order. Rather, it is a language of action that is enmeshed with construction of the current reality and with decisions at its boundaries about what is true, reasonable, and possible. For educational leaders, the rhetorical resources of neoliberalism speak directly to their perceptions of meaningful practice and the subject positions to which they are drawn. As such, in their constitutive work, they are resources that are integral to a broader conception of discourse, famously described by Foucault (1972) as “practices that systematically form the objects of which they speak” (p. 54).

One way to counter the significant language effects of neoliberalism is to add some different rhetorical resources to the repertoire of leaders. Resources that can be used by educational leaders to formulate oppositional positions that keep alive the ideas of personal and collective rhetorical power even as they “ensnared” within neoliberal discursive regimes (Danisch, 2017). Two examples from a broader field are now described.

The first of these rhetorical resources draws on “the aporia of a freer self” proposed by Webb, Gulson, and Pitton (2014) and is here deployed to look beyond the currently favored subjectivities of educational leaders by working *with* the obdurate paradox of their freedom rather than railing *against* it. To this end, Webb

et al. describe the “conundrum” of the free subject “ironically, evidenced in the choices that regulate the self” which they suggest, under neoliberal conditions, are “largely determined *a priori* and regulated within appropriate identifications, metrics and performances” (pp. 39–40, italics in original). The use of “aporia” is to signal “an attempt to not resolve such conundrums, but rather, to examine and better understand how such a puzzle has been constructed and to discuss possible effects that such a puzzle produces” (p. 32). The aporetic qualities of this freer self are useful for considering the struggle that attends the neoliberalization of educational leaders. They create extended puzzlement about the construction and activation of freedoms beyond and aside from those that disguise the covert control of government and raise ontological questions about the possibility or otherwise that leaders might have available “any kind of self-originating ethical intention” (Leask, 2012, p. 57). They suggest a stepping back from instrumental concepts such as principal autonomy and local governance, and a consideration of the meaning-in-practice of a language that reconstructs ideas about *participation*, *struggle*, and *resistance*.

In this aporetic reading, the process of neoliberalization is held open, so that new lines of questioning and different ways of thinking and speaking about the “messy process” (Niesche & Gowlett, 2015, p. 381) of subject formation might emerge. In a space of macro/micro influences, the everyday lived experience of educational leaders is taken as exceeding the neoliberal order, so that they are not just rendered obedient servants in the thrall of irresistible global forces. Rather, educational leaders can also be “locals” who are legitimately and strategically situated to speak at the nexus of external governance requirements and home-grown issues and priorities. In terms of “rhetorical agency” (Danisch, 2017), the aporia of the freer self appears to provide leaders with a resource for speaking of more plural and nuanced ways in which their neoliberalization might actually happen in practice. It may, for example, authorize leaders to speak about and convey other versions of their subjectivity, fit them with a more persuasive language of opposition, and better position them to “tell stories of destabilisation to monolithic representations” (Niesche & Gowlett, 2015, p. 382).

To better link neoliberalization with resistance, the second of the resources proposed uses Phillips’ (2006) “rhetorical maneuver” for enhancing the possibility of meaningful challenge. Phillips describes a “maneuver” that is “performed at those moments when we choose to violate the proscriptive limits of our subject position and speak differently by drawing upon the resources of another subject position we have occupied” (p. 311). This “maneuver” fits usefully with a variegated and contingent reading of the discursive effects of neoliberal policy and the subsequent production of multiple subject positions. It invites educational leaders to exploit the processual character of their neoliberalization in order to remember, re-establish, and reinvigorate other versions of themselves and to talk inside of discourses other than those that anchor them to the hegemony of the neoliberal project. In this conception, Phillips (2006) notes, “the notion of the ‘self’ is a constantly changing object crafted and re-crafted out of the points of identification provided in the exterior fields of power and knowledge” (p. 310) so that it becomes possible that “a ‘palette’ of multiple patterns of self” might emerge (p. 314).

**Critique.** In testing how a processual reading of neoliberalization might interrupt the coherence of subject formation, the qualities of Foucauldian critique – such as questioning of established norms, creating critical explanation of discursive and constitutive limits, and interrupting the hegemony of dominant discourses – can be usefully configured as tactics of introspection and oppositional constitutive recognition. This is a shift toward what Foucault (1984) describes as “practical critique” in the form of a “crossing over” so “that criticism is no longer going to be practiced in the search for formal structures with universal value but, rather, as an historical investigation into the events that have led us to constitute ourselves and to recognise ourselves as subjects of what we are doing, thinking, saying” (pp. 45–46). This critique of what we are, Foucault (1984) describes as a “labour of diverse inquiries . . . at one and the same time the historical analysis of the limits imposed on us and experiment with the possibilities of going beyond them” (p. 50).

A concern with finding discursive limits is well captured by Butler (2004) in “What is critique? An essay on Foucault’s virtue.” Butler’s insights suggest the presence of blockages, silences, confusions, and ambiguities in the current “epistemological field” and foreground a predicament for educational leaders as they inhabit preferred and endorsed subject positions:

One does not drive to the limits for a thrill experience, or because limits are dangerous and sexy, or because it brings us into a titillating proximity with evil. One asks about the limits of ways of knowing because one has already run up against a crisis within the epistemological field in which one lives. The categories by which social life are ordered produce a certain incoherence or entire realms of unspeakability. And it is from this condition, the tear in the fabric of our epistemological web, that the practice of critique emerges, with the awareness that no discourse is adequate here or that our reigning discourses have produced an impasse. (p. 307)

Insights into critique from Foucault and Butler develop possibilities for educational leaders to face and resist excessive governing and suggest the adoption of what Foucault (1997b) calls a “critical attitude.” He describes this attitude as:

both partner and adversary to the arts of governing, as an act of defiance, as a challenge, as a way of limiting these arts of governing and sizing them up, transforming them, of finding a way to escape from them. (pp. 44–45)

Importantly, notions of “driving to the limits” and “adopting a critical attitude” acknowledge the crucial role played by the will of the individual within the framework of governmental power mechanisms (see also Lorenzini, 2016). For educational leaders these notions presuppose an individual’s propensity to accept that they no longer recognize themselves within available governmental truth regimes and the subject positions they make available. Beyond acceptance, these notions also suggest a voluntary risking of the self in acts that exceed the limits of established truths.

As Foucault (2007) introduces “the ugly word” (p. 161) governmentality in *Security, territory, population*, his target of critique shifts to governmental power or what he what he calls the “conduct of conduct.” In advocating practices that

challenge the truth claims imbricated with this power and the technologies that hold it in place, Foucault (2007) pursues a “striking back” theme in proposing a “tactically effective analysis” of “the circle of struggle and truth.” In this, he describes “tactical pointers” and says that this imperative should be of the kind: “If you want to struggle, here are some key points, here are some lines of force, here are some constrictions and blockages” (p. 3). Foucault’s (2007) insights into how these pointers might run to acts of refusal and resistance are framed by what he calls “counter-conducts” – the “sense of struggle against the processes implemented for governing others” (p. 201).

**Counter-conduct.** While the “stiff bit of utility” that Foucault (1997b, p. 25) attributes to critique connects usefully to choices educational leaders might make about their subjectivity, the notion of counter-conduct (Foucault, 2007) shifts attention to the “conduct” of the educational leader as political “actor” and to a broader conceptualization of their involvement in a constitutive struggle. Counter-conduct infers a contest, with one side formed around shaping of conduct by the imposition of governmental power the other by refusal among the targeted to be conducted this way and a desire to be conducted differently. As Lorenzini (2016) notes, at the core of counter-conduct is “the struggle in order to claim and obtain an *other* conduct” (p. 130 italics in original).

In finding (and finding out about) counter-conducts, Foucault (2007) explicitly advocates a focus on politically oriented practices when he says, “by using the word counter-conduct . . . we can no doubt analyse the components in the way in which someone actually acts in the very general field of politics or in the very general field of power relations” (p. 202). The emergence of counter-conduct, Davidson (2011) claims, indicates Foucault’s careful and deliberate attempt “to find a specific word to designate the resistances, refusals and revolts against being conducted in a certain way” (p. 28). For various reasons, Foucault departs from the more unruly registers of revolt, dissent, disobedience, and insubordination, and embraces the variability and intrinsic ambiguity of counter-conduct and the implied simultaneity of its work in transforming relations of the self and others and in the formulation of a countervailing power that subverts its dominant oppositions.

In the process of neoliberalization it is the various expressions of these transformations and subversions by leaders that shift counter-conduct away from its theoretical potentialities and toward “a counter-conducts approach” where “modes of protest . . . form in parallel to techniques of governmentality” (Death, 2016, p. 202). In a rather limited library of empirical studies into educational leadership and resistance (see Thomson, 2008; Thrupp & Willmott, 2003), examples of these modes of protest provided in the literature include activism and strategies of “irresponsibility” (Anderson, Cohen, & Seraus, 2015), silence and the formulation of counter narratives (Niesche, 2013), resistance, subversion, and refusal (Dolan, 2020), challenging the status quo and pushing back against injustice (Heffernan, 2019), and rigorous analysis of policy documents to expose taken-for-granted conservative assumptions (Ylimaki, 2012). Counter-conduct may also run to privileging aspects of practice that do not align obviously with neoliberal logics. For example, DeMatthews, Mungal, and Carrola (2015) describe an “ongoing struggle” focused “on the day-to-day realities

of creating more socially just schools in inequitable societies” (pp. 18–19). Commenting on leadership development programs, Smolović Jones, Smolović Jones, Winchester, and Grint (2016) claim that they can “act as important forums for resistance and the crafting of new identifications” (p. 426) even though they are generally sites for control and regulation of identity (Gagnon & Collinson, 2014).

Counter-conducts form the broad inventory of practices that function as correlatives to instruments of government and position educational leaders as various actors engaged in ongoing contestation. This inventory is generally oriented away from grand gestures of refusal (see Foucault, 1978, pp. 95–96) and toward a “general mobility” (Foucault, 1997a, p. 123) based on a shift to more equivocal and invigilated acts of participation. The practices of educational leaders that might be construed as counter-conducts are moderated by a strong tendency to compliance and acute awareness of the professional and personal risks involved. The contribution of counter-conduct to a more variegated and contingent process of neoliberalization is, therefore, dependent upon the willingness of leaders to embrace those conducts that exceed, interrupt or oppose the more general governing apparatus of neoliberalism. In what amounts to particular take on the political project for leaders, the risk of engaging in a struggle both within and against the orthodox expectations of the system to which they belong (and which employs them) is set against the potentially hazardous confinements of apathy and inaction.

**Agonistic practice.** A fourth resource for operating in the spaces opened up by a processual treatment of neoliberalism is fashioned from Foucault’s (1982) summation of the tying together of power and freedom. He says:

At the very heart of the power relationship, and constantly provoking it, are the recalcitrance of the will and the intransigence of freedom. Rather than speaking of an essential freedom, it would be better to speak of an “agonism” – of a relationship which is at the same time reciprocal incitation and struggle; less of a face-to-face confrontation which paralyzes both sides than a permanent provocation. (p. 790)

The agonistic quality of relations of power that Foucault alludes to is here fashioned into a type of agonistic practice. Wenman (2013) describes *agonism* as “a strategic and tactical doctrine concerned with the capacity of human agents to challenge the tragic forces that seek to govern their lives and determine their conduct” (p. 39). Therefore, *agonistic practice*, in the first instance, denotes a positioning of educational leaders as subjects able to wrest back possibilities for self-formation by contesting the “tragic” effects and dominating tendencies of governmental power in neoliberal times. Belgian political theorist, Chantal Mouffe (2000) emphasizes the value of conflicts and confrontations in political activity, claiming that “far from being a sign of imperfection (they) indicate that democracy is alive and inhabited by pluralism” (p. 93). Elsewhere, Mouffe (2013) proposes an “agonistic model of democracy” in which the struggle over competing ideas is between “adversaries” who share a belief in the right to defend their ideas, rather than between antagonistic “enemies” bent on destroying each other. From this distinction, Mouffe claims that “a well-functioning democracy calls for a confrontation of democratic political positions” (p. 7).

Applying Mouffe's perspectives to the political practices of educational leaders helps inform choices about their participation. Recognizing both the importance and inevitability of conflict invites them to embrace the possibilities conflict holds for seeing and performing intelligible subjectivities beyond the versions favored in the current doxa. In drawing attention to the need for plurality and to the distinction between agonism and antagonism, Mouffe's description takes on a certain resonance in exploring the importance of oppositional practices to the shaping of a neo-liberalized policy subject. Mouffe (2013) also alludes to a preferred tenor for participation in adversarial contests. She advocates the ever-present prospect for mutually destructive antagonism between political "enemies" be transformed into, and played in, a more constructive form of rivalry with an "adversary." Agonistic practice is laced with warnings of the dangers of hurrying to consensus in decision-making, with an expectation of consensus likely to obscure the power differential between participating parties and quiet the possibilities for local disagreement and push-back.

This brief consideration of struggle tactics attempts to link the neoliberalization of educational leaders with what Niesche and Gowlett (2015) term "the ambivalence and fragmentary nature of discourse construction of subjects" (p. 377). Bringing a more malleable interpretation of Foucault's neoliberal governmentality to contingent and dispersed reading of neoliberalization gives additional efficacy to this link. Neoliberal governmentality, with its "ensemble of rationalities, strategies, technologies, and techniques" (Springer, 2012, p. 137), submits individuals to relations of power that re-interpret and re-locate outwardly focused disciplinary pressures. While hegemony and its vertical domination continue to be important, the decentering of government imbues educational leaders with a desire to govern themselves and connects them to promulgated notions of freedom and autonomy. Thinking with Leask (2012), it is this "profoundly normalising" rationality of the self as enterprise that creates a more immanent and material dispositif and, concomitantly, more multiform and various power relations (p. 63). Of course, it does not follow that leaders may now more easily transcend the dominant discursive order from which they draw their existing subject positions. Rather, pairing conditions of neoliberal governmentality with the process of neoliberalization allows for the possibility that leaders may work on themselves in ways that are beyond or contrary to the dominant order. Following Phillips (2006), this pairing may create "a crucial space in which an element of creativity can be introduced" and "a potential for disruption," brought on by competing subjectivities, can occur (p. 314).

---

## Conclusion and Reflections

The lives and work of educational leaders are both constituted and haunted and by the worldwide specter of neoliberalism. As this reach extends to the practices of educational leaders, their neoliberalization is often depicted as a process of tight conformance that ties them intimately to the logics of the market and implores their willing participation in governmental technologies and freedoms that shape and

support its practices. In this chapter, depictions of neoliberalism as an insidious, hegemonic, and damaging global presence were described alongside of a processual reading of its many subject forming strands. The possibility was subsequently mooted that the neoliberalization of educational leaders might be taken as a more variegated, contingent, and unstable process of subjectivity than hegemonic readings of a “worldwide specter” suggest. When joined with Foucault’s (2008) identification of a reconfigured relationship between governing and the governed under conditions of neoliberal governmentality, a further possibility emerged for understanding how leaders might be “neoliberalized” from the outside by policy discourses and, at the same time, take responsibility for their own neoliberalization. While much of the analysis directed to unpicking and resisting the status quo relied on hard-to-reach and, at times, imaginative possibilities, three summative claims are advanced for the use of a processual understanding in consideration of the neoliberalization of educational leaders:

1. *A processual understanding complicates accounts of neoliberalism as a universal and inevitable force by providing insights into its local constitution, variability and politics.* Rendering neoliberalism as contextual and contingent highlights its complexities and contradictions. As Lerner (2003) claims, it “allows us to think about the multiple forms that political strategies, techniques, and subjects take” (p. 511). This understanding invites analysis of internal ambiguities, lines of weakness and contradictions that reside in hegemonic conceptions, and foregrounds, revives, and imagines other discourses that might work to unseat its dominance.
2. *Linking the process of neoliberalization to the constitution of the policy subject allows in more fine-grained, variable, and locally responsive accounts of subject formation.* Applying a processual understanding of neoliberalism to subjectivity helps account for differences in the priorities and perspectives of designated educational leaders and in speculating on variations in their intervention and compliance in policy work. Cast more broadly, consideration of the subject as formed in a variegated and uneven process has individual leaders occupying a more *or* less distinct position in the discursive realm. This means that each subject is taken to be differently influenced by the discourses in play and that the truth claims of dominant neoliberal discourses may be diminished and interrupted by others from outside.
3. *Neoliberalization makes available a multiplicity of subject positions and, subsequently, helps interpret subjectivity as a resource for resistance.* In raising the prospect of a multiplicity of subjectivities, a processual reading of neoliberalism also keeps alive the possibility of educational leaders choosing into “minority” and even “radical” subjectivities (Demetriou, 2016) formed in the risky politics of counter-conduct and in practices of opposition, refusal, and resistance. Nicoll and Fejes (2008), after Foucault (1982), mark out this agonistic territory when they claim that “there is always on the one hand an incitation to act in a particular way and on the other the possibility of acting wilfully in disregard of this incitation” (p. 10).

In focusing on leader subjectivity, this chapter tried to engineer a move from the totalizing tendencies of a dominant governmental rationality to the possibilities of including various forms of resistance as interventions in constitutive practices of compliance and docility. Such a discussion flounders at an emphatic and telling question about the possibilities of turning theory into practice, including the temptation to make a pessimistic estimation of the practices of resistance that are actually possible. Hamann (2009), in accordance with much of the theoretical analysis in this chapter, reinforces the importance of the will of the individual in understanding such possibilities:

the proof will be in our practices . . . a better understanding will emerge by attending to our everyday activities, what we say and how we think, our commitments and obligations as well as the kinds of truths about ourselves we rely upon and reinforce in the process of doing so. (p. 58)

Willful individual acts of resistance and critique, however well intended, carry with them serious professional and personal risks (see Anderson et al., 2015; Thomson, 2008). These acts work against neoliberal entreaties to educational leaders to cultivate their individuality as active participants and enterprising subjects in the educational market. This call to the individual, which “is key to the rhetoric of neoliberalism” and carries with it the “rhetoric of personal responsibility” (Wingard, 2017, p. 141), thus renders acts of non-conformance and confrontation risky and unwise. Following Rose (1999), neoliberal governmentality allows in “a technological rationalisation of the human soul . . . a reduction of human subjectivity and creativity to that which can be acted upon in the interest of government” (p. 54). These workings on the “soul” of educational leaders (see also Foucault, 1977) are abetted by the profoundly individualizing tendencies of a rationality that champions those who are competitive, enterprising and triumphant. The effect is to divide one leader from the other, to set up colleagues as rivals and to depict those who will not come onboard as lone wolves or as a poor match to the job at hand.

In holding to the idea that the subjectivity of educational leaders might continue to be a resource for resistance, this chapter finishes on a more emphatic note. It advocates, with some urgency, that individual counter-conducts held in acts of courage, silence, disobedience, and resistance be tied to strategies of risk mitigation founded in the caucusing of like-minded leaders and the possibilities, in their collective voice, of speaking back more safely and assuredly to the current neoliberal hegemony. This is work directed to agonistic thought and action, guided by the “counter-power” of “pluralistic association” (Myers, 2008, p. 125) and the public demonstration of a productive resistance that refuses to be reduced to the fragmented “discontents, murmurings, indifference and disengagements” (Ball, Maguire, & Braun, 2012, p. 150) of disaffected individuals.

An appeal to the power of association and to productive caucusing possibilities also implies a need for more research into effective group processes and strategies. Following Thomson’s (2008) observation of headteacher associations, such a study focus “would allow a more nuanced and critical discussion of the potentials of . . .

collective organizations to effect widespread educational change” (p. 99). Such research could usefully extend to consideration of the power of the group as both an antidote to individuation and its attendant vulnerability, and as a “chemical catalyst” (Foucault, 1982, p. 780) to more productive apprehension of power relations.

## Abstract

This chapter begins by examining why the work of educators can be regarded as an ethical social practice at both procedural and substantive levels, based on the virtues of the teaching profession itself and involving a deeply relational approach to ethics, coalescing round the moral concept of care.

Despite the highly ethical nature of the daily work of educators, there is not necessarily an appreciation of how the ethics of the profession can be applied to improve day-to-day professional practice by teachers and school principals.

This chapter offers two ways of remedying this situation: firstly by developing a more comprehensive understanding of the concept of care as it relates to caring

for students and colleagues within schools and by outlining a plan for educators to problematize care in their educational practice.

Initial theorizing about education as an ethical social practice has its philosophical foundations in the work of virtue ethicist Alasdair MacIntyre (1981, 1985), while an examination of the meaning of care as a central moral concept for education is based on a revised understanding of care as developed by Carol Gilligan (1982) and Nel Noddings (1984) in their ethic of care and then revised and expanded by various theorists.

The plan for problematizing care in educational practice outlines an action research framework based in the key dimensions of caring practice, namely, *responsiveness*, *responsibility*, and *critical reflection*, and related personal and interpersonal competencies. It is an approach to ethical professional practice which is dynamic and evolving and which involves educators developing an intersubjectively realized form of moral autonomy and agency in the specific sociocultural context of the school as a collaborative, democratic, and ethical learning community.

### Keywords

An ethic of care/care ethics · Relational basis for ethics · Moral interdependence · Intersubjectively realized moral autonomy · Ethics of the teaching profession

### The Field of Memory: Some Innovations and Disjunctures

Over the last 50 years, there have been some quite dramatic developments in understanding what is involved in being ethical and appreciating how we develop as ethical or moral human beings. It is argued that the older moral paradigm involved a moral self conceived as a sovereign self, devoid of social and emotional context, who, typically, adopted either a deontological or principle-based approach or who based their moral reasoning on a consideration of the consequences of action. An example of the former approach could be to follow Kant's (1785/1993, p. 30) categorical imperative "to act only according that maxim whereby you can, at the same time, will that it should become a universal law," while the latter approach could be illustrated by following John Stuart Mill's (1863/1962) utilitarian manifesto to seek "the greatest happiness for the greatest number."

Lawrence Kohlberg's (1981, p. xii) cognitive developmental approach was an example of the deontological approach to ethics as it combined Kantian principles with developmental psychology based on the work by Piaget. Kohlberg's (1981, p. xii) approach was based on the belief that "the first virtue of a person, school or society is justice interpreted in a democratic way as equity or equal respect for all people" and has been applied in schools known as *Just Community Schools* throughout America.

Nevertheless, the 1970s and 1980s were decades that saw a number of fundamental challenges to deontological and consequentialist approaches to ethics. Post-modernism, in particular, denied the assumptions of the very metanarratives on which most existing ethical approaches were based. As Lyotard (1979) declared:

In contemporary society and culture – post-industrial society, post-modern culture – the question of the legitimation of knowledge is formulated in different terms. The grand narrative has lost its credibility, regardless of what mode of unification it uses, regardless of whether it is a speculative narrative or a narrative of emancipation.

However, postmodernism provided a focus on the hegemonies hidden in plain sight within various mainstream discourses, such as those associated with patriarchy. Postmodern analysis such as that undertaken by Foucault (1977, p. 27) revealed regimes of power and illuminated the particularities of contexts where “knowledge linked to power, not only assumed the authority of the truth but has the power to make it true.” Within this disbelief in the great Western tradition of the Enlightenment, two feminists, Carol Gilligan (1982) and Nel Noddings (1984), proposed a more phenomenologically based approach to ethics based in an ethic of care within relationships. Gilligan (1982), as she reported in her book, *In a Different Voice*, had observed that many women undertaking Kohlberg’s justice-oriented program often seemed to justify their moral positions in terms of care within relationships rather than in abstract conceptions of justice as in Kohlberg’s (1981, p. xii) higher stages of moral reasoning. The concept of care as originally proposed by Gilligan (1982) and Noddings (1984) did not link care to justice and stressed the overriding importance of the particularities of context and rejected the possibility of any application of universal principles.

Nevertheless, there were those like Jurgen Habermas (1984) who insisted that the Enlightenment Project was not yet over. Habermas (1984, 1987) adopted the *linguistic turn* of the twentieth-century Western philosophy in proposing a theory of communicative action based on the belief that all speech acts have the inherent goal of mutual understanding and that human beings have the capacity to achieve this.

It was also in the early 1980s that virtue ethics, which traces its origins to ancient Greek philosophers such as Aristotle, was reinvigorated by Alasdair MacIntyre (1981) who argued that it was possible to find a basis for ethics in the virtues inherent in various social practices.

However, the prevailing global ethos of neoliberalism, with its focus on markets, commodification, and profits, has been in the ascendancy in the Western world. Even where there has been a reorientation of the modernist project, such as that undertaken by Habermas (1984) in developing discourse ethics based in communicative action, there is still concern with the possible usurpation of individual moral choice by the *mediatization of the lifeworld*. This refers to the influence of the media or the Fourth Estate in shaping and framing the processes and discourse (conversation) of political communication and thus reducing, or even of distorting, the capacity of the individual to exercise independent, rational autonomy. Ironically perhaps, the meta-narratives of the Fourth Estate have now become widely disparaged, especially by those courting populist opinion, and the term *fake news* has become ubiquitous.

### Field of Presence

After drawing on the work of virtue ethicist Alasdair MacIntyre (1981, 1985) to make a case for accepting an ethical base for the teaching profession in the moral

concept of care, the chapter then examines the meaning of care as outlined by Gilligan (1982) and Noddings (1984, 2002, 2005, 2018) in an ethic of care. This involves the presentation of a new moral paradigm for ethics in which the moral process is seen as relational and interdependent.

This relational approach is aligned with a very different basis for moral development to that proposed by Kohlberg (1981). Moreover, it is suggested that educators themselves need to develop various personal and interpersonal competencies in order to exercise an intersubjectively realized form of moral autonomy and agency in their professional practice.

### **Field of Concomitance**

In this chapter the term ethics is used interchangeably with the term moral, and the interpretation of the term ethics is based in Peter Singer's (1993, p. 174) explanation that:

To live ethically is to think beyond one's interests. When I think ethically I become just one being, with needs and desires of my own, certainly, but living among others who also have needs and desires. When we are acting ethically, we should be able to justify what we are doing, and this justification should be of a kind that could, in principle, convince any reasonable being. (Singer, 1993, p. 174)

The "should" or "ought" of ethics presupposes the "can" of human capacity, which is now informed by a range of disciplines.

Sociobiologist E.O. Wilson (1975, 1978, 1998) believes that as members of a socially interdependent species, we have an evolved capacity for altruism. Psychologist Martin Hoffman's empirical research has also demonstrated that children typically begin to demonstrate empathy between ages 2 and 3 and by age 12 can show empathy to groups of people experiencing discrimination or other forms of distress. Other developmental psychologists, such as Bowlby (1975), Damon (1988), Kitwood (1990), and Noam (1988, 1991, 1993), have shown that we learn to care through being cared for and that we continue to be sustained morally in and through the care we receive and give in relationships. So these theorists propose a very different view of moral development to Kohlberg's (1981) non-variant stages of cognitive moral development.

Moreover, the emotions, once seen as a threat to the proper exercise of rational moral autonomy and moral agency, have been reappraised to echo and exceed the positive role accorded to moral sentiment by just a few earlier philosophers such as David Hume (1777/1975). Contemporary theorists such as Ridley (1996, pp. 5 & 135) see our emotions as intrinsic to our capacity for positive moral response, with our higher emotions even acting as "guarantees of our moral commitments."

### **Ontological and Epistemological Assumptions**

The relational approach to Ethics recommended in this chapter is based in the ontological assumptions that we are a socially interdependent species with evolved predispositions for bonding with close others in relationships of attachment but also with a capacity to reject those who are not of "our tribe" (Wilson, 1975, 1978, 1998).

We co-construct moral meanings within our family, workplace, and friendship circles and are shaped morally across our lifetimes by relationships of care or the lack of such relationships (Bowlby, 1971; Kitwood, 1990), as the nature of our interactions with others is deeply reciprocal. We learn to care through being cared for by others and develop a capacity for trust and mutuality through the care that most of us are fortunate enough to receive from our parents or first caregivers.

### **Disruptions in the Field**

The moral relativity of much of the wider neoliberal culture of developed Western nations is one where individualism and personal preference have been in the ascendancy. So much so that the illusory meme of teachers being “values neutral” can persist and even provide justification for teachers to avoid discussion of controversial issues in the classroom. Schools are also faced with meeting multiple accountabilities, such as those related to externally imposed testing of students. Where there is an overemphasis on this type of “performativity,” an appreciation of the deeply ethical work of educators can be obscured.

---

## **Introduction: An Overview**

The chapter begins by confronting the anomaly of an apparent lack of ethical discourse by teachers and principals about their professional practice despite the deeply ethical nature of their work. This provides an impetus for exploring why education can be considered an ethical social practice as defined by virtue ethicist Alasdair MacIntyre (1981) and why care could be considered a preeminent virtue among those virtues and values typically listed in Codes of Ethics for Teachers and Standards of Professional Practice for Teachers and School Principals.

However, care is rather like a self-evident truth that can remain abstracted and largely unproblematized in theory and practice. This chapter addresses this problem in two ways. Firstly, it provides an analysis of care within an ethic of care as initially outlined by Carol Gilligan (1982) and Nel Noddings (1984) and identifies both the strengths and limitations of the theory in providing a base for understanding the nature and scope of caring for others.

It is proposed that the highly relational approach of an ethic of care, or care ethics, can provide the basis for an intersubjectively realized form of moral autonomy and agency to assist educators to maintain and sustain dialectical engagement with students and one another within the school operating as a collaborative, democratic, and ethical learning community.

---

## **Some Reasons for a Lack of Ethical Discourse in Schools**

Over the last 30 or more years, the deeply ethical nature of education has been recognized by many theorists, as the following small sample of references suggests (Campbell, 2008; Carr, 2016; Duignan, 2015; Hansen, 2007; Noddings, 1984, 2002,

2005; Purpel, 1999; Slote, 2007; Sockett, 2012; Starratt, 1994). Given such wide recognition of the ethical nature of the teaching profession, it was intriguing that none of the school principals involved in an Australian study conducted by Ehrich, Harris, Klenowski, Smeed, and Spina (2015, Discussion, para. 2) “reported overtly speaking with their staff about the topic of ethics” and “one principal (Carey) said he thought there is a paucity of talk about ethics throughout the school system.” In considering possible reasons for such a lack of ethical discourse about educational practice, Elizabeth Campbell (2008, p. 357) offers the following explanation:

The moral dimensions of teaching and the ethical nature of the teacher’s professional responsibilities often seem to be taken for granted in both the academy and practitioner communities, overshadowed by cognitive theories connected to teaching and learning, effective approaches to measurement and assessment, classroom management strategies and other aspects, that, while important are rarely viewed from a moral or ethical perspective.

Schools in many countries such as the USA, the UK, Australia, and Canada are also facing challenges associated with externally imposed testing of students, such as the Australian Government’s NAPLAN or National Assessment Program – Literacy and Numeracy, for students in Years 3, 5, 7, and 9 in Australian schools. While this kind of testing was designed to make sure no child was left behind, it can literally lead to a situation where:

Current definitions of equity are linked to the introduction of multiple layers of technical and numerical mediation to measure equity, translating life in schools and communities into a series of abstract representations of graphs, grids, league tables and indices. (Lingard, Sellar, & Savage, 2014, p. 715)

The dialogic, dialectical interaction between teacher and student can be compromised, and the teacher’s role and capacity for exercising intersubjective autonomy in meeting the needs of individual children can be severely curtailed.

The lingering and illusory myth of teachers being “values neutral” simply amplifies the silence about ethical issues in day-to-day practice. This can be traced back to the 1970s and 1980s when the Values Clarification (Raths, Harmin, & Simon, 1978) movement became popular in American schools and elsewhere. Values Clarification seemed to provide a way of tactfully acknowledging that while you could identify and clarify your own values, this did not involve proving by recourse to rational justification that your set of values was superior to those held by someone else.

The pervasive influence of moral relativity in the wider society and the effect of postmodernism in discrediting moral metanarratives like those implicit in Kant’s categorical imperative have eroded bases for moral consensus in the wider society. As Bellah, Maden, Sullivan, Swidler, and Tipton (1985, p. 76) observed in their classic study of the values of middle-class Americans:

If selves are defined by their preferences but those preferences are arbitrary, then each self constitutes its own moral universe and there is finally no way to reconcile competing claims about what is good in itself.

However, despite the moral relativism and plurality of ethical approaches in the wider society, it will now be argued that it is still possible for members of professions like medicine, law, and education to have an agreed basis for professional ethics through an approach suggested by virtue ethicist Alasdair MacIntyre (1985).

---

## Why Teaching Is an Ethical Social Practice Based on Care

While MacIntyre (1985, p. 11) thought that the West was left with just the remnants of various traditions and that “the nature of rational argument was interminable,” he offered the hopeful possibility of finding a solution to this impasse in the virtues intrinsic to social practices within various traditions. In this approach the virtues contribute to the attainment of a *telos* or goal such as the Aristotelian one of *eudaimonia* or flourishing.

When we examine the virtues and related values typically outlined in codes of ethics for teachers and in standards of professional practice for teachers and school principals, we can see a range of virtues and values for educators such as care, justice, responsibility, respect, dignity, and integrity, with these contributing to attaining a *telos* where “the ultimate aim of education is nothing other than the creation of human beings in the fullness of their capacities” (John Dewey, 1930/1984, pp. 289–298).

This *telos* is remarkably similar to the Aristotelian one of *eudaimonia* and clearly places the education of the child “front and center” (Duignan, 2012, p. 2). Such an aim, Dewey (1916, *Democracy in Education*, p. 99) argued, depended upon the creation of a democratic school culture and would ultimately contribute to the flourishing of a democratic society.

The Code of Ethics for Teachers in Queensland (QLD College of Teachers, 2011) identifies care, justice, integrity, responsibility, respect, and dignity as key values to be upheld by teachers ([www.qct.edu/standards-and-conduct/code-of-ethics](http://www.qct.edu/standards-and-conduct/code-of-ethics)), but the detail about these is quite minimal in terms of the kind of behaviors that it is suggested teachers should ideally demonstrate. *Responsibility*, for example, is seen as involving

- Giving priority to the education and welfare of all students in our care
- Engaging in ongoing professional development and improving teaching and learning strategies
- Working collaboratively and cooperatively with colleagues in the best interests of the education and welfare of our students

while *care* is seen as being demonstrated by

- Having empathy for and rapport with students and their families and caregivers, colleagues, and communities
- Committing to students’ well-being and learning through the practice of positive influence, professional judgment, and empathy in practice

But, as can be seen from the above, these values are only illustrated by a few examples, with no explanation for their selection or how they might be interrelated and are rather like self-evident truths which hover at the edge of professional educational practice but remain largely abstracted. The codes are also static, whereas ethics is dynamic (Forster, 2012, p. 14), and there is a need to problematize and share the meaning of the moral concepts in the codes. Moreover, as Forster (2012, p. 1) has noted, while formalized codes of ethics for teachers can define “the terms of trade” between the profession and school administration and the public, they can also have unintended consequences, such as teachers treating the codes superficially or their very existence producing a false sense that “all is well.”

There is a need for those who lead education in schools, both principals and teachers, to develop much “thicker” understandings of what moral concepts like care involve and how these concepts can inform, and even potentially transform, professional practice.

This study has chosen to consider the concept of care within the theory known as an ethic of care or care ethics, as this provides a way of examining care as a practice, as an interaction between the carer and the cared-for, and as a relational, dynamic, and evolving professional practice.

---

## Understanding the Concept of Care Within an Ethic of Care

A recognition of care as a contemporary basis for ethics was first recognized by Carol Gilligan when she noticed that some people, especially women, responded differently to Lawrence Kohlberg’s (1981) moral dilemmas. Instead of justifying their moral responses in terms of justice, some subjects, especially women, were drawing their moral responses from perspectives of care, connection, and responsibility within relationships. Gilligan reported her observations in her now classic book, *In a Different Voice*, and noted that while this ethic of care was not the exclusive preserve of women, it related to the lived experience of many women in caring for children, spouses, elderly parents, and disabled members of family. Gilligan (1982, p. 19) also realized that this ethic of care was not based in abstract principles but was narrative and contextual in character. As Blum (1993, pp. 51–52) has concluded, “Gilligan has seen the moral self as radically situated and particularized, and as utilizing the inter-related processes of cognition, emotion and action. Kohlberg, on the other hand, has argued for a rational impersonal approach that he believes transcends the particularities of the social and cultural context.”

