Emotions emerge from more than basic processes and may be constituted by neurobiological processes when understanding how emotions arise. In 1890, William James and, again in 1897, Wilhelm Wundt transformed psychology into a science of the mind. The focus shifted to the science of behavior as a scientific view regarding the experience of emotion with John B. Watson in 1919 and Skinner in 1953. Studying emotions emerged again in the 1980s and 2000s with a focus on the experience of emotions with researchers such as Lisa Feldman Barrett (2006) and Nico Frijda (1986). Understanding the causes and experiences of emotions is an important aspect of reality; however, deepening ways of knowing of what people experience when facing emotions (i.e., what is felt) also plays a significant role in the science of emotion (see Barrett, 2006). Which emotions people experience, how they experience emotions, and how conceptual knowledge about emotions influences

socially situated actions are at the core of emotional intelligence (see Barrett & Gross, 2001). Therefore, the notion of school leaders' emotional labor when navigating their emotions plays a significant role in managing and regulating emotions.

### **Discontinuities and Ruptures**

In the 1980s and 1990s, researchers suggested gender distinctions exist with emotions. The social construction of what it means to be a woman encourages women to place a high value on interpersonal relations, connectedness, continuity, collaboration, and integration. These values play an important role in a school leader's social interactions within the school community. The classical feminine role of caring, nurturing, presence, and responsiveness was examined. Researchers explored school leaders' feelings of caring and examined associated moral and ethical issues.

### **Critical Assumptions**

Work by Arlie Hochschild, Jill Gilligan, Charol Shakeshaft, Nel Noddings, Jill Blackmore, and others suggest distinctions in emotions and gender. Arlie Hochschild (1983) introduced the notion of emotional labor. She suggested emotional labor is required when working and emphasizes feeling one thing but expecting to feel something else. School leaders tap engage in emotional labor when they are asked to abandon their professional collaboration and embrace new expectations, behaviors, practices, or policies. Jill Gilligan (1982) views women's sense of morality as being social constructed, contending women place a high value on integration, connectedness, and continuity. In 1987, Charol Shakeshaft contended women school leaders' understanding of power and control was related to gender identification and considered gender as highly relevant to school leadership and emotions. Leadership codes, which suggest cognitive and emotional dissonance, may emerge, and women may be encouraged to undergo extensive changes to reshaping oneself. Nel Noddings (1984) introduced the role of caring as central to people's lives and work with the feminine role of nurturing, caring, responsiveness, and relatedness as the heart of women's work. In 1996, Jill Blackmore argues the emotional labor involved in teaching and leading is relational and contextual.

Arlie Russell Hochschild's 1983 interactional model of emotion provides insight to what school leaders experience regarding the emotional management of self and others. In 1997, David Loader paved the way for leaders and understanding the emotional realities of school leadership with the "Inner Principal." The conceptual model affords school leaders to contribute their voices and experiences and reveals a myriad of emotional intricacies they experience in their profession. Norman Denzin's "Emotional Understanding" (1984) provides insights regarding the human experience of emotions such as love, hate, anger, joy, pain, and despair and the role emotion plays in developing ways of understanding personal and social interactions. Brenda Beaty (2000) reminds us that understanding the emotional experiences of school leaders may potentially provide ways to examine how they navigate their emotions and how emotions influence decision-making.

## Introduction

*I am angry.*  
*I am enraged.*  
*My patience grows thin.*  
*I am heart broken.*  
*At times, hallow.*  
*The needless killing of Black and Brown people.*  
*A whirlwind of emotions.*  
*A disdain for Black and Brown lives.*  
*How do I prepare school leaders to address these injustices?*  
*To empower our school communities?*  
 -Christa Boske

How are school leaders understanding the influence of stressors on national issues, such as reading about a Black man shot in Kenosha, Wisconsin (see Peiser & Berma, 2020); another Black man killed in Louisiana in one weekend (The Guardian, 2020); the murder of George Floyd (New York Times, 2020); and the grand jury's decision regarding the death of Breonna Taylor in Kentucky (Williams, 2020)? How are principals and superintendents addressing the impact of these national issues on local issues, such as a football player allegedly using racial slurs against teammates (see WKYC Staff, 2020); the promotion of anti-racial curriculum (see Young & McMahon, 2020); racial issues across the country and influence on children in schools (see Pierre, 2020); a high school student running on the field with a thin blue-line flag creating racial controversy (see Kennedy, 2020); or students in Baltimore promoting justice as a movement versus a moment (see Lumpkin, 2020). A former school leader of 18 years and a professor preparing school leaders to empower school community members, especially those who live on the margins, journaled the poem above. People who engage in social justice work often inspire and motivate others by utilizing emotion in stories, which contribute to their understanding of social justice work (see Steinke & Belair-Gagnon, 2020). Those who lead k-12 schools, especially those who promote justice-oriented work, experience a wide-range of emotions. Engaging in this significant work with children and families and leading school communities can be exhausting. After learning about the most recent police brutality in Wisconsin, Louisiana, and Kentucky, to what extent are school leaders exploring the power of Black Lives Matter Movement and emotions aligned with addressing historical discrimination in schools? Black lives matter every minute, every hour, and every day. And in preparing school leaders to address historical inequities across the United States, how do preparation programs support school leaders in learning how to navigate their emotions when facing a myriad of injustices impacting the lives of children and families?

If we look at the data available on intellectual, spiritual, cognitive, and philosophical views on leadership, the power of emotions is evident. And when we think about emotions shaping understanding, we can imagine the power emotions play when we consider the myriad of challenges facing the United States and those who lead k-12 schools. Facing the daily challenges of leading school communities encourages school leaders to look within and reflect on the power of their emotional responses, personal accomplishments, and capacity to believe in oneself, which can

fade or grow. At the heart of this work is the understanding of emotions, whether positive or negative; leaders who report increased levels of emotional exhaustion also report more anger, frustration, or anxiety, often experiencing burnout or leaving the profession versus school leaders who experience more positive emotions, such as joy or hope (see Brackett, Floman, & Bradley, 2018). When considering the myriad of societal conflicts facing the United States, how are educational leaders navigating their emotions as they lead schools? What is the emotional impact of the COVID-19 pandemic, systemic racism, voter suppression, police brutality, homelessness, and the continued marginalization of underserved populations on their capacity to lead school communities in culturally responsive ways?

Human emotions play a significant role throughout social phenomena. People may know what emotions are and understand the importance they play in their experiences and understanding of the world. As human beings, we experience life emotionally. We feel emotions and respond to those emotions. The essential nature of emotions was discussed by Edward Lawler (1999) as well as challenges in defining what emotions, which was examined by George Marcus (2000). The complexity of emotion, which characterizes human life, is often reflected in a myriad of emotions. Norman Denzin (1983) defines emotions as “a lived, believed-in, situated, temporally embodied experience that radiate through a person’s stream of consciousness, is felt in and runs through his body, and, in the process of being lived, plunges the person and his associates into a wholly new and transformed reality- the reality of a world that is being constituted by the emotional experience” (p. 267). Seymour Epstein (1967) examined emotions. He suggested emotions were complex and organized responses that offered specific feelings or affect as well as a patten or expressive reactions. Furthermore, Edward Lawler (1999) contends emotions as brief, negative or positive evaluative states, in which people experience cognitive, neurological, and physiological elements. School leaders, however, often lack the support, guidance, skills, and resources essential to developing their own emotional and social competencies (see Beisser, Peters, & Thacker, 2014; Gallup, 2017).

The purpose of this chapter is to examine the extant literature on emotions in providing a framework for deepening understanding regarding the role emotions may play when leading schools in the twenty-first century. The chapter begins with an overlook of contemporary issues facing society at a macrolevel and the possible influence of these social justice-oriented issues on the school communities k-12 leaders serve. I conclude the chapter with a conceptual model to move school culture from one of emotional silence to authentic emotional engagement.

## **COVID-19 Pandemic**

The COVID-19 pandemic represents a major challenge around the world that, perhaps, has not been seen since the Spanish flu in 1918. The virus continues to disproportionately claim the lives of the poor and Black and Brown people, who have been hit the hardest (see Finch & Hernandez Finch, 2020). Schools across the country are reopening and, in many cases, engaging in virtual learning.

The 2019–2020 and 2020–2021 school years ended and started in chaos as some parts of the country opened despite spikes in the infection. School leaders are in a position in which the virus may infect their children, teachers, staff, and communities at large, triggering quarantines, delaying school openings, and creating temporary school shutdowns when school community members test positive for the deadly virus. Furthermore, according to the 2018 US Census Bureau, 27.5 million people and 4.3 million children did not have any health insurance in 2018, which, for children, was an increase of 425,000 from the previous year.

## **Systemic Racism**

Systemic racism runs deep. After more than 60 years after Jim Crow laws were repealed, the Supreme Court's ruling in *Brown v. the Board of Education* in 1954 attempted to do away with the doctrine of separate but equal. However, US school systems remain racially segregated and chronically underfunded, and, in many instances, even suggest segregation has worsened, and are anything but equal (Bell, 2004; Garcia, 2018, 2020). This disturbing trend, wherein Black and Brown children are funneled out of public schools and into the juvenile and criminal justice system, is called the school-to-prison pipeline. School leaders are responsible for addressing these inequities facing these children with many of them identified as having learning differences, living in poverty, and victims of abuse and/or neglect. And instead, these children are often isolated, disciplined at higher rates with more severe punitive consequences, and pushed out of the educational system.

## **Voter Suppression**

When the US voting system is working, people have the opportunity to express their views at the polls. This is a fundamental right for US citizens in order to promote policies that uphold human rights. However, when the system is broken, repressive voter ID laws, racial gerrymandering, the elimination of polling places, removing mailboxes, and precinct closures disturb the system and disproportionately target impoverished, urban, Brown and Black communities (see Litvinov & Means, 2020). These, and other voter suppression practices (e.g., the elimination of early voting or absentee ballots and requiring specific student IDs to vote), promote injustice and systemic racism. The United States desperately needs a citizen movement to address attacks on the nation's democracy that ensures every voice is protected, welcomed, and heard.

## **Police Brutality**

Sadly, the trend of fatal police shootings and police brutality in the United States seems to be increasing (see Statista, 2020). In recent years, fatal shootings include, but are not limited to, Michael Brown, George Floyd, Breonna Taylor, Atatiana Jefferson, Aura

Rosser, Stephon Clark, Botham Jean, Philando Castile, Alton Sterling, Michelle Cusseaux, Freddie Gray, Janisha Fonville, Eric Garner, Akai Gurley, Gabriella Nevarez, Tamir Rice, Michael Brown, and Tanisha Anderson.

## Homelessness

The pandemic has exposed the depth and disparities within school communities and across the United States. As economic disruptions continue to spike due to loss of employment and the closing of businesses, the virus also triggers a spike in housing stability. Stay-at-home orders from governors and mayors influenced millions of Americans, and for those who were homeless, they had nowhere to go. The plight of those who lived on the streets, living paycheck to paycheck, and loss of wages/employment created long lines at food pantries across the country. Some populations are more likely to experience homelessness in comparison with other groups: American Indians, Black Americans, multiracial Americans, Latinxs, and Pacific Islanders are more likely to be homeless than the national average or White Americans (see National Alliance to End Homelessness, 2020). And according to the School Nutrition Association (2020), nearly 100,000 US k-12 schools serve 29.6 million students every day, including 20.1 million free lunches, which is correlated with households living in poverty.

## Studying Emotions

Emotions emerge from more than basic processes and may be constituted by neurobiological processes when understanding how emotions arise. In 1890, William James and, again in 1897, Wilhelm Wundt transformed psychology into a science of the mind. The focus shifted to the science of behavior as a scientific view regarding the experience of emotion with John B. Watson in 1919 and Skinner in 1953. Studying emotions emerged again in the 1980s and 2000s with a focus on the experience of emotions with researchers such as Lisa Feldman Barrett (2006) and Nico Frijda (1986). Understanding the causes and experiences of emotions is an important aspect of reality; however, deepening ways of knowing of what people experience when facing emotions (i.e., what is felt) also plays a significant role in the science of emotion (see Barrett, 2006). Which emotions people experience, how they experience emotions, and how conceptual knowledge about emotions influences socially situated actions are at the core of emotional intelligence (see Barrett & Gross, 2001).

---

## Emotions and School Leaders

Most school leadership preparation programs do not provide candidates with opportunities or skills to support their efforts to regulate their emotions effectively in schools. However, leaders who have the capacity to accurately identify their

emotions and the emotions of others often exhibit skills to transform school communities (Berkovich & Eyal, 2018). Leading schools has its highs and lows, successes and failures, and a myriad of emotions that accompany these experiences including, but not limited to, courage, anger, sadness, rage, frustration, and disappointment (see Loader, 1997). Works by scholars such as Arlie Hochschild, Jill Gilligan, Charol Shakeshaft, Nel Noddings, Jill Blackmore, and others suggest distinctions in emotions and gender. Arlie Hochschild (1983) introduced the notion of emotional labor. She suggested emotional labor is required when working and emphasizes feeling one thing but expecting to feel something else. School leaders engage in emotional labor when they are asked to abandon their professional collaborations and embrace new expectations, behaviors, practices, or policies. Jill Gilligan (1982) views women's sense of morality as being socially constructed, contending women place a high value on integration, connectedness, and continuity. In 1987, Charol Shakeshaft contended women school leaders' understanding of power and control was related to gender identification and considered gender as highly relevant to school leadership and emotions. Leadership codes, which suggest cognitive and emotional dissonance, may emerge, and women may be encouraged to undergo extensive changes to reshaping oneself. Nel Noddings (1984) introduced the role of caring as central to people's lives and work with the feminine role of nurturing, caring, responsiveness, and relatedness as the heart of women's work. In 1996, Jill Blackmore argues the emotional labor involved in teaching and leading is relational and contextual.