Nel Noddings (1984, 1992a, 1992b, 1994, 1995a, 1995b, 1997, 2002, 2005, 2013, 2018) consolidated and extended the theoretical base for an ethic of care, beginning with her book, *Caring: A Feminine Approach to Ethics and Moral Education*. Noddings (1984) stressed the importance of the interaction between the carer and the cared-for, with the latter regarded as making a crucial contribution to the moral interaction. As Noddings (2018, Chap. 12, Care and Education, para 6) has said, “Dialogue is implied by the phenomenology of caring” because “when we care we receive the other in an open and genuine way.” Noddings calls this receptivity to the other, to the one cared-for, “engrossment,” which is not meant to suggest

infatuation or obsession but rather “a non-selective form of attention.” She says that as the dialogue unfolds, there is a mutual construction of the frame of reference. Ideally, the one cared-for also shows some positive receptivity to the carer which encourages and supports the carer in the action of caring. So the moral action involved in the caring interaction does not reside in the carer alone. The interaction between the carer and the cared-for involves the exercise of intersubjectivities which are often exquisitely nuanced to enable the carer and the cared-for not only to interpret what is said but also to read approval or disapproval in the slightest differences in tone of voice, facial expression, or body posture. It is through the exercise of interpersonal intersubjectivities that both the cared-for and the carer can potentially build mutual appreciation and trust. It is in the light of this understanding of moral interdependence that Noddings (2002, p. 88) was able to claim that: “How good I can be, depends, at least, in part, on how you treat me. My goodness is not entirely my property and the control I exercise as a carer is always a shared control.” Instead of moral agency being exercised by a lone, autonomous Kantian self, an ethic of care proposes moral selves who exercise a form of intersubjectively realized moral autonomy and moral agency.

However, as Annette Baier (1987, pp. 51–52) realized, given the non-contractual nature of many relationships, such as those between parents and children, and between teachers and students, there can clearly be differences in power between the carer and the cared-for, and sometimes those most vulnerable in the relationship can become victims of abuse. The findings detailed in the final report of the Australian Royal Commission into Institutional Responses to the Sexual Abuse of Children (2017) revealed shocking evidence of the harm done to individuals who were sexually abused as children, as shown by these comments from one of the survivors of such abuse:

As a victim, I can tell you the memories, sense of guilt, shame and anger live with you every day. It destroys your faith in people, your will to achieve, to love, and one’s ability to cope with normal everyday living. (Final Report, Royal Commission into Institutional Responses to Sexual Abuse of Children (2017). <https://www.childabuseroyalcommission.gov.au/final-report>)

An ethic of care is characterized by a concern for the rights of both the cared-for and the carer but especially for those most vulnerable, oppressed, or marginalized. Given this orientation, Noddings (1995a, p. 188) declared that if A claims to care for B but B denies that A cares, then the relationship between A and B is not one of care. Despite the protective intention of Noddings’ approach, what if B is not correct about a lack of care from A? How can both parties in a supposedly caring relationship be protected from abuse, manipulation, or incompetence?

---

## Issues of Justice

Initially, “an ethic of care” provided no way of integrating “justice” with care. Gilligan (1982, p. 19) saw a morality based on caring as being focused on developing an “understanding of responsibility and relationships,” while she

thought a conception of morality as “fairness” concentrated on developing an “understanding of rights and rules.” Care and justice were seen as separate and as involving:

Two moral injunctions – not to treat others unfairly and not to turn away from others in need . . . two lines of moral development” with “different standards for assessing moral judgments and behavior.” (Gilligan & Wiggins, 1988, p. 115)

There was a clear division between care and justice with no means of reconciling these two major moral concepts. Noddings’ (1984, 1992a, 2005) work also suggested a highly subjective approach and a focus on caring for close others but with no suggestion as to how this could be extended to distant others or ways of dealing with multiple, simultaneous, caring responsibilities. Moreover, Noddings’ (2002, p. 14) division of caring responses into “natural caring” which was a spontaneous response to care for close others and “ethical caring” where there was a more duty-driven motivation to care for others potentially aligned women with the cultural stereotype of women as “natural carers” (Edgar, 1995, p. 277) who were expected to selflessly carry the burden and responsibility of caring for the young, the elderly, and the disabled within their families. Gilligan and Noddings’ early theorizing also did not suggest an approach for caring for global others or even those within one’s local geographical region who were unknown to the carer. It soon became obvious that care raised many issues of justice.

A number of theorists challenged Gilligan and Noddings’ demarcation between the perspectives of care and justice. Elizabeth Porter (1991, p. 159), for example, believed that there was not an inevitable and irreconcilable division between the *rights* focus of the justice and the *responsibility* of the care perspective. Other theorists agreed with Porter, and Paul Crittenden (1992) and Robert Starratt (1994) suggested combining justice and caring perspectives.

Crittenden (1992, pp. 92 and 261–265) proposed “a reflective ethic of care” where there was a need to distinguish between selfishness and self-sacrifice and where the individual could be expected to meet certain standards of behavior associated with virtues or rules, such as respect for persons and a commitment to justice within a democratic framework.

Robert Starratt (1994, pp. 45–54) advocated a somewhat similar amalgamation of care and justice by suggesting a multidimensional ethic that combines caring, justice, and critique where each of these compensates for the shortfalls in each of the others and where these are seen as interdependent. Starratt (1994, pp. 29–40) believes that commitment to ethics of care, justice, and critique requires the personal qualities of autonomy, connectedness, and transcendence. Starratt (1994) also sees an interconnection between autonomy and connectedness to produce an intersubjectively realized form of autonomy which has also been endorsed earlier in this chapter, in connection with the moral interdependence proposed within an ethic of care.

Care ethicists like Joan Tronto and Berenice Fisher (1990, p. 40) extended the scope of care in proposing a broad definition of care as:

A species of activity that includes everything that we do to maintain, continue, and repair our world so that we can live in it as well as possible.

Tronto (1993, 2008) like a number of other theorists (Held, 2008; Fischer, 2008) appreciated the relevance of care ethics to global concerns as well as the possibility of evaluating various forms of care by suggesting that levels of attentiveness, responsibility, competence, and responsiveness might be able to be used as measures for various forms of care involved in caring about, caring for, care-giving, and care-receiving, respectively.

Other theorists such as Diemut Bubeck (1995, pp. 213 and 216) and Catchpoole (2001, p. 139) also believe that justice is intrinsic to care, because it cannot be otherwise if care is to be authentic.

Noddings (2002, p. 22) herself acknowledges that while

The emphasis in care ethics is on the affective . . . this does not mean caring is irrational or even non-rational. It has its own rationality or reasonableness and in appropriate situations carers draw freely on standard linear rationality as well.

Virginia Held (1998, p. 14) also realized that

Caring, empathy, feeling with others, being sensitive to each others' feelings, all may be better guides to what morality requires in actual contexts than many abstract rules of reason, or rational calculation, or at least they may be necessary components of an adequate morality.

Indeed, Michael Slote (2007, p. 15) has observed that “an ethics of empathetic caring” could provide the basis for a general normative theory applicable to both public and private morality. So while Slote (2007), like various other theorists, has been critical of certain aspects of the feminist ethic of care, he has appreciated its rich possibilities and potential.

Any adequate general normative theory of care needs to be grounded in a credible theory of moral development, and it is to a consideration of this that we now turn.

---

## Moral Development Within an Ethic of Care

Noddings (2018, Chap. 12) believes that we develop the capacity to care for self and others through the experience of being cared for ourselves. There is a great deal of evidence from a variety of disciplines (Bowlby, 1971; Damon, 1988; Kitwood,

1990; Noam, 1993; Wilson, 1978, 1998) to support this idea of finding a basis for morality/ethics in the care that most of us are fortunate enough to receive from our parents or first carers and then in caring relationships across the rest of our lives. None of us would survive our first year without the care of others, so we are all cared for, and most of us also care for others and exchange these roles throughout our lives within the complex web of our private, workplace, and community relationships.

While Gilligan and her colleagues (Gilligan, Brown, & Rogers, 1990, p. 113) have only sketched the outline of a theory of moral development, they have seen this process as “fraught with vulnerabilities” and entailing “losses and gains,” so their view of moral development aligns with that of Noam, Powers, Kilkenny, and Beedy (1990) as being an uneven process marked by both advances and reverses. This is also recognized by Tronto (2017, p. 32) who observed that:

Care presumes that people become autonomous and capable of acting on their own through a complex process of growth, in which they are both interdependent and transformed as they live. They can become more or less attentive to the effects they have on others and the world.

Evolutionary biologist, E.O. Wilson (1975, 1978, 1998) believes that reciprocal altruism is a genetically evolved human predisposition because our very survival as a species has depended upon our capacity to bond to close others. It is also within these close relationships that we learn to value ourselves and to return affection and love to those who have loved and cared for us. Psychologist Tom Kitwood (1990, p. 109) thinks “the self is relational, and in a sense, moral in its very essence” and

that we may well suppose that the strength of the self – the person’s ontological security, depends on the extent to which ... relationship (with parents or first carers) embodies empathy, respect, concern and reliable provision: qualities that are usually taken to be of the essence of morality. The infant comes to an awareness of self as one-who-trusts.

Psychologist Gil Noam (1990, 1991, 1992, 1993, 1998) and his colleagues (Noam, Powers, Kilkenny, & Beedy, 1990) have recognized the continuing importance of trust within relationships to individual and collective well-being across the life span and have noted how difficult it can be for individuals to trust and care for others if they have suffered abuse or neglect as a child from primary caregivers.

So our early social relations are critical in terms of what we learn about ourselves and others and develop our capacity for social perspective taking. “In this sense personhood is an ineluctably moral concept which is embedded and embodied in social interaction”(Catchpoole, 2001, p. 53). As Vygotsky (1935/1978, p. 37) realized, what is experienced interpersonally over time is translated into intrapsychic experience which moderates our further interpersonal relations. Work undertaken by Selman, Watts, and Hickey-Schultz (1997) and Noam (1993, 1998) suggests that children who suffer abuse from adults who are supposed to be their primary caregivers experience disconnection. These children are then unable to develop proper self- or other-perspectives and make progress through positive dialectical

engagement with others, to reach higher levels of social perspective coordination. Hickey-Schultz (1997) identifies the highest level of social perspective coordination as “autonomous interdependence,” but this depends on being sufficiently “secure and connected” (Staub, 1993, p. 353) to be truly responsive and responsible in dealings with others so that it is possible to be less defensive, less psychologically precarious, and more able to be sufficiently “decentred” (Gibbs, 1992, p. 223) “to attend to and inter-relate multiple perspectives in a social situation, or, in general terms, multiple features of a problem situation.” It is this self who is less preoccupied with self, who can be more *responsive*, *responsible*, and *reflective* in relationships with students and colleagues within the school operating as a democratic, collaborative, and ethical learning community.

---

## The School as an Ethical Learning Community

Given the importance of creating a caring culture to support cycles of positive reciprocity, it is suggested that schools become democratic ethical learning communities, comprised of the school principal, teachers, and other members of staff, as well as students, parent representatives, and other members of the wider community, where all are valued and respected and given the opportunity to share in decision-making (Sergiovanni, 1992) by contributing to the development of a shared vision of what caring involves for their particular community. This could reveal different cultural perspectives about care but also reveal deeper levels of commonality about the nature of care. It is a scenario where the vicissitudes of school life would not suddenly disappear but one where trust, mutuality, and positive cycles of reciprocity would be more likely to flourish. Certainly, the Child Development Project (Lewis, Schaps, & Watson, 2003) in the USA has achieved extraordinary success over a long period in integrating care into all aspects of school life.

It is now proposed to present an action research framework and related personal and interpersonal competencies that are required to undertake key stages in the caring process.

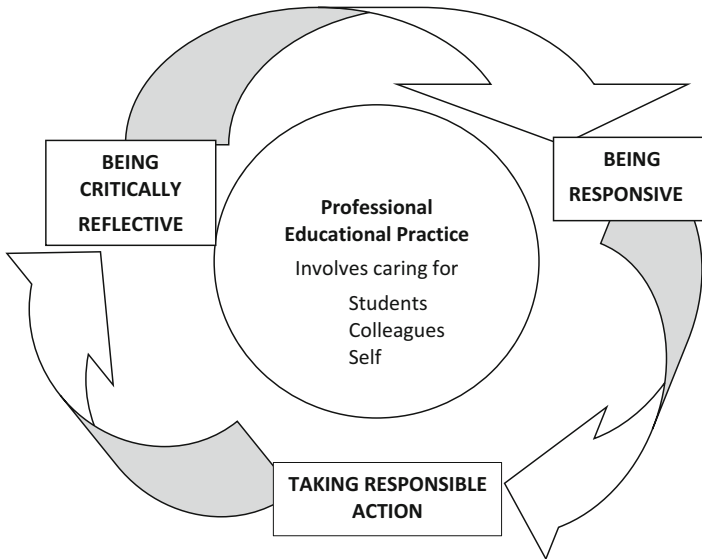

---

## An Action Research Framework Based on the Key Dimensions of Case

A simple analysis of *care* reveals three key elements:

- *Responsiveness*
- *Responsibility*
- *Critical reflection*

The action research framework outlined above can be used by teachers and educational administrators working together to focus on the learning needs of particular groups of students, individual students, or their own professional development. This is an approach which is consistent with the respect for the particularities of context, as advocated by Gilligan (1982) and Noddings (1984) within an ethic of care and one which allows participants in these relationships to “negotiate between them a shared interactive social reality” (Sammut & Moghaddam, 2013, p. 4) that enables the carer and the cared-for to become attuned to each other and to develop a much more nuanced understanding of the needs of the other. It also provides a model where the needs of the carer are seriously taken into account, and this can potentially prevent teachers and school principals from being overburdened with professional caring responsibilities. For example, no teacher should be expected to carry an unreasonably heavy teaching load, and all educators, including the school principal, should be encouraged to find a healthy and ethical balance between meeting professional needs and their own personal needs. The school principal could have a particularly important role in tactfully helping members of staff to set reasonable boundaries on the scope and intensity of their professional caring practice and, by example, could demonstrate the importance of responsible self-care. As mentioned earlier, justice is an intrinsic part of care if care is to be authentic. Moreover, ethics requires the individual to find a balance between meeting the needs of others and their own needs; it does not require a life of self-abnegation. Indeed, within an ethic of care the focus is on moral interdependence within relationships and maintaining positive caring relations which generate trust and are more likely to contribute to positive cycles of reciprocity. As Damon (1988, p. 74) realized,

Moral living revolves around the assumption that social actions are reciprocal. This assumption has implications for one's conduct towards oneself. One therefore takes responsibility for the former and asserts rights with regard to the latter, and these responsibilities and rights exist in reciprocal relationship to one another.

As Virginia Held (2008, p. 51) realized, care ethics focuses “on caring relations rather than on the virtues of individuals” and therefore prioritizes the development of “trust, empathy, sensitivity, natural considerations, solidarity and responsiveness to need.”

It is now proposed to consider some of the personal and interpersonal competencies required by teachers and school administrators to be *responsive*, *responsible*, and *reflective* in their professional practice.

---

## Personal and Interpersonal Competencies

### Being Responsive

It is suggested that the competencies required to be responsive to students and colleagues include:

- (i) The dispositions to care about others where this involves developing (a) self-esteem and (b) empathy
- (ii) An understanding of the nature and scope of what is involved in caring for self and others which requires a range of critical and collaborative competencies
- (iii) A capacity for intersubjectivity which requires the development of social intelligence – the capacity to interpret, respond to, and evaluate verbal and social cues from others

An educator's capacity to be responsive to their students relies on maintaining and sustaining their dispositions to care about their students. While it could be expected that teachers should automatically care about their students, it is certainly possible for even the most enthusiastic teachers to have their motivation reduced through the vicissitudes and demands of their day-to-day work. Christopher Day (2017, p. 85) has noted that there is a range of research internationally that suggests “that governments world-wide in placing persistent emphasis on the functional aspects of teachers' work have implicitly denied, minimized or neglected to ensure teachers' ongoing commitment to having a positive sense of professional identity, care, well-being and resilience in order to teach at their best.” As Sharp and Splitter (1995, p. 173) have also observed, “given the reciprocity inherent in personal development, self-esteem goes hand in hand with esteem for others.”

Hoffman's (1988, p. 509) research related to the development of empathy has suggested that even quite young children between ages 2 and 3 demonstrate empathy by often becoming upset when they see someone else, such as another

child, becoming upset. By age 12, Hoffman (1988, p. 509) says that the child is typically able to empathize with groups of people experiencing discrimination or mistreatment. Moreover, sociobiologist E.O. Wilson (1978, 1998) believes that as members of a socially interdependent species, we have evolved to be “soft-core altruists,” and this suggests that our capacity for sympathy, and probably empathy also, is hardwired. But the very neuroplasticity of our brains makes us vulnerable to negative experiences within relationships across our life span so it seems that nothing is necessarily assured, even when we have received the love and attention of our first caregivers. Nevertheless, it is possible to hypothesize that whether school administrators and teachers can maintain high levels of empathy for students might be dependent upon how supportive individuals are within the school community.

Finally, as already discussed, being truly responsive to students and colleagues ideally involves a capacity for interpersonal intersubjectivity as developed in social psychology by George Herbert Mead (1934/2009) and which involves the ability for mutual engagement and the capacity to interpret, respond to, and evaluate a range of verbal and non-verbal cues to try to appreciate their students’ perspectives. Michael Carrithers (1992, p. 43) thinks “intersubjectivity” is dependent upon a level of “social intelligence” which he defines as “the ability to attribute to others various mental states, plans, intentions and so forth – to guess what others are thinking and planning with a fair measure of success.”

## **Taking Responsible Action**

The competencies that are needed to take responsible action for students include being able to:

- Assess the nature and scope of one’s professional responsibilities
- Investigate and decide what action is most likely to contribute to responsible care for students, colleagues, and self, given the sociocultural and socioeconomic context of the school
- Work collaboratively and cooperatively with colleagues to promote a shared vision for caring for students, one another, and our world
- Respond calmly and non-defensively to critique and then consider alternative suggestions for action as well as demonstrate tact, diplomacy, and patience

Responsible professional action by teachers and educational administrators crucially depends on developing a particular kind of moral identity that is secure in being able to take an autonomous moral position and yet also demonstrate a sense of connectedness to, and interdependence on, others. As Staub (1993), Gibbs (1991, 1992), and Noam (1993) have argued, it is only when an individual has developed the capacity to form a strong and well-integrated moral self that he or she is literally free to be concerned with others and therefore more fully able to meet the challenges of professional commitments and responsibilities. As secure and connected selves,

educators can be self-critical and accept reasonable critique from others without becoming angry or defensive or unfairly blaming others.

## Being Critically Reflective

Critical reflection is an integral part of educators' professional caring practice as learning is a dynamic and evolving process which needs to be refined, amended, and progressively developed as the learner's needs and circumstances change. Educators therefore need to be able to undertake critical review of their work and be unafraid to face feedback about their professional approaches and performance. Once again, educators need to be secure and connected selves to avoid being defensive about critique or tempted to unfairly externalize blame. Instead, educators need to explore alternative approaches after undertaking further investigations and consultations with those for whom the original approach had been devised. This consultation within the caring interaction has been the characteristic way of evaluating and adjusting caring practice within an *ethic of care* as theorized by Gilligan (1982) and Noddings (1984). However, it is also suggested that teachers and school principals can evaluate the effectiveness of their professional practice through various existing forms of accountability as well as through peer and self-evaluations.

---

## Conclusions and Reflections

As Tronto (2017, p. 33) has observed:

Care conceptually offers a different ontology from one that begins with rational actors. It starts from the premise that everything exists in relation to other things; it is thus relational and assumes that people, other beings and the environment are interdependent.

As suggested in this chapter, there is a very considerable body of theoretical and empirical research to support a relational and interdependent basis for the ways in which we develop and exercise moral autonomy and moral agency. While an ethic of care has had a number of limitations, especially in its initial separation of care from justice, it provides the basis to revolutionize our understanding of the moral process. As mentioned earlier, Michael Slote (2007) recognized that if care takes empathy seriously, it can, and should, provide a comprehensive normative theory at both personal and political levels. While further research remains to be undertaken to achieve this goal, it is proposed that there is already enough contemporary research and theorizing to support educators in basing their professional practice in a relational approach to ethics within relationships of care. In increasing their own moral resilience in and through positive cycles of reciprocity in and through the care they give and receive, educators also have the opportunity to become more secure and more connected selves and hopefully increasingly able to exercise an intersubjectively realized moral autonomy and agency. Engaging with students in ways which

help them to learn and flourish goes to the heart of the teaching profession and is to the mutual benefit of the student and teacher. As David Purpel (1999, p. 941) realized over two decades ago, schools have a crucial role to play in appreciating

a dynamic dialectic between the social and the individual, between the forces of social realities and the possibilities of individual responsiveness and between individual rights and social responsibility.

As our world has reeled under the impact of a global pandemic, there is a sense of urgency about what we need to learn. A philosophy of care based in our moral interdependence as human beings has never seemed so cogent.

## Abstract

Since the urbanization of many nations' populations, schools have become increasingly bureaucratized, often becoming the basic building blocks of larger school systems. Despite this, schools have retained some of their unique properties because of varying student needs and expectations of the immediate cultural and economic environments. Since the late twentieth century, the market ideology within neoliberalism has become a dominant feature of them, often advanced in the guise of education reforms. In this regard, strict standardization and accountability policies have been introduced to push schools to produce uniform student outcomes, often embedded in the agenda

of reducing or eliminating achievement gaps between identifiable student groups by race or class. Within the scope of these policies, competition between schools has been encouraged through school choice reforms and ranking of schools. Professional associations and educational agencies at different governmental levels have supplemented these policies through identifying the so-called result-oriented leadership practices for school principals. Despite much legislation and financial investment, schools have produced overall disappointing results, especially in the academic subjects. Competition between schools has worsened the situation of low performing and culturally different students. Teachers have not always supported the applications and goals prescribed by these policies, and their unions have sometimes adopted a hostile reaction to them. However, school principals have struggled to be effective leaders, even as their increased workload has resulted in pushing it to the classroom teacher level. Accordingly, rigid policies have failed to address the highly variable human aspects of education, and the one-size-fits-all approach centered on eliminating achievement gaps has not been able to transform school contexts to conform to policy requirements. One paradox of this dilemma is that as instruction becomes more effective it increases rather than decreases the achievement differences between students. The aim of decreasing achievement gaps through standardization is therefore somewhat of “a fool’s errand.”

Institutional environment · Machine bureaucracy · Iron cage · Leadership dilemmas · Standardization · Accountability policies · Market ideology · Neoliberalism

**The Field of Memory**

The schools have mostly been operated as parts of education systems regulated by bureaucratic hierarchies since the urbanization of the population movement from rural areas to the cities. The structures and functioning of schools have increasingly been shaped by bureaucratic hierarchies while they have retained some of their unique challenges depending on critical variances within the student population and their immediate idiosyncratic environments. The growth in the administration of the schools has paralleled the transformation to the dominant bureaucratic form so prevalent in modern times.

**The Field of Presence**

Since the late twentieth century, market ideology has increasingly come to dominate the development of education policies. Strict standardization and accountability policies have forced schools to produce uniform student outcomes particularly in academic subjects. Competition between schools has been encouraged through school choice reforms and the establishment of reward and punishment systems. High-stakes assessments have been used to determine whether schools meet the requirements about

standards and to rank schools according to students' test scores. Schools and school systems that do not perform well are subject to further strictures and punitive measures.

### **The Field of Concomitance**

There is a surprising level of homogeneity between the organizational forms and practices in a specific industry. Behaviors that are routinized, repetitive, habitual, and performed without being questioned have a great weight in professional life. Restrictions, rules, and norms may shape individuals' actions, leading to interorganizational homogenization (DiMaggio & Powell, 1991). In this regard, machine bureaucracies are generally associated with simple and stable environments as dynamic complex environments cannot be made repetitive and standardized easily. Furthermore, machine bureaucracies are identified with regulating technical systems (teaching), which reduces work complexity and makes it easier to control. External pressure exerted by punitive legislation is employed to ensure the stabilization of these features. The effect of these changes in educational systems has been to reduce its capacity to engage in organizational specialization and unique work demands (Mintzberg, 1993). The model of the factory from industrial management practices fits this situation perfectly.

### **Discontinuities and Ruptures**

The publication of Milton Friedman's 1962 book *Capitalism and Freedom* in the USA marks the beginning of a serious turn in school administration. While schools and school systems in urban areas had long been bureaucratized, it can be argued that the implementation of Friedman's ideas, oftentimes advanced as "reforms," accelerated this bureaucratization. It also marked an increasing encroachment of regulation and standardization into the lives of teachers and the control of their work. Legislative punishments prompted by low test scores and the inability to remove achievement gaps meant the loss of jobs of principals and teachers in chronically low performing schools. This draconian and punitive aspect of particularly No Child Left Behind Act (NCLB) was among the hallmarks from specifically those of industrial models, which depended on extreme standardization as their means of exerting control of job performance and cost containment.

### **Critical Assumptions**

Strict standardization and accountability policies have dictated schools to produce uniform student outcomes, but schools have mostly failed to reach this goal. These policies have highlighted that competition between schools could lead to better outcomes for students, yet it has aggravated the situations of low performing and culturally different students. School principals have been expected to lead teachers in complying with policy requirements; however, there have always been teachers unconvinced about the potential outcomes of these policies. School principals have been supposed to undertake additional tasks required by these policies; nevertheless they have become so overwhelmed that they have needed teachers' sharing their administrative workload. One key assumption behind these developments is that more direct control is required to force school leaders and the teachers in them to conform to a standardized set of tasks and focus on only one set of educational outcomes.

## Introduction

Schools predominantly operate as a part of education systems. Whether centralized or decentralized, the administrations of educational systems typically have the authority of affecting in-school activities through determining legitimate organizational structures and setting the rules and procedures regulating administrative and instructional work and the relationships between school stakeholders. Schools and in-school structures, rules, and procedures are all parts of the same environment. Schools represent a layer within this environment while retaining their unique features like in-classroom teaching and relationships with immediate environment to some extent. School principals practice leadership in such a highly structured school environment. When making decisions, they must take structures, rules, and procedures regulating the functioning of the schools into consideration. This also implies that environments in which schools operate can constrain the actions of school administrators and teachers (Berends, 2015).

Hierarchical structures, rule-bound routinized activities, and standardized outcomes in schools are frequently depicted by using the metaphor *iron cage* when they function merely as a prisoner's structure strictly confining individuals' actions within certain patterns (Weber, 1930). Schools are usually regulated by bureaucratic organizations, such as ministries, departments, and district administrations. This primarily leads school administrators and teachers to be seen as officials representing different layers of a bureaucratic hierarchy that functions on the basis of a set of rational and neutral legal regulations and procedures. In addition, societal expectations fueled by politics, standards set by professional associations, and prescriptions provided by scientific communities contribute to the establishment of highly rationalized comprehensive *cages* (Ashworth, Boyne, & Delbridge, 2009). Such an *iron cage* can be so internalized by administrators and teachers that predetermined standards and methods to realize specified uniform outcomes can be seen as the most efficient and plausible *modus operandi* (Mintzberg, 1993; Weber, 1930).

In this respect, almost all reform attempts have put emphasis on standards, testing, and accountability worldwide since 1970s to overcome the widespread achievement gaps between schools and between students (Lessinger, 1970). Standards indicating the minimum attainment level of learning outcomes and the methods to be employed to attain these outcomes have frequently been used as a means of control. National and international large-scale testing of students and widespread reporting of results have been used to check whether standards have been met and to compare the schools publicly. Schools, school administrators, and teachers have increasingly been held accountable when they have failed to meet those standards (Froese-Germain, 2001; Holloway, Sørensen, & Verger, 2017). It can then be argued that policies promoting standards, testing, and accountability create highly rigid environments in which school administrators and teachers are expected to perform in narrow *cages*.

Particularly school principals are deemed as the main undertakers of the burden of accountability in schools. They have negligible effects on highly variable social capital and cognitive characteristics of students, but they are supposed to lead

teachers to produce uniform student outcomes. They are supposed to collaborate with other principals to accomplish district-level goals, nonetheless at the same time they need to compete with them due to school rankings. They are confined by the *cage* of prescribed goals and means; however, they are expected to be leaders of their schools. They are expected to devote much time and effort to instructional matters to improve student learning, while spending their work hours on administrative tasks (Allen, English, & Papa, 2014; DeMatthews & Serafini, 2021). Accordingly, such an *iron cage* gives rise to a series of leadership dilemmas. Some of these are discussed in the sections which follow.

---

## Institutional Environments of Schools

The constraining environmental factors (e.g., standards, policies, rules, laws, and others) that “lock” school administrators and teachers into “grid lock” can be portrayed by analyzing institutional environments of schools. The process of institutionalization is one of the central concepts of organizational sociology. These concepts are used to describe prescriptive rules and social structures, which have the power to put individuals under obligation. According to Berger and Luckmann (1991), the institution is social actors’ habitualized repetitive actions. Expressly, the concept of institution is a social order (e.g., organizations, agencies, associations, and others) or pattern (e.g., habits, norms, procedures, and alike) that has acquired a certain status or characteristic within a period of time. Institutionalization refers to this process of acquisition. Institutions are generated and sustained not through collective interventions toward social consensus but rather through routinized procedures that are not prevented by deliberate collective actions or environmental shocks, and which encourage the arising and maintenance of the patterns. In this way, institutionalization turns into a recurrent pattern, consistency, or persistence (Jepperson, 1991).

Either as an action or an organization, institutions do not solely exist on their own; they survive in an environment together with many other institutions that are specialized in (dis)similar areas. This environment can determine legitimate organizational forms via establishing the rules and standards on the functioning of a whole industry or system (Öztürk & Tataroğlu, 2018). This environment consists of many actors and agencies, namely, governments, political parties, ministries, departments, local educational authorities, educational organizations at different levels, teacher unions, and nongovernmental organizations (Fidan & Balcı, 2018).

---

## Types of Environmental Pressures

Coercive pressures denote the existence of a common legal environment and/or superior organizations that impose certain ways of operation on schools. They arise from the formal and informal pressures by other organizations schools are affiliated with and the society’s cultural expectations. Such pressures can be

sensed through coercion, persuasion, or agreement. Factors like legal regulations; supervisory and regulatory activities; standards, rules, procedures, and policies dictated by public organizations; legal obligations in financial matters; and service conditions of monopolies are within the scope of the mentioned coercive pressures. To give an instance, schools can accept and graduate students with qualifications specified by other organizations, employ teachers at certain standards, and appoint administrators. Likewise, curriculum goals predominantly reflect the expectations of outside bodies, other organizations, or those of the society (DiMaggio & Powell, 1991).

Normative pressures signify the expectations from schools and educators about playing certain roles considered appropriate by professional associations and values, and the professional scientific community. Professional knowledge, skills, abilities, habits, and ethical principles acquired through professionalization create behavioral similarities between administrators and teachers. At the end of the professionalization process, teachers with similar subject matter knowledge levels, competencies, tendencies, and orientations emerge in different schools (Fidan & Beyhan, 2020). Two characteristics of professionalism lead to this homogenization. The first one is formal education. Education provided in the universities and later, on the job, aim at bringing in similar qualifications to a large extent. It is not surprising then that there exist great similarities between contents and goals of teacher education programs worldwide. The second factor that leads to homogenization is the professional networks of school administrators and teachers. Particularly professional associations and societies do play key roles in this by issuing professional standards (Puttick, 2017).

Mimetic pressures allude to the following of the successful exemplars in uncertain situations (Puttick, 2017). DiMaggio and Powell (1991) averred that technical or environmental uncertainties encourage organizations to imitate what are perceived as successful models or procedures. Consonantly, when the goals that will be reached at the end of the education period are uncertain, or when the methods and techniques to realize these goals are not certain, even though the goals were determined, educators usually observe others before taking actions as a way of coping with uncertainty (Puttick, 2017). The spectrum of examples to be followed in case of uncertainty can indeed be considerably wide for administrators since the strategies of educational administration and leadership are often from those in noneducational areas, viz., rationalized systems of business management and marketization of educational services that appear popular (Traver, 2006).

When coercive, normative, and mimetic institutional elements are tightly coupled, the *iron cage* arises. Tightly coupling refers to situations where institutional elements like legal regulations, policies, standards, and scientific prescriptions are so strongly dependent on each other that it is difficult to change any of them without affecting the others (Ashworth et al., 2009). Standardization of work processes and the existence of professionals, to illustrate, analysts, experts, and high-ranked officials who bear the task of standardizing others' works, are some of the major character(istic)s of the *iron cage*. Ministerial, departmental or district divisions, to wit, instruction, personnel, research, and development units usually undertake this

task in education systems. Furthermore, decision-making is centralized in the hands of administrators at the top of the bureaucratic hierarchies. Standardized work processes and goals lead to the routinization and formalization of school work, which typically requires a highly stable environment and repetitive work procedures (Lunenburg, 2012; Mintzberg, 1993).

In the *iron cage*, administrators and teachers are interned into spheres set by these elements and expected to follow certain presumptively rational and efficient ways of operation to reach predetermined quantifiable ends (English, 2015). For instance, strategies to be applied to realize a student outcome, a test score, or decreased absenteeism, to name a few, are well formulated and documented as logical prescriptions, best practices, or field-proven cost-effective measures (Chen & Ke, 2014; Traver, 2006). Leadership is predominantly reduced to compulsive rule compliance (Lumby & English, 2010).

---

## Leadership Dilemmas in the Iron Cage

It can be argued that market ideology has emerged to dominate the development and application of many education reforms since the late twentieth century in a global scale. Competition, which is regarded as the main driving force behind the productivity and efficiency in economics, has been applied to schools. The assumption that the competition between schools creates positive outcomes for students has been situated at the core of education policies. Families want their children to study in high performing schools. Regulatory agencies want resources allocated to schools to be used with increasing efficiency. Due to these reasons, student achievement and the quality of education have been transformed into common measurable criteria to make comparisons between schools possible. Meeting standards regarding learning outcomes has become the main criterion of competition between schools (Linn, 2000).

What is more, criticisms claiming the evaluation criteria of school principals have become both shallow and narrow paved the way for the development of leadership preparation programs at the university, which aim to consolidate their shortcomings. The said endeavor is oftentimes reinforced by national/state accreditation as a form of policing. This situation has given rise to the below dilemmas:

### **Dilemma 1: Producing Uniform Student Outcomes Despite Highly Variable Student Differences and Needs**

Students' acquisition of common knowledge and skills prior to graduation has been among the fundamental aims of mass public education systems since the industrialization of public schooling in the late nineteenth century. The standardization of curriculum content and goals has gained momentum due to the acceleration of accountability policies over many decades beginning with Leon Lessinger's (1970) *Every Kid a Winner*. A strong expectation has been set for schools to produce

uniformly equal student outcomes. Supporters of this standardization assert that assessment variations among schools, districts, provinces, or states have hindered effective functioning of education systems. A general accountability scheme for schools at a national scale is very difficult. Furthermore, categorizations of low performing and high performing schools may vary in accordance with comparison criteria specific to each district, province, or state (Bushaw & Lopez, 2010).

High-stakes standardization is a global phenomenon. For example, in Turkey, a highly centralized system, curriculum content, and goals are determined by the MoNE (Ministry of National Education). To be able to study in high performing secondary schools, students must take national high-stakes exams. What is more, they must take national high-stakes exams again to get admission to a university program. The coverage of these mass assessments largely determines which knowledge and skills are to be acquired by students and forces schools to produce highly uniform student outcomes to be categorized as a high performer (Yalçın & Ereş, 2021). Even though the USA is a decentralized system in which schools, districts, and states bear the main responsibility in curriculum development and assessment matters, similar standardization quest has been observed since the emergence of accountability legislation in recent decades (Allen et al., 2014).

As can be seen, coercive and normative institutional elements facilitate the creation of the *iron cage* by exerting pressures on school principals to use contextless leadership practices while leading teachers toward the aim of producing uniform student outcomes at predetermined levels. However, one-size-fits-all style of education is not ideal for every student. Schools are heavily affected by the socioeconomic discriminations and tensions in a society, which leads to great differences among schools in terms of student profiles. Plus, there is always a great diversity of student backgrounds and learning needs within each school (Deas, 2018).

## **Dilemma 2: Competing Rather Than Collaborating with Peers**

Market ideology, which has dominated education reform movements since the late twentieth century, pretends that competition between schools is the prerequisite of efficiency. Friedman (1997) is without doubt one of the pioneers of the introduction of market ideology into public sector. According to him, the inefficiency of public organizations was the main reason of economic crises arisen in the second half of the twentieth century. What he proposed as a remedy is the marketization of public services. In this sense, competition not only between public and private schools but also among public schools is promoted to increase the efficiency of the overall education process. Competition can force public schools to improve for the retention of students (Friedman, 1997). Verily, the main criterion of competition between schools is the production of better student outcomes. Those who succeed are rewarded and those who do not are punished. Such a reward and punishment mechanism is thought to encourage schools and school principals to show high performance.

In order for this to happen, competition must infiltrate into institutional environments of schools. To cite an example, Education Reform Act (ERA), enacted in the United Kingdom in 1980s, has aimed at building an institutional framework in which competition between schools is encouraged to produce better outcomes for students. In this direction, the autonomy of schools to enable them to compete with each other is increased and families are granted the right of school choice. Schools' meeting standards prescribed by national curriculum and student achievement have been publicized as league tables (Levin & Fullan, 2008). In the USA, NCLB has established a similar institutional framework. It has introduced reward and punishment mechanisms based on student achievement. Families whose children are enrolled in a chronically low performing school are able to transfer their children to a high performing one. NCLB has given rise to a framework promoting market-based competition and choice (Sunderman & Kim, 2007). Turkey tells a different story. There is no legal regulation dictating a competition between schools. However, the results of high-stakes national exams for the entrance to high performing secondary schools or university programs function as an informal performance evaluation mechanism for families and top educational administrators. These results are transformed into performance lists and shared with all schools in a district or province. Families tend to choose schools according to their past performances in high stakes exams. Principals of these schools are more advantageous in reaching financial resources and finding high performing teachers. This puts pressures on school principals and teachers to compete with others and attract promising students to increase the average score of the school in high-stakes exams (Buyruk, 2014).

Either formally or informally, it would be fair to accentuate that institutional environments of schools have created competitive settings. The main struggle of school principals is toward not being the last one on the list, or at least not being at a lower place than a peer working in a similar school. This is because they want to protect their principalship positions (Buyruk, 2014; DeMatthews & Serafini, 2021). School principals compete with each other to reach promising students, to hire high performing teachers, and to move up to higher positions (DeMatthews & Serafini, 2021; Jabbar, 2015; Shipp & White, 2009).

Competition puts pressure on schools to attract and retain students. Higher scores attract higher numbers of students. In a similar vein, more students mean more financial rewards. School principals' first reaction against such a competition is to improve school quality and functioning (Buyruk, 2014). In this direction, improving test results to build a positive image and changing curriculum and instruction to attract gifted students are frequently observed in competitive settings. This also yields the cutting of unnecessary activities and channeling financial resources to those that can enhance student outcomes. Some principals prefer differentiation to refrain competition. To give an example, schools may choose to specialize in a subject such as arts and language to occupy a niche in district through attracting families demanding a certain kind of education. Similarly, increasing the number of extracurricular activities in certain areas (e.g., sports) can be useful to attract families (Jabbar, 2015). It can be argued that the most frequently used strategy is to find students whose prior

performances hint that they can accomplish outcome expectations and not to choose those who are regarded as not good fit (Shipps & White, 2009).

Due to the competition, school principals feel the pressure of recruiting high performing teachers. High performing teachers are deemed as a very effective advertisement for schools as families usually monitor and scrutinize not only the performance of schools but also that of teachers (Kotok, DiMartino, & DeMatthews, 2021). Allocating extra financial resources to hire the most demanded teachers is a frequently used strategy; but the most effective one is to take advantage of personal networks in this frame. Building high quality relationships with education professors in universities, student associations and professional associations to identify high performing teachers or promising novice teachers can be effective in recruitment processes. Also highlighting collaborative school culture and teacher autonomy can turn schools into attractive workplaces (Shipps & White, 2009).

Some principals may see winning such competition as a means of promotion to higher positions like a superintendency. When the main criterion of school leadership evaluation is students' test scores, the effective principals are the ones who can get scores up. Higher test scores mean more advantages in the pursuit of higher positions (DeMatthews & Serafini, 2021).

It can be argued that competition requires school principals to act like a marketing manager trying to sell their schools and programs with a view to increasing their financial resources. Advertising has become an integral part of principalship (Kotok et al., 2021), even it risks surpassing traditional administrative and instructional tasks of school principals. Competition leads to the isolation of school principals. It pushes social and democratic purposes of education into the background while highlighting individual gains. It also prevents principals' appealing to the help of others while seeking a solution to educational problems or contributing to effectuate district-level performance goals (Keddie, 2016; Reid, 2010). Furthermore, as the competition escalates, it risks the emergence of unethical actions to the detriment of low performing students. As an illustration, classifying low performing students as the ones needing special education, excluding these students from tests, exclusively concentrating on promising students, and suspending low performing students close to the examination date can frequently be observed in highly competitive environments. Focusing on merely test-based instruction can surpass the importance of education or learning suitable for all students (Jennings, 2010).

### **Dilemma 3: Leading Without Constructing Leadership Appropriate for School Contexts**

One of the most substantial tasks of school principals, as designated leaders in an *iron cage* is to change school settings in accordance with the demands of the institutional actors (Fidan & Balci, 2018). In such cases, educational leadership as individual agency is reduced to ushering in standardization and accountability pressures of social and institutional actors and motivating in-school stakeholders to meet these pressures (Kohansal, 2015; Murphy, 2015).

The aim of the principalship in an *iron cage* is not preserving the interests and identities of in-school groups, but just convincing them of the legitimacy of institutional demands (e.g., policy requirements and directives of higher authorities). In this manner, school principals are limited with contextless result-oriented practices that emphasize arriving at the strictly predetermined goals. While groups whose interests overlap with the institutional demands tend to approve the leadership of the school principal, the others tend to see them as caretakers of the status quo. Institutional actors commonly prefer to preserve the status quo and apply interventions to refine current activities (English, 1999, 2007). The *iron cage* permits only highly narrow spaces for school principals to exert leadership as they dictate the goals to be achieved and the methods to be employed. When the main aim of the principalship is just promoting the standardization of school work, the incentive to seek alternatives is greatly reduced (Ashworth et al., 2009).

For instance, in Turkey, the education system is a highly centralized bureaucratic structure at the center of which MoNE has the authority of decision-making over the allocation of resources, the assignment of teachers and school principals, the development of course curricula, and the preparation of textbooks. The functioning of each school, the output of education, and actions of school principals are heavily shaped by the policies and directives of MoNE. School principals are expected to strictly follow directives of MoNE and keep the stability of school activities. In situations where school principals choose only to convey the directives of MoNE, it is not surprising to encounter teachers who think “there is no need for a school principal in this school. Because the same routine goes on so that everybody knows his work” (Hammersley-Fletcher, Kılıçoğlu, & Kılıçoğlu, 2021, p. 197).

On the other hand, leadership is largely co-constructed by school principals and in-school stakeholders through informal relationships, which renders leadership a contextual phenomenon affected by needs, expectations, emotions, and past stories of individuals taking part in the co-construction process (English, 2007). The *iron cage* inhibits school principals’ from effectively responding to the needs and expectations of in-school stakeholders unique to each school context in which leadership is compromised.

What is worse, their developing and employing leadership practices unique to each school context instead of those encouraged by institutional regulations can be harshly criticized and disapproved by their superiors. They can be labeled as low performers. For instance, strict standardization and accountability policies have led to the removal of some school principals since their schools failed to meet policy requirements and performance expectations of superior organizations (McGhee & Nelson, 2005).

Even though their autonomy in goal setting is restricted and the number of leadership strategies they can employ is lessened, school principals do not frequently content themselves with only conveying policy goals and directives of higher authorities. Instead, they generally make an effort to persuade teachers to work toward goals and directives by informing them about potential positive outcomes and gaining their support through the help of informal relationships (Fidan & Balci, 2018).

#### **Dilemma 4: Pressures of Principalship Allowing Little Space and Time for Leadership**

Standardization and accountability policies have restructured the operational aspects of schools. The principalship has become more stressful, unhealthy, and a difficult position than it was in the past. It demands higher levels of energy, time, flexibility, and resilience (Oplatka, 2017).

Administrative tasks, such as paperwork, meetings, family/community issues, security issues, communication, data entry into management information systems, budget preparation, resource allocation, procurements, payments, and maintenance and repair work, occupy the majority of school principals' work hours (Spillane & Hunt, 2010). As these tasks are rule-bound periodically repeated activities dictated by legal regulations, they turn into restrictive routines for school principals and decrease the time that can be allocated to instructional matters. Similarly, school principals in Turkey complain about spending most of their time for paperwork and data entry into management information systems like teacher attendance, student attendance, and test scores (Ayyıldız & Baltacı, 2020; Balıkcı & Aypay, 2018).

What is worse, competition fueled by standardization and accountability policies has led to the increase in the frequency of some tasks, such as budget preparation, resource allocation, and marketing. Marketing in particular has become the most frequently undertaken administrative task by school principals. They endeavor to render their schools more attractive for families, recruit high performing teachers, and enroll promising students (Jabbar, 2016).

School principals usually spare lesser effort and time for instructional tasks than administrative ones. Preparing for high-stakes assessments comes to the fore as the most significant instructional task (Cranston, Ehrich, & Billot, 2003). Leadership in the *iron cage* is thoroughly transformed into management.

School principals around the globe generally employ similar strategies to cope with excessive workload and time constraints. For instance, Israeli principals delegate some tasks and responsibilities to assistant principals and teachers. They also set priorities and give up certain tasks (Oplatka, 2017). Turkish principals use the same strategies; apart from that, they distribute work among administrators and teachers, and prepare detailed schedules about periodical tasks (Altun, 2011). School principals in the USA emphasize the distribution of the school works and the encouragement of teacher leadership as coping strategies (Wells & Klocko, 2015).

---

#### **Conclusions and Reflections**

The metaphor of the *iron cage* created by Max Weber (1930) has come to represent the intersection of the ideology of neoliberalism (English & Papa, 2018) with its emphasis on market logic and dynamics, competition, and efficiency, combined with the need for absolute control of the educational environment obtained by eliminating differences through the characteristics of what Mintzberg (1993) has labeled *the machine bureaucracy*. Such an organizational structure requires rigid

standardization and workplace homogenization and very close supervision. The space for difference, individualism, idiosyncrasy is severely reduced and punished. A machine cannot deal with exceptions. It requires environmental stability and homogenization to operate at maximum efficiency. The existence of achievement gaps caused by a lack of differentiation to cultural, economic, and social differences of students is ignored let alone eliminated. The presence of gaps is testimony to the fact that the rules of efficiency are inefficient.

Principals face a number of distinct dilemmas, which have been described in this chapter. The *iron cage* pushes school principals to adopt result-oriented leadership practices, which include leading teachers to produce standardized learning outcomes in only a few core subjects (e.g., mathematics, reading, language arts, and science). This has led to the decrease in the instruction time of subjects that have not been parts of accountability frameworks (Pederson, 2007). On the flip side, it is impossible to confine individuals' abilities and skills within a few subjects due to cultural, socioeconomic, and cognitive differences. Similarly, economic and cultural needs of societies are too variable and heterogeneous to satisfy with narrowly defined homogeneous human capital. What is worse, competition has accelerated the engagement of schools in subjects included in accountability frameworks and worsened the situations of students whose needs, competencies, and interests fall outside these frameworks. In addition, the *iron cage* overlooks different opinions and tendencies of administrators and teachers about the process and outcomes of education. They are expected to follow homogeneous methods to reach homogeneous outcomes, which complicates the co-construction of leadership unique to each school context. The fact that the *iron cage* creates highly structured work conditions for school principals causes them to focus on management rather than leadership.

What is firstly required to exit from the *iron cage* is to reorganize teaching activities in accordance with the existing situations in schools. Rather than expecting students to adapt to standards determined by policymakers, teaching should adapt to individual needs and differences of students. It can be argued that cultural, economic, and social differences are effective in learning experiences of students. Such differences should be taken into account while organizing teaching activities and in-school relationships. This requires teachers' understanding of each student's cultural community and home life. In a similar vein, students are encouraged to understand others' cultures and engage in positive relationships with culturally different students. Such a culturally relevant teaching has positive effects on academic achievements of particularly low performing students. Moreover, it gives rise to decreased prejudice against other cultures and increased critical cultural consciousness about weak groups in a society (e.g., Byrd, 2016; Howard, 2001).

Notwithstanding, a single school cannot always provide adequate opportunities for the individualization of teaching activities. Collaboration, in lieu of competition, among schools can produce cost-effective solutions for the scarcity of resources. The employment of teachers and administrative staff who can overcome lingual and cultural barriers, and the development of teaching methods and materials for each cultural group mostly surpass the human and financial

capacities of individual schools (Kayes, 2006) and require them to combine their resources. At this point, it can be argued that rigid accountability frameworks hinder efforts to develop culturally relevant teaching activities unique to each school. The loosening of these frameworks has inevitably invited the support of external stakeholders like political figures and school district administrators (Fusarelli, 2002). Such a support can alleviate the obligation of producing standard results through regulatory changes and policy exemptions and create relatively more flexible work environments in which school principals and teachers can co-construct a value-oriented leadership emphasizing individual student needs and differences. This can also encourage teachers to engage in administrative tasks and share the workload of school principals by enhancing teacher autonomy and empowerment.

Implementing policies toward assessing students in only few subjects to produce standard outcomes and eliminate achievement gaps between students has inevitably created new gaps. Not only the subjects that students are proficient in, but also their levels of proficiency tend to be highly variable. The differences among students necessitate the use of multiple assessment criteria enabling the implementation of teaching activities sensitive to individuals' cultural and social backgrounds. Here, it should also be noted that the origins of achievement gaps largely lie in students' cultural and social capital that schools and students have little or no effect to make significant changes. Racial, cultural, and socioeconomic discriminations in a society create detrimental conditions for students from weak groups. The disadvantages they inherit from their families mostly constrain them to reach the same academic standards with others even if they are treated equally. The intervention of large governmental agencies through welfare programs and policies is needed to address cultural, economic, and societal inequities leading to such gaps. It can also be argued that focusing on growth and improvement suggesting the value added to individual student knowledge and skills can be a more acceptable indicator of progress. This does not mean to reinforce or sustain the existing inequalities among students; on the contrary, such an approach can allow school principals and teachers to spare more educational resources and time for low performing students and minimize achievement gaps in the long run.

## Abstract

The large discourses about leadership have created understandings that are often glamorous, dramatic, and devoid of the skills real leaders use in everyday practice. Fantastic depictions of leadership in the zeitgeist also perpetuate notions that leadership is a seemingly effortless endeavor devoid of disciplined training and reliant on “natural talents.” This discussion extends understandings of leadership within the extraordinary times of the COVID-19 pandemic. A dialectic approach was applied to the literature focused on stoicism (Epictetus, *The discourses of Epictetus: the handbook, fragments*. Everyman’s Library, London, 1995), resiliency (Duggan B, Theurer B. *Resilient leadership 2.0: leading with Calm conviction, and clarity in anxious times*. Infinity Publishing, New York, 2017), and neurobiology (Hanson R. *Dr Rick Hanson: hardwiring happiness* [Video File]. Retrieved from: [https://www.youtube.com/watch?time\\_](https://www.youtube.com/watch?time_)

G. W. Jenkins · A. Tooms-Cyprès (✉)  
The University of Alabama at Birmingham, Birmingham, AL, USA  
e-mail: [cypresa@uab.edu](mailto:cypresa@uab.edu)

[continue=641&v=jpuDyGgIeh0&feature=emb\\_logo](#), 2013; Hart AW. *Educ Urban Soc* 22:153–169, 1990; Hanson, 2020). This effort was framed in a naturalistic lens, which allowed emphasis on the everydayness of individual leadership practices and the deconstruction of the relationship between stoicism and resiliency. Major insights from the chapter include identifying differences between fantasy leadership and authentic practice and defining specific resiliency skills as a central contour of everyday leadership.

---

### Keywords

Reality · Stoicism · Neural pathways · Organizational leadership · Communication

### The Field of Memory

Ideas of reality as fixed or one-sided. The idea that leadership is based on scientific constructs. The idea that the quality of leadership practice is directly related to age and experience. The idea that leadership skillsets and styles are gender based. The idea that fixed models of leadership reform can authentically change organizations without employee turnover.

### The Field of Presence

Teaching as a form of leadership practice. Learning as a form of leadership practice. Creating “as safe as possible” spaces as a contour of mentorship and leadership. The idea that trust-building is essential to authentic communication. The idea that those new to leadership practice can influence and enhance the practice of experienced leaders. The discord between large discourses about leadership challenges and practice and the everydayness of leadership challenges and practice. The idea of change management and leadership development.

### The Field of Concomitance

The fields of medicine, social science, and political science, business, the arts, history, gender studies, critical theory, and philosophy are rich areas to draw ideas, notions, and theories of leadership. The idea that self-compassion and self-care are legitimate leadership skillsets. The connections between self-compassion, mindfulness, and resiliency. *Resiliency* versus *Grit* as a skillset.

### Critical Assumptions

The idea that there is a construct of fantasy-based leadership that co-exists with the reality of everyday leadership practice. The idea that a regular practice of disciplining the mind to understand leadership challenges through reflection, self-care, and dialog affects the physical body’s reactions to leadership challenges.

### Discontinuities and Ruptures Which Form Different Viewpoints of Leadership

The idea that authentic leadership and leadership development can only be studied and quantified in a positivistic way. The lack of identity, intersectionality, and

intentional inclusivity paradigms in leadership models. The predominance of western philosophy and the exclusion of other philosophies in leadership understandings. The fantasy of leadership and the reality of everyday leadership practice.

“Uneasy lies the head that wears a crown.”  
*Henry IV, Part 2* (III. I. 31)

---

## Introduction

Henry the IV sighed this famous line to a colleague at the end of a lousy day that capped off an awful week at work. He was tired, enmeshed in Machiavellian politics, and faced a percolating rebellion. The authors of this chapter cannot help but wonder if Henry just wanted to end his week with a hearty game of cards over a beer and good music. Shakespeare’s timeless consideration of a crown’s weight highlights the difficulty of navigating obligation and privilege within a leadership practice. Many of the Bard’s plays focus on this phenomenon, including *Henry IV Part 1*, *Henry IV Part 2*, *Macbeth*, *Hamlet*, *Richard III*, *Julius Caesar*, and *King Lear* (Corrigan, 2000). While issues of identity formation, power, and corruption undergird all of these dramas, the purpose of this discussion centers on the struggle for resiliency amid challenging times.

At the time of this writing, the world is mired in the extraordinary COVID-19 pandemic. The crisis has widened the crevasse in global discourses between the fantasy of “leadership” and the reality of *leadership practice*. The understandings of everyday leadership practice presented in this chapter took place through a 2-year-long dialectic approach which augmented the review of the literature. Focused reflections within the dialectic centered on bridging stoicism (Epictetus, 1995), resiliency (Duggan & Theurer, 2017), and neurobiology (Hanson, 2013; Hart, 1990; Hanson, 2020). Resiliency, like other mind-body-based practices, focuses on the neural pathways between the psychologic *mind* and the physiologic *brain* (Coutu, 2002; Hart, 1990; Ledesma, 2014). While there is a wealth of inquiry dedicated to strategic planning, crisis management, and leveraging change, few scholars (Ackerman & Maslin-Ostrowski, 2002; Ledesma, 2014) have deconstructed resiliency relative to everyday leadership practice.

A naturalistic paradigm grounds this examination of the mind-body connection to leadership practice. This epistemology has other aliases such as postpositivistic, ethnographic, or phenomenological (Lincoln & Guba, 1985). A dialectic approach within this paradigm (Shields & Edwards, 2005) emphasized structured dialogue focused on individual leadership practices and traditions of stoicism. This chapter begins with an introduction to *Social Constructionism and the value of a dialectic*. Next, *The brain, the mind, and the body in real leadership practice* are examined. The discussion concludes with *Fantasy leadership, real leadership skills, and the stoic mind*.

## Social Constructionism and the Value of a Dialectic

Reflective practice and authentic communication have long been core tenants in healthy leadership practices (Andrews & Grogan, 2001; Hart, 1990; Larrivee, 2000; Osterman & Kottkamp, 1993; Schön, 1983; Short & Rinehart, 1993). Researchers have noted collaboration, reflection, and a focus on the primary task (James, Dunning, Connolly, & Elliot, 2007, p. 551) are essential and integrated dispositions for both practitioners and scholars of leadership. And while there is a robust line of inquiry focused on these areas, the connection between mind and body relative to the authentic practice of leadership remains significantly hollow (English & Ehrich, 2019; Nhat-Hahn, 2007; Tooms-Cyprès, 2019). Additionally, those focused on leadership in education can easily confuse theories of *Social Constructionism* with *Social Constructivism* (Ogawa & Malen, 1991). *Constructivism* is a theory frequent to the academic silos of teacher preparation, teaching, and learning because of its focus on how the mind codes and decodes symbols (letters, words, and numbers) into reality (Ratner, 1989).

Alternatively, Social Constructionism “...underscores the central importance placed, not on individuals, but on relationships as the site of world construction” (Gergen, 1999, p. 8.). The two terms are closely related. Some scholars see fit to cleave the difference between the terms, and some do not. Like (Gergen, 1999), these authors underscored the importance placed on the relationship between two leaders in shared reflection as the site of the construction of leadership realities. Scholars such as Berger and Luckman (1966) have further argued that reality is co-created by humans through interactions; in turn, this affects the creation of other realities. In other words, “The world creates humans, and humans create the world” (Gergen, 1999, p. 47). According to Gergen (1999, p. 47), there are four contours that best define Social Constructionism:

1. The terms by which the world and the self are understood are not based on “what there is.”
2. Modes of description, explanation, and representation are derived from relationships.
3. Describing reality reflexively fashions how the future is understood.
4. Reflection on how reality is understood is vital to one’s future wellbeing.

These contours demonstrate the immense challenge found in sustaining valued traditions and yet creating new realities. Such a crux of leadership highlights the intersection of societal (“up there”) and everyday (“down here”) discourses framing *the work* of leadership (Gee, 1996; Stevenson & Tooms, 2010). Constructionists believe that reality comes from a tradition of constructions built and passed on in a group through inculcation (Gergen, 1999; Tooms-Cyprès, 2016). What is a good leader? What is the true purpose of an organization? Who counts? All of these questions are examples of how Social Constructionism plays out in bureaucracies (Gouldner, 1954; Tooms, Lugg, & Bogotch, 2010; Tooms-Cyprès, 2013).

Social Constructionism has also played a role in leadership development as a tool to help leaders understand the mechanics of work and the nuances of politics. Barnett (1985, p. 1) noted that “Peer Assisted Leadership is a year-long activity of professional development in which leadership peers partner and analyze each other’s practice in nonprescriptive and non-judgmental reflective dialogs of shared observation.” Building a network of peers with similar experiences is one of the first steps in growing a robust practice of leadership (Collins, 2000; Collins & Scott, 1978; Derrida, 1995; Tooms-Cyprés, 2014). The tenants of Social Constructionism allow leaders to seek out *what is* and *is not* reality through shared, reflective dialog about the everyday mechanics of decision making and working with groups. In terms of modern leadership practice, *reality* (along with accountability) is rooted in honoring the work expectations assigned upon hire. Examples include “Implementing a strategic plan, managing a budget per the organization’s mission, and ensuring a safe and orderly work environment.” A difficult and common thread through a leader’s portfolio of work is the expectation to leverage change. Unfortunately, resistance to change is common because it is uncomfortable for many. This discomfort/resistance is framed colloquially as “noise.” This consists of a spectrum of activities ranging from employee coffee klatches of complaints to organized strikes by a workforce. Authentic change leadership requires maintaining the level of noise to such a degree that new way of working occurs without losing the followership of employees. Sometimes this is possible and sometimes this is not. Additionally, factors that enhance or constrict the level of organizational dysfunctionality impact both the management of change and noise. In the midst of this kind of turmoil, the leader’s ability to stay focused on what is real (i.e., reaching specific goals) and what is noise (i.e., gossip, complaining, and false accusations) is paramount to a resilient and real practice of leadership. Such practice is strengthened through understanding of connections between the mind, the brain, and the body.

---

## The Brain, the Mind, and the Body in Real Leadership Practice

Research has long recognized the ways in which life experiences build and reinforce the neural pathways connecting the psychologic mind to the physiologic brain (Hanson, 2020). Simply put, the *mind* reacts to the external environment by telling the *brain* what chemical cocktails to release to the machinery in our bodies. These cocktails (typically in the form of hormones) travel around the body via an ever-growing series of interconnected pathways made of neurons. Understanding of this phenomenon and its relationship to various life events has moved from the arenas of medicine and other professional disciplines to global discourses about mental health and its relationship to work. The forced isolation brought by the COVID-19 pandemic fostered heightened discourses around the world about the mind-brain-body considerations through umbrella terms such as “wellness” or “work-life balance” which devolved into hollow understandings of resiliency. Currently, there is a dearth of research illustrating the day to day impact the body endures while meeting the requirements of authentic leadership practice.

Recent research has demonstrated that living through various stressful and traumatic events leave revenants within the physical body (Menakem, 2017). In other words, enduring what the mind and brain perceive as stressful and traumatic events wreaks permanent havoc on the body (Van Der Kolk, 2014). Real leadership requires encountering noise every day. Noise is often enrobed in drama because of how followers react to events and information. Ominously, noise surrounding everyday discourses can sour far beyond employee water cooler complaints and votes of no confidence into entrenched cultures of toxic work environments. Differentiation between the two is vital for leaders. Toxic work environment includes persistent and pervasive microaggressions, mobbing, coordinated smear campaigns, and threats to a leader's physical safety (Bernstein, 2012; Samier & Schmidt, 2012; Tooms-Cyprés, 2014; Westhues, 2004; Wittgenstein, 1972). The following brief explanation of how the brain reacts to noise extends discussions focused on the physical effects of every day leadership practice.

---

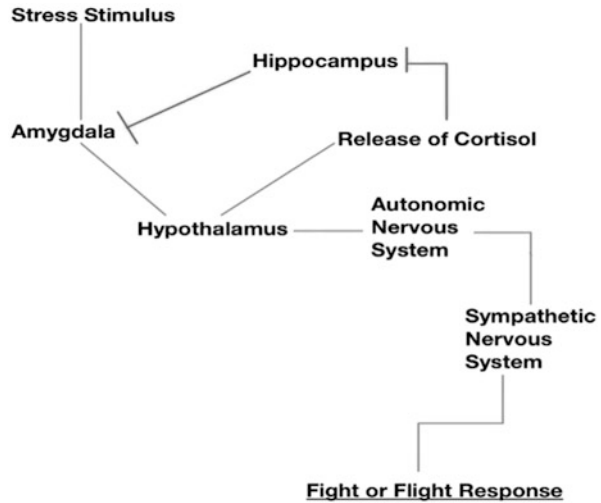

## The Neurobiology of the Brain-Mind-Body Leadership Connection

To begin a deconstruction of how the brain-mind-body connection functions in leadership practice, it is important to recognize that universities were among a litany of enterprises that suffered catastrophic fallout in the 2020 year of the COVID-19 pandemic. Senior level administrators around the world were responsible for delivering the fear inducing news to employees that steep budget cuts and furloughs were eminent on many campuses (Doyle, 2020). For the leader planning and then facilitating such meetings, the pressure was amplified by the awareness that audiences under duress are unpredictable and can erode into incivility quickly and that effective facilitation required a demeanor of calm resolve.

The awareness of such dynamics awakens a portion of the leader's brain called the Amygdala. As tensions in such a meeting unfold, the Amygdala continues to alert the Hypothalamus (the control center of the brain) to flood the body with a chemical cocktail consisting mainly of cortisol, a hormone produced in response to stress. Cortisol also increases the ability to break down sugar into usable energy. This primes the body for the *fight or flight response*, a warp-speed reaction of the overall nervous system that occurs when humans (like many species) believe they are in danger (Hanson, 2020). Cortisol, along with a host of other chemicals rages through the body resulting in dilated pupils, accelerated breathing and heart rate, increased blood pressure, and flushed skin as noted below in Fig. 1:

These primal reactions give the leader (as well as the audience members disheartened by brutal news) a heightened readiness to react to others (known as the fight or flight response). Fight or flight responses can play out in several ways within a group meeting: a red face, the increased tapping of one's writing pen, an elevation in the tone and speed of speech within a difficult discussion, or the inability to refrain from interrupting a colleague. An unchecked fight or flight response is also what escalates meetings into shouting matches. Because leaders are often

**Fig. 1** Pathway of fight or flight inhibition and activation (Jenkins, G)

responsible for facilitating difficult discussions within a group, keeping the tone of a meeting even-keeled and focused on specific tasks is crucial.

The skill of facilitating a group discussion through the noise is regularly oversimplified as “listening more than talking.” In this context, “listening” requires no less than the Homeric effort to harness a chemical assault inside the human body in the midst of the discursive chaos brought on by disgruntled followers. The prolonged escalation of fight or flight chemicals in neural pathways also results in a sense of exhaustion after they return to normal levels. This rapid decompression is most easily seen in children who shrink into a space of quiet after throwing a temper tantrum.

Neural pathways (like an invasive vine) grow and deeply embed themselves in response to both negative and positive stimuli over our lifetimes. The body also acts as a kind of scorecard for trauma events over a lifetime by growing more networks of neurons (Van Der Kolk, 2014). Thus, similar experiences for two different leaders can result in differing degrees of internal responses. For example, two leaders explaining budget cuts to two separate audiences can experience heckling very differently. For the first leader who was shamed publicly as a child, the ever-growing neural pathways fired up by consistent hostile meetings reach deeper into an entrenched undergrowth growth of pathways created through the endurance of years of bullying. The second leader, in an equally stressful meeting, may experience very little firing of trauma laced neural paths as their childhood experiences were different. In both cases, controlling these neural pathways a key to the discipline required of those who wear the crown, as real leadership practice centers on managing conflict, facilitating difficult conversations, and telling people things they do not want to hear. Because some “shared decision making” meetings are kabuki theater that feign shared governance and others are arenas where input is

valued and utilized, it is difficult for many leaders to tame surging neuropathways that flare within the context of daily leadership work. Many have developed the ability to control the fight-or-flight response through the use of a stoic practice which contributes to an overall resiliency as leaders. Because this skill is often framed with the umbrella term “experience,” stoic practice is not widely recognized as a specific, modern, and useful skillset necessary to leading in turbulent times.

---

## Leadership, Resiliency, and Stoicism

This discussion is not concerned with the gestalt of leadership as an idea. Instead, the focus is on the *authentic, everyday practice* of leading. The heart of such a disciplined and real practice is resiliency. Resiliency is defined as the ability to persevere in executing daily responsibilities and ultimately thrive, despite sustained difficulties (Ledesma, 2014; Tooms-Cyprés, 2019). This ability separates the wheat of authentic leadership practice from the chaff of leadership mythology. President Theodore Roosevelt alluded to the crucial relationship between resiliency and leadership when he gave a speech at the Sorbonne over a century ago:

It is not the critic who counts; not the man who points out how the strong man stumbles, or where the doer of deeds could have done them better. The credit belongs to the man who is actually in the arena. Whose face is marred by dust and sweat and blood; who strives valiantly; who errs, who comes short again and again, because there is no effort without error and shortcoming.; but who does strive to do the deeds; who knows great enthusiasm, the great devotions; who spends himself in a worthy cause; Who at best knows of high achievement, and who at the worst, if he fails, at least fails while daring greatly. (Roosevelt, 1910)

---

## Resiliency and Grit

The COVID-19 era has seen a heightened focus on striving valiantly in the face of adversity (Brown, 2012; St. John & Haines, 2017). The trend has brought forth a constellation of terms used interchangeably by many to define nuances of leadership. Like other notions in the global zeitgeist, these words have warped into misunderstandings of *what is* and *what is not* leadership practice. Such is the dynamic that feeds leadership mythologies. *Grit* is “The passionate perseverance that distinguishes high achievers” (Duckworth, 2018). *Resiliency* is distinguished by “. . . the ability to bounce back and even thrive from adversity, frustration, misfortune, and is essential for the effective leader” (Ledesma, 2014, p. 1). *Thriving* is what differentiates grit from resilience. It refers to growing beyond one’s original level of leadership functioning despite repeated instances of adversity. Resiliency speaks to the evolution of skills within the chaos of adversity. Grit speaks to a distinguishing characteristic that supports the completion of a task. Resiliency is characterized by: positive self-esteem, self-efficacy, optimism, low fear of failure, hardiness, high tolerance of uncertainty, and a deep value of strong

social resources (Ackerman & Maslin-Ostrowski, 2002; Hart, 1990; Heifetz & Linsky, 2004; Tooms-Cyprès, 2014).

---

## Stoicism

Like resiliency and grit, *stoicism* is a term identified with effective leaders. It is a unique Hellenistic philosophy concerned with the daily practice of committing to a life of virtue and reacting to the world in a particular way. Founded in Athens by Zeno of Citium in the early third century, Stoicism was first practiced in a radical venue, the *Stoa Poikila*: A porch located on the north side of Athens' grand marketplace, the Agora (Salzgeber, 2019). The term stoicism takes its name from the *Stoa Poikila*, a public and democratic forum of its birth. Citium understood the co-construction of reality as a democratic exercise. He argued opinions beyond the bounds of privilege are necessary to co-construct and understand reality. Thus, his bold choice to hold class in a public market rather than the sterile spaces typically used by the Athenian elite. Major leaders of the Stoic movement include Marcus Aurelius, one of the most effective emperors of the Roman Empire; Seneca, a tutor to Roman Emperor Nero; and Epictetus, the slave who earned freedom and founded his own school dedicated to stoicism. The meditations of these men are regarded as touchstones of a stoic practice (English & Ehrich, 2019; Hart, 1990; Epictetus, 1995). The tenants of stoicism (Epictetus, 1995) include:

1. The only thing humans truly control is our thoughts, judgments, and reactions to the world around us.
2. Once it is understood what is truly within one's control, it is possible to apply value judgments of good, bad, or indifference to the external things that we encounter.
3. Good things are of benefit, bad things cause harm; everything else is considered indifferent and not important.
4. Life's highest goal is to live every day in a space of integrity through actions based on wisdom, justice, courage, and restraint.
5. Enduring hardship in an honorable manner is exponentially preferable over seeking wealth, fame, and joy in a shameful manner.
6. Putting ideas into action is the key to a life of integrity

To bring these tenants to life in everyday practice, one must learn the stoic practice of being *in* the moment, but not *of* the moment. The first step requires deciding if an experience is good, bad, or indifferent. The Stoics use the word virtue to define good. They frame all virtues into these silos: wisdom, justice, courage, and restraint. The ultimate goal of a stoic life is to live virtuously. That is, to practice the virtues previously listed every day in service to others and thus, nature. Vices (the "bad" things) are identified as those that do not benefit the self and are rooted in injustice, cowardice, foolishness, and intemperance. Everything else is considered something indifferent. In other words, actions of indifference are simply noise.

Interesting examples of indifference that manifests as noise are attempts by others to disrupt our health, wealth, reputation, sense of fear, and pleasure. These, as with all other things of indifference, can be acted on in the name of vice or virtue.

---

## Noise and Toxicity: A Look at the Neurobiology of Stoic Leadership

A stoic practice requires more than simply approaching an issue with objectivity (Salzberger, 2019). Specifically, when a stoic leader encounters one of the many surprises of their day, the clash of real leadership practice and neurobiology goes something like this: The *brain* recognizes the event (encountering a vitriolic rant from a colleague in a public space) is *a threat*; the Amygdala activates the cascade of chemicals that results in the fight or flight response. Simultaneously the *Stoic mind* struggles to inhibit the Amygdala through the hippocampus by considering the true reality of the surprise. In effect the Stoic mind says “Slow down. . . Is this simply noise reverberating from those who do not like change, (an event of indifference) or is this truly a threat to me?” Is this event a contour of a toxicity? Depending on the judgment of the event, the mind then tells the hippocampus to soothe the Amygdala or tells the Amygdala to unleash the fight or flight Response through the body’s matrix of neural pathways. The discipline to choose in the heat of an event if something that *feels* harmful, *but in reality, is not*, (i.e., noise) requires us to go against our biological nature and is the very definition of courage. Over time, the practice of calming the fight or flight response rewires neural pathways to become less reactionary to the noise leaders encounter on a daily basis (Ackerman & Maslin-Ostrowski, 2002; Hanson, 2013; St. John & Haines, 2017; Van Der Kolk, 2014).