Arlie Russell Hochschild's 1983 interactional model of emotion provides insight to what school leaders experience regarding the emotional management of self and others. She introduces the concept of school leaders and emotional labor. Hochschild suggests school leaders may feel one way, however, these leaders contend they may be expected to feel another way. In 1997, David Loader paved the way for leaders and understanding the emotional realities of school leadership with the "Inner Principal." The conceptual model affords school leaders to contribute their voices and experiences and reveals a myriad of emotional intricacies they experience in their profession. In 1984, Norman Denzin's "Emotional Understanding" provides insights regarding the human experience of emotions such as love, hate, anger, joy, pain, and despair and the role emotion plays in developing ways of understanding personal and social interactions. Brenda Beaty (2000) reminds us that understanding the emotional experiences of school leaders may potentially provide ways to examine how they navigate their emotions and how emotions influence decision-making. She uncovered school leaders who engaged in authentic distributed leadership and experienced less stress and the joy of success. If school leaders thrived on their own empowerment, Beaty discovered leaders needed emotional support as well as community affirmations for their work. If, however, leaders felt disempowered, the experience often led to increased anxiety, feeling threatened, or emotional turmoil, because these school leaders were left feeling out of control. If these school leaders felt detached and out of control, they often engaged in more rigid management interactions, which may lend itself to additional efforts to regulate their emotions.

## The Emergence of Emotional Intelligence (EI)

Although the definition of intelligence may vary from theorists or conceptualizations, intelligence often involves the capacity to learn, retain knowledge, solve problems, and apply solutions to challenges encountered (see Cherry, 2018). As early as the 1930s, Edward Thorndike (1901, 1933), a psychologist who conceptualized social intelligence (SI), suggested SI identified an individual's capacity to collaborate with others. Next, in the 1940s, David Wechsler, a psychologist, proposed a myriad of effective components within the realm of intelligence, which could play a significant role in the level of success people could achieve (see Wechsler, 1974). During the 1950s, humanistic theory thinkers, such as Abraham Maslow (1954, 1962), focused on the fundamental physiological people's needs (e.g., love, safety, food). And in the 1970s, Howard Gardner introduced the development of multiple intelligences, which was a precursor to the emergence of emotional intelligence (see Gardner, 1999). In the 1980s and 1990s, a myriad of emotional intelligence models and assessments emerged.

In 1986, emotional intelligence was identified in a dissertation by Wayne Leon Payne. He studied emotion and conceptualized emotional intelligence. Emotional intelligence (EI) didn't come into our vernacular until around 1990. In 1990, Peter Salovey and John Mayer published the first landmark article on EI in a scholarly psychological journal. They examined ways to measure differences in emotion and concluded that some people were better at identifying their own feelings, expressing empathy for others, solving problems related to emotional issues, and regulating their emotions than others. Despite being a relatively new term, interest in the concept grew tremendously. Emotional intelligence is linked to an individual's emotional expressiveness, which, for the purpose of this chapter, reflects a school leader's capacity to acquire skills in expressing emotions, regulating emotions, and emotional sensitivity. Neurobiological data provides firsthand information regarding how the human brain works, especially when examining emotions, such as love, happiness, sadness, anger, frustration, disappointment, and other emotions (see Caruso & Salovey, 2004).

Without emotional intelligence skills and strategies, school leaders may have a difficult time effectively leading, inspiring, collaborating, and managing the complexities of leading the twenty-first-century school communities. Salovey and Mayer (1990) identified emotional intelligence as a subset of social intelligence that involves the ability to monitor one's emotions and others' emotions, to discriminate among them, and to use this information to guide one's own thinking and actions. When leaders increase their emotional intelligence, they learn to authentically listen, facilitate efforts that demonstrate their leadership efforts, and support their school community members.

In 1997, Mayer and Salovey noted the following about EI: (1) the ability to perceive accurately, appraise, and express emotions; (2) the ability to access and generate feelings when they facilitate thought; (3) the ability to understand emotion and emotional knowledge; and (4) the ability to regulate emotions to promote emotional and intellectual growth (Mayer & Salovey, 1997a, p. 10).

The brain's center of emotion plays a crucial part in understanding how people recognize, process, and understand their own emotions and the emotions of others. Emotions are organized brain responses that often cross cognitive, motivational, experiential, and physiological subsystems of the brain (see Salovey, Brackett, & Mayer, 2007). Although emotions were once viewed as disorganized mental activity interruptions, now, emotions are perceived as "motivating forces which are processes which arouse, sustain, and direct activity" (p. 2).

Salovey and Mayer created a four-branch model for emotional intelligence. These four branches included (1) emotional perception and expression; (2) emotional facilitation of thought; (3) emotional understanding; and (4) emotional management. First, emotional perception and expression examines an individual's capacity to identify personal emotions within someone's physical and psychological states; the ability to understand emotion in other people; the extent someone can express emotions accurately and needs aligned with their emotions; and the ability to demonstrate how to discriminate between honesty and dishonest feelings (see Salovey et al., 2007). These competencies play a vital role in the first or the four-branch model, because without them, Salovey, Brackett, and Mayer contend emotional intelligence cannot be achieved.

The process of developing one's emotional intelligence includes attending to, understanding, and deciphering emotional messages. This interpretation may be expressed by an individual's facial expressions, cultural artifacts, or tone of voice. For example, if someone witnesses and interprets fear on another person's face, that someone would better understand that other person's current emotional state and thoughts versus someone who dismisses, ignores, or misses that signal.

The second branch within the model centers on the emotional facilitation of cognitive activities. In other words, what emotions emerge when thinking and problem-solving (see Salovey & Grewal, 2005)? If we respond to something emotionally, then something captured our attention. If people developed a strong emotional input, then that understanding will help direct their thinking to situations that play an important role to them (Mayer & Salovey, 1997b).

The third branch regarding understanding and analyzing emotions focuses on an individual's capacity to understand emotions and utilize that understanding as emotional knowledge. Leaders have the ability to identify relationships between emotions and words; the capacity to understand what meanings are derived from emotions and what causes emotions to emerge and deepen understanding of complex feelings; and the ability to identify emotional transitions such as from anger to hurt or from fear to anger or from anger to sadness (see Salovey et al., 2007).

The fourth and final branch is emotional management. This branch focuses on an individual's ability to reflect and self-regulate emotions that promote emotional and intellectual growth. The capacity of someone to manage emotions is considered the most advanced skill in emotional intelligence. At the heart of this branch is an individual's capacity to be present for oneself and others. The person is open to a myriad of emotions whether pleasant or unpleasant in addition to recognizing and balancing emotions to cope with feelings.

## The Next Development in Emotional Intelligence

Although Salovey and Mayer published the first landmark article on emotional intelligence, in 1995, Daniel Goleman published the book *Emotional Intelligence: Why It Can Matter More Than IQ*. Goleman suggested that EI played a more significant role in understanding people and personal success than someone's intelligent quotient (IQ). He also proposed that EI was a type of emotional literacy that aligned with one's moral development and character. Goleman's revised definition of emotional intelligence included the following qualities: (1) self-control; (2) optimism; and (3) moral character. Furthermore, he applied four EI competencies. These competencies include self-awareness, self-management, social awareness, and relationship management.

### Self-Awareness

First, self-awareness involves people understanding what they are feeling at any moment and understanding the influence these emotions have on one's mood and the extent the mood impacts others. In 2013, Peter Northouse suggested self-awareness as a process in which people look within to understand themselves, including, but not limited to, one's strengths and challenges, as well as the influence these strengths and challenges have on others. This deep understanding suggests people become more aware of their limitations, values, and motives (see Goleman, Boyatzis, & McKee, 2002). Furthermore, he concluded that being self-aware also included a person's ability to critically reflect on one's identity, values, motives, and goals to better understand oneself. In the process of recognizing an inner purpose for engaging in specific behaviors, Raelin (2003) reminds us to be self-aware suggesting people to find their inner purpose and examine gaps between one's behavior and intentions.

Leaders with a strong sense of self-awareness are often realistic. According to Goleman et al. (2002), self-aware leaders are honest with themselves and others. They often understand the influence their values, goals, and dreams have on their emotions. Oftentimes, these leaders are aware of their destiny, recognize why they set these specific goals, and recognize what feels right. Self-aware people reflect and think over before impulsively responding to a situation, which provides a leader with opportunities for thoughtful reflection, which resonates with others as authentic responses. These leaders often have a clear sense of who they are, what they believe, what they value, how they make decisions, and the influence of their decisions on others (Northouse, 2013). A self-aware leader recognizes the power of thinking rationally and applying technical skills and has a strong sense of self; therefore, these leaders are often perceived as authentic (Northouse, 2013).

### Self-Management

Second, self-management is aligned with how people regulate their emotions internally (Goleman, 2015). This quality of emotional intelligence includes emotional

self-control, transparency, adaptability, achievement, initiative, and optimism. In 2002, Roger Volckmann suggested self-management involves the developmental (or anomic, when poorly executed) process of relating internal/individual (intention) to external/individual (behavior). He contends humans evolved “as a species about learning, growing and developing as human beings, physically, emotionally, mentally and spiritually—education, training, therapy, counseling and consulting, human potential activities, physical development and coaching” (Volckmann, 2002, p. 3).

Self-management and school leadership resemble an ongoing internal dialogue, which affords people with opportunities to concentrate and mental clarity in order to meet the demands often involved in leading communities (Goleman et al., 2002). The process of self-management keeps disruptive emotions that may steer people off track and allows leaders to handle their own emotions. Self-management plays a vital role in helping leaders understand the power of emotions and public consequences (see Goleman et al., 2002). Learning how to self-manage emotions also enables leaders to be transparent, which is considered a strength in any organization (see Goleman et al., 2002). This transparency creates an authentic openness regarding feelings, beliefs, and actions taken, which builds a foundation of trust. According to Goleman et al. (2002), leaders who take responsibility and self-manage their emotions have the capacity to control their own state of mind.

## Social Awareness

According to Karl Albrecht (2004), social intelligence (SI) is the ability of people to get along with one another and to collaborate with the leader. Some people may refer to the term *people skills* or *soft skills*. SI is the capacity of a leader to understand social dynamics, interaction styles, strategies to build relationships, and ways to support others in achieving their goals. Furthermore, SI involves a certain amount of personal insight and consciousness of self-perceptions and responses.

When developing interpersonal skills, Albrecht (2004) classifies leaders' behaviors on a spectrum ranging from toxic to nourishing effects. For those who engage in toxic behaviors, leaders can create a culture in which people feel frustrated, angry, inadequate, and undervalued. When leaders engage in nourishing behaviors, people may feel respected, validated, encouraged, and competent. If leaders continue to engage in toxic behaviors, this indicates a low level of social intelligence due to the leader's inability to authentically connect with those served. If leaders engage in nourishing behaviors, they are more effective in working with others, which indicates a high social intelligence.

For those with a high level of SI, Daniel Goleman (2016) suggests empathy plays a significant role in having the capacity to perceive the feelings of others and attempt to view the world through their eyes. The ability to read the emotions of others entails sensing and responding in authentic ways to unspoken concerns that often lie behind someone's feelings. Another important aspect to developing empathy is understanding the significance of diversity and inclusion. People come from

a myriad of backgrounds and lived experiences. A lack of exposure to diversity may influence a leader's capacity to view the world in narrowly defined ways. These narrowly defined understandings may trigger a leader's implicit bias (see El-Attrash, 2017). Therefore, knowing oneself creates a strong foundation for understanding others and deepening empathic responses.

## Relationship Management

People developing relationship management skills focus their efforts in formulating meaningful relationships and teamwork. School leaders who are skilled in relationship management spend most of their time building trust and bridges among community members beyond their work obligations (see Goleman et al., 2002). These leaders work to achieve cohesiveness and authentic collaborations to build meaningful relationships and support group activities aligned with creating close relations. School leaders who excel at self-awareness and self-management are often socially competent and employ strategies to strengthen their relationship management.

An imbalance in a school leader's emotional skills is often linked to poor psychosocial adjustment in teams, leading to poor leadership. In summary, a leader's capacity to develop emotional intelligence may increase organizational effectiveness. Effective leaders make considerable efforts to identify, analyze, and understand the feelings of others and their capacity to express their own emotions to those served. Therefore, thoughtful leaders take time to listen, speak with care, and lead with conviction.