As the pathways become rewired, their new elasticity contributes significantly to a leader’s resiliency and ability to manage stress. In other words, a stoic practice of leadership is a skill that contributes to one’s mental health, physical wellness, and resiliency (Ackerman & Maslin-Ostrowski, 2002; Brown, 2012; Coutu, 2002; Hanson, 2020; Schön, 1983; St. John & Haines, 2017; Van Der Kolk, 2014). The process is reflexive: The more fluent one becomes at transcending challenge; the more neural pathways are rewired and/or created. Enriching as well as depleting experiences create the neuropathways that affect our levels of resiliency. Because authentic leadership is based on conflict management and making difficult decisions, the professional practice of administration can be akin to “living off a thin soup” (Hanson, 2013). In other words, the crown of leadership is heavy because solving problems can often be more depleting than enriching work. A day (or months) rife with repeated fight or flight synapses along neural pathways leads to the “hollowness of existence” (Hanson, 2013) bemoaned by Shakespeare’s poor Henry IV. The antidote to this is found in nurturing the growth of neural pathways linked to learning

something new, acceptance, creativity, kindness, and joy (Hanson, 2013; Ledesma, 2014).

---

## **Fantasy Leadership, Real Leadership Skills, and the Stoic Mind**

There are several factors that diminish recognition contours of real, professional leadership practice. They include:

1. Employment requirements in government, hospitals, prisons, and universities around the globe do not consistently require leadership training for employment in leadership roles.
2. The literature on leadership preparation struggles to recognize resiliency as a necessary skillset.
3. Intellectual pursuits of stoicism are typically housed within studies of philosophy or history and not included in leadership preparation.

Additionally, leadership is often understood within a loose framework based on fantastic instances of overcoming. Examples of this include the cult of the superhero. Cultural references to the fantasy of superhero leadership permeate societal cultures to such an extent that the tools used in everyday work (journals, writing instruments, drinking glasses, and computer screen savers) are emblazoned with images of them; as if possessing such an object would imbue the owner with the virtues mythologized. One of this chapter's authors admits to cherishing a gift of a tiny replica of Mjölnir. This is the hammer of Thor, God of Thunder, War, and Protection of Humanity. While this object does not bring thunder from the heavens to quiet rude colleagues during a meeting, it remains amusing and a reminder of the importance of a stoic practice and the seductive traps and messages of Fantasy leadership.

Unfortunately, these fantasy-based symbols and discourses are disconnected from the authentic work of real leadership because they do not unpack of what to do in the moment when the neural pathways fire. The hard truth is that whacking the tiny Mjölnir on the desk during a tense meeting over budget issues will not stop frustrated colleagues from yelling over budget problems. In considering the hallmarks of Fantasy Leadership and Real Leadership (as outlined in Appendix A), perfectionism is arguably the most potent as it sets up achievement-driven aspiring leaders for cognitive dissonance (Klibert et al., 2014; Schön, 1983). Modern studies on achievement seeking personalities, self-esteem, and brain biology have proved that acts of self-compassion are extremely effective in rewiring trauma laced neural pathways (Hanson, 2020; Menakem, 2017; Neff, 2011). In Western culture, self-compassion is often mistaken for self-pity and weakness. In actuality, self-compassion is a practice of opening a space to admit and take responsibility for our mistakes and move on to self-forgiveness (Neff & Germer, 2018). Examples of acts of self-compassion include:

1. Recognizing that making a mistake and failure is part of the human experience and real leadership practice
2. Giving ourselves credit for a virtuous action regardless of the outcome
3. Recognizing that humanity is connected to others who share our experiences of struggle
4. Forgiving ourselves for our shortcomings as human beings and as leaders

One “feeds” neural pathways when self-kindness is practiced through mindfulness, the practice of savoring moments of joy for a few seconds longer than is typical. Mindfulness can be particularly challenging for leaders who are natural multitaskers. A great first step to mindfulness is to start or end the day free from technology (Neff & Germer, 2018). Or, when eating, focus on the pleasure of the meal (Hanson, 2013). Quietening the mind in stillness ten minutes before addressing a group is another example of mindfulness. The research on mindful activities is rich with pragmatic suggestions and the practice of yoga or meditation being the most prominent examples (Menakem, 2017). Engaging in mindful behavior as part of a resilient leadership practice has demonstrated drastic long-term changes to the landscape of neural pathways (Duggan & Theurer, 2017). As with a stoic approach to noise, this is the stuff of a resilient leadership practice.

---

## Conclusions and Reflections

The large discourses about leadership have created understandings that are often glamorous, dramatic, and fantastic. The historic depictions of leadership throughout global cultures perpetuate notions that leadership is a somewhat effortless endeavor that is both dependent on one’s innate talents and devoid of the practice of disciplined skills. This chapter argued that real leadership practice requires the use of skills centered on the mind-body connection that is rarely valued within the literature on leadership or in the circles of leadership preparation. The authors wonder if this was due to the cognitive dissonance between preconceived notions of leadership weakness found in the literature (Brown, 2012). Real Leadership is more often a mundane difficult activity that lacks the grandeur associated with fantasies linked to the word. The stakes of leadership practiced without attention to resiliency skillset that includes self-care and a stoic mindset is clearly present in the literature focused on the politics of leadership, burnout, and maladministration (Ackerman & Maslin-Ostrowski, 2002; Heifetz & Linsky, 2004; Westhues, 2004). *Real leadership* is a disciplined practice based on intentional inclusivity, resiliency, grit, self-care, courageous vulnerability, and reflection. Real Leadership forges ideas into action and is the unsung, disciplined energy behind innovation *Real leaders recognize that the process is hard as hell: Yet they engage in the work anyway.* What inspires such authentic leaders to stay on this path is knowing the challenge of service, failure, reflection, compassion, forgiveness, and ultimately success – triumphs over the difficulty of the journey.

## Appendix A

### Hallmarks of Fantasy and Real Leadership

Fantasy leadership. . .	Real leadership. . .
Is an imbued monolithic gift people have akin to a physical trait Has no tolerance for a leader's imperfection or trajectory of growth	Is a practice of collecting and honing a constellation of skills and dispositions Understands the practice as imperfect and requires the commitment to constant improvement
Recognizes that the leader is wiser than others	Recognizes leaders must value others' perspectives
Conflates age and experience with wisdom and leadership acumen	Defines leadership as a fluid cultural construct
Sees "good" as always triumphing over "bad"	Defines "good," "bad," "winning," and losing" as fluid constructs
Defines courage as a product of drama	Understands courage as a mundane practice
Assumes physical attractiveness, physical strength, wealth, and charisma are leadership requirements or qualities	Does not consistently recognize physical attractiveness, physical strength, wealth, and charisma as leadership requirements
Equates charisma with intelligence, preparedness, and authentic skill	Recognizes the difference between intelligence, charisma, preparedness, and disinformation
Assumes success in one field (i.e., medicine) is a predictor of leadership abilities	Defines leadership as a skillset and profession unique to other fields of intellectual endeavor
Often defines the motivations and rewards of leadership with extrinsic factors such as glory, fame, wealth	Often defines the motivations and rewards of leadership with intrinsic factors such service and changemaking

## Abstract

This chapter examines the historical developments in the field of supervision focusing on key time periods from the 1900s to the present. Starting with Frederick Taylor's approach to supervision from the field of management and John Dewey's focus on Democratic principles of education, several approaches that contribute to today's practices of supervision are examined through a Foucauldian lens to understand the vestiges to bureaucratic and humanistic tenets. Clinical supervision evolved as a preservice teacher model in the 1950s, providing the foundation for its use in K-12 schools, and in the 1980s, the constructs of developmental and differentiated supervision emerged followed by classroom walkthrough models in the 1990s. Fueled by several reports that highlighted the failure of American education and suggesting more accountability, input-output and value-added measure debates emerged in the 1990s where students' test scores were used to gauge teacher effectiveness. Supervision was embedded in teacher evaluation systems.

**Keywords**

Accountability movement · Classroom walkthroughs · Clinical supervision · Developmental supervision · Differentiated supervision · Foucauldian analysis · Supervision

**The Field of Memory**

For school supervision, the field of memory includes inspectional, bureaucratic functions that included tight oversight as envisioned by Taylor (1911) and the Industrial Age of efficiency. Between the late 1950s through the late 1980s, more humanistic approaches including clinical, differentiated, and developmental supervision emerged. Memory resurfaced in the 1990s with the emergence of accountability.

**The Field of Presence**

The accountability movement caused disruption with federal programs (e.g., No Child Left Behind, Race to the Top) that increased the tensions between the purposes and intents of supervision and evaluation with efforts and mechanisms that persist with test scores and blinded, standard, and uniformed expectations. Clinical, differentiated, and developmental supervision in schools supplanted inspectional supervision briefly but remain, albeit limited and embedded as secondary processes in high-stakes learning environments in K-12 schools from the 1990s to post No Child Left Behind.

**The Field of Concomitance**

Supervision in K-12 schools for in-service teachers found its own model through the evolution of the clinical supervision model – a model originally developed and envisioned for preservice teachers. The constructs of developmental and differentiated supervision evolved from the fields of cognitive/social psychology, adult learning theory, and human development and career stage theory.

**Discontinuities and Ruptures**

Moving from the 1990s to the present, accountability demands further confused the underpinnings of supervision, by often negating the individualization as described in the constructs of differentiation and developmental approaches to supervising teachers and by attempting to shape students and teachers in the same manner.

**Critical Assumptions**

Historically, educational supervision has been shaped by two main philosophical assumptions. The first assumption was that schools operate in the same way with other industrial workplaces and that a one-size-fits-all approach in which all teachers were supervised the same could lead to highly effective teachers in the classroom. In contrast, the second major assumption was that teachers could develop professionally based on meeting their needs through supervisory interactions and supports that were developmental and differentiated. This view assumed that teachers were

professional, capable of making decisions about what types of supervisory support would be more beneficial to their growth and development.

---

## Introduction

Supervision and its practices date before the early formation of schools in the United States. Its purposes and methods have evolved undergoing paradigm shifts based on community accountability (Rousmaniere, 2013) and scientific management (Taylor, 1911) aligned with efficiency and control of teachers by direct oversight (Cubberley, 1916; Drake & Roe, 1999). Moving beyond custodial and scientific supervisory methods that relied on the inspection of teachers were the more humanistic methods that focused on teacher growth through differentiated and developmental approaches (Glatthorn, 1984; Glickman, 1981, 1985; Glickman, Gordon, & Ross-Gordon, 2017; Zepeda, 2017). With the emergence of more humanistic views, differentiated and developmental approaches replaced for a short time, scientific supervisory practices. Although accountability often overshadows supervision, the clinical model of instructional supervision has been a consistent part of the field of presence in debates that illustrate the tensions between supervision as a way to support teacher growth or supervision embedded as part of teacher evaluation systems that seek to rate teachers.

With formative and growth-oriented processes, developmental supervision focuses on feedback about instruction (Sullivan & Glanz, 2013) as well as the development of teacher's knowledge, skills, and abilities to make informed instructional decisions (Sergiovanni, Starratt, & Cho, 2013). Differentiated supervision engages teachers as decision makers (Glatthorn, 1984) and as active researchers about their own practices (Glanz, 2014) to support teacher agency and voice (Zepeda, 2017, 2019).

Political and public demands for increased accountability have accentuated the tensions between supervision and evaluation most notably as a result of federal legislation including the No Child Left Behind Act of 2001 (NCLB) and to a lesser degree, the Every Student Succeeds Act of 2015 (ESSA); federal programs (e.g., Race to the Top and the American Recovery and Reinvestment Act of 2009); and harkened calls in national reports and research that identify, debate, contest, or advocate for value-added measures as a way to gauge teacher effectiveness through evaluation systems (Glazerman, Loeb, Goldhaber, Raudenbush, & Whitehurst, 2010; Harris, Ingle, & Rutledge, 2014).

This chapter provides a brief overview of supervision with an examination of the clinical supervisory model (Cogan, 1955, 1973; Goldhammer, 1969) and the constructs of differentiated supervision and developmental supervision primarily from the late 1950s to the present day. This time period, model of supervision, and these constructs pivoted supervision not only as a helping and applied process in schools but also illustrates how supervision was supplanted by evaluation by the heightened focus on high-stakes test results of students as a measure of teacher effectiveness. This chapter also brings forth thinking about school supervision and the Foucauldian notions related to the field of memory, the field of presence, the field of concomitance, the discontinuities and ruptures found in

school supervision, and critical assumptions that ground thinking about supervision in schools.

---

## Supervision

A broad overview of the definitions, the purposes, and intents of supervision are examined followed by a brief history of supervision starting from the industrial period through the present with a focus on the 1950s through the 1980s, and then an overview of supervision from the 1990s to present is offered. This historical overview examines the clinical model of instructional supervision and the constructs of differentiated and developmental supervision tracing ruptures and changes necessitated by accountability and that illustrates disconnection in practice.

The prevailing beliefs about supervision are that it supports “the ongoing, non-judgmental, collaborative process that engages teachers in dialogue that encourages deep reflective practices for the purpose of improving teaching and student learning” (Sullivan & Glanz, 2013, p. 28) and as such, “supervision promotes growth, interaction, fault-free problem solving, and a commitment to build capacity in teachers” (Zepeda, 2017, p. 60). In this view, supervision is developmental, differentiated, and requires ongoing and collaborative work between teachers and supervisors to pivot efforts to “help increase the opportunity and the capacity of schools to contribute more effectively to students’ academic success” (Sergiovanni & Starratt, 2007, p. 7). These beliefs about the intents and purposes of supervision did not fully evolve until after the Industrial Age that focused on scientific reasoning and efficiency.

### Scientific Period – 1900s to End of World War II, 1945

The efficiency movement emerged in schools as an extension of Taylor’s (1911) scientific management model. Scientific management was a workplace approach that relied on efficiency and productivity through the standardization of labor. This model was based on judging quality and efficiency through a focus on inputs (teacher behavior) and outputs (student results) (Shaw, 2016; Taylor, 1911). From a Foucauldian perspective, the main objective of this movement was based on the assumption that if scientists could study the most effective teachers to capture descriptors of behaviors, then administrators could rate the ineffective and inefficient teachers based on what they captured from observing effective teachers (Glanz, 1998; Hazi & Arredondo Rucinski, 2009).

In its early stages, Bobbitt (1912) applied Taylor’s model in educational management and planning by arguing that schools, like businesses, should be efficient and focus on outcomes that illustrate the degree of the usefulness of curriculum to shape students into adult workers. Bobbitt (1913) proposed that teachers, due to their inability to make instructional decisions, must be required to follow the methods determined by their administrators. During this time, social system and organizational change theory focused supervisory attention on linking student outcomes to observable teacher behaviors illustrating the influence of behaviorism and learning

concepts found in behavioral psychology from the writings of B. F. Skinner and others (Ellett & Teddlie, 2003). This behavioral approach included classroom research that tried to identify effective teaching methods. An unprecedented number of classroom observation checklist systems emerged (Ellett & Teddlie, 2003; Ponticell et al., 2019). The checklist has influenced and expanded with accountability rubrics, remaining contentious in the supervisory context of classroom observations (Donaldson & Papay, 2015; Van Geel et al., 2019).

Two competing philosophical views of education influenced supervision. The first philosophical view was grounded in scientific management. The works of Taylor (1911), Spaulding (1913), Cubberley (1916), and Wetzel (1929) applied scientific management in supervision to address inefficiency in schools and to promote a factory-like model where principals controlled and directed educational methods and rated teachers (Fine, 1997; Marzano, Frontier, & Livingston, 2011). The second, competing view advocated for democratic and more humanistic educational and supervisory approaches (Dewey, 1938). Dewey (1938) assumed that teaching was not a mere performance of particular teaching strategies or behaviors; instead, it was a deliberate process and a tool for helping students come to know themselves as learners.

## Humanistic Period – 1950s to the 1980s

The era spanning from the late 1950s through the 1980s included a shift in supervision from scientific management methods focused on efficiency to supervisory practices focused on human resource development and organizational change (Glanz, 1990; Zepeda, 2006). Historically, the United States lost its bid to be the first in space with the launching of Sputnik in 1957. The precedent setting *Elementary and Secondary Education Act* of 1965 (ESEA) was legislated. The 1960s witnessed great social unrest. With the release of *A Nation at Risk: The Imperative for Educational Reform* (1983) report, teacher evaluation and accountability became the main tenets of the 1980s. Throughout the 1980s, teachers were under scrutiny through a series of reports that criticized education. Each one of these events in history created discontinuities and ruptures in the practice of supervision in schools.

Three major concepts emerged during this timeframe: clinical supervision, developmental supervision, and differentiated supervision, supplanting temporarily the scientific models of working with teachers. Vestiges of these concepts remain today.

*Clinical Supervision:* Departing from behavioral checklists where the events of teaching were pigeon-holed to fit predetermined instructional behaviors, clinical supervision emerged in the mid-1950s. Originally conceptualized by Morris Cogan (1955) as a way to support students enrolled in an advanced degree in teaching at Harvard University, clinical supervision proliferated in the 1960s and 1970s (Goldhammer, 1969), and by 1980, approximately 90% of school administrators used some form of this model (Marzano et al., 2011). The goal of clinical supervision was to improve instruction by observing, analyzing, and supporting teachers (Cogan, 1973). Cogan's model included eight highly intensive phases that were streamlined into a five-phase model by Goldhammer (1969), and then a three-phase model by Acheson and Gall (1980) as elaborated in Table 1.

**Table 1** The evolution of the phases of the clinical supervision model

8. Renewed planning	5. Renewed planning	

Source: Adapted from Zepeda (2006)

Inherent in the clinical model was the focus on “supervision up close” instead of supervision “conducted at a distance” (Goldhammer, 1969, p. 54) to promote “face-to-face interaction between the supervisor and the teacher in the analysis of teaching behavior and activities for instructional improvement” (Goldhammer, Anderson, & Krajewski, 1980, p. 19). In the late 1990s and early part of the 2000s, the clinical model was further shortened with the emergence of the walk-through (Downey, Steffy, English, Frase, & Poston, 2004; Kachur, Stout, & Edwards, 2010).

*Developmental Supervision:* In 1983, the National Commission on Excellence in Education published the report, *A Nation at Risk: The Imperative for Educational Reform*. This report described the educational system in the United States as failing students due, in part, to untalented and under-prepared teachers (Berliner & Biddle, 1995). The premise was that teachers were “broken,” and the assumption was that teachers needed to be remediated. Much like the ruptures in thinking and practice with the emergence of more humanistic thinking and supervisory methods to support teachers in the Industrial Age, Glickman (1981, 1985) and Glatthorn (1984, 1997) introduced the developmental and differentiated constructs that served as the foundation to supervision in schools. The tensions between supervision for growth and development tied to models (as in clinical supervision) continued.

As a field and as outlined by the mid-1980s, researchers began to articulate alternative perspectives to clinical supervision primarily as a response to prescriptive, one-size fit all applications. Building from the premises of Cogan (1973) and Goldhammer (1969) to situate teachers as active learners, Glickman (1981, 1985) added a developmental element based on the supervisor’s ability to assess the level of adult development (Zepeda, 2006) and to apply supervisory approaches that reflected this level. The term developmental, in the behavioral sciences, is associated with growth and improvement often defined as “changes in *observed* behavior across age” (Overton, 1998, p. 109, emphasis added). Initially, Glickman (1981) focused on teachers’ developmental level on two elements of teacher effectiveness: (1) teacher’s

commitment and (2) teacher's ability to think abstractly. According to Zepeda, Alkaabi, and Tavernier (2020), the responsibility of the supervisor was to identify the teacher's developmental stage based on her/his place on the commitment continuum and continuum of abstract thinking, then use appropriate techniques to assist with professional growth.

For the field of supervision, this construct was a milestone in that developmental psychologists focused on a limited segment of the life span, particularly child and adolescent development, but almost no attention to adulthood (Blake & Pope, 2008). Glickman (1981) built this construct on the premise that applying the developmental principles from human development, particularly, how children and adults grow cognitively, socially, physically, and aesthetically, was beneficial for the field of educational supervision.

Glickman (1981) suggested that supervisors use a nondirective approach with teachers of high conceptual levels, a collaborative approach with teachers of moderate conceptual levels, and an informational directive approach with teachers of low conceptual levels. Glickman and Gordon (1987) explained this model was based on the critical assumptions that teachers operate at different levels of professional development due to their varied personal backgrounds and experiences and that teachers needed to be supervised in different ways.

*Differentiated Supervision:* Built on similar premises as developmental supervision, the construct of differentiated supervision considered the differences in teachers' experiences, skills, abilities, and professional needs (Glatthorn, 1984). Glatthorn's (1997) foundation for differentiated supervision necessitates a professional culture of collaboration, inquiry, and continuous improvement; supportive work conditions; and facilitative structures for decision making.

The differentiated construct evolved historically when the clinical supervision model was condensed to a more efficient three-part process (Acheson & Gall, 1980), and Glatthorn (1984) first wrote about it the year after the release of the publication, *A Nation at Risk: The Imperative for Educational Reform* (National Commission on Excellence in Education, 1983). Differentiated supervision allowed teachers the latitude and flexibility to make decisions about the types of support they needed from their immediate supervisor.

Glatthorn (1997) identified three main supervisory options: intensive development, cooperative professional development, or self-directed development. The intensive development option should be required for nontenured teachers and tenured teachers who have instructional problems. In cooperative professional development, a small number of teachers would work together to assist one another in developing professionally and to empower teachers to take control of their own growth. The self-directed development option provides opportunity for teachers to work independently to foster their own individual growth by setting their own goals, implementing the plan to achieve these goals, and then self-assessing their own instructional growth. The overriding assumption was that teachers needed to be engaged in ways that made sense for where they were in their careers.

Both the developmental and differentiated constructs of supervision were formative in nature, focusing on teacher growth, and these constructs avoided

entanglements with teacher evaluation. Ruptures began to evolve with supervisory thought and practices most notably associated with accountability and the legal responsibilities to evaluate teachers for continued employment.

### **Accountability Period – 1990s to Present Day**

The tensions between teacher evaluation and supervision became more acutely present as the formative-summative views gave way to accountability. The 1990s forward were known as the era of increased accountability that focused attention on growth models and value-added models (VAMs) that looked at teacher effectiveness and its relationship to student test scores (Dooley, Owens, & Conley, 2019). During the twenty-first century, the focus of supervision shifted on two levels – from teacher behavior to student achievement and from supervision to evaluation (Jewell, 2017).

Reminiscent of the scientific era, inspections, checklists, and prescribed behaviors were organized to illustrate teacher performance in rubrics embedded in lock-step teacher assessment models that included classroom observations to be conducted with predetermined rubrics to assess teachers (e.g., Danielson Teacher Evaluation System, 1996). From 2001 to present, teacher growth and development was tied to teacher evaluation through the federal government's involvement fueled by funding streams. This era boasted an even more efficient incarnation of the clinical supervision model.

*Classroom Walkthroughs:* Beginning in the 1990s, a new model of classroom observations evolved – classroom walkthroughs – that have undergone numerous incarnations (David, 2008; Downey et al., 2004). This model's origins date to the 1970s when Hewlett Packard introduced Management by Wandering Around (MBWA) (Peters & Waterman, 1982) and made its way into schools in the 1990s. Enacting MBWA situated supervisors to close physical proximity with workers to engage in formal and informal communication about their work (Peters & Waterman, 1982).

In the context of schools, classroom walkthroughs were originally designed to be short and focused visits by school principals to gather data on instructional practices, student engagement, and provide feedback to teachers (Downey et al., 2004; Kachur et al., 2010). Two pioneering books examined walkthroughs in schools. In *The Three-Minute Classroom Walk-Through: Changing School Supervisory Practice One Teacher at a Time*, Downey et al. (2004) promoted that supervision was at times cumbersome and tied to the three phases depicted in clinical models (see Table 1). Kachur et al. (2010) in their book, *Classroom Walkthroughs to Improve Teaching and Learning*, reported findings from their empirical research that teachers do not resist support when it is nestled in an environment that embraces the examination of practice. The walkthrough was also envisioned as a way for school leaders and teachers to identify professional development needs to support school improvement goals (David, 2008; Zepeda, 2017).

Although there are numerous iterations and falling within the Foucauldian field of memory, the classroom walkthrough incorporates at least one component of the clinical supervision model: the classroom observation. The preobservation conference

is not customary and follow-up conversations are often eclipsed by well-meaning notes and completed rubrics left in teacher mailboxes. Evolving from a one-on-one “face-to-face” supervisory support exclusively from a building administrator, the walkthrough evolved to include small teams (school leaders, teachers, and central office leaders), focusing the observation on local or state learning objectives and using a rubric or some routinized form to track information and communicate the results.

There were advocates and critics of classroom walkthroughs. Advocates believed the walkthrough would encourage “teachers [to] closely examine their practices and become increasingly reflective, self-directed, critical thinkers focused on continually improving their teaching” (Kachur et al., 2010, p. 113). Critics such as City, Elmore, Fiarman, and Teitel (2009) stated, “unfortunately, the practice of walkthroughs has become corrupted in many ways by confounding it with the supervision and evaluation of teachers” (p. 4). The amount of time spent in classrooms during walkthroughs became a point of tension. Kachur et al. (2010) indicated that time spent in classrooms ranged from 1 to 25 min while in most schools, these observations lasted approximately 10 min. Downey et al. (2004) suggested the 3-min classroom observation. However, such short observations may not be an effective practice in that “the egg-timer approach to classroom observations of this duration is a ‘blitz’ in which the observation’s brevity minimizes data collection” (Zepeda, 2005, p. 19).

Although the intention of the walkthrough was to support teachers, many in the field of supervision believed that the foundational basis for the classroom walkthrough and the practical applications were tied to accountability (Sullivan & Glanz, 2013; Zepeda, 2005). With the passage of NCLB (2001), federal policies mandated accountability-based systems that held teachers and school leaders responsible for their students’ achievement results. As a result of NCLB’s insistence on providing highly qualified teachers in every school, teacher evaluation became a federal policy target (Hazi & Arredondo Rucinski, 2009). Highly qualified, however, was not synonymous with highly effective (Zepeda, 2017).

When the goals of NCLB were not met, waivers incentivized states to implement a new playbook with different policies to hold teachers accountable for their students’ growth in learning and achievement over time. With NCLB waivers and funds from Race to The Top (RTTT) grants as a part of the American Recovery and Reinvestment Act of 2009, the federal government stipulated the use of test results not only to measure students’ growth in learning over time, but also to measure teachers’ impact on students’ growth in learning over time. The uses of value-added measures to assess instruction diverted attention from focusing on classroom observations, the mainstay of the clinical supervisory model.

The passage of ESSA in 2015 has provided flexibility on teacher evaluation practices to the states; however, VAMs persist in statewide teacher evaluation systems (Close, Amrein-Beardsley, & Collins, 2020). In light of the recent research and court cases regarding VAMs (Close et al., 2020), many states have reduced significantly the weight that VAMs are factored in teacher evaluation systems as a way to shift away from the overreliance on these measures (Ross & Walsh, 2019).

## Conclusions and Reflections

Three primary periods of supervision in schools were examined, including:

1. Scientific period [1900s to the end of World War II, 1945] situated in the efficiency era illustrating the highly scientific model where teachers were supervised akin to workers in a factory
2. Humanistic period [1950s to the end of the 1980s] grounded in democratic processes, the clinical supervision model situated in a graduate teacher preparation program that found its way into schools
3. Accountability period [1990s to present] reverting to highly mechanical and efficient methods embedded in evaluation systems where teachers are supervised with classroom observation rubrics with predetermined areas to focus the evaluator, not necessarily the teacher, whose final evaluation is more dependent on value-added measures that link student gains in learning to classroom teachers

Throughout each period, key ideas about the methods, models, and constructs about school supervision evolved. Of primary focus is the clinical supervision model, two trains of thought – developmental and differentiated supervision – and the proliferation of the classroom walkthrough.

This section offers conclusions and reflections about supervision through the lens of Foucault's field of memory, presence, and concomitance as well as the ruptures and discontinuities from changing historical and policy contexts and most notably, the critical assumptions that fueled the tensions throughout the scientific, humanistic, and accountability periods. The supervisory tensions throughout these periods include issues of power and struggle, a central theme of Foucault's works (1972). Moreover, the critical assumptions that grounded the thinking about supervision across time have remained consistent.

The first assumption was that schools operate in the same way as other industrial workplaces and that if highly qualified and effective teachers were in classrooms, the outcomes, or student achievement, would be greater (Taylor, 1911). The second assumption was that a one-size-fits-all approach to working with teachers was needed to ensure compliance with teaching the curriculum according to standards. Practices aligned to this assumption included value-added measures vis-a-vis student test scores and rubrics with predetermined categories to rate teacher performance during classroom observations (Harris et al., 2014). These assumptions created tensions as they were at odds with others. The third assumption valued the need for humanistic approaches found in developmental (Glickman, 1981, 1985) and differentiated supervision (Glatthorn, 1984, 1997) that championed that teacher effectiveness can be developed by supervisory practices based on the needs of teachers through face-to-face interaction with supervisors (Dewey, 1938; Glatthorn, 1984; Glickman, 1981; Zepeda, 2017).

During the Scientific Period, two competing philosophical views of supervision emerged – methods that were scientific and efficient as espoused by Taylor (1911) and supervisory practices that were based on Democratic principles espoused by

Dewey (1938). As background, Taylor developed the theory of scientific management in the context of a steel factory through a mechanical engineer's perspective. Scientific management related to supervision became a temporary part of the field of memory during the 1980s with the emergence of differentiated and developmental supervision constructs in which growth and development were the primary focus for teachers across their career spans considering experience, education, and other factors that shape meeting their needs. However, scientific methods resurfaced in the 1990s as part of the accountability era with vestiges of Taylor's (1911) principles of scientific management (e.g., merit pay based on student performance). Dewey (1938) positioned that the democratic and more humanistic side of education could support supervision where teachers and school principals could work together. This view was at the extreme end of the spectrum of scientific management and a business/factory-like model where principals controlled and directed educational methods and rated teachers (Marzano et al., 2011). The changing the nature of instruction through a more child-centered and constructivist model further challenged the scientific management approach that trailed to the concept of clinical supervision (Duffy, 2016).

Supervision in the Humanistic Period spanning from the 1950s to the end of the 1980s evolved *from* an inspection and control model *to* a more collegial model (Moswela, 2010). Supervisors began using their time to work with teachers in a collegial manner to improve instruction versus merely inspecting it. Cogan (1973) focused on the collegial relationship and nonjudgmental observation and inquiry processes involved with working with preservice teachers. Although the stages of the original clinical supervision model were reduced from eight to three as the model moved from preservice to in-service applications in schools, the major elements of the preobservation conference, the classroom observation, and the postobservation conference continue more in theory than practice (Ponticell et al., 2019). The classroom observations associated with clinical supervision have remained in the field of presence in that they are embedded in most teacher evaluation systems. The field of supervision was and continues to protest bundling supervision as part of the teacher evaluation process and contests supervision and evaluation being conducted by the same person, perpetuating the formative summative tug-of-war (Zepeda et al., 2020).

In the 1980s, two constructs in the field of supervision emerged – developmental supervision and differentiated supervision. During this period, seminal works about supervision in schools were published in response to clinical supervision and illustrate ruptures. For example, McGreal (1983) examined the disparities in supervision practices for teachers based on their tenure status in *Successful Teacher Evaluation*; Glatthorn (1984) published *Differentiated Supervision*, supporting teacher's involvement in their own professional development and growth; and Glickman (1981) published *Developmental Supervision: Alternative Practices for Helping Teachers Improve Instruction*, intending to support instruction through supervision.

The differentiated and developmental constructs of supervision became foundational to the field as each acknowledged the understanding of developmental

psychology, adult learning, and career span and stage theory as ways to support a better developmental life for teachers (Zepeda, 2017). Tensions in school supervision related to teacher development and growth in the 1980s were exacerbated with a series of national reports such as *A Nation at Risk: The Imperative for Educational Reform* (National Commission on Excellence in Education, 1983) and increased testing requirements for students (Hoffman, Assaf, & Paris, 2001). From these ruptures moving to increasing accountability from the 1990s to the present, the emphasis shifted almost fully away from supervision to evaluation. Several shifts in the teacher evaluation process, such as performance-based accountability, merit pay, high-stakes testing, and the adoption of value-added models, changed the nature of instructional supervision to focus more on results than the needs of teachers (Zepeda, 2017). Moreover, the accountability movement with the introduction of education policies embedded in NCLB (2001), ESSA (2015), and federal initiatives such as RTTT (2009) forced school systems to link supervision to a lesser degree *from* classroom observations *to* standardized test results and high student achievement through teacher and leader evaluation systems. To be clear, value-added measures trumped classroom observations that had been reduced by including checklists and rubrics that focused the attention of the classroom observer on predetermined areas making it easier not to engage teachers in preobservation conferences prior to the classroom visit. Procedurally, the focus of classroom observations was determined *a priori* based on standards. In a review of many state-wide evaluation systems, postobservation conferences have become “optional.”

Several tensions have emerged about supervision in schools. These tensions have not been fully reconciled and as such, they continue often becoming more complex as changes occur in the context of schooling in the United States. The tensions over time include:

- The irreconcilable differences between supervision and evaluation including whether or not the same person can supervise and evaluate teachers. This tension suggests a power struggle between teachers and leaders.
- Accountability demands have further confused the underpinnings of supervision, by negating the individualization as described in the constructs of differentiation and developmental approaches to supervising teachers and by attempting to shape students and teachers in the same manner. Conjoining test scores to teacher evaluation systems does not offer “a robust view of teacher effectiveness” (Little, Goe, & Bell, 2009, p. 5).

These tensions have been manifested in discontinuities and ruptures (Foucault, 1972). The consequences of these ruptures are that supervision has been situated in almost universal contexts that are characterized with practices that are standards-based, test-fueled, teacher evaluation-bureaucratic, and highly political. The narratives around these ruptures have monopolized the discourse about public school education, further eclipsing opportunities for teachers to grow and develop in ways that address their own learning needs.

In conclusion, supervision as a field has in many ways lost its identity from the original intents of being a growth-oriented process that employed its first model, clinical supervision, that moved from an eight-step process to a three-step one for efficiency purposes of school leaders who had to fill the dual function of supervising and evaluating teachers. With the advent of embedding supervision vis-a-vis classroom observations in teacher evaluation systems often without any expectation for pre- or postobservation conferences, the clinical model of supervision has been further diluted and the constructs of developmental and differentiated supervision founded in the 1980s have been eclipsed with the accountability era focusing on teacher evaluation and the summative functions including federally mandated uses of value-added measures to assess teacher effectiveness.

## Abstract

Good leaders understand that they have a responsibility to inspire the led through modeling good followership. This is a key trait in effective leading. Good followers are their own leaders, who understand the role of supporting the leader. Competent and effective followership, leadership, and collaboration skills are necessary in K-12 educational settings, including teachers, administrators, and other educational professionals. Effective followership skills are in line with cohesive organizations that stress collaboration skills. Understanding the relational skills of the leader/follower dynamic are important to developing teacher effectiveness, a positive school climate, workplace satisfaction, and improved student and teacher outcomes.

**Keywords**

Followership · Leadership · Teaching · Administration · Education · Collaboration

**The Field of Memory**

Followership is often less valued than leadership. However, by looking at historical examples (e.g., in the military, Meilinger 1994; grassroots movements, Ehrich & English, 2012), successful models for followership can be derived.

**The Field of Presence**

As it relates to education, current models of maximizing educational outcomes through followership exist when explored as identities (Kellerman, 2008; Taylor & Hill, 2017), categories of and approaches to change (Ehrich & English, 2012), or as collaborators to achieve co-flow (Hurwitz & Hurwitz, 2015).

**The Field of Concomitance**

The importance of followers has been increasingly recognized in the literature. The need for leaders to develop good followers and the ideas that empowering followers can educate them as future leaders is an essential component of the leader/follower dynamic (Suda, 2013). The leader/follower dyad is impacted by organizational context. In leadership vacuums (e.g., where no leader exists, when leaders are ineffective, where leaders are locked in battle for overall control), engaged and committed followers can emerge as new leaders (Bullington, 2016; Changing Minds, 2020).

**Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field**

Leadership and administration are often seen as synonymous in education – the authors look at all roles in the organization and how leadership and followership are fluid relational constructs.

In education, teachers as their own leaders is a new concept. The sharp difference in how this chapter views followership as a skill to develop stands apart from the traditional view of the leader/follower dynamic.

**Critical Assumptions or Presupposition**

We make critical assumptions that leadership/followership skills apply in educational settings, that leader/follower dynamics are relationship based. We critically assume that every follower is their own leader (self-determined and making decisions based on knowledge and data), that competent followers enhance organizational outcomes, and that climate and professional relationships are important up and down the leader/follower chain.

## Exploring the Dynamism in the Leader/Follower Dyad

“A good leader must first learn to follow”  
(General Martin Dempsey 2020 NPR Interview)

Followership in itself is not a new concept. Virtually every individual spends more time in the role of follower than leader and there have been both effective leaders and followers throughout the course of history. Currently, followership as a construct for examination is relatively fresh, especially in education. In many cases, leading and following roles occur simultaneously, since most of us have a supervisor or a higher person who evaluates our work. With a focus on leading, the importance of following is rarely highlighted and certainly under-studied. In fact, this focus on leaders is at the expense of followers, fostering the belief that followers are less important (Kellerman, 2008). Organizations can benefit from tapping into followership and the impact effective followership has on organizational success.

Situations related to cultural and organizational phenomena (i.e., shared experiences of vast groups of people), such as those found in the military and large business structures, have had research conducted associated with followership. The research around followership in these cultural structures has existed for decades. Comparatively, followership research in educational structures is scant with a most of the available research focused on higher education and postsecondary settings (Taylor & Hill, 2017). As schools are comprised of teachers and administrators in the roles of followers and leaders, understanding nuances in the leadership-followership dynamic provides opportunities for improving collaboration and school climate.

If leaders effect change, both good and bad, followers facilitate and foster change (Kellerman, 2007). There are numerous programs and structures in place to create and improve leaders. So many in fact, that leadership training is its own profitable industry (Kellerman, 2008; Ready & Conger, 2003). Recently, there have been several books published that address followership as part of the discussion on leadership (see Kellerman, 2008; Schindler, 2014). This includes the practices of following established rules, implementing policy, engaging in personal and professional development, complying with instructions, and supervising or being supervised by others. As followership applies to K-12 teachers, the role of follower is in addition to teaching students daily.

As defined by Kellerman (2008), followership implies a relationship (rank), between subordinates and superiors, and a response (behavior), of the former to the latter. Applying this definition to primary, middle, and high school settings, followership refers to the behaviors of teachers in response to the overt or implied behaviors of the administration (Taylor & Hill, 2017). For example, how do teachers (both individually and as a collective group) respond to the directives or requests of the principal of the school? More specifically, if a principal continuously requests a small group of preferred teachers to perform preferred tasks, the followership for those teachers may be different (more positive) than that of other nonpreferred

teachers. Based on this scenario, relational leadership processes, reputation, overall school climate, and effective collaboration between teachers and teachers/administrators may be adversely affected (Seers & Chopin, 2012; Taylor & Hill, 2017; Treadway et al., 2012).

Teachers and administrators (as followers and leaders) would benefit from training in group dynamics, relational leadership, and navigating transformative environments to adapt to these changing dynamics. Understanding the impact of implementing evidence-based practices, managing staff, and remaining positive affect while coordinating the work of diverse and specialized educational professionals can enhance and elevate trust from followers and leaders alike (Ashkanasy et al., 2012; Humphries & Howard, 2014). Northouse (2013) defines leadership as influencing a group of individuals to achieve a common goal, guided and influenced by the leader's core values. Leadership and followership are emotionally relevant, interactional, and transactional (Ashkanasy et al., 2012). The relationship requires one to motivate and shape the effectiveness of the other as part of a multidisciplinary team to provide professional and evidence-based educational services. When applied constructively, there are individual and group benefits to leading and following with common purpose. According to Kellerman (2008), thinking leadership without thinking followership is flawed thinking. The affective nature of the leader/follower dynamic cannot be understated (Ashkanasy et al., 2012).

---

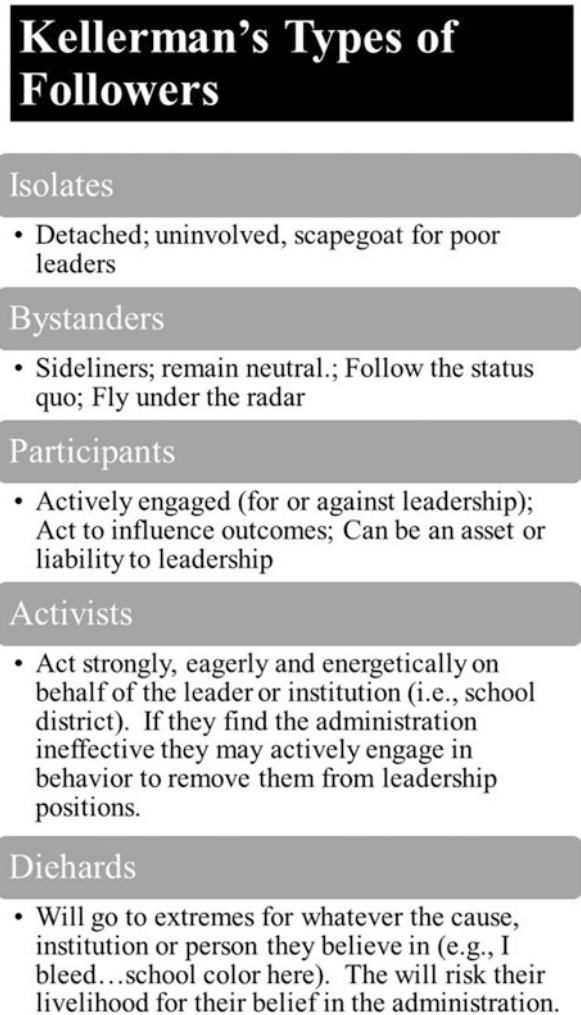

## Examining the Leadership/Followership Dynamic and Models of Followership

In her book *Followership: How Followers are Creating Change and Changing Leaders*, Barbara Kellerman (2008) takes a broad world view of followership and how it effects multiple aspects of life. She goes on to define followership, what it means to be a follower, and identifies types of followers in four different contexts/industries. In fact, Kellerman (2008) asserts that followers are more important than ever due to their ability to enact change and sometimes become more influential than the leader. Followers can be identified by rank (as subordinates in the hierarchical structure) or by behavior (enacting the intentions of another).

Based on her theory, followers fall into five types (i.e., isolates, bystanders, participants, activists, and diehards) with behaviors specific to each type (Kellerman 2008; see Fig. 1). Each type of follower is represented regardless of cultural group (i.e., military, society, business organizations, etc.).

Other broad models of the leadership/followership dynamic exist as well. Hurwitz and Hurwitz (2015) provide a partnership-based model. Their model presents the leadership/followership dynamic in a paired manner that emphasizes how each person in the dynamic compliments each other (i.e., as a partnership). The authors posit that the relationship between leaders and followers is dynamic and context dependent. Each followership adaptable skill that is identified by the authors is complemented by a matched adaptable skill that leadership should display. See Fig. 2 for Hurwitz and Hurwitz's (2015) list of complementary skills.

**Fig. 1** Kellerman's types of followers. (Note: Adapted from Kellerman (2008))

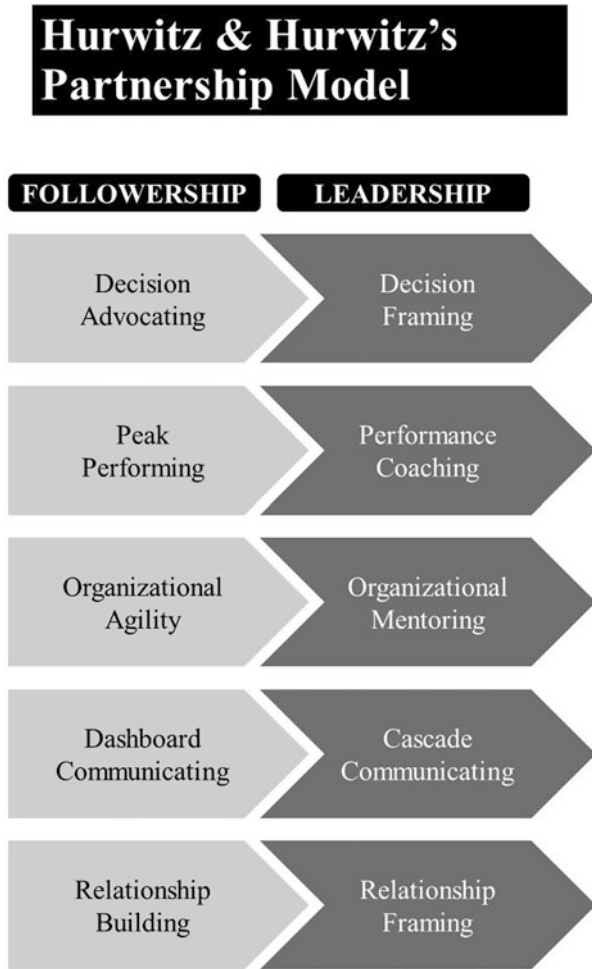

Kellerman (2008) and Hurwitz and Hurwitz (2015) provide frameworks for examining followership, leadership, or both. Both frameworks can be applied to a variety of organizational structures across fields in disciplines. However, when discussing followership, it is important to investigate models of followership more in-depth. That is, examining followership specifically by organizational culture.

## Military Models

Understandably, the military arena, due to the nature of the enterprise, establishes followership as a construct to develop. Within any organization, there exists the defining culture. Culturally competent followers and leaders will make changes

**Fig. 2** Hurwitz & Hurwitz’s partnership model. (Note: Adapted from Hurwitz and Hurwitz (2015))

within an organization to model respect and foster collaboration across disciplines. Competent followers are prepared to work with leaders and followers of diverse demographic backgrounds by developing inclusive relationships within organizations (Offermann, 2012). In their book *Extreme Ownership* about the United States Navy Sea Air and Land (SEAL) Team, Willink and Babin (2017) discuss how their SEAL team adapted their uniforms (which were adjusted depending on the environment to blend in with civilians) to meet the standards of their partner units of other branches of the military. This was done to show respect for their Army and Marine comrades, who viewed appearance as a measure of professionalism. This willingness to become part of a larger culture helped develop mutual respect by putting their own SEAL Team practices second to the overall unit mission. Willink and Babin (2017)

also cite that leaders must not only lead but be ready to follow when a subordinate is in a better position to develop a plan, make decisions, or lead in specific situations, again putting ego second.

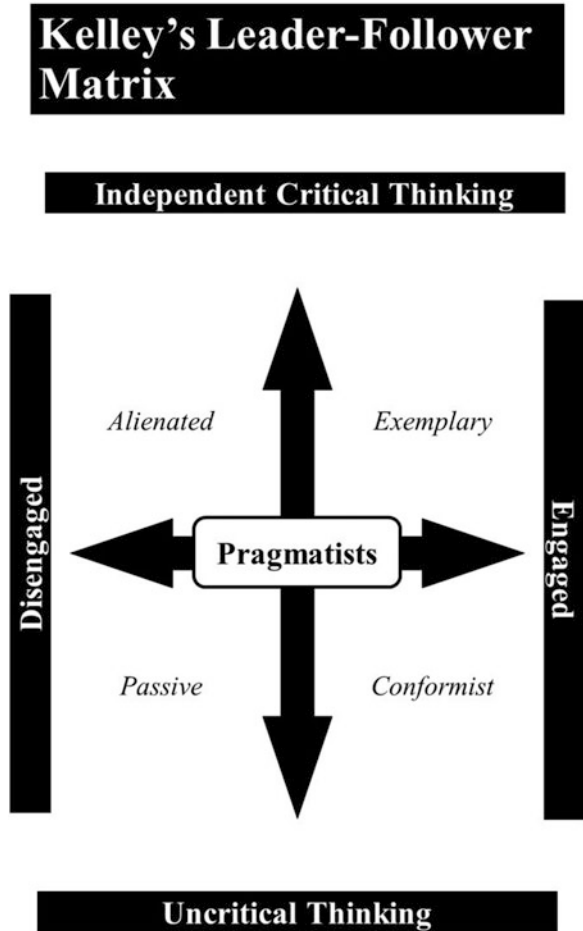

Meilinger (1994) outlined principals of followership (see Fig. 3). Exhibiting good followership mirrors the traits that make for good future leadership. Kelley (1992 & 1996) focused on two behavioral dimensions of effective followership: critical thinking and participation and engagement in the organization (see Fig. 4). Critical thinkers process situational information for implications and possibilities before action, a skill valued by most successful leaders. Participation involves anticipating requirements and planning in accordance with them. Effective

**Fig. 3** Meilinger's ten rules of good followership. (Note: Adapted from Meilinger (1994))

## Meilinger's Ten Rules of Good Followership

1. Don't blame your boss for an unpopular decision or policy; your job is support, not undermine.
2. Fight with your boss if necessary; but do it in private, avoid embarrassing situations, and never reveal to others what was discussed.
3. Make the decision, then run it past the boss; use your initiative.
4. Accept responsibility whenever it is offered.
5. Tell the truth and don't quibble; your boss will be giving advice up the chain of command based on what you said.
6. Do your homework; give your boss all the information needed to make a decision; anticipate possible questions.
7. When making a recommendation, remember who will probably have to implement it. This means you must know your own limitations and weaknesses as well as your strengths.
8. Keep your boss informed of what's going on in the unit; people will be reluctant to tell him or her their problems and successes. You should do it for them, and assume someone will tell the boss about yours.
9. If you see a problem, fix it. Don't worry about who would have gotten the blame or who now gets the praise.
10. Put in more than an honest day's work, but don't ever forget the needs of your family. If they are unhappy, you will be too, and your job performance will suffer accordingly.

**Fig. 4** Kelley's Leader-Follower Matrix. (Note: Adapted from Kelley (1996))

followership involves working well with others, embracing change, accepting responsibility for your actions, building trust, engaging in professional self-development, and communicating with courage. Competent followership from teachers can translate to productive administrative leadership in creating atmospheres where all team members adopt the vision of the administration as their own through communication and joint collaboration (Kelley, 1992, 1996; Maxwell, 2007; Schindler, 2014). Major General Michael Rothstein (2019) developed nine rules for dynamic followership. In them, he writes that most computer general searches focused on leadership (3.8 billion hits) compared to followership (1.1 million hits). Being a great follower is just as important to an organization as being a great leader. In fact, modeling good followership improves the skills needed to lead organizations. See Fig. 5 for Rothstein's Rules of Dynamic Followership.

**Fig. 5** Rothstein's rules of dynamic followership. (Note: Adapted from Rothstein (2019))

## Rothstein's Rules of Dynamic Followership

1. **Think Two Levels Up:**
  - Leaders must contend with different priorities. Understanding those priorities helps you think through operations and add value to your participation on the team (visualize the bigger picture).
2. **Speak Truth to Power:**
  - Disagree professionally, provide constructive criticism, and provide alternative perspectives (behind closed doors). Once a final decision is made, support it.
3. **Bring a Problem; Bring a Solution:**
  - Think in terms of what would fix the situation (logistically, strategically, ethically).
4. **Internalize and Work the Boss's Priorities:**
  - Understand unit and leader mission, vision and values and determine priorities before problems arise.
5. **Give Good Readback:**
  - Make sure you understand the mission and your role in ensuring completion.
6. **Hold Yourself Accountable for Your Performance:**
  - Plan ahead to ensure success.
7. **Don't Pass the Buck:**
  - Be accountable for your own actions.
8. **Demonstrate Professional Loyalty:**
  - Be accountable your unit, group, or organization.
9. **Excel at your Job:**
  - Be a competent and committed professional.

An important facet of disciplined followership includes the courage to speak truth to power (Chaleff, 2009a). In a healthy leadership/followership environment, a courageous follower can assume responsibility, support the leader and/or group, display mutual trust, constructively challenge poor policy and behaviors, participate in systemic change and transformation, and take moral and ethical action (including leaving the organization if necessary). Followers are not position to solely serve leaders. Followers, as well as leaders, serve a shared mission and share a common set of values (Chaleff, 2009a, b). Although this model was conceived in business, it has been embraced through research of military leadership.

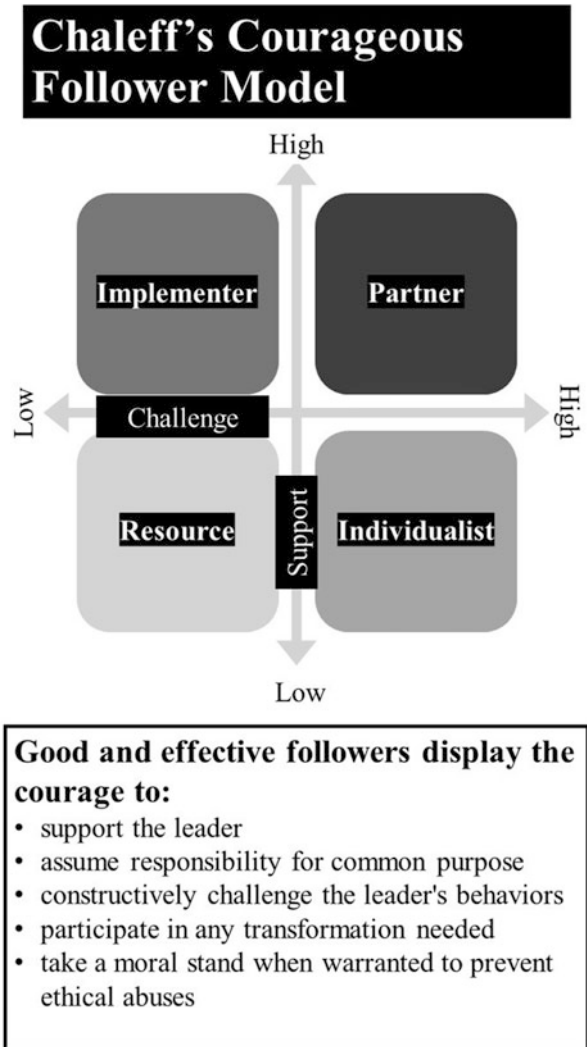

## Business Models

Suda (2013) posits the questions “if followers didn’t exist would we have leaders?” and “how and where do we groom the next leaders?” Research on business organizational structures and human resource management has provided some insight into the leader/follower dynamic. In business, and broadly in society, the idea of followership has a negative connotation. The emphasis on developing leaders and leadership has led to an over-abundant focus on those skills while mostly underappreciating the necessary elements that responsible followership develops for effective leaders. That is not to say that some followers’ behaviors do not warrant poor perception. However, to place the term followers and all those who would be identified as such as a negative is erroneous and shortsighted. Positive and negative types of followers in organizational structures (e.g., business organizations) exist in any system. Kelley (1992) identifies five types of followers (the sheep, the yes-people, the alienated, the pragmatic, and the star followers) based on independent and critical thinking and on active or passive engagement. The more leadership can foster positive followership the better the organization. In fact, company and organizational initiatives do not get accomplished without both good leadership and better followership. Followers provide support for goals and objectives by adding expertise and input to what needs to be accomplished (Business News Daily Editor, 2020).

The dynamics related to good leadership are so intertwined with good followership that some of the same qualities are needed for both. Broadly, effective followership includes displaying commitment, independence, initiative, support, and courage (Suda, 2013). Courage being essentially important in that followers should be empowered to challenge unethical or ineffective leaders who may not value the goals and objectives of the group, team, or organization. Chaleff’s (2009a, b) followership model focuses on dimensions and styles positioned as courage a follower must have when interacting with leadership. See Fig. 6 for components to Chaleff’s (2009a) Courageous Follower Model. Specifically, for effective followership to occur, followers should possess a number of qualities and skills to maximize the outcomes that a team or organization will strive to accomplish. See Fig. 7 for a list of qualities and skills (Business News Daily Editor, 2020; McCallum, 2013).

Ultimately, the creation of effective followers leads to the development of good leaders. McCallum (2013) notes that the stigma of followership, the negative belief of subordination, is a paradoxical exercise; in that, most people in any organization are followers, even those in leadership (i.e., managerial) positions. Weak followership can be a sign of weak leadership. Ineffective leadership can lead to followers with poor examples and execution of work ethic, morale, and goal completion which lead to lost revenue due to dissatisfaction among clients (McCallum, 2013). Business News Daily Editor (2020) acknowledges that being a competent and content follower is a personal choice. Furthermore, it is important to recognize that not everyone wants to be or is cut out to be a leader. Paperwork and bureaucratic demands may not appeal to all individuals. Additionally, the desire to being doing the “real work” or being a part of a team (as opposed to leading it) or personal

**Fig. 6** Chaleff's courageous follower model. (Note: Adapted from Chaleff (2009a))

nonwork decisions influence each person's ambitions in the leader/follower dynamic. Regardless of reason, followership is vital to the success of any group or organization.

### **Educational Models**

The broader field of education, aside from business and military postsecondary education, has fewer studies focused on followership. As with most, Susan Cain's

**Fig. 7** Skills and characteristics of followers. (Note: Adapted from Business News Daily Editor (2020) and McCallum (2013))

(2017) observations about leadership focused on the rush for acceptance to prestigious universities and institutions of education by graduating high school students. Students highlight their leadership skills on their resumes in pursuit of leadership positions in various organizations to increase their chances of acceptance to top-tier and selective universities. Cain (2017) suggests that universities should not focus entirely on leadership, but also excellence, passion, and a desire to contribute beyond the self in service to others (i.e., as followers).

Beyond looking at followership for students entering postsecondary school, Ehrich and English (2012), Hurwitz and Hurwitz (2015), and Kellerman (2008) introduce broad models of the leadership/followership dynamic applied to university educational settings. Conversely, while Kellerman's work does not specifically focus

on K-12 educational settings, Taylor and Hill (2017) applied the followership identities to the K-12 school environment. In addition to applying the Kellerman (2008) model to identify teacher follower types, Taylor and Hill (2016) connected followership and leadership as equally important skills and identities that promote collaboration and ethical responsibility to students taught.

Ehrich and English (2012) use the experiences and histories of grassroots movements as a way to better understand leadership and followership dynamics and how these movements can be applied in contemporary educational settings. Through their examination, they create and provide a framework for the leader/follower dynamic in the form of a quadrant-based matrix that focuses on what they deem as categories of change (i.e., reformist and refinement) and approaches to change (i.e., conflict and consensual). Combinations of these factors from their developed cells are represented by the following terms that influence the leader/follower dynamic:

- A: reformist/conflict = tactics of confrontation
- B: reformist/consensual = tactics of collaboration/democracy/distribution
- C: refinement/conflict = conflict avoidance
- D: refinement/consensual = collaborative/democratic/distributive

Ehrich and English (2012) also provide advantages and disadvantages of each approach for establishing the leadership/followership dynamic.

The leader/follower dyad is not always clear cut and the informal leadership chain can be as strong as the formal one (Willink & Babin, 2017). Alvesson and Sveningsson (2012) discuss four criteria around which the leader/follower dyad can be discussed. They include *leader centrism* (leader as the active agent with influence, who act on rather than with followers, who are the passive receivers of influence and of lesser importance), *entitism* (fixed traits of leaders/followers which exist in isolation, neglecting leader/follower dynamics and relationships), *romanticism* (Leaders as perfect, positive and productive, offering ideal solutions that should be celebrated), and *objectivism* (leadership variables to be measured and controlled in isolation rather than a construct impacted by social interaction individual definitions). The authors contended that studies of leadership must broaden the approach to include social interactions and their influence networks with others to move beyond the four criteria above.

Hurwitz and Hurwitz (2015) explore the leader/follower dynamic through the prism of teamwork and collaboration. The authors stress that the increased emphasis on collaboration warrants a reimagining of leadership/followership. In support of their position, they describe the idea of co-flow, which is based on the theory of flow (Csikszentmihalyi, 1991). Co-flow expands upon the original theory to express a level of motivation and achievement as a group or team of individuals. Along with co-flow, Hurwitz and Hurwitz (2015) describe what they call a FLIP model which stands for followership, leadership, innovation, and partnership.

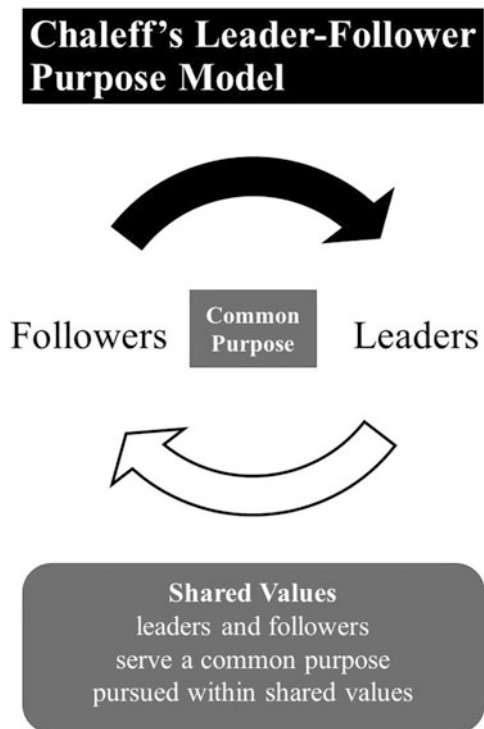

Kellerman (2008) focused specifically on followership and identifying followers by type (i.e., isolates, bystanders, diehards, participants, and activists). Each identified type of follower is further explored based on characteristics that each would exhibit. Taylor and Hill (2017) expanded on the identities and characteristics of

followers by applying Kellerman's (2008) identities to the K-12 school environment. They focused on examples of each type of follower and the behaviors they characterized in scenarios specific for primary, middle, and secondary schools.

## Ethics and Followership Behavior

Kelley (1992) cites values and ethics as a trait of exemplary followers, which feeds courageous and moral acts, even when under significant social pressure. In a healthy organizational environment, leaders and followers share information, maintain shared understanding, and critically assess organizational progress through mutual trust (Department of the Army, 2012). Ira Chaleff (2009a) addresses the responsibility of the follower to be courageous in his book *The Courageous Follower*. Chaleff (2009a) identified key variables needed to prevent the abuse of power. They are proximity and courage. Proximity provides access to exercise the courage to help leaders improve. His dynamic model of followership is based on the common purpose and core values that the leader and follower share. Chaleff (2009a) noted, "followers and leaders both orbit around the same purpose; followers do not orbit around the leader" (p. 13; see Fig. 8). Followership ethics include having the courage

**Fig. 8** Chaleff's leader-follower purpose model.  
(Note: Adapted from Chaleff (2009a) and Chaleff (2009b))

to: (a) assume responsibility for yourself and the organization, (b) serve the leader and a shared common purpose (usually summed up in a stated mission, vision, and values), (c) challenge the behaviors or policies of the leader that conflict with an individual's core values and sense of right and wrong, (d) participate in transformation, and (e) leave ineffective leaders who are detrimental to the organizational common purpose and to disavow destructive leaders.

Competent followers are their own leaders, who believe in their own decisions and integrity, and have the power to make choices about whether and how they follow and to withdraw support of the leader if their actions are not in line with the followers values (Chaleff, 2009a). Competent followers/leaders develop relationships of trust up the chain with their leaders and down the chain with subordinates. This trust goes both ways. When a follower moves above peers to a leadership position they need to plan and lead, give simple, clear, concise direction (this is easier to accomplish if leadership and trust are already well developed). They need to maintain humbleness (check their ego), take input from former peers (now subordinates), and to listen (Willink, 2019). When courage and moral acts are not fostered, the organization erodes through neglect and a lack of trust (Paolozzi, 2013). When deviance is normalized, and unacceptable practices or a lack of standards are reinforced, they become the organizational norm and can lead to disaster. Often these normalizations occur when individuals and organizations are under time and budget constraints, and shortcuts impede safe acts (e.g., BP oil spill, Chernobyl disaster, health care, and combat). In a fluid environment where professional discretion is allowed to ensure the spirit of the law through challenging times, this normalization and erosion is less likely to occur (Thomas & Berg, 2014).

---

## Conclusions and Reflections

Educators are expected to be a society of caring, creative, and committed people who are called to service rather than stature. This positionality goes toward recruiting the type of teachers that will excel in our schools. Excellence, however, is not just comprised of good leadership. It is a function of inspiring leadership that encourages effective followership. Followers make up the bulk of the teaching force regardless of grade level or school setting. Cultivating a motivated follower force of competent and empowered teachers is in the best interest of our schools and the students we teach. These qualities are explicitly expressed in statements from Kelly (1992):

- Quality followership is the ultimate test of leadership.
- Exemplary followers add value above and beyond by championing new ideas and increasing competence through self-development.

The benefits of competent, ethical followership with shared values cannot be overstated. These benefits include increased academic success through student/teacher engagement, positive school climate, increased accountability and attendance, a reduction in teacher turnover, and reduced office referrals. Administrators

who understand relational dynamics and foster effective followership and collaboration skills in teachers will reap the benefits in enhanced school climate and overall professional effectiveness. In school settings, as there are more teachers (as followers) than administrators (as leaders), and having a positive dynamic is essential for success. Cox et al. (2010) suggested that the leader-follower relationship could be interchangeable.

Furthering this notion, Hollander (1992) described effective followers as having the potential to demonstrate effective leadership capabilities. Ultimately, understanding the types and behaviors of followers can enhance a leader's ability to lead. It also helps develop those who aspire to be successful future leaders. Developing collaboration skills is important to enhancing the distributed leadership responsibilities across principals, assistant principals, and teachers within schools and across districts (Crockett, 2007). Understanding effective followership and nurturing the practices associated with good followership can provide the basis for effective leadership later. These foundational skills can set the example to model professionalism and active followership to other teachers (Price, 2008). Developing good leadership, followership, and collaboration skills are essential to developing effective leaders and healthy school climates as we make the transition to twenty-first-century schools.

McGrath (2007) stresses continuous communication and notes that when classroom teachers are oriented toward inclusion and collaboration the following occurs: (a) professionals share leader-follower responsibilities; (b) they establish goals that can be achieved; (c) they understand the broader mission to accomplish; and (c) they work together to solve problems on behalf of the student. For these reasons, it is imperative to develop strategies aimed at reducing stress, increasing collaboration, sharing leader/follower responsibilities, improving school climate, and developing effective future administrative leaders by demonstrating and encouraging good followership as professional development. Coupling followership skills with the skills requisite to overcoming barriers can be extremely helpful to educators, especially since training time for teachers is limited (Lerman et al., 2004). These strategies have the potential to enhance retention, job satisfaction, collaboration, professionalism, and improve the teaching environment for all students. Administrators (i.e., leaders) should demonstrate and encourage the skills for effective collaboration as a model for followers to foster a positive working environment. In examining how individuals become leaders, it is important to study the origins of leadership which lie in the practices of good followership, particularly related to education and the educational outcomes for students.

### Abstract

African American women have always been in positions for formal and informal leadership. Yet, there has been a consistent underrepresentation of the African American women in the superintendency. Additionally, there has been the lack of published literature on the African American female superintendent. In the larger microculture, the lack of representation of African American women that are actually in leadership positions is across the board in all organizations. There is still the lack of research on, about, and by African American women in leadership in general and more specifically African American women superintendents. For many who are African American women leaders, the call to leadership is deep and it does indeed represent the gospel or the “good news” that they have to share. Many heed the call to leadership because they are clear of the plans for and purposes of their lives as

African American women. Their gospel is a gospel of education, liberation, and love. Using the Foucault lenses presence, memory, and concomitance, this chapter will illumine how the lived experiences of African American women superintendents can lead change and reconstruct theory and practice in the field of educational leadership.

## Foucault's Frame

### The Field of Memory

In the field of memory, Foucault (1982) noted the historic discourse, research, and teachings. In the case of this chapter's focus, the field of educational leadership, it is seen that while there are some historical beliefs that are no longer accepted and seen merely as precursors, there are also some antecedents of our original ancestral knowledge that ground and inform the leadership practice of African American women today.

### The Field of Presence

In this area, all forms of practice must be open to constant scrutiny; so-called "evidence based" research is a form of legitimization of one form of validation and truth telling; hegemonic practices depend upon forms of political power; knowledge is never neutral and is an expression of power. Kusch (1991) stated, "the field of presence of Boyleans contained the philosophical discourse on vacuism and plenism only as something to be rejected and transformed into the language of experiments" (p. 68).

### The Field of Concomitance

In the field concomitance, Foucault (1982) noted that it consists of statements outside the discourse that serve as points of analogy or higher authority, such as cosmology for natural history. These are statements that are transferable and usable to current contexts.

### Discontinuities and Ruptures

For Foucault (1994), discontinuities and ruptures were a part of the flow of history and things are no longer perceived, described, expressed, characterized, classified, and known in the same way from one era to the next. These are paradigm shifts. Black women leaders in education are a true paradigm shift from the dominant narrative and models.

This is who I am, this is what I do  
 I'll spread the gospel, share the good news  
 This is who I am, this is what I do

I'll spread the gospel, share the good news  
Lord, You knew me long before I was here  
Shaped my destiny, had a plan for me  
Then you sent me to the world to proclaim  
Your love and grace, so in spite of what men say  
This is who I am, this is what I do. . .  
(Price, 2006)

## Introduction

Not until the late twentieth century did literature on leadership make gender an observable factor. There have been some studies that suggested that there are differences between male and female leaders, while others suggested that there are no significant differences (Adkinson, 1981; Frasher & Frasher, 1979; Shakeshaft, 1989). However, most of the characteristics that are associated with leadership are those with masculine connotations. In addition to the lack of “gendered leadership research,” there was also a lack of research and problematic research of “raced people” individuals who “have faced discrimination because of race and/or class, and have been oppressed psychologically, physically, educationally, or economically” (Tate, 1997). Without such culturally inclusive perspectives (gender and race), the field of leadership is weakened. In addition, without such perspectives, current theories of leadership remain narrow in scope lacking a more inclusive frame (as cited in Gooden, 2002, p. 135).

Race-neutral theorizing (Parker, 2005) has been the mainstay in the study of leadership. White male privilege has been the standard to define, research, and report about leadership. African American women do not fit neatly in these various models of leadership as presented. Understanding the intersections of work and family in black women’s lives is key to clarifying the overarching economy of domination and leadership (Collins, 2000). In the famous words of Sojourner Truth’s rhetorical question, “Ain’t I a Woman,” Black women have been addressing the concerns of White male domination and hegemony from the very beginning.

Black women have played and continue to play a pivotal and prominent role in leadership, from ancient periods with Egypt’s Queen Hatshepsut to the twenty-first century leadership of US VP Kamala Harris and many others. As Alston and McClellan noted (2011):

By contextualizing Black women’s experiences as leaders within traditional leadership theories, we are answering the call of scholars (Allen, 1997; Walters & Smith, 1999; Walton, 1994) who beseech the black academics to theorize and analyze the contributions of black women within leadership concepts and definitions. (p. 30)

## Historical Context

For too long, an African American woman leader has been an oxymoronic concept (Alston & McClellan, 2011). The fact is African American women have always been in positions for formal and informal leadership. Historically, by the 1930s, African

American women in educational leadership were represented by what was known as a Jeanes supervisors (Alston, 2005). The vision of Anna T. Jeanes, a Philadelphia Quaker, was to hire and train college educated, African American teachers to supervise African American schools and to improve African American communities. Given that background and believing that in order to effect educational change, many African American women choose to leave their lower-level administrative and teaching positions in search of a leadership role as a superintendent (Tillman & Cochran, 2000). "African American female educators and African American female superintendents, however small in number, demonstrate that they are well prepared to lead" (Alston, 2005, p. 681).