---

## The Influence of Stress

Stress and leadership go hand-in-hand and with the inevitable daily demands of new challenges, problem-solving, and accountability, often leading to a myriad of emotions. According to Kelly McGonigal (2016), moderate amounts of stress may encourage a leader to achieve meaningful goals that improve engagement, sense of self, and work performance. When school leaders develop the skills to manage their emotionally charged situations, they can navigate and learn how to prevent workplace stress. However, stress may become a concern when leaders become overwhelmed, feel paralyzed, or lose their passion or sense of accomplishment, which can lead to burnout (see Friedman, 2002; Le Fevre, Matheny, & Kolt, 2003; Maslach, Schaufeli, & Leiter, 2001). Not only can burnout impact a school leader's capacity to effectively work with school communities, stressors also influence a leader's mental and physical health. Leaders experiencing burnout often experience higher levels of emotional exhaustion, exercise less, miss work, lose sleep, and may develop mental health challenges. The influence of stressors, like social-emotional demands or dilemmas that challenge a school leader's perspective, may lead to fatigue, chronic or physical exhaustion (see Grissom & Andersen, 2012). However,

researchers Roger Federici and Einar Skaalvik (2012) suggest stress can be effectively navigated when school leaders display higher levels of self-efficacy, which is the leader's belief to execute behaviors essential to producing specific performance goals and higher job satisfaction.

---

## The Power of Emotional Leaders

James D. Barber, a former Duke University political scientist and scholar on American presidential character, described the power of emotion and leadership:

...the degree of a president's emotional involvement are powerful influences on how they define the issue itself, how much attention he pays to it, which facts and persons he sees as relevant to its resolution, and finally, what principles and purposes he associates with the issues. Every story of Presidential decision-making is really two stories: an outer one in which a rational man calculates and an inner one in which an emotional man feels. (p. 4, Barber, 2009)

Leadership is stressful, being responsible for the welfare of hundreds and sometimes thousands of other people. A school leader's capacity to decode emotions within their school settings involves an acute awareness of nonverbal cues (i.e., body language), tone of voice, word choice, and indicators to understand underlying feelings. Leaders with a low emotional intelligence may unravel during stressful situations because they may not have the skillset to regulate their own emotions. This lack of understanding may manifest itself as verbal attacks or passive aggressive behaviors toward those served. School leaders engage in emotional decoding, which is the ability to read emotions, especially in the workplace during crises. Those who seem particularly good at controlling and masking their emotions may be perceived as emotionally distant, aloof, or indifferent toward their school communities. This lack of skills may create a more stressful environment, influence team productivity, and negatively impact collaboration. A school leader who lacks emotional intelligence may be unable to address situations fraught with emotion, such as conflict, problem-solving, and controversial issues.

Practiced emotional expressiveness is essential to effective expression and requires a skillset of emotional control, sensitivity, and expression. Lyashevsky, Cesarano, and Black (2020) created a blueprint for developing content aligned with social emotional learning and concluded that as learners develop the capacity to apply social-emotional knowledge across diverse contexts, they deepen their emotional system to navigate challenges, relationships, and understandings of self. School leaders who develop the capacity for positive emotions often engage in thoughtful choices and unselfishness in those they serve. These leaders are often able to identify and manage their emotions, develop empathy in others, and create helpfulness among those they serve. Expressing emotions seems to play a vital component in a school leader's capacity to inspire and motivate their school communities, which often encourages authentic cooperation.

Emotional leaders may also bring a full range of emotions to a school community. Expressing positive emotions often has a positive influence on groups. However, there is limited extant literature regarding the influence of negative emotions, such as disappointment, frustration, and anger, and how these emotions influence school communities.

---

## The Development of a Conceptual Model

The intellectual, cognitive, and philosophical perspectives of leadership afford opportunities to understand the power of emotion. Engaging in emotions provides school leaders with the capacity to acquire knowledge and ways of knowing and, therefore, understanding emotions. As school leaders deepen their understanding of self and others, the capacity for shifting school culture from silence to empowerment to voice is supported through emotional engagement. This shift or transformation has the capacity to influence a school leader's focus, well-being, esteem, and capacity to overcome challenges.

Emotions matter in schools, especially when considering the myriad of demands placed on leaders including, but not limited to, decision-making, problem-solving, relationships, social-emotional health, learning, and daily performance. If school leaders can utilize authentic opportunities to engage in positive communication, conflict management, empathic responses, systems thinking, reflection, and feedback, they may increase their emotional intelligence capacity. Below is a conceptual model (see Fig. 1) based on the extant literature to reinforce a school leader's emotional intelligence. This process affords school leaders opportunities to explore individual emotional challenges as well as personal successes. The critical reflective process provides leaders with spaces to inquire, listen, analyze, and navigate possible resources to further develop their emotional intelligence skills, such as emotional regulation.

Leading schools is a profound emotional activity (Fried, 1995). For those interested in leading schools and making meaningful change, leaders cannot ignore the emotional dimensions of addressing and promoting educational change (see Hargreaves, 1997). The process begins with school leaders examining their personal values and school leadership vision as well as goals for their own emotional development. School leaders interested in promoting this work may recognize the process begins from within. Thoughtful discussions and reflections on difference, oppression, and justice are crucial to doing their own work and recognizing the role privilege that shapes their worldviews and what may need to be unlearned in order to better advocate for those who live on the margins. School leaders may ask themselves: How do school leaders conceptualize systemic social problems facing their k-12 school communities? Next, leaders identify blind spots and challenges associated with increasing their emotional intelligence by asking themselves: How do children, families, and community members identify their own social justice issues and articulate their understandings of social justice? For example, school leaders should be provided opportunities to listen to others, engage in collaborate problem-solving, demonstrate empathy, self-regulate emotions, and be more aware of the emotions of those served within their

**Fig. 1** Conceptual model for understanding the influence of emotions when leading school communities

school communities. Next, school leaders may ask themselves: What emotions arise when contemplating the influence of systemic social challenges?

School leaders may recognize the role difficult conversations play in validating personal feelings as well as validating others' emotions and experiences. There may be an implied or actual emotional silence within the school community, thus suggesting emotions do not play a significant role or are simply denied. Furthermore, deepening ways of knowing and feeling provide a myriad of perspectives, suggesting emotions are not right or wrong, but are deeply connected to people's experiences with themselves and others. Deepening one's emotional knowledge and ways of understanding encourages school leaders to use this knowledge within daily activities. These activities may include, but are not limited to, overcoming challenges, problem-solving, relationship-building, and strengthening one's sense of self. School leaders develop the capacity to interpret their own emotions and the feelings of others and learn how to respond empathically with self and others. The leader has the capacity to nurture emotions aligned with further developing culturally responsive pedagogy, caring, and skills aligned with supporting a school culture of learning.

What are the goals of the conversation? What does it feel like to be heard? To be validated? To be understood? Whether school leaders are sad, enraged, shocked, depressed, confused, uncomfortable, or insecure or experience other feelings, school leaders should be curious about their feelings and ask themselves, as well as others, about diverse perspectives. Compassion and empathy play a significant role in respecting others and learning how to speak without fear of judgment, ridicule, and possible ostracization. School leaders should be mindful of how they engage in dialogue, language used, and the myriad of ways in which people may interpret emotionally stressful experiences.

As school leaders progress throughout this process and attain their goals, they have opportunities to learn how to engage in hope, gain self-confidence, and recognize imaginative possibilities for those they serve. Difficult conversations are critical to learning how to facilitate thoughtful dialogue about civil unrest. Violence and discrimination are inherently traumatic, especially for marginalized populations who experience hostile environments at disproportionately higher rates. Layers of difference, as school community members share their experiences and understandings, may bring even more tension to the dialogue. Thoughtful interactions welcome difference and embrace empathy. The dialogue may not resolve systemic social challenges, but, perhaps, the process validates the concerns of those who are historically unheard or silenced.

School leaders who may feel emotionally distant, misunderstood, or disconnected to the community may not have the capacity to engage in empathic responses, suggesting these leaders may only have the capacity to theorize about the community's motivations, values, and experiences (see Denzin, 1984). Leaders who engage in this authentic emotional process may benefit from looking within and gaining access to the emotional realities of self and others, especially those from their school communities. Developing a culture of open, authentic, and collaborative communication, as opposed

to a culture of silence and oppression, has the capacity to support sharing, empowerment, and voice (see Edge, Descours, & Frayman, 2016; Heifetz & Linsky, 2002; Murphy & Louis, 2018; Tschannen-Moran & Gareis, 2015).

The emotions of school community members may influence the feelings of leaders engaging in meaningful change. As school leaders reflect on their knowledge, bias, and assumptions, they have the capacity to deepen their awareness of inequities and lived experiences of disenfranchised populations. School leaders who engage with school community members in vulnerable and meaningful ways, in other words, participating in emotional vulnerability, create spaces in which school community members and leaders work together to navigate social challenges together. As school leaders navigate their emotions, they reflect on the power of their critical action(s) to address social, political, and/or economic contexts influencing the lives of their school community members (see Yamamoto, Gardiner, & Tenuto, 2014). As school leaders engage in reflecting and regulating their emotions, they may be better equipped to navigate challenges. These skills and increased knowledge of emotional intelligence have the capacity to influence a school leader's self-efficacy and outreach to the community at large.

School leaders, in turn, engage in emotional activities that encourage the development of a strong sense of self. This recognition of self refers to a leader's regulation of self and emotions, which is often defined as an individual's self-cohesion. This process affords leaders opportunities to affirm oneself, increase emotional empowerment, deepen support, and engage in authentic collaboration.

At times, leaders' emotions may be coupled with those served. This coupling of emotions may lend itself to scholars' understandings of emotional labor (see Hochschild, 1983), empathic and caring responses (see Boske, Osanloo, & Sherman-Newcomb, 2017; Louis, Murphy, & Smylie, 2016), emotional understanding (see Denzin, 1984), and new understandings of self (see Elson, 1986; Mead, 1934).

Within this process, school leaders become proactive with their emotions, which may impact their capacity to address workplace stressors. These stressors have the ability to trigger burnout; however, increasing conscious interactions, developing meaningful relationships, and authentically supporting others may provide emerge, which helps school leaders work through difficult issues versus avoiding them.

---

## Conclusion and Reflections

The role school leaders play in US schools has become more stressful over the last 20 years (see Byrne-Jimenez & Orr, 2012; Fullan, 2001). School leaders have the capacity to influence student and teacher outcomes as well as the overall climate of the school community. Recognizing the role emotions play in the lives of school leaders plays a central role in supporting social and emotional learning.

The quality of a leader's relationships matters. These relationships influence the emotional school climate. As leaders create school communities that build a sense of belonging, validation, empathy, appreciation, and authenticity, those served have opportunities to be immersed in genuine dialogue with the hope of improving

the lived experiences of all school community members. As leaders begin to deepen their understanding of self and others, the school climate will depend upon the leader's capacity to sustain their willingness to engage in imaginative possibilities. School leaders engage in a process in which they keep in mind their emotions and the emotions of those they serve. Emotions can take a toll on their work; however, emotions also can provide school leaders with diverse perspectives, experiences, self-discovery, and a stronger sense of self. As school leaders continue to share their feelings, they also have the capacity to build meaningful connections with others (Patti, Senge, Madrazo, & Stern, 2015). They may listen more intently. Leaders may shift their focus from self to others. When they listen to those they serve, hope and possibility may shift the climate of the community, increasing positive perceptions and actively engaging community members to authentically collaborate.

School leaders who engage in this process may be equipped to address systemic-wide approaches to promoting EI. They have the capacity to create an expectation for community members: emotions matter and play a significant role in how individuals and communities navigate relationships, conflict, challenges, stressors, and emotions. This conceptual model may lead to the creation of a culture that supports authentic collaborations as well as help members socially and emotionally. The incorporation of reflective practices provides school leaders with ways to examine their thinking about emotions as well as emotional skill levels. Within this reflective process, school leaders may examine school community norms and how members feel about their school climate, practices, and policies; thus, teachers, families, students, and community members may develop a greater sense of belonging to the school.

Recommendations for researchers, policymakers, and practitioners to advance their emotional development and their leadership to create caring schools consist of the following: (1) extend research by examining social emotional outcomes of leaders in understanding how emotions, culture, and context influence effectiveness; (2) create professional development programs and leadership courses for school leaders as part of their preparation; and (3) propose policies at the local, state, and national levels to support school leaders and social emotional learning.

When school leaders are provided spaces to develop their EI, they are more likely to respond to stressors through the development of self-efficacy and personal achievement (see Federici & Skaalvik, 2012). Understanding personal emotions is critical to effectively leading school communities (see Wang, Pollock, & Hauseman, 2018). With the further development of self-awareness, school leaders will better manage stressors and may have the capacity to build support, reconnect with others, cultivate flourishing school communities, and promote hope and possibilities.

**Abstract**

Strategic planning is a broad topic which references a process, a product, and a paradigm. With historical ties to Frederick Taylor and John Dewey, its range of influence within education has been both widely heralded and deprecated by practitioners and scholars. Purposed to examine its utility, this practitioner-positioned chapter spans strategic planning's rise to prominence, as well as its arguable resurgence as an accountability tool following No Child Left Behind legislation. The chapter includes a comparison between this *rational-structural* approach, which has changed minimally over essentially 100 years, and the *strategic-systemic* method known as professional learning communities, which has been in place in education for the past 30–40 years. Finally, this review concludes by engaging in open-ended conjecture concerning strategic planning's future role in public education.