Yet, the underrepresentation of the African American female superintendent and the lack of published literature on the African American female superintendent is problematic. The foremother in research on African American women in educational leadership, Barbara Jackson (1999) stated, "without accurate information, we cannot measure progress in equity or identity and thus remedy the condition of underutilization of women [and persons of color] school leaders" (p. 144). Not only is the physical presence of the African American woman absent from the superintendency, but also missing is the African American women's lived experiences and perceptions as a superintendent (Shakeshaft, 1989). Brunner and Peyton Caire (2000) argued that by no means are African American women superintendents "invisible to themselves. . . their scarcity in school districts makes their practices in the role of superintendent invisible to most African American women and others in the academy who may aspire to the position" (p. 537). Alston (1999) submitted that the literature on the career paths of female superintendents, especially African American female superintendents does not exist, primarily because the current literature on superintendents' careers documents the career paths of men, and this literature has been produced and promulgated by men, specifically White, cis-gendered, heterosexual men.

## Present-Day Context

Another part of this problem hinges on the lack representation of African American women that are actually in leadership positions across the board in all organizations. To specifically look at the field of education, the U.S. Department of Education (2018) noted:

In fall 2016, of the 1.5 million faculty in degree-granting postsecondary institutions, 53% were full time and 4% were part time. Faculty include professors, associate professors, assistant professors, instructors, lecturers, assisting professors, adjunct professors, and interim professors. Of all full-time faculty in degree-granting postsecondary institutions in fall 2016, 41% were White males; 35% were White females; 6% were Asian/Pacific Islander males; 4% were Asian/Pacific Islander females; 3% each were African American males, African American females, and Hispanic males; and 2% were Hispanic females.

By the same token, a closer look into higher education leadership positions reveal that in toto, there is a very small percentage of women of color in the professoriate. According to a National Center for Education Statistics report, among full-time

professors across all disciplines, 1% were African American females, 1% were Hispanic females, 2% were Asian/Pacific Islander females, and making up less than 1% each were professors who were American Indian/Alaska Native and of two or more races (NCES, 2016).

In the same vein for public schools, in 2017–2018, about 78% of public school principals were White, 11% were African American, and 9% were Hispanic. This research also showed that 46% of public school principals were male and 54% were female in 2017–2018 (NCES, 2020). Furthermore, African American women represented only 12.9% (6340) of the principalships (90,410) in public schools in the USA, and 23% (1290) of those women held a doctoral degree (NCES, 2020).

Even with these numbers, the fact remains that there is still the lack of research on, about, and by African American women in leadership in general and more specifically African American women superintendents. The words from Brunner and Peyton (2000) still ring true that

“. . .there is still very little published specifically about African American female superintendents or other women of color. Certainly, the lack of published research about African American female superintendents is further evidence that they are scarcely represented in the superintendency ranks.” (p. 534)

The words of Kelly Price in the abovementioned song, “This is Who I Am” are some of the guiding words for many who are African American women leaders. The call to leadership is deep and it does indeed represent the gospel or the “good news” that they have to share. Many of them heed the call to leadership because they are clear of the plans for and purposes of their lives as African American women. Their gospel is a gospel of education, liberation, and love. Using the Foucault (1982) lenses presence, memory, and concomitance, this chapter will illumine how the lived experiences of African American women superintendents can lead change and reconstruct theory and practice in the field of educational leadership.

---

## **Out with the Old (Memory)**

Systems of education (PreK-graduate education) claim to promote diversity and want to increase social justice, but the daily activities and functions of the both perpetuate the “good ole boy” network (Alston, 1999; Brunner & Peyton-Caire, 2000). There must be a creation and construction of a new way of doing and being in the field of educational leadership that is inclusive, culturally responsive, and socially just. While the position of superintendent has been a gender biased, male-dominated position (Alston, 2005; Brunner & Peyton-Caire, 2000), it cannot and should not remain that way. Through the redevelopment of leadership training programs and improved hiring practices among school boards and search firms, African American female superintendents can contribute to closing the gender and race biased superintendency gap.

Women should have equal access to leadership positions within “formal structures,” like the superintendency, which have been historically “systematically advantageous to men” (Levac, 2008, p. 41). Search firms can be a barrier for African

American female superintendents, primarily because of the role they play in who they present as a candidate for the superintendency to school boards. The research has shown that African American women are often excluded from the selection process. The barrier is not in the application and interviewing portion of the recruitment process but the “problem lies in the decisions made by those in power” (Brown, 2014, p. 577).

How appropriate for this present discussion as African American women who are most often excluded in foundational and secondary discussions, examples, and research in the leadership field. The fact is that African American women have historically been present in lead positions throughout human history, from ancient Egypt to this contemporary, twenty-first century current day. As noted by McPherson (2013), African American women have been present in leadership roles within the household and developed their skills inside and outside of classroom before and after the Civil War.

In her research on African American women superintendents, Bailey (2018) found that their lived experiences served as the advantage of them being an African American superintendent. The participants in her study shared that as an African American superintendent, they were able to connect more with the community and with the students. One participant in the research noted the following:

*Obviously, serving as an African American superintendent to primarily African American students, I think it's an advantage. I think that for me it's been beneficial because these are my children. Just keeping it real; these are my children. I think that it has helped me in actually knowing the community, knowing the culture; and knowing what to expect and what not to expect; and know how to deal with it effectively. So, I think that that has been an advantage.*

Another African American woman superintendent stated:

*The advantage, you truly relate with the on the ground troops...the teachers, parents, students, that is the advantage. If you have a White male sitting here, particularly in an urban district, the chances that you relate to my plight are slim to none. I think I have the advantage of being an African American female in this community. I am going to say you are more than just the superintendent; you have been called to heal this community, to unite this community and because I think I have the passion, now my people understand the passion.*

As African American women in the role of the superintendent, these women have a greater ability to connect with the students and community, but also as African Americans they understand that they are role models for the marginalized and the disadvantaged students. They are in positions to advocate for these students, faculty, staff, and community as well. These women serve as what Horsford (2012) called bridges which is as an effective model for leading diverse school communities where race and class divides continue to stifle learning opportunities for large numbers of poor, Black, Latino, and immigrant children and youth.

Another participant in the Bailey (2018) study shared that it was important for the students to see an African American who had beaten the odds and who overcame difficulties.

*I feel the biggest advantage is being a model. When I walk into the schools and the kids see me. We have a lot of disadvantaged kids in this district. So, when I walk through the school buildings and they see me, it is a source of pride for those children. I am an example of somebody who has beaten the odds. I am the person in charge and the kids appreciate and like that.*

As a result of these experiences and being able to overcome these challenges, African American female superintendents are more apt to inspire their students toward achieving success because they are a living example (Tillman & Cochran, 2000) and an advocate.

Along with being an African American as an advantage within their roles as superintendent, African American female superintendents are more aware of the lower expectations placed on poor and minority students by educators because this may have been a barrier for them to overcome in their own educational experiences. The participants within the Bailey (2018) study talked about their plight to make education equitable for all students. The superintendents shared their intolerance for the low expectation being placed on minority and disadvantaged students. One noted the following:

*I would say in African American leadership; I don't want to hear excuses about what kids can't do. I don't want to hear the excuses about where they come from; what they don't have and how unprepared or their situations at home. I don't think we are doing our kids any favors by giving them a free pass because they are impoverished. In fact, I think we are doing a disservice to kids by writing them off for those reasons. Because the only way out and I am living proof; the only way out of that situation is through education. I am going to continue to advocate for all kids, but particularly those kids...disadvantaged, special education, ESL, African American, girls in STEM.*

These African American women superintendents understand the importance of “being and becoming” in their positions. Being and becoming present (not locked in a past that constrained them) is central to their success in their leadership roles. It is the South African Zulu concept of Ubuntu – “I am because we are” (Williams, 2018). Simply put, it is about humanity, caring, and advocating for one another.

---

## **Servant Leadership and Spirituality (Presence)**

For African American women superintendent, the field of presence is planted in her ancestral DNA – those shoulders upon which they stand and are grounded in the servant leadership and spirituality of their culture. These are core to their belief systems. Through her ability to possess a strong sense of efficacy, dedicate herself to the

education and well-being of the children, and the ability to foster relationships and unanimity, the African American female superintendent is able to demonstrate her servant leadership (Alston, 2005). This servant leadership is often grounded in her spirituality. For many African Americans, spirituality is at the core of who they are and it connects them to their past, present, and future. It is what Dantley (2003) defined as “that internal mechanism that guides human beings to make meaning for their lives, to establish purpose for themselves, to enter into connections or relationships with others, and serves as the facility for people to create through inspired imagination” (p. 3). This connection between spirituality and servant leadership is illuminated in the context of how they relate to others (Keyes, Hanley-Maxwell, & Capper, 1999). For many of these women, their spirituality is directly aligned with their religious beliefs and practices.

Bailey (2018) found that many African American women superintendents in sharing their lived experiences that a strong sense of faith and belief in God surfaced. As servant leaders, the African American female superintendents in this study demonstrated a strong belief in God. The participants believed that they had a purpose and a calling from God in their lives to serve as the superintendents of their school districts. They attributed their successes as superintendents to their faith and spiritual connection to God. Prayer is something that participants referenced. Prayer was a strategy for overcoming barriers. It was also used as a support for staff. One participant noted that she would be willing to pray with staff, when and if they requested. The idea of prayer as a way to address barriers or troubled situations promotes the message that, “And whatever things you ask in prayer, believing, you will receive,” (Matthew 21:22 [New King James Version](#)). This is the action of the critical servant leader; it is the connection to marginalized communities and people; it is the willingness and commitment to care and promote equity, fairness, and justice (Alston & McClellan, 2011). It is the construction of their [our] own type of leadership based on our individual and collective epistemologies and ontologies.

The primary concern of servant leaders is serving others; they have a social responsibility to be concerned with the “least privileged” (Alston & McClellan, 2011, p. 58) and to recognize them as equal stakeholders in the life of the organization (Northouse, 2010). Alston and McClellan (2011) further argued that African American women leaders throughout history have surmounted the solicitation and execution of critical servant leadership within their communities through their service and activism. The African American woman superintendent as a critical servant leader is willing to take risks to lead in poorly managed and maintained urban school districts that have a high minority population (Alston, 2005; Alston & McClellan, 2011; Jackson, 1999). She does this through her ability to possess a strong sense of efficacy, dedicate herself to the education and well-being of the children, and the ability to foster relationships and unanimity (Alston, 2005). This type of leadership builds on the advocacy of the aforementioned field of presence and constructs the space for the field of memory.

As shown in the research of Bailey (2018), each participant shared that an advantage that they had as African American female superintendents was being able to develop the relationships with their community, parents, and students. These superintendents shared how making education equitable for all students was a major priority and that being an advocate for marginalized students was a major focus for

them in their roles as superintendent. In other words, this critical servant leadership is not just a modern-day lip service activity. This is a way of being for many African American women superintendents and is in their leadership DNA to navigate the world this way. It is the belief in the notion of reciprocity and commitment to service to others that is the goal for these women.

---

## **Social Change and Activism (Concomitance)**

Concomitance is defined as the fact of existing or occurring together with something else ([lexico.com](http://lexico.com)). This is work that is grounded in the field of presence. For African American women superintendents, this is viewed as her being a representation for social change. Social change is the transforming of cultures and social institutions due to human interactions and relationships (Dunfey, 2019). Through her daily interactions and transformational as well as transformative leadership, the African American female superintendent is an activist for social change. The educational system as it is known in America is inequitable to the underrepresented and marginalized populations. When considering leadership as it pertains to women and women of color, transformational leadership is apposite because it can be altered to ensure that leadership responds thoughtfully to underrepresented and marginalized populations (Levac, 2008).

These women are effective leaders who have a passion for social change and they “engage in discourse analysis; deconstruct the discourse; and strategically determine the most effective method of intervention to have a transformative impact on the lives” (Pratt-Clarke, 2010, p. 41) of those children and adults entrusted to them. This is social activism on a very needed level. For so many underrepresented and marginalized groups, it is often noted that if you can’t see it, then you can’t imagine being it. So, the very presence of African American women superintendents is an act of advocacy and social activism.

Hudson, Wesson, and Marcano (1998) shared that an educational leadership quality of African American female superintendents is their activism for all children. Not only is she a change agent but also because she has concern for all students; the African American female superintendent is a transformational and transformative leader (Alston & McClellan, 2011; Brown, 2014; Northouse, 2010; Shields, 2010).

## **Transformational and Transformative Leadership**

According to Levac (2008), women who continue to be excluded from positions of leadership, like the superintendency, can recognize the benefit in these newer perspectives on leadership, such as transformational, because they highlight their extraordinary leadership skills displayed in the maintenance of their families, churches, and communities. One explanation for this is their ability to take positive attributes of their cross-cultural differences and combine them with empirically effective leadership practices (e.g., transformational leadership), which for them has resulted in different and often positive outcomes. Some believe that

transformational leaders are not just exceptional leaders but leaders who can change their environment (Kirby, Paradise, & King, 1992).

Many of these women take the step from transformational leadership into transformative leadership. Transformative leadership in this twenty-first century and beyond sometimes requires stepping out of the boat like our foremothers and forefathers, stepping out of the traditional, the comfortable. Weiner (2003) noted that transformative leadership is “an exercise of power and authority that begins with questions of justice, democracy, and the dialectic between individual accountability and social responsibility” (p. 89). Furthermore, Shields (2010) stated, “transformative leadership takes account of the ways in which the inequities of the outside world affect the outcomes of what occurs internally” (p. 584). This African American woman transformational and transformative leader is what Alston (2018) named as a Refined Revolutionary: one who has survived the processing, become improved and stepped out of the boat to lead in a bold and subversively profound manner toward a new destiny.

## **Transformational, Transformative Change Agent for Equitable Education**

Combining the transformational, transformative, and opportunity for change, one participant in Bailey’s (2018) study discussed a need for change in her district and exhibited attributes of being a change agent. She stated:

*They want you to be the face of things and what I have pushed was that I’m going to be the face, but the plan is going to be something that we work on together. So, one of the first things that I did was start on a five-year strategic plan. That’s the first thing we did here and part of that plan was; here’s where we are academically; here’s where we are financially, and in order to sustain that we cannot go further. So, I brought together communities, students and parents and we worked for six months on a five-year strategic plan which included an equity goal.*

Even though the responsibility of the transformational and transformative leader is to introduce the initiatives that will bring about change, in the end the followers need to express their true desires for change (Alston & McClellan, 2011). This African American woman superintendent was not only able to bring about change by influencing the community, but also, she was able to display her ability to be “self-effacing, stimulating others to put forth their best efforts rather than making [herself] too active or prominent” (Brawley as cited in Alston, 2008). This superintendent noted:

*The community wanted that, they said we believe that this district has not focused on equity and there are a lot of inequities; so, our go to is equity. So, we put the plan together and it was a new mission. We came up with a decision-making criteria of how we are going to make decisions in this district, even our core values. It was even important to the community that we established some consistency in programming for all students. So, that really gave me the*

*opportunity to say if I am going to focus on inequalities then the focus is on the goal and not [my] focus. The plan cannot be [my] plan; it has to be something that we all agree on and come together; something we can live with and it has to outlive [me]. I had the Board adopt the strategic plan. I was able to push for an equity policy. So, we are the only district in the county who has an equity policy.*

---

## Conclusions and Reflections

Oftentimes for African American women superintendents a common self-reflecting statement surfaces: “why bother?” “Why bother” with the unfairness of accountability; “why bother” with the glass ceiling, the glass escalator, and the concrete ceiling; “why bother” with the politics and demands; and “why bother” with choosing a career over family or even having a family. Regardless of the “why bother” statement, African American women superintendents have chosen to be the leaders of their school districts, displaying their ability to be transformational, transformative, visionary, critical servant leaders.

In order for more of these women to take their right places in the superintendency, some changes must occur within the various systems. The literature has suggested that colleges and universities have shown a lack of commitment toward diversifying their superintendent training programs (Tillman & Cochran, 2000). Therefore, a leadership recommendation for superintendent training programs is for there to be a more diversified recruitment process. It is suggested that indicators be in place to monitor the number of women of color admitted into these training programs. This recruitment process should be reevaluated yearly to address any cultural differences or gender-biases that may impede women and women of color from entering into the training program.

With a large portion of women excluded from literature, an assumption is made that educational leaders are male (Alston & McClellan, 2011). This perpetuated flaw needs to be challenged by the superintendent training programs. It is recommended that the superintendent training programs include literature that reflects the educational leadership experiences of women and women of color. The course work in administration or educational leadership programs naturally reflects the White male perspective but is a disservice to African American women entering the field of educational leadership because the experience and perspective is different for women of color (Brunner & Peyton-Caire, 2000). A recommendation for superintendent training programs is to incorporate literature authored by women and women of color within the curriculum. In addition to this, it is recommended that superintendent training programs have existing African American, Latino, and Asian female superintendents share their perspectives and lived experiences with both male and female aspiring superintendents.

As an avenue toward closing the gap of a male-dominated industry, it is also suggested that superintendent training programs should prepare aspiring African American women in the area of “self-recruitment and self-retention” (Brown, 2014, p. 583). Superintendent training programs should develop curricula that teach women of color various ways of how to market themselves so that they can be considered for superintendent positions. Rooted within the concept of self-

recruitment and self-retention are the concepts of mentoring and support networks, which are also strategies of success for African American women who aspire to be superintendents (Alston, 1999, 2000; Anderson, 2000; Brown, 2014; Brunner & Peyton-Caire, 2000; Tillman & Cochran, 2000). As a result of this information, it is recommended that superintendent training programs provide African American women with mentors. The superintendent training program should have the resources to connect aspiring African American female superintendents with other superintendents. There should be an assertive effort on the part of the superintendent training program to connect aspiring African American female superintendents with other African American female superintendents or women of color in educational leadership.

In the end, the resiliency of the African American woman allows her to place the focus on the whole student, ensuring that every student receives a quality, equitable education, that prepares the student for the global community. African American women leaders have been and will continue to be sempiternal in our commitment to our advocacy (presence), their service, (memory), and their activism (concomitance) because they were made for such a time as this.

## Abstract

Global free market neoliberalism has spurred widespread change in education’s purposes, policies, and practices, with concomitant repercussions for school business. As a consequence, school business demands and accountabilities continue to escalate in scope and complexity, while governments, education authorities, and school communities increasingly appreciate the importance of specialist business leadership in schools. This chapter documents the work, impact, subsequent rise, and rapid professionalization of school business leaders as pervasive policy imperatives continue to influence school business priorities, before discussing issues in this field that are looming across the developed world. Finally, the chapter proposes some foundational evocations for future developments and research in this emerging area of education leadership.

**Keywords**

School business leadership · School business management · Education business

**The Field of Memory**

School business “managers”/bursars positioned as backroom functionaries; school business “managers” without formal qualifications who learnt “on-the-job”; “business” as a dirty word in education.

**The Field of Presence**

Education business influenced by global free market neoliberalism; school business “management” refocused to emphasize business “leadership”; education business repositioned as socially focused, socially responsible business; the rise of specific school business professionals; the professionalization of school business personnel; school business leaders enable school principals to concentrate on teaching and learning.

**The Field of Concomitance**

Increasing importance placed on astute and competent education business leadership; education business leaders require business skills in addition to specific education-related knowledge; school business professionals are leaders who work in leadership teams alongside education leaders.

**Discontinuities and Ruptures**

“Hidden” education business practices; a dearth of research interest in the business aspects of leading education institutions or in the education business profession; “anti-business” sentiments and a lack of understanding about business in education.

**Critical Assumptions**

Education business leadership is very different from other forms of business: it is business for good, business with a social purpose; every education decision has a business implication; increasing expectations that education resources (inputs) will lead to measurable learning enhancement (outputs).

---

**Introduction**

Worldwide, education is BIG BUSINESS. From early learning to higher education, from basic training to vocational education to professional learning, from knowledge transfer to knowledge creation – no matter what form it takes, where it is conducted, or at what level – education is a multi-trillion dollar industry. Education supplies the world’s insatiable appetite for learning and creates millions of jobs through its continual need for services, products, and facilities and stimulates countless millions of ancillary enterprises built on supplying its needs (Starr, 2012a). Education would

not exist without a host of business activities that are essential to enabling and supporting it – business work that is extensive and never-ending.

It is staggering, therefore, that this essential and fundamental area of education is greeted with general disinterest and receives so little attention in education research (Aldridge, 2008; O’Sullivan, Thody, & Wood, 1999). The work of education business leaders and managers, who are responsible for overseeing this extensive business activity, is likewise, under-theorized. Hence, even though education business work is expanding exponentially, a paucity of research reveals a very incomplete public picture of this hidden yet critically important field of endeavor and its labor force. Amazingly, many texts on education leadership pay scant attention or elide mention of education business altogether.

While all organizations at every level of education conduct a host of business functions and rely on the work of a host of employees to undertake myriad business activities, this chapter focuses specifically on schools and those employed to lead school business. First the chapter focuses on the functions of school business leaders and the changing nature and impact of the school business profession. The chapter then discusses looming issues before concluding with a series of contentions that underpin education business and its distinctiveness.

---

## The Rise of the School Business Leader

Global free market neoliberalism has intensified the focus on school leadership and improvement. Education policy has been increasingly focused on fundamental neoliberal tenets – individualism, autonomy, competition, privatization, choice, efficiency, productivity, improvement, innovation, entrepreneurialism, and emphasizing accountability and performativity – while governments expect greater value for money, enhanced “outputs,” and systemic risk reduction (Starr, 2021 forthcoming). One common policy move across nations has been increasing institutional autonomy as “small government,” individualism, choice, and competition imperatives are pursued in neoliberal education policy (see Starr, 2019a). The USA and Canada’s empowered district school business model (where school business officials and their teams work closely with school superintendents and school boards to oversee school provisioning and services to students within a defined geographical area); Canada’s provincial-specific variations of site-based management (such as Alberta’s public charter schools); England’s academy schools and multi-academy trusts; Australia’s Independent Public Schools initiatives and “default autonomy” policies; and New Zealand’s school restructurings since the 1980s *Tomorrow’s Schools* reforms – are all forms of school autonomy with the rationale of driving up school performance outcomes by devolving decision-making authority and responsibility to the local level. In many of these jurisdictions, each school has a dedicated school business leader (such as in Australia, New Zealand, UK – except in the case of very small rural or remote schools where services may be provided by business services hubs that work across several schools). They are referred to with

titles such as Manager of Corporate Services in Schools, School Business Manager, School Business Official, and Director of Finance and Administration, for example.

Neoliberal policy motivations and their concomitant accountabilities are inherent in reforms impacting directly on school business and its leadership, with much work that used to be conducted at the systems level being diverted to schools, making schools more businesslike and attentive to business and governance issues (Aldridge, 2008; Bottery, 1994; Starr, 2012b, 2019a, 2021 forthcoming). Neoliberal policy ambitions have, therefore, accelerated growing recognition that effective education business management is an essential component of education leadership.

Schools must prepare and operate budgets; hire and remunerate staff; pay for goods and services; maintain campuses, assets, and resources; observe legislative and policy mandates; manage risk; and control communications, public relations, image, and reputation. They are overseen by, and report to, independent school boards. Schools cannot avoid “doing” and managing their business. In many respects, managing education business *is* the same as managing any other business endeavor. The difference is the organization’s core focus and important social function.

Schools are important community assets, and the public expects them to operate as smoothly, efficiently, and effectively as possible. Propitious education business decisions save schools money and time, support the work of school leaders and teachers, enhance the fulfillment of strategic education goals, and improve learning experiences and opportunities for students. School business leaders and their teams are integral to every aspect of successful schools.

Individuals leading school business come from diverse backgrounds, possess various qualifications and skill sets, and work within all kinds of education institutions at all levels of education, in sectarian and non-sectarian organizations. They work in publicly and privately funded institutions, as well as education institutions that are “for profit” such as proprietary colleges and publicly traded companies.

There is ample evidence to suggest that schools operate more effectively when they use the services of a qualified school business leader/official (National College, 2011; Southworth, 2010). Leading school business demands specific education-related knowledge, skills, and dispositions, in addition to business and, increasingly, governance expertise. Expected requisites include:

- Delineated technical knowledge, skills, and competencies (relating to school administration, finance, human resource management, marketing, plant and facilities, asset and ICT management, for example)
- Non-negotiables: trustworthiness, integrity, honesty, reliability, respect, courtesy, and time-management skills
- Effective communication skills, risk aversion, ability to work effectively with others and a commitment to equity and inclusion, highly developed “people” skills to work with and provide service to teachers, students, parents, governing councillors, education authorities, suppliers, and the general public
- Capabilities to lead and develop staff, report to and work with governing councillors, and work in a distributed school leadership environment

- Taking a broader outlook on education and the school business profession beyond the school – actively participating in discussions and actions for improvement, including committing to continuous professional learning
- Entrepreneurship, taking professional initiative for improvements
- Working outside and beyond usual hours of employment as required to get work completed (Starr, 2012a, 2019b, 2021 forthcoming; Stevenson & Tharpe, 1999)

School business leaders, like school principals, have roles that have intensified – their attention is diverted in quick succession from one task/situation/meeting/phone call to another. Their work spans an enormous range of activities and responsibilities and is continually interrupted. Demands on the role are increasing, as are expectations. Current job descriptions – where they exist - do not fully represent the range of tasks and responsibilities undertaken by school business officials. Further, the role is expanding and becoming more complex as expectations are heightened, work commitments grow, and accountabilities intensify (Starr, 2012a, 2019b; see also Armstrong, 2018).

Within this context, expectations for school business leaders to be involved in strategic governance decisions and to play a more visible role within the education system are heightened. School business leaders are expected to demonstrate initiative to benefit schools – for example, seeking new funding sources, collaborating with other schools or institutions to secure mutual benefits, and saving time and money to focus finite resources on learning and teaching (Starr, 2012b; O’Sullivan, Thody & Wood, 2000). They have to be strategic and future-thinking, ensure legislative and regulatory compliance, and oversee education administration (Aldridge, 2008; Moorcroft & Summerson, 2006; Southworth, 2010; Summerson & Green, 2010).

However, having professionals “taking care of business” and leading the gamut of school business and administrative responsibilities is a relatively recent phenomenon. Previously school principals had to control or do this work themselves. The status and standing of school business leaders has thus changed rapidly, from backroom book-keeper to a strategic leader of business and administration (see Starr, 2012a, Chap. 2).

Education authorities expect continual school improvement and enhanced student learning achievement in all schools, so there is growing awareness that school principals should primarily focus their efforts on learning and teaching and not be diverted by time-consuming and increasingly extensive business and accountability tasks. To this end, there is a trend for school business leaders to go beyond leading usual business activities to oversee much of the work previously undertaken by principals and teachers, for example, timetabling, yard duty, student enrolment, and managing student learning record-keeping.

Now considered indispensable members of school leadership teams, school business officials lead and manage myriad responsibilities emanating from within and outside schools. Mounting and more complex business imperatives have positioned school business leadership and management as a “fledgling” profession (Moorcroft & Summerson, 2006), which has taken off, such as been the growth and need in this field. Southworth (2010) refers to this emergent acknowledgment of education business professionals as a quiet “revolution.”

---

## Leadership and Positioning

School business leaders manage and lead “the other side of the school” – the business, administrative, compliance, services, assets, resources, information, and governance side; the side of the school that also has its own staff for whom business leaders are responsible for building capacity, ensuring work quality, developing teams, and fulfilling expectations for innovation and improvement; and the side of the school behind every aspect of educational provisioning and delivery (Armstrong, 2018; Moorcroft & Summerson, 2006; Odden & Busch, 1998). School business leaders advise principals and governing councils and take a leading role in education business decisions – they are education leaders (see, e.g., Grieve, 2014; Marchant, 2018; Starr, 2012b; Woods, 2014).

There are some things over which school business leaders have complete discretion and considerable freedom and others where they have little or no control. Traditional power and positional structures ultimately exist – residing with politicians and government departments, district authorities, and governing boards – but others at the school level are less overtly hierarchical as leadership functions are distributed, with leadership being evidenced at all levels (Starr, 2014; Summerson, 2006). Hence, school business leaders work within multiple layers of authority, some dispersed and delegated, some concentrated and tightly controlled. They mediate intersecting authorities, interests, and levels of decision-making. Organizational reporting reflects these multi-layered accountabilities with their varying levels of authority.

The skills of school business leaders are used more propitiously when they work alongside school principals and governing councillors. However, moving the school business profession from one formed initially around notions of “management” to one expecting “leadership” has required considerable cultural change. As mentioned in the previous section above, school business “managers” were largely hidden, their role considered to be mostly technical, perfunctory, and “behind the scenes.” School business “leaders” have come into prominence through increasing necessity.

---

## Impact

The role of school business leaders is both educative and developmental and has positive impact. School business leaders:

- Provide ideas and advice to educators and governing councillors to aid astute decision-making
- Support the work of school leaders and teachers, enabling them to focus on learning and teaching improvement. Principals save between 35% and 45% of their time by delegating business, administrative, governance, and compliance work to a school business leader (PricewaterhouseCoopers, 2010; see also Moorcroft & Summerson, 2006; Southworth, 2010)
- Ensure greater levels of job satisfaction and less stress and anxiety for school principals, especially in matters relating to finance, strategic, and operational management (McKinsey, 2007; National College for School Leadership, 2011;

PWC, 2010; Starr, 2012; see also Bergman, Corabian, & Harstall, 2009; Phillips, Sen, & McNamee, 2007)

- Support and oversee school support staff
- Educate colleagues – school principals and governing board representatives – in business, legislative, and governance matters
- Source and secure resources making a return on investment for school business employment costs of more than 80% (National College for Leadership of Schools and Children’s Services and the Training and Development Agency for Schools, 2010; PricewaterhouseCoopers, 2010)
- Recuperate most costs associated with school business salaries (Oakleigh Consulting, 2010). The National College for Leadership of Schools and Children’s Services and the Training and Development Agency assert salary recuperation within 3 years (National College for Leadership of Schools and Children’s Services and the Training and Development Agency for Schools, 2010), while Oakleigh Consulting suggests the return on investment of UK school business leader salaries is 575% (in Starr, 2012, p. 31). Further, the more qualified and experienced the school business leader, the more cost-effective the position becomes.

Education business leaders ensure schools meet compliance and risk management obligations and oversee an increased range of accountabilities including audit reporting. By taking increasing responsibility for business, they enable busy principals to focus on the school as a learning organization and spend more time on pedagogical leadership. This, along with benefits brought about by propitious resource management, supports educational aims and priorities.

---

## Looming Issues

Despite education policy differentiations, there are some common features and issues concerning school business leadership across the developed world, and it is to these matters that the discussion now turns.

## Professionalization

As school business work has expanded and become more complex, and as school business leaders are increasingly recognized as essential members of school leadership teams, various jurisdictions have invested in the rapid professionalization of school business personnel (Woods, 2014; see also Starr, 2012). A range of school business-related qualifications/certifications, professional standards, and codes of ethics have been developed, recognizing that school business professionals must retain current relevant skills and knowledge and be able to demonstrate their expertise and value in schools (see, e.g., ASBO International, 2005; Institute of School Business Leadership, 2018).

It is still possible in some contexts (but less commonly so) for school business leaders to hold no formal qualifications. However, emphasis on raising qualification levels has spurred the development of bespoke courses and professional learning programs including at tertiary levels. While such programs have a long history in some countries, in others they are new or emerging. What is common in all countries is a new emphasis on credentialism. This remains an ongoing issue and work in progress – more easily addressed in jurisdictions that are investing in school business leadership learning and development than in those where incumbents have to find the personal time and funds to undertake such a commitment (e.g., see Starr, 2019b).

## Succession and Renewal

Demographic data around the globe presents a similar picture – an urgent imperative is the school business profession’s renewal. Problems stem from aging incumbents, too few young appointees (see, e.g., ASBO, 2018), and difficulties attracting newcomers to what has been a “hidden” group of employees within education (Moorcroft & Summerson, 2006; Southworth, 2010). Succession efforts are also hampered as the profession at large is considered too homogenous and requiring diversification.

Persistent obstacles to supply and renewal include some of the issues discussed above such as role invisibility and a general lack of understanding about the role. However, the general elision of the business aspects of schooling and business leadership in systemic strategic plans exacerbates this issue.

## School Governance

Being the main business authority often means having to “educate” or explain business matters to other school leaders and governing councillors – it is concerning when the business and governance knowledge of principals and governors is lacking, which becomes a significant risk, in and of itself. Profligate or unwise spending, a lack of understanding about important considerations such as budget planning or cash flow, failure to see the connection between budgeting and strategic planning, being unable to read financial statements, boards’ skill set deficiencies, or failure to appreciate the extent or seriousness of board responsibilities and liabilities or the difference between governance and management are some of the common governance concerns expressed by school business leaders (Starr, 2012, 2021 forthcoming; see also Connolly, Farrell, & James, 2017).

In the context of new accountabilities and heightened expectations, the rapid professionalization of school boards is viewed as an essential education business priority – an issue being taken up by different jurisdictions to varying degrees.

## Business Backlash

Education institutions serve communities and individuals and produce knowledge and sociocultural benefits. However, education leaders cannot simply focus on “educative” concerns – they must juggle teaching and learning matters with necessary and inescapable business and budgetary concerns, much to the chagrin and disgust of those who dislike the thought of education being inextricably bound up in business affairs (Hallinger & Snidvongs, 2008; Leithwood & Jantzi, 1999). Most schools exist in the not-for-profit sector, and their purposes are not concerned with profit-making, but they cannot avoid involvement in business. Hence, while school business is in ascendance and increasingly recognized as an important aspect of education leadership, it often engenders negative connotations as some individuals are offended by the thought of schools being associated with business or of being a business.

“Anti-business” sentiments in education are not new. In the mid-1990s, Bottery noticed a pervasive sense of disapproval about business matters within education cultures and defended business being a valid area in the leadership and management of education, arguing that, “[e]ven a nodding acquaintance with businesses makes one conscious of the host of functions which *all* organisations must perform” (Bottery, 1994, p. 1), and he wondered why business antagonists did not appreciate this obvious point.

Much of the negativity surrounding school business concerns widespread beliefs that education is now negatively influenced and manipulated by free market and neoliberal precepts (Starr, 2019a; see also, e.g., Ranson, 2003; Ravitch, 2010; Smyth, 2006). And many education leaders would agree that activities and memes associated with the business and corporate sectors have woven their way into education and diminished its goals (Ball, 2014; Marginson, 1997; Perry & McWilliam, 2007; Starr, 2019b). Greenfield and Ribbins (1993), however, proffer a different view – that being anti-business sentiments are due to literature and research in the field of educational management, administration, and organization being so utterly boring as to turn most people off! But boring or not, the fact remains that every education enterprise would unravel without the foundations of sound business leadership and management.

Whatever the stance, the links between schools, education, business, and the market are inextricably linked and intractable. Educating the public and school-based personnel as to what school business is, what it entails and what it achieves, is an important goal for the school business profession.

---

## Conclusion and Reflections

Education would not exist without a host of business activities required to support it. Propitious education business leadership pervades every aspect of education. Schools are fundamentally important community assets, and the public expects

them to operate as smoothly, efficiently, and effectively as possible for the benefit of all. School business leaders and their teams are integral to this essential community-building pursuit. If school business flounders, education suffers or ceases to happen (Starr, 2021 forthcoming).

The following propositions are foundational to school business leadership and the work of school business leaders (Starr, 2019b, 2021 forthcoming):

- Every education decision has a business implication. This incontrovertible fact needs to be broadly understood and acknowledged by all stakeholders in education.
- Education business is business for good – it is business with a social purpose. “Business” is not a dirty word in education: it enables educational aspirations and objectives to be met and enhances the school experience for students and educators.
- Education business focuses on meeting strategic education goals – it is not an end in and of itself.
- The more education business leaders understand and know about education, education policy, pedagogy, and the aims of educators, the better able they are to lead and manage the business of education.
- Education business supports and thrives on a “leadership at all levels” leadership stance with school business personnel working alongside educators in executive leadership teams. Hence, while it is imperative that school leaders and board members understand school business, they do not have to conduct it.

As education continues to be a turbulent, contested, and uncertain terrain, it will become equally dynamic and difficult for business decision-making. As a result, school business professionals will continue to be, and are increasingly expected to be, more specialized, qualified, and recognized leaders within education to ensure its social, economic, and political utility and future advancement.

## Abstract

Neoliberal reforms in higher education have shaped the nature of academic work since the 1980s in Australia and other countries. These reforms have resulted in the use of private sector performance practices designed to improve productivity, efficiency, and customer service in research and teaching within public universities. The use of these practices within public sector institutions has been termed “managerialism.” A key component of these reforms has been the establishment of performance management schemes and the process of performance appraisal

for individual staff members (Morris et al., 2007). The central argument in this chapter is that, given the current pervasiveness of managerialism in higher education, collegiality, autonomy, and the traditional role of academic work are being compromised.

The focus in this chapter lies with two aspects of performance management – performance appraisal and performance-based pay. The role and purpose of performance appraisal is reviewed alongside the argument that an approach recognizing the traditional values of academics and is developmental in focus holds merit and is preferable to an approach based on control and surveillance. Caveats are raised regarding the adoption of performance pay within universities. In the final part of the chapter, some discussion is afforded to the actions that managers within universities can take that may help mediate the tensions between traditional and corporate roles of the university.

**The Field of Memory**

Contemporary perspectives of performance appraisal and performance management have been influenced by scientific management. Scientific management is thought to have originated in the early part of the twentieth century and is associated with the work of engineer, Frederick Winslow Taylor (1856–1915). It is a term used to describe a series of approaches that were designed to improve workers' performance. As part of this approach, Taylor implemented a pay system so that those workers who exceeded the target level of output received more pay (Davidson & Griffin, 2003, p. 41). The metaphor of a machine might be used to describe scientific management as work is considered predictable, highly regulated, standardized, and focused on efficiency (Taylor, 1911). Under New Public Management, which emerged around 40 years ago in Australia, there was a resurgence of interest in scientific management's basic principles. A revised version of scientific management is a key feature of the contemporary landscape of universities demonstrating its location in the *field of presence*.

**The Field of Presence**

Performance appraisal and performance-based pay in universities continue to be viewed as controversial and highly divisive practices in Australia and other countries such as the United Kingdom and the United States. While performance-based pay has not been embraced widely in Australian universities, performance appraisal schemes are ubiquitous. Performance appraisal has been described as damaging, limiting, dehumanizing, undermining creativity, and at odds with the traditional values of academe. There have been strong calls for alternative perspectives and practices ranging from eliminating them altogether to implementing more humane and developmental types of schemes. Academic managers, those charged with

carrying out performance appraisals on staff, have been identified as key players who have some discretionary power to make performance appraisal not only more palatable for staff but also relevant and useful.

### **The Field of Concomitance**

Foucault's (1981) field of concomitance refers to ideas, theories, and perspectives borrowed from other fields and applied to a particular field. Performance appraisal and management have been influenced by several different disciplines over the last hundred years. Proponents of scientific management (following Taylor) were influenced by insights from manufacturing, engineering, accounting, and science. Critiques of performance appraisal in universities have come from a number of different perspectives including the human relations movement which was embedded in industrial and organizational psychology, labor process perspectives, and sociology. Micropolitics (Blase & Blase, 1997; Hoyle, 1982), a type of organizational theory, has also been used to explore the way formal and informal power is used by academic managers to achieve performance appraisal goals. A more recent perspective has used the insights of cognitive science and "neuroleadership" (Kairuz, Andriés, Nickloes, & Truter, 2016).

### **Discontinuities and Ruptures**

There were three broad ruptures that emerged in the twentieth century which formed different viewpoints about performance appraisal. The first was in the early 1900s with the advent of Taylor's scientific management which was designed to lead to more efficient and productive workers by close supervision and a standardized approach to work. The second "was a reaction to [the dominance of] scientific management" and was known as the human relations movement (Kimber, 2001, p. 10). Its researchers came from industrial or organizational psychology and their concern was to reinstate human concerns within management. Originating in the Hawthorne studies conducted during 1920–1930s, the human relations movement focused on issues such as employee motivation and satisfaction, interpersonal dynamics and norms of groups, and the influence of the social context of the workplace on workers. Abraham Maslow and Douglas McGregor were two key proponents of the human relation movement. The third key rupture was observed in the 1980s as part of wider neoliberal reforms that resulted in managerialist practices being adopted in universities. At that time and to the current day, performance indicators, output targets, benchmarking exercises, research and quality reviews, and performance management systems (including performance appraisal and performance-based pay) have been among the tools used by managers within university contexts (Kenny, 2017; Kimber & Ehrlich, 2015; Shore, 2008; Waring, 2017).

### **Critical Assumptions**

Under a neoliberal/managerial agenda, there has been an intensification of academic work, with increasingly heavy workloads impacting on academics' performance. Some writers argue that the assumptions underpinning this agenda run counter to the traditional values of universities (including collegiality and

autonomy). They contend that these values have been compromised or marginalized, perhaps even undermined. When considering the implementation of performance appraisals and performance-based pay in universities research indicates that it is rife with challenges and thus highly problematic. As performance appraisal is part of the landscape of universities and unlikely to disappear in the immediate future, it is argued in this chapter that academic managers should approach it “more sceptically and reflexively” (Grint, 2007, p. 61). They need to be mindful that, while a scientific management approach to performance appraisal is based on control and surveillance of academics, much depends on which perspective is informing it and how universities, academic managers, and managed academics approach it. Academic managers, therefore, have some agency in the way in which performance management schemes are implemented. They have some power to be supportive, collegial, and responsive to the context in which academics work.

---

## Introduction

Public sector organizations have been experiencing considerable change over the past three decades. Such unprecedented change has been particularly evident in Australian public service organizations and universities since the 1980s. Much of this change in Australia and internationally has been shaped by managerial thinking – derived from neoliberal economic theories and New Public Management – that using private sector management practices in the public sector will increase efficiency, improve accountability, and result in citizens being served better (Kimber & Ehrich, 2015; Kimber & Maddox, 2003).

Advocates of such thinking believe in individual freedom from government and the free market. Focusing on universities, those borrowing these practices from the private sector argue they will strengthen accountability, improve efficiency, and ensure citizens (in their role of students) are being served better. Others, however, argue that use of these practices can have the opposite effect. They have the potential to “weaken accountability,” “deny the roles and values of public sector employees,” and “hollow” out public sector institutions (Kimber & Ehrich, 2015, p. 84; Kimber & Maddox, 2003, pp. 62, 67). The focus in this chapter is whether “inappropriate use of private sector performance practices” – a “performance focus” – denies the traditional roles and values of public employees (Kimber & Maddox, 2003, p. 62), in this case academics and universities. While a “performance focus” includes performance indicators, performance measurement, and the management of staff performance, this chapter concentrates on the management of staff through performance appraisal and performance pay, arguing that inappropriate use of performance appraisal, particularly when it is linked to pay, can “erode” trust among academics and managers. This “erosion” (Kimber & Ehrich, 2015, p. 83) might be attributed to: an emphasis on the summative rather than developmental elements of performance appraisal; how the performance appraisal interview is conducted; or misunderstanding academic motivation.

By misunderstanding what motivates academics and undermining trust, the misuse of performance appraisal and performance pay has the potential to decrease efficiency and weaken accountability, thereby eroding universities as “a public good *for* the public good” (Kimber & Ehrich, 2015, p. 85. Emphasis in original).

This chapter begins by providing a short discussion pertaining to the origins of performance appraisal and its continuing presence in universities. Following this discussion, consideration is given to some of the theoretical insights and debates informing contemporary thinking about performance appraisal. As is demonstrated, while these insights have emerged from a variety of fields and disciplines, the legacy of Taylor’s scientific management can be acutely felt in contemporary universities today. The next part of the chapter focuses on the purpose of performance appraisal and performance-based pay in Australian universities and the ongoing challenges and tensions they have created for the work of academics. The focus in the final part of the chapter lies with academic managers; those actors who have within their power the possibility of mediating the tension between traditional and corporate roles of the university, thus humanizing performance appraisal for staff. It is suggested that they use a range of micropolitical strategies to ensure that performance management schemes are not only supportive and collegial but also cognizant of the context in which academics work.

---

## Origins of Performance Appraisal

Throughout different periods of history and across different countries, there have been references to different forms of performance appraisal of staff. For example, there are references to performance appraisal in the Han Dynasty in China (206 BCE–220 AD) (Wright, 2002) and, in the 1800s, Robert Owen used daily performance reviews to rate the performance of workers in his textile mills in New Lanark, Scotland. In the 1840s, the US Federal Government passed laws so that department clerks would undergo yearly performance reviews (Nankervis, Baird, Coffey, & Shields, 2016). By the early twentieth century, the military and private and public organizations used performance appraisals to evaluate the performance of individuals (Weise & Buckley, 1998).

Taylor’s seminal work (1911) on scientific management theory created a system that spelled out the most efficient way workers should work. His focus was on increasing worker efficiency and he advocated financial incentives to workers who could increase their output. Performance was conceived in terms of volume and cost. Taylor’s ideas were greatly influential in the way that performance management and appraisal were viewed (Radnor & Barnes, 2007). While scientific management was lauded as a system that increased productivity for organizations producing simple products, its critics were quick to point out its inadequacies including an inattention to the human factor and human relations (Bechner, 2006).

The human relations movement, commencing with the Hawthorne studies and then influencing the field of organizational behavior (following McGregor, 1972),

proposed a more worker-centered approach to performance appraisal. In universities in Australia, performance appraisal was placed under the spotlight in the 1980s with the advent of managerialism. Prior to the 1980s, universities were described as “loosely coupled” – which meant that academics operated within them as independent professionals not impacted by bureaucratic structures (Mintzberg, 1994 in Kenny, 2017, p. 367). Moreover, they were based on collaborative and collegial models of governance where academic work was discretionary; academics set their own standards and regulated those standards themselves. The climate was one of participation; academics had “the responsibility for assessing the work and making judgements about its worthwhileness” (Morris, 2005, p. 391). It has been argued that notions of sharing, trust, and collegiality have since been replaced by control, distrust, and compliance.

---

## Definitions and Theoretical Insights Informing Performance Appraisal

Performance management has been defined as, “the systematic, regular and comprehensive capturing, measurement, monitoring and assessment of crucial aspects of organizational and individual performance through explicit targets, standards, performance indicators, measurement and control systems” (Diefenbach, 2009, p. 894). It is a strategy that aims to increase productivity by making staff more accountable (Field, 2015). Unlike public accountability which is broad in nature, managerial accountability is narrow and focused on “market signals” (Kimber & Ehrich, 2015, p. 84). Proponents of the managerial perspective view people as self-interested and therefore motivated by higher pay, which is one form of extrinsic motivation (Kimber, 2020, p. 5; Park & Word, 2012, pp. 708, 711).

Performance appraisal is often described as a human resource concept and activity that sits within the broader purview of performance management. Its purpose, then, is to “encourage job performance, to flag areas that need attention, to inform both parties [the appraisee and the appraiser] as to expectations” (Jefferson, 2010, p. 111). Another purpose of performance appraisals is to “provide systematic judgements to back up salary increases, promotions, transfers, and sometimes demotions or terminations” (McGregor, 1972, p. 28).

For academics, performance appraisal can be described as a single annual interview or meeting that focuses on staff members’ achievements and goals for the following year (Field, 2015). It enables progress to be reviewed, plans to be altered, feedback provided, and decisions about probation and promotion to be made. Drawing attention to power and control, the formal performance appraisal interview can be experienced differently, depending on a range of factors and the particular context. These include “organisational philosophies and attitudes and skills of those responsible for its administration, together with the acceptance, commitment and ownership of those being reviewed along with those performing the review” (Nankervis et al., 2016, p. 335).

## Influence of Human Relations Theory

There are formative (growth and development) and summative (pay, promotion, salary increments) elements to performance appraisal (Delahaye, 2000, p. 139). This duality can present conflicting roles for the appraiser; on the one hand, they are judge and on the other hand they are helper (McGregor, 1972). McGregor, one of the proponents of the human relations movement, questioned the role and value of traditional performance appraisals for staff which he saw as fraught with danger. He referred to the resistance that evaluators can feel when they are required to conduct performance appraisals. McGregor (1972) said:

supervisors are uncomfortable when they are put in a position of “playing God”. The respect we hold for the inherent value of the individual leaves us distressed when we must take responsibility for judging the personal worth of a fellow human being . . . The modern emphasis upon the supervisor as a leader who strives to *help* staff members achieve both their own and the agency’s objectives is hardly consistent with the judicial role demanded by most appraisal plans. (p. 28)

McGregor (in Newton & Findlay, 1996) argued that appraisal should be participative so that the appraisee is actively involved in making judgments about themselves, and identifying needs for change and development. The appraiser should be helpful, encouraging, and supportive. This understanding lies in stark contrast to a neo-scientific approach that is top down and promotes close monitoring and regular evaluation of staff. The debate regarding the purpose of performance appraisal could be construed as one between development (promoted by a human relations perspective focusing on the importance of human factors) and control (inherent within a scientific management perspective focusing on technical matters).

Newton and Findlay (1996) argue that writing in the field of performance appraisal continues to be influenced by human relations theory. Pointing to McGregor’s seminal work, they give many examples of how performance appraisal is described as serving both the individual and the organization; how it enables staff to be active participants in setting their own goals; and helps them to identify their needs for development. Current texts (Casio, 1991 in Newton & Findlay, 1996; Nankervis et al., 2016) reinforce these messages about what performance appraisal should look like. Later in the chapter we explore some of the research that points to how performance appraisal has been implemented and we look for the vestiges of the influence of human relations theory and scientific management theory.

## Sociological Insights: Power as a Central Concept

Just as McGregor critiqued performance appraisal schemes influenced by scientific management approaches, some contemporary theorists have critiqued performance appraisal shaped by human relations theory. For example, Newton and Findlay (1996) raise questions about the assumptions underpinning human relations theory which they see as problematic. To support their argument they use some of the

concepts from labor process perspectives and some selected concepts from Foucault to interrogate the human relations movement and what it is saying about performance appraisal. Their arguments provide a critical perspective of performance appraisal and contribute to the debate about its conceptualization. Some of these ideas are presented here.

According to Newton and Findlay (1996), labor process perspectives (influenced by Marxism) are concerned with the nature of work and how people's work is controlled. These perspectives maintain that performance appraisal is one mechanism through which management controls the labor process by rewarding or punishing employees who do not comply. It is management that establishes the "rules of the game" since it can use its power to sanction non-participation. Moreover, appraisal "is a direct intervention in the labour process which makes performance more visible and the employee more accountable" (Newton & Findlay, 1996, p. 14).

Sociological insights from Foucault's work have been applied to understand performance appraisal. For example, a term Foucault developed in his seminal text, *Discipline and Punish* (1981), "the panopticon," has been used as a metaphor to explain the close supervision, observation, and control inherent in performance appraisal. The panopticon was a prison designed in the eighteenth century by Jeremy Bentham where a guard could view prisoners at all times without them being aware if and when the surveillance was taking place. Newton and Findlay (1996) refer to the plethora of appraisal scales and measures that some organizations use to judge the performance of staff that provide illustrations of panoptic power. Within this perspective, the appraiser is described as the observer who must "measure, appraise, hierarchize" (Foucault, 1981, in Newton & Findlay, 1996, p. 16).

Another insight from Foucault applied to performance appraisal is the notion of power; and the way power is construed and can be used both positively and negatively (Kenny, 2017; Newton & Findlay, 1996). Newton and Findlay (1996) make the point that the human relations perspective highlights the positive/creative aspects of power inherent in performance appraisal, since key concepts such as "learning," "self-awareness," and "solving problems together" can be the result of productive relationships. Yet because of the power imbalance between appraisers and appraisees and that "appraisal remains inextricably linked to the contested terrain of control" (Newton & Findlay, 1996, p. 32), Newton and Findlay remain skeptical of its potential for positive or creative outcomes for appraisees. The field of micropolitics (Hoyle, 1982) has also been used to explore a range of power-based strategies adopted by individuals, such as academic managers, to achieve their goals (Ehrich, Kimber, & Ehrich, 2016). Such strategies can range from conflict and control to cooperation and collaboration, and the consequences of these strategies can be either positive or negative or somewhere in between depending on the situation and persons involved.

Kenny (2017) uses Foucault's concept of power relations as an entrance point into understanding the impact of neoliberal reforms on academics' work. Some of these impacts include the intensification of academic work, the deterioration in working conditions, and the increasing levels of stress all pointing to disempowerment and

“reduced self-determination” (p. 365). He argues that to remedy this situation there needs to be a restoring of power. He cites an earlier study he and his colleagues undertook that demonstrated the productive use of power where there was equal representation of academics and managers on a committee that designed and implemented a workload model for the faculty. This process was viewed by the academics as fair, transparent, and credible in that it allowed them opportunities to contribute to discussions about the workload impacting on them. This productive example of power lies in contrast to Kenny’s (2017) case study of a university that investigated academics’ experiences of a new performance management system. While academics were reported to be open to improving their performance, they remained skeptical about a system that was top down and mandated minimum expectations pertaining to research targets yet did not consider other competing demands on their time. Kenny (2017) concluded “academic voice” is critical to ensure institutional policies are developed that promote productive relations of power. His perspective, then, is one that is not arguing for the dismantlement of performance appraisal in universities, but the need to make the design of such systems more reflective of the values inherent in academic work. It has been argued by a variety of writers (Field, 2015; Grint, 2007; Newton & Findlay, 1996) that the outcomes of performance appraisal schemes are likely to depend on the way in which managers approach them. This is a point with which we concur and one explored later in the chapter.

## Insights from Cognitive Science and Neuroleadership

Kairuz et al. (2016) provide a further critique of performance management. Similar to Kenny (2017), they raise concerns about the detrimental impact of performance management on the well-being of academics, citing increased stress due to unrealistic demands of academic work. Their critique draws on insights from cognitive science and neuroscience. For example, Kairuz et al. (2016) argue excessive pressure on academics via Key Performance Indicators and other demands on their work impairs their cognitive ability and cognitive thought processes; it is these cognitive processes that are identified as essential for learning, creative and critical thinking, and the creation of new knowledge. Given that universities are places of higher learning and knowledge creation, the implications of Kairuz et al.’s (2016) argument are dire for their future livelihood and role of universities. Although coming from a different perspective, Hall (2018, p. 98) argues that academics are being “alienated” from their “labour.”

Citing research from the business sector, Kairuz et al. (2016) refer to “neuroleadership” – an “approach that encourages co-operation and fairness” – with evidence to suggest that this approach “leads to increased activity in areas of the brain associated with reward and motivation” (p. 888). Coaching and mentoring are identified as being relevant developmental processes that fit within a neuroleadership approach that enhances performance (Kairuz et al., 2016). For this reason, models that support learning, facilitation, and collegiality that are fairly

implemented are recommended as alternatives to the current metrics-driven approach of performance appraisals. Hall (2018, p. 98) too proposes “mass intellectuality” as the antidote, which seems to entail more collaborative ways of working, identifying and teaching hopelessness, and using these to work toward social transformation. The aforementioned discussion has referred to some of the current theoretical debates and insights drawn from a variety of fields and disciplines that have been used by researchers in their quest to understand the nature and function of performance appraisal in universities. The next part of the discussion considers performance appraisal and performance-based pay in higher education in Australia.

---

## Performance Appraisal in Australian Universities

The purpose and effectiveness of performance appraisal schemes in universities is a heated topic (Harkness & Schier, 2011). In Australia, the move to “performance management for academic staff” commenced in “the mid-1980s,” becoming “focused with . . . 1991 [academic] award restructuring” (James, 1995, p. 185). There was a “trial period” in 1992 and 1993 (which was extended), with schemes to have a “developmental intent” during this time (p. 185). One of these early schemes was at The University of Melbourne (James, 1995). In a 1993 review of this scheme, attitudinal “differences” were found between appraisees and appraisers and between “continuing” and “limited”-term academics (p. 193). Less than 35% of academics felt they had experienced “developmental” (p. 194) benefits from the scheme, but “the main strength of the scheme [was] the opportunity it provide[d] to clarify goals, roles, and responsibilities, and to acknowledge achievement” (James, 1995, p. 192). Some academics felt that, “‘If you are an active, responsible academic, the process is irrelevant’ . . . Some appraisees questioned the value of the appraisal scheme in the light of the effort involved” (pp. 192–193). For James (1995, p. 196), “tensions” between the formative elements and summative elements of performance appraisal risk “processes” becoming “shallow formalities . . . The clashes between summative and formative purposes which are evident in the understandings and attitudes of academic staff toward The University of Melbourne’s appraisal scheme probably limit its effectiveness” (p. 196).

As this review of The University of Melbourne scheme suggests, while the introduction of performance appraisal partly has been driven by the perception that it will “provide” “predictability” and “accountability” (Morris, 2005, p. 390), many criticisms have been made. Appraisal has been seen “as evidence of new corporate management approaches which are a threat to collegiality and inappropriate for educational institutions (Smyth, 1989)” (James, 1995, p. 186). In the late 1980s, some writers viewed “performance appraisals inappropriate for academics, . . . an attack on academic freedom . . . [and] a potential tool to monitor and control staff, preventing unpopular research or discussion not popular with the university” (Stone, 1998, p. 265 in Morris, 2005, p. 390).

Cannizzo (2016) makes the accountability focus of performance appraisal in Australian universities clear, describing it as “(o)ne clear strategy through which

accountability to the institution's identity and mission is ensured is through the management and evaluation of staff performance against institutional goals" (p. 886). Drawing on statements from several Australian universities over 2011–2013, performance appraisal has been seen as a management tool for aligning the performance of individual staff members with the university's strategies. Cannizzo (2016) notes the implications of performance appraisal for not only salary increments and promotion but also for "an academic's sense of self" (p. 886).

The approach Cannizzo is describing seems a top-down one. A top-down approach to implementing performance appraisal is "linked to the contested terrain of control and thus lies at the heart of the management of the employment relationships" (Newton & Findlay, 1996, p. 56). Echoing this concern, Harkness and Schier (2011, p. 55) say academic freedom is eroded when universities:

become beholden to the economic imperatives of a managerial framework . . . Where an academic environment based on collegiality, peer evaluation and review has in the past served well to uphold academic quality and standards, the shift to a hierarchical framework threatens to undermine this process by imposing top-down managerial control.

If there is movement away from academic freedom and economic imperatives are privileged, then the traditional roles and values of academics can be "denied" (Kimber & Maddox, 2003).

## Accountability Versus Development

When performance appraisal schemes are used for monitoring and control purposes rather than for development purposes, some writers suggest appraisees can perceive these schemes negatively (Simmons in Harkness & Schier, 2011). If appraisal is seen as a threat (Townsend, 1998), trust is eroded. Trust can also be eroded where appraisees view the process to be neither transparent nor fair; nor the rewards proportional to the work carried out (Harkness & Schier, 2011). Trust between appraiser and appraisee, therefore, is an important element of a successful performance appraisal scheme.

Use of managerial practices can erode trust between "managed academics" and "academic managers" (Deem & Brehony, 2005), suggesting use of such practices might illustrate what Menzel (in Samier, 2008, p. 3) refers to as "morally mute managers." Such managers "are seduced by a sense of duty as competent purveyors of neutral information" (Samier, 2008, p. 3). Consequently, academic managers' actions in implementing managerial reforms influence how academics perceive these practices. How performance management systems are being implemented in Australian universities, combined with possible insufficient consideration of "the traditional values of teaching and research," has been increasing "the levels of stress and anxiety among academics . . . [and] diminish[ing] the significance of corporate performance management systems" (Christopher & Leung, 2015, p. 181). Performance management in universities, therefore, can be counterproductive.

One response, advocated by writers such as Morris (in Harkness & Schier, 2011, pp. 55–56), is universities returning to an earlier “highly participatory” “model which . . . was no less rigorous in its intent . . .” Given the dominance of managerial-inspired thinking in universities, it seems unlikely there will be a full return to such a governance model. Academic managers, however, have the power to make performance appraisals better. They “have agency and can use their power in ways that can empower or disempower themselves and others” (Ehrich et al., 2016, p. 195). This point is illustrated in Field’s (2015) interviews with 40 academics from an Australian university regarding their performance appraisal experience. Field found the appraiser’s stance had much impact on the way performance appraisal was perceived and experienced. Field notes “six stances” held by managers and, in many cases, managers held a combination of stances. These stances are “nurturing, hard-driving, self-serving, coddling, disengaged, and hostile” (Field, 2015, p. 172).

Appraisers who took a “nurturing” stance showed genuine “interest” in the appraisee and provided “positive feedback” (p. 177). While it was the stance most appreciated by staff, it is “out of step with the sought-after emphasis on results-based management and accountability” within managerialism (Field, 2015, p. 185). A “hard-driving” appraiser had very high expectations for appraisees to excel in all aspects of work. They held appraisees responsible for output shortfalls. Appraisers who were “self-serving” viewed “the appraisee as a resource” to be used (p. 177). These appraisers “reward[ed] those who complied” (p. 177). “Coddling” appraisers were seen to be those who coddled the appraisee and treated them in an “over-protective way” (p. 177). “Disengaged” appraisers were described most frequently by the academics in the study. These appraisers viewed appraisal as a routinized tick the box exercise, focusing on quantity not quality of outputs. “Hostile” appraisers were those who showed “contempt towards the appraisee,” focusing on their shortcomings (Field, 2015, p. 177). Field notes that, of the stances, the “hard driving” stance and “self-serving” stance resonate most closely with managerialism, since both are concerned with academics pursuing either the university’s interests (as in the case of hard driving) or the appraisers’ interests (self-interest). For some staff, their appraisal was found to be a mix of “nurturing” and goal setting, yet a considerable number of academics felt threatened and hurt by managerial-inspired practices (Field, 2015). It could also be argued that the stance of “nurturing” resonates with human relations theory, as this stance has genuine regard for the well-being of staff and meeting their developmental needs. Later in the chapter, when the implications for managers are considered, this idea is returned to.

---

## Performance Pay in Universities

While performance pay is common in some parts of the public sector and the private sector, it does not seem widespread in Australian universities. An exception has been Swinburne University, which established a Performance-related Pay (PRP) scheme in 2007 (Harkness & Schier, 2011). Staff could obtain:

a bonus equal to a maximum of ten per cent of their current substantive salary, as a reward for meeting a number of performance measures. Management advised that there would be sufficient funds for 30% of staff to win such a bonus. (Harkness & Schier, 2011, p. 51)

From their review of literature, Harkness and Schier (2011, p. 56) argue there has been much variety in the way PRP schemes have been implemented and their effectiveness depends on variables including the type of work, the level of organizational commitment, presence of participatory practices, staff attitudes and motivation, and proportion of staff rewarded. They conclude there is insufficient data to suggest PRP increases staff motivation or productivity (Harkness & Schier, 2011). One reason might be, “The motivation to engage in creative, knowledge-intensive work, such as the work carried out at universities, is typically intrinsic” (Kallio & Kallio, 2014, p. 574). It can be “difficult to evaluate the value” of “non-profit expert work. . . one top-level study could easily be more valuable than a hundred mediocre research papers. In the case of basic research in particular, when the value of the work may only be appreciated after several years . . .” (Kallio & Kallio, 2014, pp. 574–575).

Consequently, use of PRP in universities “implies a belief that academic behaviours are modified by money” (Blackmore & Kandiko, 2011, p. 399). Yet academics’ motivations can be a complex intersection of intrinsic and extrinsic factors. There is a relationship between intellectual interest, allegiances to disciplines or fields, and university-specific factors (Blackmore & Kandiko, 2011). When managers “ignore the complexity of academic motivation, [their “actions”] are likely to be ineffective . . .” (Blackmore & Kandiko, 2011, p. 408). Indeed, since the early 1990s, evidence has indicated performance pay can demotivate and demoralize, lower quality, and increase costs. Where greater motivation exists, it has come from organizational changes and performance review enabling the goals of public employees and the “goals of the organization” being better aligned (Marsden, 2010, pp. 197–198). Much discussion about performance pay hinges on motivation.

While a performance focus may increase efficiency and improve accountability, it is argued that this is likely to happen only when performance-based pay is used appropriately. It is possible that in some cases performance-based pay might have the opposite effect such as ignoring the intrinsic motivation of some academics or ignoring the complexity of academic work and the university environment. As a performance focus might impact on all academics, it is academic managers who are perhaps in a position where they can harness the appropriate uses and minimize the inappropriate uses of this focus.

---

## **What Can Be Done About Performance Appraisal? Academic Managers Hold the Key**

Prior to the use of managerial-inspired practices in universities, administrators were respected academics who upheld traditional values of the institution (Morris, 2005). Today, administrators are “professional managers” who are required to work and operate in a system based on a “business” model characterized by measurement and

assessment (Morris, 2005, p. 390). It is these administrators who are often responsible for overseeing the performance appraisal system. This section begins with an exploration of ways academics and academic managers have responded to managerialism. It then considers ways forward for academic managers to navigate their role within a managerialist framework. We adhere to the call (e.g., Kairuz et al., 2016; Kenny, 2017) for an appraisal system that restores the balance of power and gives academic a voice.

Three ways academics and academic managers have been seen to respond to managerial-inspired reforms are now discussed (Teelken, 2012, 2015). First is via “formal instrumentality,” which refers to accepting uncritically the performance agenda. Academics are willingly compliant. Second is via “symbolic compliance.” Academics accept managerial changes at a superficial level. There is “acquiescence and avoidance” (p. 278) such as “engaging in performance appraisal in [a] nominal way” (Kimber & Ehrich, 2015, p. 92). Third is “professional pragmatism.” Here academics respond to managerial imperatives in a critical manner. Similarly, “Resilient compliers” “apply the rules, but try to avoid becoming known as vassals of the system . . . Resilient compliers reinterpret and assimilate the sources of ambivalence in potentially productive ways as a survival strategy” (Sousa, de Nijs, & Hendriks, 2010, p. 1454). It could be said academic managers who are “professional pragmatists” or “resilient compliers” are attempting to mediate between the demands of the system and the academic staff for whom they are responsible (Sousa et al., 2010).

The managerial context has given academic managers the opportunity to exert considerable power over academics’ work (Ehrich et al., 2016). Managers are expected to meet a variety of performance targets and ensure staff compliance with the performance agenda (O’Brien & Down, 2002). Of interest is *how* managers use power to try to humanize a dehumanized work environment. It is argued that “professional pragmatism” and “resilient compliance” hold the greatest promise for achieving this end, as the managerial agenda is neither denied nor accepted uncritically. What those who hold either of these perspectives recognize is there is space for mediation and negotiation. Managers’ location within the system may enable them to exercise their agency in proactive ways to maximize the appropriate uses and minimize the impact of the inappropriate uses of performance appraisal and pay. We have suggested elsewhere that the pervasiveness of managerial-inspired reforms means that there is likely to be no return to the collegial governance of the past (also see Graham, 2016). Indeed, previous research indicates performance appraisal can assist academics to undertake their roles better (Field, 2015; Halligan, 2008; Hawke, 2012; Morris, 2011; Taylor, 2015; Zepeda & Ponticell, 1998). Such a finding provokes consideration of managers’ agency in relation to performance management in universities (Sousa et al., 2010).

## **Micropolitical Strategies and Suggestions**

Considering managers’ agency draws attention to the micropolitical strategies they might use if they wish to work as savvy actors in the current context. These strategies relate to how managers use their power (i.e., their resources, decisions) to achieve their goals (Ehrich et al., 2016). Understanding these strategies can assist managers to

influence the quality and type of relationships they have with colleagues (Ehrich et al., 2016). Cooperative micropolitical strategies academic managers might use entail facilitation, support, and negotiation. Professionalism and collegial relations describe the interactions among people. This use contrasts with academic managers who “practice excessive monitoring, misuse performance reviews, and distribute resources inequitably . . . [and] coerce others into passivity” (Samier, 2008, p. 15). Any power-based strategy needs to be exercised in an ethical and professional manner (Ehrich et al., 2016). Examples of ethical use might be: filtering or prioritizing policies and creatively interpreting policies; collaborating with colleagues; keeping colleagues well informed of system practices and patterns; using power to model expectations of fairness and equity; and strategizing that involves a sophisticated understanding of institutions and actors (Ryan & Armstrong, 2016). These sorts of practices involve managers as negotiators, mediators, and managers of meaning operating in a highly political arena.

Field (2015) refers to managers who “buffer . . . academics from external threat, allowing them to get on with meaningful work” (p. 185). Buffering has been used by managers in university research organizations to protect staff from unwanted managerial demands (Sousa et al., 2010). For Sousa et al. (2010), “Research performance management is nothing short of meaningless unless the agency of research managers – their capacity to make their own judgements and decisions – and the activities via which performance management is put into practice are drawn into the picture” (p. 1453). Buffering, then, can be considered to entail collegiality that is based on “sharing, trust and participation . . . ” (Smyth, 1989, p. 153, cited in Morris, 2005, p. 391). Management practices used in Australian universities, therefore, must reflect the complex roles of academics and the multiple values public institutions must seek to represent. For example, research managers in Sousa et al.’s (2010) study used “mediation and boundary management” (p. 1149) to ensure compliance with the performance agenda, yet “negotiate [d] exceptions” (p. 1449) to rules whenever possible.

As university managers have agency, their management approach is likely to affect the experience and outcomes of performance appraisals of staff (Newton & Findlay, 1996). This conclusion was based on the strength of two research studies. First, Morris (2011) has investigated performance appraisal across four universities in Australia. From a survey of 103 academic staff, Morris found academics accepted performance appraisal schemes to meet both university and individual goals, but were dissatisfied with the way performance appraisal had been implemented. These academics noted that the process was more bureaucratic than developmental and the institutional goals took priority over their individual goals. They noted managers lacked adequate training in conducting performance appraisals and resources were often inadequate to support outcomes that emerged. This need for those conducting appraisals to be trained has been noted in the Australian literature for some time (James, 1995, p. 186).

Second, there was evidence of poorly conducted performance appraisal interviews by many managers in Field’s (2015) study. As highlighted earlier in the chapter, Field is critical of stances he associates with a managerial agenda such as a “hard driving” and “self-serving” stance. Of the “six stances” he puts forward, a nurturing stance was particularly appreciated by staff and seems more in line with

what might be considered the traditional roles and values of academics. “Nurturing” academic managers focus on “the appraisee as a whole person” and as “a colleague” (Field, 2015, p. 177). A “nurturing” stance fits with Newton and Findlay’s (1996) neo-human relations approach to performance appraisal, as it is about the appraisee’s development and the support the appraiser provides to assist this growth.

Effective performance appraisal schemes, therefore, are built on trust between the appraiser and the appraisee (Townsend, 1998). Townsend offers several suggestions for building trust between both parties. One is having an overt policy that both parties understand. This policy needs to be implemented in an open, fair, and transparent manner. Morris (2011) refers to this transparency and fairness as “credibility,” which involves gaining staff support through a fair and transparent process of performance appraisal.

Another suggestion is training so appraisees and appraisers are familiar with the program’s purpose (e.g., formative or summative), expectations, and processes. Performance appraisal poses a dilemma: on the one hand, independence and autonomy for appraisees, and on the other hand, monitoring their work. Although this paradox may not be resolved, managers need to acknowledge it, and ensure clarity surrounding the purpose and expectations of the program (Morris, 2011). Astute managers would be aware of this dilemma and would be playing an active role in mediating between the two foci of performance appraisal.

Training helps managers develop or strengthen their skills. One such skill set is good interpersonal skills, which are necessary for conducting effective performance appraisal interviews (Townsend, 1998). In universities, effective performance appraisal requires managers to have an understanding of research and teaching (Harkness & Schier, 2011). Such knowledges indicate the importance of the traditional roles and values of academics. Turning to appraisees, training allows them to understand their role in performance appraisal, the importance of identifying their needs and areas of improvement, and being open to feedback and learning opportunities.

A third suggestion for developing trust is seeing performance appraisal as a moral activity (Townsend, 1998) because it is not only based on power but also involves judgments that can have implications for an appraisee’s ongoing work and practice. The manager who appraises and makes judgments holds the power. Favoritism, secrecy, withholding of information, and personal biases and prejudices against the appraisee (Townsend, 1998) are examples of issues likely to impact negatively on the judgments made by the appraiser/manager regarding an appraisee’s performance. Developing a climate of trust where there is not only openness and transparency but also a focus on developing and nurturing staff growth is a step in the right direction for ensuring that appraisal is a moral activity.