---

**Keywords**

Strategic planning · Accountability · Compliance · Buy in · Capacity building · Inspiration · Investment · Social justice · Cultural conflict

**The field of memory**

Frederick Taylor's accomplishments with scientific management revolutionized industry while helping to build a nation. Packaged to offer an innovative trajectory, strategic planning afforded a *rational-structural* offshoot (Evans, 1996) that some claimed more commonly advanced the status quo and replication of existing programs in pursuit of certainty. Strategic planning, perhaps the standout example of the rational-structural paradigm, continues to have strong advocates. However, during the past 30–40 years, its much-heralded dominance of market share within the school improvement conversation has been regularly challenged by competition from more socially oriented *strategic-systemic* improvement paradigms (Evans, 1996) such as professional learning communities (PLCs).

**The field of presence**

Schools are complex social organizations that exist in response to even more complex societal and political realities and pressures. While there are plenty of mandates which schools are obliged to satisfy through prescribed practices, the fact is that social justice and related conflicts pose unique and monumental unmet challenges. Perhaps in part because of its early success and long-held favor, strategic planning has been loath to deviate from its underlying structural origins in order to embrace an ever-expanding and challenging social context. Effective schools' approaches have increasingly addressed underlying motivations, established capacity, and inspired investment into a shared cause – instead of targeting passive acceptance and *buy in* for what are often merely *dressed up* mandates that are often overhyped as evidence of collaborative planning. In this uncertain world, it would be difficult to contend that the champion from either the rational-structural or

the strategic-systemic approach has cornered the market in creating one complete and self-contained approach to pursuing future school improvement.

### **The field of concomitance**

Education has borrowed heavily from psychology and scientific method; over the past 40 years, it has been influenced more consistently by business, and, in recent years, increasingly by technology. Each of these disciplines has contributed to school improvement efforts. The resulting strategies from this crossover have been fruitful contributors for decades. That said, the overreliance, if not outright dependence on outside planning resources has diminished staff investment in change. The effects of excessive regulation have also contributed to educators' deteriorated sense of self-efficacy. Contemporary theorists (Goldsmith, 2012; Harnack & Seebaum, 2017) contended it is only by asserting professional conviction through the practice of genuine investment that educators can stand up to government domination and the undeserved scorn from the business and political sectors and elements of society they dominate. Though outside sources such as those described above have gifted schools with strategic planning, the approach may struggle to find continued favor even among external theorists.

### **Discontinuities and ruptures which form the different viewpoints of this area or field**

Strategic planning, both as a theoretical approach and a form of practice, have changed comparably little as the field of education and the world itself have experienced steady growth and shifts in thinking during the past 30 years. New and varied planning approaches have taken root across multiple professions, including education. While these advances challenge the head start and historical advantages of strategic planning, forces including state and federal mandates, standards, and research-based interventions significantly narrow the scope of what planning of any variety is even allowed to address.

With the compliance expectations schools face already firmly entrenched (Popham, 2005), educators have increasingly become implementers – not planners. As compliance, accountability, and strategic planning have moved forward in time, it could be argued that what was once heralded as an organization's vision might better be considered *code* signaling that the organization's leadership has bought into one or more assorted government mandates. That said, even if there is implementing to do, the structures and data sets long associated with strategic planning appear to fit favorably with accountability practices.

With changing times, and the emergence of more socially oriented improvement approaches such as professional learning communities, one might wonder how much longer schools would continue to choose one option ahead of the other. Perhaps it is time to set out to utilize the best of both approaches in charting their long-term operational priorities while relying solely on neither.

### **Critical assumptions or presupposition**

There are multiple reasons why strategic planning processes have been popular across education for decades. The potential spectacle of employing a proven business practice

in any interested hometown setting is only one of the draws. This approach has enjoyed well-deserved success; however, historically speaking, it cannot be assumed that the foundation it relies upon has proven to be particularly adaptable when implemented. Modification could diminish the curb appeal of the proven product, and would likely also add significant complications to efforts to replicate it.

Consumers interested in a more current version of planning are likely to be limited to searching for subtle differences among facilitators to carry out their event. The inevitable questions that will be asked at the end of this chapter need to be: Is it time for a change; Is change even likely; and finally, if change is not forthcoming is strategic planning potentially heading toward retirement?

---

## Introduction

This chapter examines and critiques strategic planning's ongoing position in education. Instead of primarily cataloging the planning process itself, it is viewed according to the history, contexts, contributions, and struggles that have defined its life of service to public schools. Strategic planning's origins will be addressed first and will include a brief overview of its core components.

The changing social and organizational contexts that have impacted planning and their interactions with competitive approaches are considered next. This effort will include an examination of strategic planning's strengths in comparison to those of a chief competitor, professional learning communities. After examining developments ahead of No Child Left Behind, including changing conditions, and how they helped shape the school improvement area, Post-NCLB realities will be reviewed.

After examining possible gaps in the planning approach, the final segment addresses options to retain, revise, or retire strategic planning, along with perspectives on why there may be a need for changes of some sort. Each segment has an orientation, supporting facts, and a discussion of critical perspectives.

---

## The Early Years

Planning has always played an essential role in the educational process. While a limited history of the approach is offered here, it needs to be noted first that initial planning efforts may not have been formally labeled nor necessarily envisioned as *strategic planning*, according to the University of Wisconsin Emeritus Professor of Educational Planning Jacob Stampen. Therein, there is no distinct historical event, design step, or date that denotes the start of its use (J. Stampen, personal communication, July 9, 2020). While considerable attention has regularly been devoted to the formalization of the process, many important underlying assumptions predate the celebrated work that took place in the early twentieth century (Mintzberg, 1994). The following section introduces pertinent facts, including features of the approach, and considers insights common to the early years of strategic planning in public schools.

## Facts

It is essential first to acknowledge the work of Frederick Taylor, who popularized scientific management well over 100 years ago (Evans, 1996; Mintzberg, 1994; Traver, 2006). Taylor's work had profound implications, and it is impossible to acknowledge the work of his successors without witnessing Taylor's influence. Within education, John Dewey's work with laboratory schools marked a significant venture into expanding the science of education. He may not have been employing strategic planning as it would end up being operationally defined; however, Dewey had education moving more toward that direction and was doing so "reasonably well" (J. Stampen, personal communication July 9, 2020).

At the very least, it could be said that "Dewey recognised that to make changes in schools required curriculum planning and pedagogical adjustments allied to a transformation in the way schools were organised and managed" (Thorburn, 2017, p. 151). Contributing further to the organizational mindset of school systems was the work of Phillip Selznick, regarded by some to be the father of institutionalism (Traver, 2006). Even ahead of the famed Sputnik crisis, American schools were consolidating boundaries and subsequently formalizing organizational practices as well. The rational-structural oriented strategic planning approach to organizational operations was the prevailing approach and well underway by the 1970s and 1980s (Evans, 1996).

According to Reeves, Levin, and Uedua (2016) biological sciences and business studies share a penchant for examining larger complex settings and systems, then drawing from the inherent stability they afford to plot courses of action. Understandably, biology has been viewed as a point of origin for strategic planning. However, the approach has been so widely adopted that its beginnings have popularly been linked to other endeavors as well. Some have held that the strategic planning approach grew from computer engineering (Ndaruhutse, Jones, & Riggall 2019) and emerged in the corporate world toward the end of the 1960s and early 1970s (Ocasio & Joseph, 2008). Others, including Bryson (2018), traced strategic planning's origins to government operations during the twentieth century. Though its roots trace back decades earlier, the application of strategic planning gained favor within public education as early as the 1980s (B. Miles, personal communication, July 15, 2020). Coincidentally, this was roughly the same period during which the approach began to experience increasing rebuke from the corporate world (Ocasio & Joseph, 2008) as did institutionalism (Traver, 2006).

---

## Strategic Planning

For purposes of this discussion of strategic planning's utility and alignment with education, it is essential to define it by first acknowledging some *general underlying assumptions*, the existence of multiple *planning formats*, and then the *unique relationship* it has with schools. According to Mintzberg (1994) many of the general underlying assumptions that are shared across strategic planning can be traced back

hundreds of years, if not longer. In fact, Mintzberg (1994) referenced Sun Tzu's *The Art of War* as an example of the many underlying preconceptions. Among the most significant assumptions common to strategic planning initiatives have been the *assumption of formalization*, the *assumption of detachment*, the *assumption of quantification*, and the *assumption of predetermination* (Mintzberg, 1994).

Recognizing that people are unpredictable, imprecise, and subject to carrying out their whims as much as employing reason, Mintzberg (1994) indicated the *assumption of formalization* holds that *systems* create the strategies, not people. Thus, "the system does the thinking" (Mintzberg, 1994, p. 222). Building on this, the *assumption of detachment* stresses the importance of managers who are removed from direct participation in operations, and able to thus oversee the efforts from afar and "think the big thoughts" (Mintzberg, 1994, p. 223). The *assumption of quantification* values data enables the managers to remain removed from actual planned actions, while, finally, the *assumption of predetermination* holds that good design and good practice make it possible for the system to accurately predict needs and effective courses of action (Mintzberg, 1994).

The variation or format most commonly associated with schools, and therein referenced here, is the classic "Design School Model" complete with strengths, weaknesses, opportunities, and threats (Mintzberg, 1994). In a more general sense, while still focusing on work with nonprofits, Bryson (2018, p. 8) defined strategic planning as "a deliberative disciplined approach to producing fundamental decisions and actions that shape and guide what an organization (or other entity) is, what it does, and why." Though they may use different terms with different incarnations, Harnack and Seebaum (2017) indicated it is common for most models to have a leadership framework, explicitly detailed action, and delivery steps, as well as steps for monitoring implementation and progress. The process that leads up to establishing these elements may also vary but typically includes data collection and deliberative steps among stakeholders directed toward establishing organizational priorities and procedures.

Finally, Bryson (2018) focused more specifically on nonprofits including schools when he espoused multiple benefits for strategic planning. These benefits, as understood across education, essentially establish a series of assumptions for educational practitioners of strategic planning. The first benefit, *strategic thinking*, is viewed as being central to the second benefit of improved *decision making*, which both contribute directly to the third benefit of enhancing *organization effectiveness* (Bryson, 2018, p. 14). Combined, each of these qualities contribute to *organizational legitimacy*, which helps nonprofits and schools succeed with their broader mission of *impacting* the societal and economic systems that they serve (Bryson, 2018). Advances like these are understood to be advantageous in increasingly competitive markets since the emergence of open enrollment practices and charter schools.

## Critical Perspectives

According to a veteran strategic planning resource, the vast majority of public schools in the United States would be considered small organizations. They could

commonly lack sufficient resources to adapt or expand planning efforts beyond the same traditional or *generic* approach that most employ (B. Miles, personal communication, July 15, 2020). In those settings, the process has mostly been adopted as a complete model – with tremendous emphasis placed on following the process with strict fidelity. A very common criteria or *qualification* for facilitating a planning event is to have participated in one facilitated by someone else ahead of time.

The process could aptly be described as an *event* because of the brief but intensely focused activities. Hallmarks of the undertaking have typically included completing a nominal group process with a collection of stakeholders, often including community members. These efforts typically resulted in the articulation of goals, objectives, and some type of action steps with oversight and promotion responsibilities eventually assigned to designated committee members (Snyder, 2015).

Some have contended that strategic planning is a vital determinant of any organization's outcomes and that poor outcomes are the result of ineffective execution and not the process itself (Chukwumah, 2015). While application of the process to the educational setting has traditionally been viewed favorably, there is legitimate cause to reflect on its continuing effectiveness nonetheless. Education differs from other institutions in many ways, including how it accesses internal stakeholders and community *stockholders*. Further, the rules for managing public schools have changed drastically since strategic planning was incorporated. The starkest evidence of this would be how schools once set their budgets according to their priorities, but have subsequently been operating under funding restrictions that dictate their actions for decades.

This abbreviated introductory glance back to the origins and early years of strategic planning was intended to set the historical stage for further examination of its implementation both ahead of and following No Child Left Behind (NCLB). The distinct and diverse dynamics leading up to the landmark legislation, as compared to expectations resulting from its inception, make it a natural point of comparison (Traver, 2006).

The critical perspectives discussed within these segments will examine strategic planning's place in light of changing conditions and increased competition. After addressing realities from the 1980s forward to today, the final focus will be tasked with considering whether strategic planning's future in education is likely headed for retention, revision, or retirement.

---

## Run Up to No Child Left Behind

The years between the early 1980s and the inception of No Child Left Behind in 2001 marked a period of changing times across American society and institutions, including public education. Digital technology was making its presence known. Many would come to link strategic planning to the flow charts and thought processes associated with computer programming. However, critical thinking was also *en vogue* at the time (Hughes et al., 2019). Further, educational stewardship was increasingly seen passing the torch from traditional *titled* forms of guidance to

more distributed forms of leadership (Hughes & Davidson, 2020). This section considers the changing norms during this period and weighs how they interacted with strategic planning and a contemporary competitor – namely professional learning communities. This section also includes an examination of the strengths and benefits attributed to both approaches.

## Facts

The rational-structural approach stemming from Taylor's original work continued to flourish within a favorable educational setting despite losing influence in business and other settings (Evans, 1996). Running more consistently under the mantle of *strategic planning*, there was little designed change to the widely accepted approach, especially concerning its application in smaller organizations that relied extensively on the readily available *stock version*.

While acknowledging the overall value of the approach, Mintzberg (1994) found it to be too generic in design, too controlling in approach, and too inflexible to change. Mintzberg (1994) further decried the overreliance on scientific management and echoed criticisms that the process often amounted to little more than a formal *run-through* with stakeholders to record and publicize ideas that had already been decided.

Just as strategic planning was becoming a fixture within growing segments of public schools, alternative options were being introduced. By the 1990s, public education was able to avail itself of its own pipeline of organizational theorists. Michael Fullan, Phillip Schlechty, Thomas Sergiovanni, among others, spoke to the strengths of a new *strategic-systemic* paradigm that embraced irregularities and human inconsistencies instead of attempting to plan them away and further *teacher-proof* education (Evans, 1996).

Strengths of the emerging paradigm largely encompassed weaknesses left unaddressed by strategic planning. Bolman and Deal (1991) noted that the rational-structural approach emphasized by strategic planning does a splendid job of mapping out how organizations should run but typically fails even to identify, let alone address reasons why plans do not work out as intended. Schlechty (1990) and Evans (1996) both advised that education is very much a social setting. Progress is both complicated and fueled by people and their interests, behaviors, and issues, especially within what Schlechty (2009, p. 24) would come to call “bureaucracies which are by and large change-inept organizations.”

While proponents of strategic planning held firm, opting to advertise its strengths, the strategic-systemic paradigm stressed adaptability and fluidity, focusing on people and culture, while also developing capacity within the organization (Evans, 1996; Schlechty, 1990). In this regard, Senge (2006, p. 283) contributed, “there are no magic bullets for building learning organizations: no formulas no three steps, no seven ways.” Capitalizing on a more humanistic mindset instead of buttressing structural-functional roles and rules, professional learning communities (DuFour, 1997) emerged as a formidable alternative to strategic planning.

---

## Professional Learning Communities

Professional learning communities were originated to counter a reality where school structures and approaches minimized staff contribution, including “collaboration, reflection, and innovation” (Martin-Kneip, 2008, p. 3). To that end, “professional learning communities are forums in which participants embrace the privilege and responsibility of learning individually and collectively” in support of their organization’s growth (Martin-Kneip, 2008, p. 4). Working in “cross-sections,” the communities embark on “collegial inquiry” where members analyze needs and articulate solutions all while they “search for the big picture without losing sight of particulars” (Martin-Kneip, 2008, p. 6).

---

## Perceived Benefits of Strategic Planning

While detailing positive aspects of strategic planning, Bryson (2018, p. 14) advocated “the most obvious potential benefit is the promotion of strategic thinking, acting and learning,” and the second is “improved decision making.” The third benefit is enhanced effectiveness and sustainability as “organizations engaging in strategic planning are encouraged to clarify and address major organizational issues, respond wisely to them and deal effectively with rapidly changing circumstances” (Bryson, 2018, p. 14). These abilities and outcomes are critical in what he described as an increasingly interconnected and complicated world where organizations are often eliminated due to their failure to adapt (Reeves et al., 2016).

From a less scholarly and more practiced accounting of strengths and benefits, strategic planning puts analysis ahead of relationship building. Therein it appears to put the decision-making upfront – often during a defined time-limited window for completing the process. Identifying stakeholders willing to champion elements of the plan, promoting collaboration, and taking steps to secure buy in and promote sustainability are often addressed within the planning – but are typically of a secondary nature. As a result, it could be said that strategic planning is more capable of *quickly creating a plan* than other approaches might be.

---

## Perceived Benefits of Professional Learning Communities

According to Martin-Kneip (2008, p. 9), instead of planning ways to make schools *teacher-proof*, a chief strength of PLCs is their ability to draw from the talents and expertise of professionals on hand. Instead of directly establishing a goal for improved student learning, advocates for PLCs would offer that “learning communities increase teachers’ learning, and that in turn translates into increased student learning.” Beyond this, Martin-Kneip (2008) cited ownership and continuity as primary strengths and positive outcomes from this approach. She did so while noting that consultants and external service providers common to other

approaches do not stay to ensure the outcomes of their work and that in addition to this, frequently, school administrators do not make extended stays either.

## Critical Perspectives

Professional learning communities (PLCs) are defined by the composition of their groups or “communities.” PLCs also tend to be established within the school setting and tend not to link well with other outside stakeholders. This common gap can limit the reach of PLC influences outside the immediate work setting. In contrast, strategic planning has long seemed to possess a proven advantage in its ability to tap representative stakeholders from various settings and achieve crossover into the greater community and the business sector.

While this appears to be a clear strength, the advantage it holds is often as fleeting as the time it takes to develop the strategic plan. Many planning events ultimately seek champions to advance the elements of the team’s work. However, experience has demonstrated that there can be severe limitations to the excitement and investment this approach is able to generate outside of the “inner circle” that would likely volunteer to produce a cadre of champions.

A significant limitation of strategic planning – perhaps the greatest – is its reliance on *buy in* to bring the plan to fruition. Per Hughes and Davidson (2020), *buy in* as it applies to strategic planning and other managerial activities describes both a method and a form of motivation for involving others in attempted change. “All too often ‘securing buy in’ is really only at best the act of achieving weak, perhaps passive and quite possibly temporary acceptance of a proposal or initiative – or yet another mandate” (Hughes & Davidson, 2020, p. 23). Instead of involving people in a way that enables them to invest their insights and talents up front and over time, the work has mostly already been decided and completed. Hence the request being made from staff is really only for *buy in*.

In the immediate comparison between popular approaches, strategic planning suffers significantly because the process is more like an event where a select group of people designs the end product for everyone else. In contrast, PLCs are not about *buy in*, but rather about involvement and shared investment in a challenge or project from the very start – and over time. When, as a matter of practice, we involve people only for their approval, *buy in* does not result in sustainable solutions the way it does with investment (Hughes & Davidson, 2020).

According to Fullan (2014), efforts to promote transformative leadership styles have been hampered by limited staff capacity and investment. That capacity development is the *something extra* that is lacking, and harnessing it starts with ensuring involvement and investment (Hughes & Davidson, 2020) in ways that strategic planning does not begin to allow for. While PLCs might appear to have the upper hand in overcoming *buy in*, there are limitations to this approach as well; and the years following No Child Left Behind seemed to expose several of them.

## Following No Child Left Behind

The implementation of No Child Left Behind (NCLB) and its punitive approach to school improvement fortified structuralism, compliance, and accountability (Hughes & Davidson, 2020; Popham, 2005). As will be discussed, these developments arguably benefitted strategic planning approaches. Strategic planning's competitors did not disappear during this time, though the value placed on critical thinking through research carried out across the professional literature and within the work setting did diminish (Hughes et al., 2019).

Similar to the preceding segment and the time frame it represents, there was little in the way of organized modification to the strategic planning model – which stayed true to what was working. Professional Learning Communities, by comparison, benefitted from a bit more formal and unified approach to the dissemination of the approach. With neither process experiencing much change, this segment is again primarily a reflection of the times and a reflection of educational environments they spurred. When they were initially coming into their own, pre- NCLB, the approaches' strengths were compared. Having both weathered the NCLB storm, an examination of the approaches comparable weaknesses is shared in this section.

## Facts

Neither strategic planning nor professional learning communities have changed much over time, perhaps because they both have marketed strengths. Those who advance the professional learning communities approach expanded their efforts to promote the model as well as train within it and offer continuing professional development along with public relations support. Strategic planning is certainly not without its advocates, sponsors, and vendors. They, too, work actively to tie the approach to the leading theorists mentioned in an earlier section.

Arguably, PLCs have improved their standing through a more united promotional effort organized by one major vendor that conducts regional and annual meetings primarily for educators. One motivational question that emerges from the challenging times following NCLB is whether a changing society would be more responsive to advertising and self-promotion or would be more interested in going with more robust results when selecting an improvement vehicle.

It can be argued that the years leading up to the NCLB legislation likely favored the rational-structural PLC paradigm in many ways. The technology was new. Society and wealth were expanding and following a more entrepreneurial path. Following NCLB, however, the need for formally documented school improvement plans and accountability likely favored strategic planning in as much as *school improvement plans* widely employed from state to state during the past 20 years or more tend to mirror the structure and appearance of strategic planning tools and summaries (Doss et al., 2020).

---

## Criticisms for Implementing Strategic Planning

Over 25 years ago, Mintzberg (1994) leveled multiple criticisms toward strategic planning as it was carried out at that time. The first fundamental flaw he identified was tied to Frederick Taylor's contention that there is one best way to do something and that proper planning will always realize that for the organization. Continued evidence of flawed thinking was the common assumption that commitment at the top of an organization will be sufficient to deliver commitment across the entire organization. Finally, and stemming from the last limitation, it is a centralized process where communication efforts are consistently directed from the top toward the bottom of the organization, instead of through collaborative participation and decision-making (Mintzberg, 1994).

Though chiefly an advocate for the approach, McREL International has acknowledged the behaviorist leanings being imposed on schools and educators (Doss et al., 2020). Instead of focusing on future learning strategies, they contended that schools focus on addressing existing behaviors. Further, they indicated that too often, strategic plans have little meaning and serve primarily as a means to record and broadcast decisions that were already made (Doss et al., 2020). Offering that strategic planning done poorly probably creates more complexity than it eliminates, they acknowledged that educators are so intent on *what* they are supposed to address that they overlook *how* to best go about change (Doss et al., 2020).

According to one veteran and progressive planning facilitator, many schools are largely lacking the resources to do planning well (B. Miles, personal communication, July 15, 2020). For his part, Miles offers organizations the option to have him facilitate plan development, or he can train them to do so themselves. There is even the option to combine the two approaches. Though the structuring of costs and service options make improved facilitation possible, schools are often closed to changes in approach. Often, they opt to stick with the same outside facilitator whose only claim to expertise is having been a participant in another district where someone else facilitated the process the very same way. With conventional approaches like this being employed, no wonder one plan often looks like a *photocopy* of any other.

---

## Criticisms for Implementing Professional Learning Communities

The literature on professional learning committees is replete with favorable reviews, but there are also inherent challenges that the approach needs to overcome. According to Marin-Kneip (2008), it is not realistic to just assume an organization is ready to successfully implement a PLC just because that is leadership's preferred direction. Success is dependent on the dispositions of staff and the organization's capacity to work within the PLC paradigm. Hughes (2000, 2014) advocated on behalf of strategically hiring change-friendly staff with PLCs in mind, but remained critical of the haphazard hiring approach in place within education (Hughes, 2018). Successful collaboration is not as easy as assigning a team. As noted by Stewart (2014, p. 28), "if members of a learning group do not feel comfortable together, they

may not be able to offer or receive feedback in a constructive manner.” Further, if they lack insight into their roles or collaboration in general, it only limits the cohesion of the group.

These considerations speak to the need for organizational capacity. There is no PLC that will work effectively if there is insufficient time and support for collaboration. Further, especially considering the perceived freedom of the PLC process and the time involved, staff needs ongoing support with direction, access to assessments, and even planning tools in order to maintain their focus (Martin-Kneip, 2008, Stewart, 2014). Professional learning communities are often sought out and implemented in educational settings because of their heralded accomplishments in other locations – but it takes more than a powerful idea to garner the success being sought after.

## Critical Perspectives

Strategic planning is the focus of this chapter. Professional learning communities have been included in the analysis to offer a contrast through which to view strategic planning’s approach and standing in education. This comparison extends to include dissemination efforts. Ironically Hughes (2020) has suggested that more recent training for PLCs has come to resemble strategic planning more and more as result of the increased emphasis being placed upon terminology and methodology. Dissemination has been an active area for PLCs as will be detailed next.

Websites of the likes of ALLTHINGSPLC sponsored by Solution Tree do more than inform; they market the approach and include evidence of success as well as provide testimonial content. In creating an online community, they are drawing on strengths inherent within the PLC approach, and appear to have a better coordinated national promotional campaign in place than the more loosely defined collection of strategic planning resources which are less likely to specialize in education.

The PLC dissemination practices and promotional strategy may offer particular advantages, but strategic planning has very likely benefitted more from the prevailing national education mentality following NCLB. As documented by Hughes and Davidson (2020) and expressed by Popham (2005), education has been living through the *age of compliance* ever since 2001. Comparatively speaking, PLCs stress the appreciation and application of local teacher insights and abilities (Martin-Kneip, 2008). In contrast, strategic planning practices draw from a more removed set of sources, often including mandates that have been handed down to schools. Doss et al. (2020) recently spoke to the 20-year period during which school improvement plans have been in place. As they celebrated the approach, the time frame they referenced was clearly post-NCLB. The plans were mainly outputs from strategic planning – or at the very least remarkably close to the same thing.

Whereas PLCs can take time for the community to arrive at the agreed-upon objective, there is an individual beauty to behold in the simplicity of completing a strategic plan. This feature is especially apparent when the purported local *vision* centers around implementing a mandate or researched program that the district is

already expected to adopt. Hughes (2020) identified just such an outcome and indicated that the local governing board subsequently allowed these mandates to be elevated to a position of *district-wide preeminence*. Employees never accepted the plan as being authentic or legitimate, but it was completed and on record. It was also difficult to amend or revise because the upper administration served as champions and realized an increase in prestige and personal power as a result. The plan allowed them to manage the district without question, and they were not willing, individually or collectively, to let go of the advantage they derived from it.