## **Limitations of Performance-Based Pay**

While some academics see well-conducted performance appraisal as helpful to their work (Morris, 2011), it would seem there are limited merits of performance pay. The experience in the public service illustrates that it can entail subjective judgments,

there is often insufficient money, and it can demotivate people (Taylor, 2015). As much as it can be argued that performance pay is antithetical to the roles and values of public servants, it can be argued that it is inimical to the roles and values of academics, and the employment conditions needed to enable academics to fulfill their roles effectively. While drawing attention to the intrinsic motivation of serving the public good or of interest in a particular topic, the sole focus on pay or service, ignores the complexities of motivation in the public sector, including universities. Clearly some academics are motivated by higher pay, but many are interested in their chosen field, are loyal to that discipline or field, and desire recognition by their peers. As much as tenure in the public service facilitates advice that is expert and what ministers ought (rather than want) to hear, tenure enables academics to conduct research, engage in teaching, and speak out when policies and procedures are detrimental to the public good. That PRP does not appear widespread in Australian universities suggests that it might be some level of commitment to the traditional roles and values of academics that has prevented the extension of PRP. It can be argued, therefore, an inappropriate use of performance management has been moderated by an adherence to the traditional roles and values of academics.

---

## Conclusion and Reflections

We have considered performance management of academics in terms of the performance focus within managerialism and have drawn out implications for university managers. It might be suggested that should Australian universities continue to experience neoliberal/managerial reforms in terms of “even more external and internal measurement, surveillance and control” (Kenny, 2017, p. 367), there is a likelihood academic conditions will continue to deteriorate. If this current trend continues, higher education could become “a high threat working environment” (Kairuz et al., 2016, p. 889). Performance appraisal can assist academics undertake their roles more effectively. This finding, however, comes with a caveat. The micropolitical strategies university managers use can influence how academics experience performance appraisal. Some of the micropolitical strategies Field identifies appear aligned with the managerial framework. Other strategies entail managers making “the most of their roles as mediators” (Ryan & Armstrong, 2016, p. xvi) and using strategies, such as nurturing, that are more aligned with the traditional academic values. Managers might comply with the letter of managerial processes, but interpret or apply these processes in creative ways that buffer academics from elements of the performance focus that are detrimental to the ethos of universities as a public good. In this sense, the performance focus can be “moderated” by an “adherence to” (Kimber & Maddox, 2003, p. 61) what the traditional roles and values of academics.

Such moderation might be seen with performance pay. While some form of PRP exists in some Australian universities, the type of scheme described by Harkness and Schier does not appear widespread. It could be speculated that this limiting comes from both the values and roles of academics and understanding of practical difficulties such as those evident in the public service. Recognition of the roles of

academics, the complexities of public management, and the complex motivations that drive academics to undertake their roles are essential to successful management in universities. As several writers point out, it is not that performance management is without a place in public sector organizations, but rather the tools and micropolitical strategies used must accord with the functions and complexities of public universities, and the roles of academics and the values that motivate them. Without such recognition, it is likely any performance management scheme, and a performance focus more generally, will be counterproductive. This moderation might also be linked with what some recent research suggests as the emergence of a hybrid model of governance in some Australian universities. Here management accommodates some collegial values and academics who hold collegial values accommodate some managerial values (Parker, 2012).

## Abstract

The manner in which traditional public education is funded has long been a source of great diversity of discussion and a variety of approaches. In preparation for pushing education more toward the private sector, while still being funded by the state, many states have made significant cuts in traditional public education funding under the guise of moving away from the dependence on property taxes, which has long been an area of contention. As a number of governmental units assumed greater control of the reduced amount of funding available, it forced school districts to cut programs, services, and personnel to the bare bones. As if that were not enough to keep school boards and administrators busy, many federal or state challenges to traditional public school funding have become *en vogue*. Following a neo-liberal approach, a number

of states in the United States have decided that funding for education should follow an approach loosely known as “the money follows the child” or the “backpack full of cash” concept. The foundation for the neo-liberal approach to funding is built upon the idea that “the market will determine” what is best for everyone, even at the risk of de-funding institutions that depend on public taxation for survival. Known by many different labels, the commonality is that public money for education is being given to non-public educational institutions, with very few regulations on how that public money should be spent. Fed by the unwillingness of government sources to subject those who receive public funds to be accountable for those funds, inequities and discrimination have become commonplace.

**The Field of Memory**

For many years, according to Odden and Picus (2014), the major philosophy in the field of public school funding was based on the concept that those who owned property in the area of the schools should fund schools as a public good – an institution as it were. Based on the ideas of free public education espoused by the likes of Thomas Jefferson and later Horace Mann, the United States had embraced the concept that those who benefit from public education, i.e., the general public, should pay for a system of public schools, and students should be able to attend for free. This dependence on property taxes, which still exists in some areas of the country, has been litigated against in several significant lawsuits which argued that the funding for a child’s school should not be based on a zip code or locality and its ability to support a system of common schools. While it was true that there were differences in how this was organized in each state, most states allowed a similar funding approach to continue through the nineteenth and much of the twentieth century and only began to change as states added terms to their state constitutions “such as *general and uniform, thorough and efficient, basic, or adequate*” (Odden and Picus, 2014, p. 12). These terms started the development of the concepts that individual students might have greater needs if they were to achieve at a higher level of performance academically and to meet state-established academic standards.

**The Field of Presence**

As lawsuits against various states developed, often based on the specific words describing the provision of public education in state constitutions, states had to create approaches to funding that moved away from a robust dependence on property taxes to other forms of funding which utilized foundation or equalization approaches to balance revenue streams and attempt to meet the needs of all students. It was in the

1980s, however, that largely due to impact of *A Nation at Risk* (1983), another school of thought began to exercise considerable influence on the philosophical basis of school funding. No matter what one thinks about that report, its original *raison d'être*, or even the qualifications of those who wrote it, *A Nation at Risk*, popularized in writing for the first time that traditional public schools were, in fact, failing and that there was not likely to be a change in this failing institution. As the idea of failing schools was propagated, neo-liberal advocates of the free market and privatization philosophy seized the opportunity to strike out against teachers' unions as the major cause of the failure and promoted the idea of choice schools which would be free of teacher union influence. Depending on the state, and often in violation of an individual state's constitution, legislatures opened the door widely to a great variety of "choice options" that would offer education to students – paid for by the state and yet not subject to oversight, accountability, or even adherence to anti-discrimination statutes at both the state and federal levels.

### **The Field of Concomitance**

One of the most prominent ideas that has made the transition from business to public education is that of establishing standards, measuring all schools by those standards, applying tests that were purported to measure success on those standards, and penalizing any school or district that does not meet the standards. The impact of this approach on the field of school finance is the dramatic curtailing of state funding to traditional public schools because the tests demonstrated a pattern of failure. The natural outgrowth has been to support and encourage alternatives to traditional public schools by providing parental choice models that use the same income stream as that from which public schools were funded. Another idea that has risen to prominence is that of demonstrating that states are business-friendly by dramatically decreasing the percentages of property taxes imposed on businesses. It has become trendy to pronounce that more than half of nearly every state's budget is spent on education. The problem with this argument is multi-faceted: first, when stating that this amount is spent on education, legislators tend to ignore the fact that education, in their terms, is not just traditional public education but also includes all other "choice" alternatives. The second problem is one of volume. If an individual who makes \$50,000.00 per year states that they spend half of their income on housing, that amount is \$25,000.00. If, however, an individual who has an annual income of \$500,000.00 spends half of their income on housing, the housing expenditure is a much larger \$250,000.00. This argument of what percentage is spent on education will always be a matter of contention, when the issue at hand is actually related to the eagerness of the state to serve business by lowering taxes and cutting funding to schools. The final idea under consideration that has grown significantly in regard to school funding is that anything that can be done by a state-regulated entity can be done more efficiently by a free market or privatized approach. The biggest argument in opposition to the privatization or free market approach is that it does not require private entities to meet accountability standards in regard to the use of state funding, thereby creating a situation in which state and federal funds can be spent in any manner that private or choice schools deem fit.

## Discontinuities and Ruptures

There are several major issues in regard to school funding in the era of privatization that must be considered.

1. A major discontinuity that has begun to be exposed to the light of day is the hidden influence long exerted by organizations like the American Legislative Exchange Council (ALEC), long a cheerleader for the privatization of education. The State of Indiana is a poster child for ALEC and has received awards from them for being one of the most privatization friendly states in the United States. This chapter will reference a number of examples from the State of Indiana which apply to many other privatized states (Shaffer, Ellis, & Swensson, 2018). When the global pandemic of 2020–2021 literally took over the world stage, including that of education, ALEC quickly took advantage of the examples of e-Learning and virtual classrooms as further evidence that the traditional public school, fully funded by individual states, was a thing of the past. ALEC stated
  - (a) Citizens, legislators, and regulators should separate the concept of public education from the monopolistic delivery system and embrace twenty-first-century methods of connecting students with learning experiences.
  - (b) Legislators should improve or pass charter school laws, striking a balance between innovation, autonomy, and accountability.
  - (c) Legislators should create or expand the type(s) of school choice program that best suits their state: vouchers, tax credit scholarships, homeschooling, and education savings accounts. Legislators and regulatory agencies should be wary of attempts to re-regulate innovative and/or private educational options, which could expose them to the death of the thousand bureaucratic cuts and sacrifice the freedoms that allow them to succeed.
  - (d) Institutions of higher education should be transparent about what outcomes students can expect and how much money they will have to spend or borrow. (ALEC, 2021, *Key Points*).
2. Traditional public schools are held fiscally responsible in many ways. State Boards of Accounts provide strict oversight. School district budgets must be published and open to the public. Each state requires school boards that must approve expenditures in an open format meeting. Various federal grant funds must be administered in strict accordance to the regulations that guide those grants or suffer the loss of that grant funding. Choice schools are not subject to most of the aforementioned safeguards. Some private schools voluntarily exercise fiscal accountability; however, it is rarely regulated by the states in which they exist. Another major issue is that many state constitutions prohibit the use of state monies for religious organizations.
3. In some cases, like the case of *Meredith v Pence* (2013), technicalities were employed by the Indiana Supreme Court to allow for the use of state funds for religious purposes by stating that “Section 6 [of the Indiana Constitution] prohibits government expenditures that directly benefit any religious or theological institution. Ancillary indirect benefits to such institutions do not render improper those government expenditures that are otherwise permissible” (p. 16). The payment of state monies to private,

religious schools in this case was permitted because initially the payments were made directly to parents who then signed the payment over to the school, thus making such a payment an ancillary benefit to the school, not a direct one.

4. Another significant disruption is that many current voucher programs siphon off tax dollars from an already limited revenue stream for education. In areas wherein there are no income restrictions for families who will be receiving the voucher, vouchers will continue to go to families whose children have never attended a traditional public school. In this situation, state dollars will now be funding choice alternatives for people who were never receiving public school dollars.
5. Another reality that has become a significant discontinuity is that of virtual schools. Fairly early in the charter school market was the advent of virtual schools like K-12 and the Connections Academy in the United States. Questions arose quickly about which school or district was permitted to consider the students for the purpose of attendance and funding. This issue came to the forefront after the demise of the Electronic Classroom of Tomorrow, ECOT, the largest online charter school in the country (Ravitch, 2020). After collecting over one billion dollars over the 18 years of its existence, and having the lowest graduation rate of any high school, the school collapsed after an investigation by the *New York Times*. The State of Ohio attempted to retrieve nearly 60 million dollars from ECOT. ECOT declared bankruptcy and closed rather than repay the owed public funds. But virtual schools go significantly beyond the early participants. As the Pandemic of 2020–2021 made regular, full attendance at traditional public schools worldwide a near impossibility, schools everywhere were forced to go “virtual.” Tracking attendance, participation, teacher evaluations and pay, and enrollment became extremely difficult.
6. When traditional public schools were the only game in town, they had a virtual and near actual monopoly of sorts on where students went to school based almost entirely on where students resided. As privatization has surged across the United States, primarily in the form of charters and vouchers, another trend has emerged: the need for traditional public schools to advertise special programs, unique approaches, and the willingness to accept out-of-district students and even make special provisions to get them to school. The reason is pretty simple: to maintain student enrollment numbers.

### **Critical Assumptions**

Traditional public schools are institutions that exist for the public good; funding that is provided by any state must be for secular, non-religious purposes; monies provided by any state should be subject to oversight and accountability measures; an institution that receives public funding should be open and accessible to all; governments should have the education of children as one of the highest priorities and not give away that responsibility to for-profit and non-regulated organizations; unless states are willing to increase taxation expectations for businesses and individuals, they should not split the income stream for education between traditional public schools and schools that are neither public nor open to all students; the

adequate funding of a child's education must not be dependent on where that child lives; the provision of adequate funding for traditional public schools must be as free from economic downfalls as possible.

---

## Introduction

Public school finance is almost never anyone's favorite topic. It is the bane of superintendents, the dread of principals who have to do the reporting, the agony of school boards who are trying to stretch every single dime, the responsibility of state legislatures, and the love of a few people in each school district who are either the Chief Financial Officer or the Director of Finance. For students going through a public school administrative licensing program, it is often the class reserved for last out of dread and a grand sense of ennui. Some students, however, find within the pages of classics like Odden and Picus (2014) *School Finance: A Policy Perspective* a philosophy and approach that can guide their professional practice as they become administrators.

In this chapter, however, the reader *will not* find a primer on public school finance. What the reader *will* find is how public school finance is different due to the current world of education, a world in which traditional public schools, wherever they exist, are not the only game in town. Instead, not only in the United States but also in various countries around the world, privatization and choice have not crept quietly into the arena, but have instead come in like a lion, heavily bankrolled by private interests and deep pockets. Again, the State of Indiana is a great case study (Shaffer, Ellis, & Swensson, 2018). It is simple to find the foundations of what has come to be known as school choice, and this chapter will examine that genesis briefly. But beyond the foundation, the chapter will examine the impact of the neo-liberal philosophy that has created the current world of traditional public school finance as it is impacted by privatization and school choice.

The chapter will provide more detail on the issues of how privatization and choice divide the revenue stream that most states have for the education of all children, what some states have chosen to do to bypass what have been known as Blaine Amendments which restrict the use of public funds for religious organizations, and how choice programs impact all traditional public schools even for those districts that do not have choice schools within their boundaries. Further, the chapter will examine the need for strict oversight by the states which have elected to permit the use of public funds for choice schools, the impact of virtual or e-Learning on traditional public schools, and how an organization known as the American Legislative Exchange Council has written policies for states to use to get around constitutional and legislative issues.

---

## Foundations of Choice and Privatization

Until fairly recently, most traditional public school educators were unaware of an organization known as the American Legislative Exchange Council. Their philosophies and influence peddling have had widespread impact on governmental issues in

general, but particularly traditional public education. William Cronon (as cited in MacLean, 2017), a historian at the University of Wisconsin, detailed the impact that ALEC exerted by creating model laws that states could pass, in some cases, almost verbatim. “Alongside laws to devastate labor unions were others that would rewrite tax codes, undo environmental protections, privatize many public resources, and require police to take action against undocumented immigrants” (Maclean, 2017, p. xix). One of the public resources that ALEC began to target then and has consistently targeted since that time has been that of traditional public schools for the very reasons quoted above, nearly all of which fit the ALEC agenda for opposition: public schools are represented by teachers’ unions. Public schools collect taxes and the revenue from those taxes is often the largest single area of public expenditure. Public schools serve undocumented as well as documented students, and public schools are in fact most often forbidden by law from knowing or seeking to know the status of undocumented students. Thus, while there are a host of reasons why groups and individuals favor and promote privatization, ALEC appears to be the lead among them.

Many have suggested that Milton Friedman is the father of the current privatization approach to education when in reality, his ideas came nearly at the same time as James McGill Buchanan, an economist from the University of Virginia, who had spent a great deal more time and effort into fleshing out a path toward privatization in specifically the areas mentioned by ALEC in both their early and current literature (MacLean, 2017). In addition to Buchanan, Friedman relied very heavily on the writings of F.A. Hayek (2011) who was actually much more persuasive and articulate regarding neo-liberal goals than Friedman himself. The American Legislative Exchange Council depends heavily even today on the writings and philosophies of Hayek, Buchanan, and Friedman.

---

## **Impact of Privatization on Traditional Public School Finance**

### **Lack of Regard for State Constitutions and Blaine Amendments**

Shaffer, Ellis, and Swensson (2018) relate that 37 states have Blaine Amendments to their state constitutions which are supposed to stop the state government from providing funds to religious organizations. The State of Indiana is a great example of the work, directed in the background by ALEC, of state legislatures to completely ignore the wording and the spirit of the amendment. In the Indiana Constitution, Article I Section 6, it states, “No money shall be drawn from the treasury for the benefit of any religious or theological institution” (Indiana Constitution, 1851). In *Meredith v Pence* (2013), the Indiana Supreme Court got around the Blaine Amendment by making the determination that the state was not really providing a tangible benefit to the religious schools because the benefit was to the student (and parents) in the form of a voucher check, which then would be delivered to the school by the parent and applied to tuition costs. What is most interesting about this is that now, 8 years later, the checks are no longer in the mail to parents, but are made as direct

payments to schools. In short, the State of Indiana is making direct payments to religious organizations that have schools, and that money is actually drawn from the state treasury.

The Choice Scholarship award is designated by the parent/guardian to be paid directly to the participating Choice school on the student's behalf. At the time of application, the Choice school will download and print a Choice Scholarship Endorsement Form. The Endorsement Form must be signed and dated by the parent/guardian. Without the completed Endorsement Form, the State will not make a payment for that student (IDOE, 2021a, p. 8).

Note that the words employed by the Indiana Department of Education are that the parents designate to which school the money goes, and it is paid *directly to the school*, which appears at the least to be a violation of the ruling of *Meredith v Pence*. Politically speaking, since the political party that wants vouchers to exist has a supermajority in Indiana, they can do as they wish, in this case fully supported by a state supreme court that is fully appointed by the same party. That issue notwithstanding, the real question, which has remained unanswered in many states that subsidize schools that are religious or attached to religious organizations is

If religious schools are going to be the dominant form of private education to receive the benefits of public funding, this raises serious issues about whether in a secularized state we intend to directly subsidize religious training. For there is little doubt that religious schools provide a substantial amount of religious education. (Carnoy, 2000, pp. 16–17)

## Laws which Contain Little or no Accountability in Fund Usage

Anyone who has ever been involved in the business office of a traditional public school knows that the level of accountability that exists for the use of various kinds of federal and state funds is extremely high. Funds from the Department of Agriculture for the federal breakfast and lunch programs must be followed very closely. Title funds (to include Title I, Title II, and all of the others) have significantly stringent rules that must be followed or funds will be discontinued. Funds from the state cannot just be spent without board approval, they have to be planned through the budgeting process, approved by a school board (comprised of elected public officials responsible to the public), appropriated through a structured approach, tracked through the use of purchase orders, and expended according to very minute detail. That is in traditional public schools.

The use of funds provided to voucher schools is by design much simpler. For example, in the use of special education services for students and the accompanying funds,

The only restriction is that the parent can choose to have them provided by the private school only if the private school offers those services. However, there are no minimum qualifications or oversight regarding the private school's ability to provide the necessary services. The option for parents of students with a disability requiring special education services to

have a private school provide those services differs significantly from other voucher programs in our report which either administer separate special education voucher programs (e.g., Ohio) or require the given private school to show evidence of their ability to provide the needed services (e.g., Louisiana). In Indiana, the private school makes the decision regarding whether or not it can provide the needed services. (Moon & Stewart, 2016, p. 8)

If there are no restrictions or oversight on how services are provided, then it follows by necessity that there is no oversight of the funds involved. What is true for special education funds is also true for the rest of the funds provided by the state to private schools which receive vouchers. Moon and Stewart (2016) found that “There are no provisions in the Indiana Code addressing fiscal accountability or audits for the program, though there are some provisions involving minimum requirements for private school participation that could be interpreted as being related to fiscal matters”(p. 8.). So, one could ask, “if there are no direct fiscal accountability requirements, what ARE the provisions that ‘could be interpreted as being related to fiscal matters’?” The answer is staggering. Schools must be accredited. Period. What needs to be understood for those who do not reside in Indiana, most voucher-receiving schools utilize the wholly legal but practically useless “freeway accreditation” approach. According to the Indiana Department of Education, the only requirements for schools that are freeway accredited is that they must show a “steady pattern of increases in performance” (p. 1) in attendance, graduation rate, state assessment performance, and a handful of statutes, none of which mention anything remotely related to finances. No mention whatsoever is included about financial accountability.

### **Promise of Savings but Escalating Costs Instead**

One of the oft-repeated threads of propaganda in regard to the privatization of schools is that the private sector can do the education process much more cheaply than can a state or federal agency. The facts, however, do not support this promise. Shaffer, Ellis, and Swensson (2018) found that “A Friedman Foundation commissioned report prior to Indiana’s passage of its tax credit voucher program promised *savings* of \$17.6 million for the state by year five of the program” (p. 9). What happened instead should be a cautionary tale to any state considering a voucher program. In the school years 2011–2012 to 2019–2020, which were the first 9 years of the program (which still continues today), the State of Indiana *spent* just over one BILLION dollars on the voucher program that was promised to save the state money in its first 5 years. Whether it was anticipated or unanticipated, of the more than 36 thousand students enrolled in the voucher program by 2019–2020, 60.7% had never attended a public school (IDOE, 2021b, p. 17). Herein lies the problem. Prior to the advent of the voucher program, these students attended private schools at expense of their families. As if that were not enough, the 2021 legislature of Indiana announced in its legislative agenda the intent to remove income limits on vouchers, which will most certainly INCREASE the cost of the program.

## Removal of Visible Dependence on Property Taxes

According to Brimley, Verstegen, and Knoepfel (2020), property taxes have been the go-to funding source for municipal entities for many years. However, because of the increase of property taxes, especially in urban areas, many states have worked to remove property taxes from the main flow of revenue for school districts, at least to a point. While the impact initially has been presented positively, what has occurred in Indiana, for example, has created the same old problem that had existed before the change – a child’s zip code determines the ability of the area or municipality to adequately fund schools. The reason Indiana is such a cogent example is that taxpayers were told that moving the General Fund to being under state control in 2008 would equalize the funding and provide an adequate education for students. However, tax rate limits, circuit breakers, and homestead exemptions significantly cut into revenue generated by the new approach to taxation. As a result, the state continued its pattern of cutting school budgets year after year. After changes in how funding was allocated in 2019, the only revenues controlled by property taxes were the transportation fund, debt service fund, and the capital projects fund. These were largely incorporated into what was called “The Operations Fund.” But, as schools began to feel the combined impact of the tax rate limits, circuit breakers, and homestead exemptions, the ability to do much needed things, to include teacher salary increases, was severely curtailed. Many school districts were forced to conduct referendums (special elections to generate revenue outside tax rate and circuit breaker limits) for operating expenses. Suburban districts in which there was strong support for traditional public schools had little difficulty passing referenda for operating expenses. Rural school districts were a different story. Populated largely by farmers, who paid a higher rate of property taxes, many rural districts were unable to pass referenda for operating expenses, leaving the districts with few options left to generate much-needed funds. So, while it appears on the surface that moving away from a total dependence on property taxes is a good thing, in reality, it often comes right back to a revenue system in which property taxes once again come into play even though it is through the referendum approach (Chu, 2019).

## Volatile Revenue Stream

As mentioned above, many states came under fire to decrease the dependence on property taxes because of the inherent inequality generated by the area in which one lived. Knoepfel, Pitts, and Lindle (2013) described what happened when, following the 30-year trend seen in other states, South Carolina cut off the dependence on property taxes as revenue for schools and added instead a one-cent sales tax. Act 388 changed the focus from property taxes to “ad valorem taxes, revenue transfers from the state in lieu of taxes, and revenues from fees. Localities were given the legislative authority to determine fees as necessary” (p. 12). What happened as a result of Act 388 is that homeowners of the very expensive

properties in Charleston benefitted greatly, much as homeowners of the expensive properties in Indianapolis did with the property tax changes in Indiana in 2008. So, what was the impact of Act 388?

The biggest losers were public schools and students along with the local municipalities whose abilities to raise revenues was curtailed by Act 388. More alarming was the total disregard for the impact that the removal of revenues would have on the system of public education in the state. Indeed, the proponents of the Act did not even consider the systemic ramifications of the removal of the most stable source of revenue for public education. (Knoepfel et al., 2013, p. 19)

Act 388 in South Carolina is a very similar approach to what many states have enacted in an attempt to lessen dependence on property taxes. The biggest problem with the approach is that by attaching the big area of expenditure (education) to a very volatile revenue stream, they have set themselves up for major problems in the event of a significant economic downturn like that experienced by the entire country in 2008. “The responses from the politically elites in this study revealed that the enactment of the law was not merely shortsighted economically, but also in terms of taxpayer equity” (Knoepfel et al., p. 18).

### **Split Revenue Stream and Cuts to Traditional Public Education**

The issue is really a pretty simple one: politics has been defined as competition for scarce resources. When all tax-receiving entities in a state depend on the very same revenue stream, if one entity receives more, and that causes a shortfall for the others, there are really only two choices: cut the funding either across the board or to the entity receiving more funds or increase the incoming revenue by increasing or diversifying taxes. A conversation with a retired traditional public school superintendent revealed an interesting perspective. He discussed the fact that in Indiana (where he had been a superintendent for many years), the expenditure for education was more than 50% of the state budget (Caddell, personal communication, Nov. 2020). As the discussion continued, however, he acknowledged that it was also true that “education” included not only P-12 traditional public schools but also higher education, charter schools, and voucher schools – all taking from the same pot of money. When Indiana started its Choice Scholarship Program in 2011, there were no additional revenue streams created to provide funding, as the original promise was that the voucher program would be saving the state money within five years. Now, in the tenth year of the voucher program in Indiana, the State of Indiana has spent over \$1.1 billion on a program that was promised to save money. This split in the revenue stream has caused continuing cuts to traditional public schools all across the state, causing most to operate on an austere budget, relying on either significant cuts to the budget or the need to secure additional funding through referenda. Perhaps the focus should move from being able to say that a state spends “more than 50% of its revenue on education” to increasing the size of the pot itself. This was mentioned briefly earlier in the chapter. When the discussion about education spending arises, one must look at the total

revenue from the designated tax sources. In the years from 2002 to 2004, a significant number of businesses for one reason or another had decided to leave the state of Indiana, causing many localities and municipalities to increase property taxes to attempt to make up the lost revenue. The push for tax reform was driven by the desire of the state under then Gov. Mitch Daniels, when he became governor in 2005, to make sure Indiana appeared more business-friendly (Chu, 2019). One way the governor and legislature decided to do this was to create a totally different take on taxes, which would result in the reduction of taxes not only to wealthier homeowners but also to businesses. To make the situation even worse, the recession of 2008–2009 cut deeply into state revenues. School districts and other municipal entities that depended on tax revenue were hurting, but they could not afford to have their budgets cut even further, so they cut essential services and had to depend more on outside grants to fund new programs. It is always good to remember when talking about the percentage of any given state's budget being spent on education, or that education spending is increasing, that many times the increases that occur are often given to other privatized recipients such as charter and voucher schools and never end up in the coffers of traditional public education districts. "More generally, privatization siphons tax dollars away from traditional public education under the guise of greater efficiency while it shortchanges families. . ." (Swensson, Ellis, & Shaffer, 2019, p. 65).

### **Virtual School Programs which Are Nearly Completely Unregulated**

While the concept of virtual schools is not a new one, it is still largely the "Wild West" when it comes to regulation and oversight. One only has to look at the supporters of virtual schools to begin to question the effectiveness of these endeavors. One of the biggest backers of virtual school is none other than the American Legislative Exchange Council (ALEC) which has been both verbally and legislatively supportive of schools like the national chain Connections Academy. Wording provided to states by ALEC for legislative action declared that virtual schools be "recognized as public schools, treated equitably, and allocated the same resources as other 'public schools'" (Ravitch, 2014, p. 185). Although the Pandemic of 2020–2021 has by necessity created virtual learning or e-Learning situations to the extent never seen before in the United States, prior to the Pandemic, there were numerous examples of the mismanagement of virtual schools and the lack of ability of local school districts or even State Departments of Education to provide more structure to virtual schools. In January 2018, the Electronic Classroom of Tomorrow (ECOT), which for 18 years had been receiving enormous amounts of funding from the State of Ohio, fell apart, and when it did, it left the state holding the bag on \$80 million that ECOT owed back to the state. One could ask how it happened, and the answer is simple: "the Ohio Department of Education failed to audit ECOT's records to force the company to be honest. . ." (The Blade, 2021, paragraph 7). The problem with virtual schools has not been limited to lack of state oversight, however. In the Dalesville Community School District in Indiana, the State Board of Accounts found that the district had failed to verify enrollment counts it had been given by two virtual schools that the district oversaw.

Daleville's lack of meaningful oversight and monitoring may have contributed to ineligible students being included in enrollment data that allowed the two schools to report inflated student counts to the state, according to the report. This allowed the schools to receive \$68.7 million from inflated enrollment and make improper payments of those public funds to multiple companies linked to school officials and their family members. (Indiana Public Media, 2020, paragraph 8)

As noted earlier, nearly all traditional public schools have had to experience the use of virtual learning or e-Learning due to the Pandemic of 2020–2021. While the results are still to be determined about the efficacy of virtual instruction during the Pandemic, even solid, traditional public school districts have dipped into the water of virtual instruction and opened their “classroom doors” virtually to students outside the district. It may take years to determine the gain or losses students made during the Pandemic when it was often true that it was virtual or nothing.

### **Acceptance of Federal and State Funds While Actively Discriminating**

For many people, this is a sticky subject. Should privatized schools, in most cases religious private schools, have the right to accept the students they want to accept with no restriction? All one has to do is to look at the storied and shameful history of private schools in the United States to clear up a great deal of the issues that appear to be important. A very brief history lesson tells the story. In 1954, a historic US Supreme Court decision in *Brown v Board of Education* overturned an earlier US Supreme Court decision *Plessy v. Ferguson* by stating unequivocally that separate facilities, all public facilities, were not equal. For public schools, this meant that all public schools should be fully integrated, NOT segregated. In a shameful part of the history of the United States, in response to the *Brown* decision, all across the south, private schools started up quickly, for the very simple reason that there were a number of White families that did not want their children to be in school with students of color (Shaffer & Dincher, 2020). These private schools went by two distinct, descriptive names – *Segregationist Academies* and *Freedom of Choice Schools*. Nevin and Bills (1976) tell the story so well in their book, *The Schools That Fear Built: Segregationist Academies in the South*. Nevin and Bills stated:

The early segregationist academies were usually secular schools that sprang up on a county-wide basis in rural areas, standing ready to serve any and all white children who applied. The more recent schools and those appearing in the larger cities are almost entirely “Christian” schools, sponsored by an evangelical Protestant church and heavily influenced by the fundamental theology which the more conservative evangelical churches follow. (p. 2)

Just in case the reader is asking the question, “Why does this matter when we are talking about school finance in the age of privatization?” The answer to this question is best illustrated by reviewing admissions practices in voucher schools in the State of Indiana. Shaffer and Dincher (2020) found that while the segregationist practices seen in private schools in the 1960s and 1970s were more visible and out in the open, private schools in Indiana, 99.6% of which were religious in the 2019–2020 school

year, are actively practicing discriminatory admissions and not just in the area of race. While no study has proved this fact as of the writing of this chapter, a simple handbook review of a number of private, religious, voucher schools in IN shows that there is an active pattern of discrimination also against students and staff who are LGBTQ+, students who are English Learners (EL), and students who should or do receive special education services.

These private schools, which operate under the full support and encouragement of the Indiana Legislature and the Indiana Department of Education, practice active discrimination so that they can offer parents “choice.” The legislation that prescribes how the voucher program was started and continues to function was written by none other than the American Legislative Exchange Council (ALEC) and in many cases the Indiana legislation comes with wording nearly identical to ALEC’s proposed legislation. Make no mistake, these are schools for White students, created by legislation and “religious organizations” so that White students do not have to attend school with students who are “different.” In case this message is not clear, the issues should be. While actively practicing discrimination on many levels, Choice Scholarship Schools (voucher schools) in Indiana receive the maximum amount of funding provided by the State of Indiana and also receive many Federal grants which amount to a large amount of money – and there is no censure from the Indiana Department of Education or the Legislature. This is, and should be, an alarming fact. Federal grants like Titles I, II, and III, monies go to private voucher schools which practice and teach a significant amount of religious instruction and practice discrimination. Special Education money flows into these schools in large amounts, and there is almost no oversight on how the money is spent. Most Federal grants have required “set asides” for students from traditional public school districts that go to voucher schools within their boundaries, and unless that particular public school district exercises great due diligence, voucher schools are allowed to spend those Federal monies with no restriction. The issue of segregationist practices at all levels should be one of the greatest concerns in regard to school funding and privatization.

## **Privatization Within Traditional School Districts**

Colleges and universities have done it for years. Businesses of every size and description do it. The question which may take some time to answer is pretty simple: Is the internal privatization of things like transportation, custodial services, and food services the way to go to save precious and hotly contested school dollars? While this is a burgeoning area for many traditional public schools, it has been done quite successfully in some school districts, especially larger ones. Another question that begs to be answered is whether the cost savings achieved by privatizing within a school actually save enough money to be worth the time and investment it takes to make the switch from district staffed and run to a situation in which these areas are run by private companies. Sometimes economies of scale are involved. A district with one campus K-12 and 800 students will not likely see the same level of savings that a district with 75 buildings and 32,000 students.

## Conclusions and Reflections

The question of privatization is no longer just a philosophical conversation in back rooms sponsored by neo-liberal organizations like the American Legislative Exchange Council. Privatization is knocking at the door and in many cases will keep knocking until given an answer. One of the questions that must be addressed in this process is how to keep traditional public education – which has the track record, the organization, the support structure, and the students to be viable – public. Public education is a function of the states in the United States, and in spite of many wishful dialogues and diatribes to the contrary, traditional public schools are getting the job done of educating mass numbers of students and doing it better than anyone else. As Diane Ravitch, our great national treasure and education historian stated it,

The free market works well in producing goods and services, but it produces extreme inequality, and it has a high rate of failure. That is not the way we want our schools to work. The core principle of American public education is supposed to be the equality of educational opportunity, not a race to the top or a free market with winners and losers. (Ravitch, 2014, p. 304)

The current most pressing issue is that while privatized schools have always existed, it is now *en vogue* all across the United States and in many other countries to provide to these schools a level of fiscal support heretofore not considered possible.

This chapter has just tapped into the questions of school finance in a time of privatization. Even with all of the detractors which should be enough in an awakening society to force a change in the legislation which encourages and mandates the fiscal and governmental support from State and Federal sources, these schools and practices are flourishing. In order for this to happen, the states must take money from traditional public schools, which are open to all students and prepared to educate all students, and give those monies to unregulated, discriminatory schools which have very few expectations or regulations about how that money is spent.

## Abstract

The purpose of this chapter is to examine the extant literature on emotions in providing a framework for deepening understanding regarding the role emotions play when leading schools in the twenty-first century. The chapter begins with an overlook of contemporary issues facing society at a macrolevel and the possible influence of these social justice-oriented issues on the school communities k-12 leaders serve. In conclusion, the author provides a conceptual model to move school culture from one of emotional silence to authentic emotional engagement.

**The Field of Memory**

The field of psychology has witnessed three major thoughts. As early as the Greeks, scholars questioned whether or not psychology should be considered a science. In the early seventeenth century, philosophers introduced the first concept suggesting a connection between the mind and body as a means to understand the human experience. Sigmund Freud's clinical work led him to believe that early childhood experiences and unconscious impulses influenced adult development, behaviors, and personality. In the early twentieth century, the second force came to light. Behaviorism dominated the field and rejected the influence of the unconscious or conscious mind. And finally, the third school of thought emerged in the second half of the twentieth century, humanistic psychology, which emphasizes the influence of conscious experiences. In the 1950s–1960s, psychology took hold of a movement known as the cognitive revolution. There was an interest in studying the human brain to better understand people's behaviors.

**The Field of Presence**

The study of human emotions began with exploring basic neurological processes. The psychology field transformed from philosophical traditions dating back to the Greeks and Romans to contemporary explorations centered on the science of the mind. Over time, the study of emotions focused on the experience of emotions to understanding how emotions influence lived experiences, beliefs, and decision-making. Today, which emotions people experience, how they experience emotions, and how emotions influence people depending on context play an important role in understanding the role of emotions in leading schools. This examination led to the development of emotional intelligence (EI) and social intelligence (SI).

**The Field of Concomitance**