To be fair to the bigger picture – ahead of focusing on the future of strategic planning – the following needs to be said. PLCs are being implemented across the United States, but as is normally the case are only as good as the people responsible for leading them. Sometimes they are being leveraged in name only. Teachers have often shared the perspective that PLCs might be little more than the new term for something they were doing right along (E. Frey, personal conversation, July 22, 2020).

An especially concerning lapse in leadership is evidenced through the example of a talented young teacher who left their dream position and elected to drive over an hour each way – each day – to their new employer. When asked why a person would leave one of the most acclaimed PLC school districts in the state the response was that appearances can be deceiving. Administrators in said location had regularly told this teacher and others to keep their thoughts to themselves – once the doors were closed.

PLCs are designed and described to be dependent on their people and their talents for success. Some (Doss et al., 2020) would continue to emphasize process over people. Practice has demonstrated, however, regardless of the approach to school improvement, success is always dependent on its people (Hughes & Davidson, 2020). Recognizing this underlying truth is critical to engaging people in supporting success rather than weakly accepting the latest ten-minute fix that will disappear by the time the next school year starts. Embracing the human side of leadership (Evans, 1996), developing trust (Davidson & Hughes, 2019; Davidson & Hughes, 2020), and establishing credibility (Hughes & Davidson, 2020) are the necessary underlying ingredients for sustainable school success. Failing to develop people and their capacity is the reason transformational approaches to leadership do not succeed, according to Fullan (2014). The outcomes are not dependent on whether a school went with strategic planning or PLC.

---

## **Retain, Revise, or Retire?**

This section considers multiple potentialities for strategic planning in education, and details multiple reasons for possible change. Earlier sections drew PLCs more directly into comparisons with strategic planning for analytical purposes. In this section, strategic planning and its future are exclusively considered within a broader range of existing and alternative options.

## Facts

To reorient the critical perspectives discussion that follows, a summary of the facts presented in this chapter reveal:

- Strategic Planning and PLCs can both be successful if carried out effectively.
- PLCs start with working relationships and eventually lead to the development of a direction, a plan, and specifics such as evaluation parameters.
- Strategic plans start with planning elements and components, and are eventually shared across the organization over time – typically in a top-down manner.
- Schools are complex social organizations that strategic planning may not always engage effectively.
- Schools are also dominated by state and federal government, meaning their choices tend to be more about how to implement a mandate than they are about charting their unique direction.
- The world is changing, and every year schools are facing additional challenges along with increased complexity (Hughes, 2014; Hughes, 2019; Miller, 2018).
- By all accounts, it appears that the main strengths of one approach represent the primary weakness of the other.

## Critical Perspectives

What does the future hold for strategic planning? Does it continue as it has for the past 50–100 years? Does it somehow adapt either in some large-scale sense or perhaps even at more local levels? Or, does it go away and enjoy a well-deserved retirement? These three futures will be the focus of speculation that completes this section.

## Too Soon to Retire

Strategic planning should not retire – and there is little chance it will go away. The approach continues to be emphasized in administrator training and aligns well with standards and mandates. Those are not going to disappear either. Further, its quick turnaround time for developing a *plan* is often viewed as being advantageous. Strategic planning suggests precision and goes well with *data*. Happily, it is also usually possible for smaller schools (of which there are many) to find a retired administrator who went through the process and is willing to attempt to duplicate the process for them at a reasonable cost. This type of facilitation could very likely result in the creation of a near duplicate or *photocopy* of plans from surrounding communities. Whereas Rick DuFour would lead participants from PLC training in reciting the near-identical language in every plan, having a predictable outcome and something the *boss wants* may actually be desirable, according to Brazer, Rich, and Ross (2010).

## Retain as Is

This option represents the most likely reality for the foreseeable future. Many of the considerations that justify the *status quo* were just described and do not need to be repeated. Added to this, a modification could diminish the proven appeal. It would likely make it more difficult to find a low-cost facilitator who can replicate the experience precisely the way they were locally lead through theirs. Past attempts to locate facilitators willing to embrace change have also not met with success.

Still, there is an opportunity to improve practice without losing the proven process, if schools would move beyond the photocopy approach of utilizing a nearby administrator to reproduce their process and likely their product as well. Reaching out to trained and more highly qualified professionals may increase the cost of the process, and that in turn could violate the budget constraints of many smaller districts (B. Miles, personal conversation, July 15, 2020), but is not a multi-year plan for a multi-million-dollar operation worth the type of investment that could lead to better results? There are multiple reasons that improvement and updating should be considered.

## Rationale for Revision

In *Leading Beautifully*, English and Ehrich (2016) described standardization efforts as often being overly managerial in approach and potentially champions of stagnation. Standards fit that pattern (English, 2012) as can strategic planning (Brazer et al., 2010; Mintzberg, 1994). Educators work in a changing world and regularly face increasing challenges and expanding complexity (Hughes, 2014; Hughes & Davidson, 2020; Miller, 2018). Added to this, the deterioration of our societal fabric is introducing cultural conflict into our lives and in our schools (Hughes, 2019). Schools need to move beyond a status quo planning reality where *vision* is often actually code for an existing *mandate*. Instead of stagnation, education needs innovation, inspiration, and investment to result from our planning – whatever form or shape that may take.

During the challenging times schools have experienced, standardization is contributing to failures to effectively communicate with families (Berklan & Hughes, 2020). The assumed *standard* financial limitations linked with teacher attrition limit our ability even to consider the glaring impacts of classroom behavior disruptions (Ramos & Hughes, 2020). Schools hire according to position and paper because that *standard* approach is all administrators know (Hughes, 2014; Hughes, 2018). Building-level administrative ownership for special education remains almost nonexistent in places because of the *standard* emphasis placed on compliance rather than collaboration and investment (Hughes et al. (2020). Finally, legal determinants of social equity are challenged and worked around daily (Hughes, 2019). As these issues continue and expand, is it realistic to contend strategic planning is keeping up with these issues?

Schlechty (1990) said there were those leaders who were music conductors. They stood in front and demanded order and precision from the moment the music started. Symphonies are beautiful, timeless *practiced* performances that require such a conductor to maximize their presentation. Schools are unrehearsed social settings that are always works in progress (Evans, 1996). In these settings, leaders and their teams may be better suited, at times, to function more like jazz musicians (Schlechty, 1990), where everyone knows their part and builds off the rest of the musicians they are collaborating with.

Oftentimes the innovation and improvisation on display in our schools is nothing short of inspiring. Sometimes it threatens the status quo and can be threatening to administrators as well (Hughes, 2020). There are also times when success would have been more certain had *someone* stood up and contributed their zest amid organized school improvement efforts. Dueppen and Hughes (2018) documented just such a need, recalling how a school district with a state mandate for improvement and national school improvement resources at their disposal struggled to sustain improvement because of minimal investment from upper-level leadership or building-level staff.

The process employed and the resulting plan put into place were organized, detailed, and robust. There was just no real clear ownership or investment to go along with it. Building administrators signed off on ownership, as did much of upper-level administration. This may have been done in order to foster a collaborative tone. No one knows because it just *happened*. However, teachers rarely knew who was leading the endeavor, and stakeholders at all levels regularly perceived the external consultants to be the leaders (Dueppen & Hughes, 2018). When the planning was finished and rolled out, and the consultants left – momentum started to decline.

Goldsmith (2012) spoke to the need to create a *culture of innovation*. That does not always happen. Shortcomings like these are standard features of strategic planning. During the 1980s and 1990s, there was less reason for concern about this deficit. For the past 20 years, NCLB and the resulting compliance mentality (Popham, 2005) have dominated schools, their approaches to planning, and their strategic outcomes. In the face of escalating challenges, Mintrop and Zumpe (2019) have stressed the need for a return of framing school improvement efforts in a more adaptive problem-solving style. Bellei, Vanni, Valenzuela, and Contreras (2015) stressed that the practice of planning needs to evolve to better address the complexities schools face and the extent to which teachers are genuinely involved. Whether revision ever takes place, there is an evident need for proponents of strategic planning to consider it strongly.

Chukwumah (2015), Mintrop and Zumpe (2019), as well as Supovitz, D’Auria, and Spillane (2019), each suggest that there are possible opportunities to unite parts of existing paradigms. Strategic thinking or scenario planning (Kahane, 2012) seem to be natural extensions of the traditional planning approach. While modifications might help advance a revival for strategic planning, Bellei et al. (2015) strongly endorsed that complete and lasting success could not be expected without forming effective and invested professional teaching teams in the equation. That approach is not the top-down dissemination of ideas and practices that result from strategic planning efforts. It is more indicative of a commitment to building capacity that is more commonly found with PLCs (Martin-Kneip, 2008).

## Conclusion and Reflections

Strategic planning is a proven and valued approach and paradigm that could be enhanced to become better able to address intensifying future concerns; and American schools face an abundance of vital challenges including equity issues, social justice, and escalating cultural conflict. At a formal academic or even scholarly level, it is unlikely that its many advocates would attempt to alter an approach that has won such acclaim. At the level of a *corporate-level provider*, there is continued emphasis on promoting strategic planning's core principles, and little apparent interest in addressing challenges known to exist in socially oriented organizations.

At a somewhat lower level, there are already private consultants who attempt to bridge the gaps that result from applying this highly structured practice in a social context. One example called a *chainsaw approach* seeks to engage a broader segment of stakeholders than would typically only be accessed during a traditional school-driven event (B. Miles, personal conversation, July 15, 2020). This adaptation emphasizes ongoing outreach that broadens input and allows stakeholders to be engaged beyond the initial steps when a plan is articulated. The approach keeps people involved, and has had success when implemented as introduced.

Though innovation is possible, developments like the *chainsaw approach* may be overlooked in favor of a more predictable *photocopy* approach. This style of planning can be very effective at maintaining the status quo while promoting the appearance of innovation. In an institution that faces government domination and has a culture of compliance, a quick and agreeable planning approach that aligns well with government forms and reporting requirements may not be such a bad thing to follow.

Strategic planning can be criticized for overreaching beyond its intended purpose, and just as frequently for underperforming when results are compiled. Strategic planning can also be as good as anyone wants it to be. For organizations that want to accomplish something more, added emphasis on investment vs buy in would go a long way to introduce the benefits of a strategic-systemic approach like a professional learning community offers. Schools are often lacking answers for emerging equity and social justice challenges that administrators are typically not trained to contend with (Hughes, 2019). Done the right way – with adaptation to include advantages strategic planning has never pursued, an updated and revised version of this popular approach stands to provide a path, a process, and a product that can work.

## Abstract

LGBTQ+ leadership and issues within education contexts recall a history of progress, struggle, and sites of possibility. On the coattails of historic yet precarious gains in rights for LGBTQ people and communities, educational practices, policies, and leadership are ripe spaces for advancing change. By offering a brief history of LGBTQ+ issues in educational research and leadership, this chapter specifically illuminates dynamic shifts in the vocabulary and praxis, alongside the underrecognized contributions of LGBTQ+ scholars and knowledges in shaping pedagogy and leadership. Brief biographical sketches and descriptions of the major contributions to the fields of education studies and education leadership are offered as a way to highlight some of the specific ways in which LGBTQ+ knowledge has innovated education and point toward future areas of growth in theory and practice.

## Keywords

Queer studies in education · LGBTQ studies · Leadership · Sexuality · Intersectionality · Queer of color critique · Queer theory · Black queer theory · Gender non-conforming

### **The Field of Memory**

For much of the twentieth century, Lesbian, Gay, Bisexual, Transgender, and Queer (LGBTQ+) scholarship and research consisted of psychological studies of disorder. Even the acronym and nomenclature of LGBTQ+ is a more contemporary understanding of the spectrum of identities related to sexuality and gender within society broadly, and the field of education leadership more specifically. Earlier iterations of the acronym included LGB (i.e., Lesbian, Gay, Bisexual), which broadened the complexity of the catch-all phrase, *gay*. Often signaling privileged identities, *gay* referenced white, cisgender, non-heterosexual identities usually linked to men. Within academic research, terms such as sexual deviants, sexual minority families, sexual minority youth, and sexual orientation disturbance characterized much of this work (Szalacha, 2003).

### **The Field of Presence**

Recent trends in the field, although still marked by studies of disorder and deviancy, have expanded beyond the documentation of LGBTQ+ victimization and death by suicide (Hershberger & D'Augelli, 1995; Savin-Williams, 1994) and normative LGBTQ youth development (Savin-Williams, 2001), to thinking about the ways in which sexuality is a part of the overt and hidden curricula of schools (Lipkin, 1999). Further strides have been made to decenter white, hegemonic gender and sexuality to consider how issues of race, class, gender, and sexuality impact the experiences of youth in general and LGBTQ+ youth specifically (Kumashiro, 1999, 2003; McCreedy, 2010; Woolley, 2019). In this way, the field has broadened to think about an ecosystem and the interconnectivity of LGBTQ+ experiences within various schooling sites, and the educational contexts for administrators, teachers, staff, students, and their respective communities.

A variety of communities across the gender and sexualities field now recognize LGBTQ+ as an umbrella term in which the LGBTQ references Lesbian, Gay, Bisexual, Transgender, 2/Two Spirit, Transsexual, and Queer/Questioning, and the + encompasses Asexual, Allies, Agender, Gender Queer, Bigender, Gender Variant, Intersex, Pansexual, Pangender, and other groups. Similarly, the term *queer* is sometimes used as an interchangeable term for gay, lesbian, bisexual, or transgender (Somerville, 2007). Within political and theoretical contexts and analyses, *queer* has also become a way to denaturalize categories and reveal them as “socially and historically constructed identities that have often worked to establish and police the line between the ‘normal’ and ‘abnormal’” (Somerville, 2007, p. 187).

### **The Field of Concomitance**

Queer studies in education has flourished as queer theory and queer studies have grown, borrowing terms and concepts such as epistemology of the closet (Sedgwick, 1990), heteronormativity (Warner, 1991), and homonormativity (Duggan, 2002) from the study of sexuality beyond education to apply to schools (DesRoches & Sweet, 2007; Riggs & Due, 2013). Adapting Halperin (1989), scholars in education have sought to uncover the ways in which heterosexuality and homosexuality are not biologically structured but are rather historically and culturally produced. Further,

education researchers have helped to illuminate the ways that sexuality and gender are produced and reproduced through educative practices and spaces.

Other concepts, theories, and big ideas that began outside the field but have taken root within the larger field of education, and in educational leadership specifically, include queer of color critique (Brockenbrough, 2013; Ferguson, 2004; Hong & Ferguson, 2011; Muñoz, 1999), queer theory (Halperin, 1989; Jagose, 1996; Somerville, 2007), Black queer theory (Cohen, 1997; Johnson & Henderson, 2005), intersectionality (Crenshaw, 1991), women of color feminisms (Moraga & Anzaldúa, 1983), and Black feminist thought (Collins, 1995, 2004; hooks, 2000, 2004). Each of these concepts have broadened analyses within the field in their own way, providing multifocal and layered approaches to illuminate how race, gender, sexuality, class, and citizenship impact the lives of youth, faculty, and staff, and inform policy and curriculum. Moreover, they provide important pathways into working toward the eradication of LGBTQ+ bullying and violence while offering a more nuanced understanding of the lives of understudied groups such as LGBTQ+ youth of color, trans youth, and bisexual youth. These ideas have helped to unsettle the normative logics of sexuality, gender, and identity in order to understand the ways that power and sexuality operationalize within educational settings, policy, and practice, and how scholars might move toward salient queertiques of educational leadership and policy (Diem & Young, 2015) while also queer(y)ing work (Duarte, 2020a; Leonardi, 2017; Lugg & Murphy, 2014; O'Malley & Long, 2017; Martino, Airtón, Kuhl, & Cumming-Potvin, 2019).

### **Discontinuities and Ruptures**

Delinking sexual acts from sexual identities, the field now wrestles with the ways that sexuality orders lives. Bourgeoning concentrations in the field of queer studies in education have attempted to understand how social institutions such as schools reify hegemonic performances of binary gender (i.e., femininity, masculinity) and privilege, and normalize heteronormativity within the day-to-day functions of schooling and within educational policy and research (Woolley, 2020). To that end, studies and policies within the field take up the ideas of safe school climate, victimization of LGBTQ students, intersections of race, class, gender, and sexual orientation, queer pedagogy, challenging heterosexism, cisgenderism, and heteronormativity, sexual identity, coming out/inviting in, homonormativity, non-normativity, and herstories.

Each of the aforementioned ideas and issues have changed the landscape of education, leadership development, teacher preparation, and policy. For example, educators and educational leaders now believe they have a social responsibility to provide an environment that supports all students, including those who are lesbian, gay, bisexual, transgender, queer, questioning, or intersex. This has meant shifting ideas about identity, representation, and inclusion from thinking about how LGBTQ+ people should declare their sexuality and gender identity as an act of fostering inclusion within educational spaces. Confronting this idea is the notion of *inviting in* rather than *coming out*. *Inviting in* works against the once-used terminology of “the closet” or “coming out,” creating a tension with current field realities, as

both are held simultaneously. As Duarte (2020b) illustrated, within an increasingly homophobic educational landscape and society that also holds newer rights and protections for some LGBTQ+ people, educators and educational leaders such as principals find “being out” on the job to be challenging and might require concealing, denying, or selectively choosing (inviting in) who is aware of their sexuality. This shift in how sexuality, gender, and inclusion are understood within the field is also reflected in Alston and McClellan’s (2011) work to think about *herstories*, changing how the field thinks about women and LGBTQ+ leadership and contributions to education and educational leadership more specifically.

### Critical Assumptions

Intersectional analyses. Sexuality orders the life chances and life experiences of all, regardless of one’s (hetero)sexual identity or performance. Heteronormativity. Hegemonic gender. Hegemonic masculinity. Hegemonic femininity. Racialized sexuality and gender. Radical potential of queer. Schools as sites that reproduce power. State and capitalist power are mediated through educative practices. Need to expand queer subject in education. Need to centralize people of color and specifically youth in queer politics and theory. Collectivity and the awareness of shared position of marginality not rooted in individual rights or an affiliation with homogenous identities.

---

## Introduction

For much of the twentieth century, LGBTQ research and scholarship classified homosexuality and gender nonconformity as disorders (Szalacha, 2003). In 1973, homosexuality was removed from the DSM-IV as a mental disorder, but was replaced by the term, “sexual orientation disturbance” (Drescher, 2015). Although a distinct field of study, educational leadership is impacted and informed by other sociocultural institutions, forces, and practices. As the guiding handbook for school social workers, psychologists, and other mental health and social welfare practitioners, the discourse of homosexuality as a disorder has had far-reaching impacts in education. Although the language has changed and terms such as “sexual deviants” are outdated, the ideologies that undergirded such terminology still linger in society and educational practices. We can see these impacts within the field; as Szalacha (2003) illustrated, LGBTQ research and scholarship within education prior to the 1970s was “dominated by psychological studies of disorder” (p. 80). Since then, there have been a proliferation of studies to examine the hidden and explicit curricular influences in schools with regards to sexuality (Lipkin, 1999; McCreedy, 2010; Sears, 1999), the experiences of LGBTQ+ educators (Glasgow & Murphy, 1999), and how race, class, gender, and sexuality impact students and educational praxis (Kumashiro, 1999).

In practice, theory, epistemology, and research, the field has shifted to recognize the hostilities that LGBTQ+ youth and communities experience in educational settings, and scholars examine what can be done to enhance learning environments and experiences by updating policy and preparing educators and educational leaders at all levels. For example, in 2016, AERA Division A: Administration, Organization,

and Leadership hosted a conversation called, “Connect Series: Queer Leadership.” Panelists highlighted the complex evolution of language, queer theory, and praxis across education and within educational leadership. One of the evolutions noted is the reality that the language used to talk about sexuality and gender has evolved. Language can be a contested landscape, as some find the evolution of language within academic literature to be overly complex and devoid of practical application and knowledge, while others see a utility in queer theory in education as a means to unsettle the ways that educational institutions and leaders reify hegemonic ideologies and essentialist notions of gender and sexuality.

It is within this rich landscape of language and contestation that the field is currently situated. The evolution of language is one which encourages social justice leadership (Gooden & Dantley, 2012; O’Malley & Capper, 2015) as a means to fully embrace LGBTQ+ identities and themes into teacher and principal preparation programs, school policies and praxis, and the cultural fabric of schools and larger US society. Perhaps surprisingly, LGBTQ+ experience has still been noted as absent from leadership preparation literature and programs (O’Malley & Capper, 2015). Other absences abound, inclusive of thinking about women’s leadership and the role that gender plays in educational leadership, theory, and practices, as well as thinking about the intersections of race, gender, and sexuality simultaneously and explicitly in regard to practice, preparation programs, theory, and policy. This chapter takes up some of these absences by examining the work and scholarship of LGBTQ+ leaders in education.

---

## **Portraits of Change and Possibility: Honoring Queeroes of Praxis and Scholarship**

Below are three brief portraits of LGBTQ+ leaders in education. This is not meant to be an exhaustive list of leaders and their substantive contributions, but rather an opportunity to highlight the ways in which Educational Leadership can grow in the future. In the tradition of *them*, a news outlet and commentary resource from the perspective of LGBTQ+ people, this entry names these leaders, these queer heroes, “Queeroes.” The name is fitting because each of the queeroes inhabit a “both/and” stance for deploying queer politics and analyses that highlight a shifting of power for LGBTQ+-identified people, while also pushing against identity as the coalescing mechanism for social change. In their own ways, each of these leaders embody the radical potential of queer politics, hinting to ways educators and educational leaders can transform their practices and the field. As Cathy Cohen highlighted, the radical potential of queer illuminates how,

individuals like Michael Brown and Rekia Boyd are important queer subjects not because of their sexual practice, identity, or performance but because they, as well as other young and poor folks of color, operate in the world as queer subjects: the targets of racial normalizing projects intent on pathologizing them across the dimensions of race, class, gender, and sexuality, simultaneously making them into deviants while normalizing their degradation and marginalization until it becomes what we expect – the norm – until it becomes something that we no longer pay attention to. (Cohen, 2019, p. 142).

It is precisely the shifting of queer subjects and queer issues in education that becomes necessary as scholars continue to grapple with how to curb and reframe school bullying and safety (Payne & Smith, 2013), and broaden the life chances and life opportunities of minoritized students across race, sexuality, gender, class, and ethnicity as mediated by educational practices and spaces. In order to actualize the highest ideals of a democratic, accessible, and liberatory education system, educators must analyze the ways that normalizing ideologies across race, sexuality, class, and gender order people's lives. The portraits below identify ways the field can begin to probe at an educational future that resists normalizing premature death and violence in all of its forms – epistemic, material, discursive, economic, and physical.

Hailing from the northwestern United States, Dennis Lynn Carlson was born on January 10, 1946 to a working-class family in Washington State. A full professor of Curriculum, Cultural Studies of Education, and the Social Foundations of Education at Miami University, Carlson was a colleague, pedagogue, and engaged citizen on his campus and in his community. Survived by a community of family, friends, and his partner of 37 years, Kent Peterson, Carlson's scholarly contributions crosscut the geographic and academic landscapes he encountered and actively built. His enduring sense of place, to make community where he was and work within the cultural contours, histories, and knowledge where he was situated remained a central lens throughout his career and life (Knight Abowitz, 2015). Described as an "idealist and firmly committed to grounding educational work in the highest principles of justice, democracy, and respect for students," Dennis Carlson's pedagogy and scholarship created indelible impacts on his students and the field of educational leadership broadly (Knight Abowitz, 2015, p. 408).

In the wake of his absence, Carlson's legacy lives on through his scholarship, which made significant contributions to the fields of educational leadership and curriculum, cultural, and sexuality studies. This chapter will illuminate his work within sexuality studies. Of note is his text, *Gender and Sexualities in Education* (2013), co-edited with Elizabeth J. Meyer. In the reader, they demonstrated the ways that gender, sexuality, and difference are constructed through educative processes inclusive of schooling. Further, the collection argued that educators and educational

institutions, whether intentionally or not, actively shape gender and sexuality by normalizing hegemonic identities (e.g., masculinity, femininity, cisgender identities) and disciplining difference. These logics are imbedded within the hidden and overt curriculum (Meyers & Carlson, 2013), manifest within teacher and leadership preparation programs (Szalacha, 2003), and demonstrate areas of growth for the field to actualize educational practices and spaces that are liberatory for all and do not replicate structures of domination. In his chapter within the reader, Carlson (2013) argued for expanding discourses related to anti-bullying and contemporary understandings of the dynamics of sexuality, gender, and (homophobic) violence.

Continuing to think about the ways sexuality and violence live within curricular practices and are ingrained in the landscape of education, Carlson (2014) offered a historic tracing of these issues alongside contemporary manifestations in his chapter within the *Critical Youth Studies Reader* entitled, “‘It Gets Better’: Queer Youth and the History of the ‘Problem of the Homosexual’ in Public Education.” By offering a critique of the 2010 “It Gets Better” campaign organized by LGBTQ activist Dan Savage in the aftermath of a series of publicized LGBTQ+ deaths by suicide and a historicization of adolescent (homo)sexuality within education, Carlson illuminated how heteronormativity and homophobia as embodied in school culture and curricula actively produce bullying. Additionally, he outlined the current failures of anti-bullying and anti-homophobia discourses to adequately address these issues (Carlson, 2014).

As highlighted previously within this chapter, what is salient about Carlson’s scholarship in the twenty-first century enterprise of American education and educational leadership is his attention to the ways that the heteronormative habitus of schooling impacts all students and staff regardless of their sexuality and needs to be transformed in order for schools to “get better” for LGBTQ+ youth and youth of color, and for all youth generally. This demarcates a charge for current and future educators and educational leaders to consider the ways that they might actively help “young people reflect on the heteronormative rituals and beliefs of their everyday lives in schools and other sites in the community, to reconstruct the habitus of schooling through diverse forms of self-reflection, dialogue, resistance, and collective action” (Carlson, 2014, p. 142).

Judy A. Alston is a reverend, professor, author, and educational leader. A proud southerner by birth, Alston was born in Charleston, South Carolina. Describing her work as a “Love Supreme,” riffing off John Coltrane’s musical masterpiece and “spiritual declaration,” Alston integrates the epistemic knowledge of Black musicality, culture, and leadership to apply to and ultimately challenge the anti-Black, heteronormative, and patriarchal impulses of the fields of educational leadership and administration (Westervelt, 2012). A pathfinder and barrier breaker, Alston became the first Black woman to hold the title of full professor at Ashland University in the history of the institution in 2010 (UCEA, 2018). To date, she continues to be the only Black woman to hold this title at the university.

In 2018, Alston was awarded the University Council for Educational Administration’s (UCEA) Hidden Figures Award, which recognizes foundational scholars and trailblazers within education who have disrupted the status quo, broken glass ceilings, and opened doors for others (UCEA, 2018). During her acceptance speech, Alston summarized her work as a scholar and person by saying, “For me, my preaching, my teaching, research, and service in the field of educational leadership is the spiritual expression of who and what I am, my faith, my knowledge, and my being”. Her ability to bring together and highlight the whole person within educational leadership is one of the reasons she is listed here as a Queero. Within her scholarship, she illuminates the ways that leadership, pedagogy, educational research, policy, and practice can and should be informed by spirituality and the historic and contemporary contributions of Black women and Black LGBTQ+ individuals’ knowledge and leadership styles (Alston, 2005, 2012, 2015; Alston & McClellan, 2011; Capper et al., 2006). Of note are the ways that her scholarship highlights the need for educational leaders to develop a profound sense of personhood in order to enact systemic change. As Alston noted, leadership is “soul work,” which means that becoming an effective leader requires that an individual knows who they are (Division A Connect Series, 2016). Further, Alston’s work transforms the field by attuning it toward the cataclysmic transformation of oppressive systems of violence, rooted in the individual as they develop a profound sense of self and how that connects to the wellbeing of others and our society in general.

Alston’s work embodies the feminist adage that the personal is political, and subsequently, that the spiritual is political (Alexander, 2006). This is most exemplified within the germinal text, *Herstories: Leading with the Lessons of Black Women Activists* (2011), co-authored with Patrice McClellan. In *Herstories*, Alston and McClellan (2011) argued for Black women’s leadership and knowledge to be centered within the field of educational leadership. In highlighting the unique contributions of Black women to the field, *Herstories* provided a corrective to the erasure of marginalized voices, particularly Black women in the fields of leadership preparation and leadership studies. Often constructed through masculinists and heteronormative lenses, leadership preparation, practice, and research are devoid of the contributions and innovations of Black women and Black LGBTQ+ women.

In examining the leadership of Black women, particularly Black lesbian women such as Barbara Jordan and Audre Lorde, *Herstories* reframed leadership through the subject position and knowledge of Black lesbian women, expanding narrowly held concepts about leadership as well as who and what makes a leader. Shifting

the landscape of leadership, *Herstories* provided values, theories, and methodologies pertinent to leadership rooted in Black women and Black lesbian women, rather than their white, heterosexual, male counterparts. In doing so, her work offers ways to think about the particular contributions of Black women and Black lesbian women, inclusive of their effective leadership strategies, innovation, and the particular leadership models they develop and champion (i.e., transformational leadership, servant leadership, and social justice leadership). Alston's radical vision of the substance of leadership rooted in spirituality, personhood, and holistic individual development, coupled with her attention to undertheorized and understudied contributions of Black women, Black lesbian women, and LGBTQ+ people broadly, expands the fields of Educational Leadership, Educational Administration, and Education, providing fertile ground for our praxis and research to be relevant to and improve the lives and experiences of LGBTQ+ people and their communities.

Tim'm T. West was born in Cincinnati, Ohio but raised in Little Rock and Taylor, Arkansas. Tim'm is a queer hip hop artist, educator, and social justice advocate. Throughout his life, he has shown a consistent dedication to youth of color, specifically LGBTQ+ youth. Utilizing multiple art forms, West has employed his art to explore the contours of Black life, Black history, and Black LGBTQ+ history in particular. This is evident in his career as an educator, queer hip-hop artist, and spoken word poet. A founding member of DeepDickollective (D/DC), established in 1999, West, Juba Kalmaka, and Phillip Attiba Goff used hip hop to complicate conversations related to Blackness, sexuality, and identity, and to respond to HIV/AIDS among Black men (Hix, 2006). Within a context of effective antiviral drugs, the ravaging of the disease within Black and people of color communities, especially LGBTQ+ communities, and a rise in scapegoating language directed toward the “down low” and stoking fears about (Black) men who sleep with men (Cheng, Juhasz, & Shahani, 2020; Snorton, 2014), D/DC's content offered a needed alternative and critique (Wilson, 2007). Queer hip hop pioneers, D/DC intervened into the loss of Black gay men and men who sleep with men to the disease, while also interjecting a very Black and queer voice – actualizing a queer feminist pedagogy – in a genre of music often characterized for its homophobic and misogynistic culture (Pabón & Smalls, 2014).

West's commitment to LGBTQ+ youth and education is not limited to his enactment of queer feminist pedagogy through hip hop and spoken word poetry (Pabón & Smalls, 2014). As the former Director of Youth Programs at Chicago's Center on Halsted – the Midwest's most comprehensive community center for LGBTQ+ people – West continued his educational work around HIV/AIDS, queering Black masculinity, and carving out educultural spaces for LGBTQ people. Covering his work within the gentrified and racially tensed gayborhood where the Halsted Center is located, West is described as someone who uses hip hop as an “unlikely tool to ease the tension between” race and sexuality, creating opportunities for LGBTQ+ youth to turn “vulnerability into something that makes them stronger” (Zarley, 2013). Documented across his discography, his inclusion in numerous LGBTQ anthologies, and through his own body of published poems and activism is a commitment to enhancing the lives of LGBTQ youth, documenting queer histories, and advancing education for LGBTQ+ communities. West's contributions in these areas were acknowledged in 2015 when he was recognized as an LGBTQ Icon (SDGLN Staff, 2015); in 2017 through the Ubuntu Biography Project, a project dedicated to telling “the largely untold stories of LGBTQ men and women of African descent, and to celebrate their remarkable contributions to our world” (Ubuntu Biography Project, 2017); and in 2019 as a Vizazi “Flame” Honoree by the Cincinnati Black Pride organization (Cincinnati Black Pride, 2020).

Drawing upon his teaching experience in K-12 classrooms, higher education, and in community centers, West currently works to advance “safer and braver classrooms” for LGBTQ+ students within pre-K-12 environments and their educators (West, 2021). Championing the idea of Brave Education, West has organized annual conferences for LGBTQ+ educators and their allies to establish what Wargo (2016) called “[q]ulturally sustaining pedagogy” within their classrooms and schools. Held across the United States, these Brave Education Summits foster an environment to engage in deep learning about current LGBTQ+ issues within schools, receive resources to navigate these lived realities, inclusive of but not limited to adapting and expanding curricula to be representative of LGBTQ+ experiences and knowledge, navigating employment issues and discrimination, providing support for parents of LGBTQ+ youth, and being aware of (discriminatory) policies that are unique to particular states and school districts. A #BraveEducator, West is a Queero whose leadership and work inside the classroom and beyond has made an important contribution to the lives of LGBTQ+ youth, educators, educational leaders, and communities.

---

## Conclusion and Reflections

The landscape of LGBT studies within and beyond education has shifted dramatically in the past 30 years. Whether that shift is demarcated in the nomenclature, the field has moved from an emphasis on sexuality and gay men in particular (e.g., LGB

Studies) to include gender and the radical politics borne of (racialized) gender and sexuality oppression (e.g., LGBTQ Studies), to more inclusive names of the fields pushing scholars to think beyond binary gender while incorporating decolonized approaches to the study of sexuality and gender (e.g., LGBTQ+ Studies) and contemporary foci on the ways that racialized sexuality and gender systematically impact all people regardless of their sexuality (e.g., Queer Studies). One of the current ruptures and discontinuities that will continue to unfold is how scholars will grapple with the enduring legacy of racism in the United States, particularly in educational settings. Scholars of sexuality have long traced how processes of racialization were integral to understanding gender and sexuality (Cohen, 1997; Ferguson, 2004; Hong & Ferguson, 2011) and how these processes are regulated through ideological state apparatuses, such as schools (Callier, 2018; Duarte, 2020b; Kumashiro, 2003; McCready, 2010; Rodriguez et al., 2016).

Accordingly, further growth would require contending with more intersectional analyses that understand how these systems of domination not only inform one another and an individual's life experience and access to opportunities, but how these systems are constitutive. That is to say, that understanding sexuality and gender particularly within a US context are predicated upon discourses of race. As the United States struggles with the culmination of a long history of exclusion, denigration, and theft of life, liberty, and the pursuit of happiness, most notably punctuated by the contemporary crises of COVID-19 and the legal and extralegal murder of Black people by police and vigilantes, so too must educational scholars and leaders. Scholars and educational leaders must not only reckon with how educational outcomes are impacted by racialized gender and sexuality, but how educational processes (re)produce and discipline racialized gender and sexuality. Similarly, the areas of queer of color critique, Black queer theory, Black feminism, woman of color feminisms and lesbian women of color feminisms provide theories and methodologies to broaden scholars and educational leaders' toolkits and help in understanding and combating the impacts of these forms of oppression.

Drawing upon the rich legacy of this work and recent (re)turns in the field would ask scholars and educational leaders to decenter U.S.-centric viewpoints. This marks yet another possible rupture. Entangling how the local is also global demonstrates another springboard for future considerations in the field. Strands of this are mirrored within the virtual symposium, "Re-imagining and Redefining Education in Times of COVID and Anti-Blackness," hosted by the Queer of Color Analysis in Education Research Institute (QOCAERI). A convening of prominent education scholars, panelists explored issues of trauma, stigma, violence, and mourning within formal (i.e., schools), nonformal (i.e., community centers), and informal (i.e., everyday practices, social media) educative spaces as they intersect with race, citizenship, sexuality, and the state. Although the overall gathering highlighted fertile ground for educational leaders and the field to further explore, two particular panelists are worth mentioning for the purposes of thinking about the direction of the field. Putting queer of color critique (QOCC) and analysis to work, Ed Brockenbrough offered a way to think about the knowledge circulated within queer of color communities for

knowledge, safety, and culture through digital, counterpublic spaces, prodding education scholars toward justice in globally minded ways. Roland Sintos Coloma analyzed the intersections of racism, xenophobic profiling, and violence in relationship to COVID-19, and urged the dislodgement of the (U.S.) nation-state as the sole unit of investigation within QOCC analyses in order to mobilize a transnational approach to QOCC. Although centered on a particular application of theory – queer of color critique – both Brockenbrough and Coloma demonstrate other directions for the field of educational leadership to explore with regards to educative processes, types of knowledge, forms of leadership, and sites of analysis, as well as a greater adoption and application of queer of color critique.

To forecast a future is to delve further into excavating the complexities of queer life and leadership for all sexual identities across formal and informal educative spaces. For example, how might drag performers be seen as educational leaders through the public performances of drag pedagogy they enact (see Keenan & Mess, 2020)? In what ways are their performances and cultivation of knowledge applicable to the performativity of educational leaders within schooling contexts? Similarly, the field must continue to expand its understanding of anti-queer violence in terms of how homo/transphobic bullying manifests, not just for those who identify or who have yet to identify as LGBTQ+, but also how bullying casts a wider net to discipline and punish nonhegemonic performances of gender and sexuality. Each of the Queeroes discussed in this chapter represent possibilities for the future direction of the field, for educational leadership to embrace expansive notions of LGBTQ+ identities, and for queer analyses that provide intersectional frames to consider processes of queering, the impacts of racialized gender and sexuality within educational structures, cultures, and policies, and global and decolonial possibilities.

## Abstract

Learning is fundamental to our existence. Learning helps to explain the very essence of each individual on this planet – past or present – no matter the race, religion, gender, color, genetic makeup, culture, or country of origin. The ability to learn is the single most important biological feature that explains how and why *H. sapiens* evolved over two million years and, then, came to dominate planet earth. Learning is fundamental to every person's existence every single day, day in, day out, from birth to death. Educators have only recently begun to utilize and apply what science knows about the brain to what we know about using the brain as an instrument of learning. Significantly, the rise of the internet has challenged

### The Field of Memory

Perelman (1992) described the late twentieth century school as an outdated model for carrying out the expectations and requirements of a twenty-first century society. The opening of Perelman's book, *School's Out* (1992), points out the gap between schooling and learning:

Maybe the folks who have been haranguing us to "save our schools" just don't understand that the classroom and teacher have as much place in tomorrow's learning enterprise as the horse and buggy have in modern transportation. Maybe they don't see that for the twenty-first century and beyond, learning is in and school is out. (p. 19)

It is only in the last 100 years that governments have attempted to manage learning as a governmental function for all of the world's children. Make no mistake, organized education accomplished a great deal in the last 100 years. However, there is no illusion that today's bureaucratic on-the-ground and face-to-face schooling is the best society – or the world – can do. Consider that in the last 100 years of bureaucratic education "minimal levels of achievement for all" is an unfulfilled, unmet . . . and, so far, an out of reach goal for every nation on the planet.

### The Field of Presence

The third decade of the twenty-first century is reshaping not just American education, but education across the world. Lynton (1991) wrote that a modern society must look beyond the basic premise of teaching, learning, and socialization as the twenty-first century reason for schooling. He believed schooling was the hub around which economies were built, social reforms were realized, and how communities endured. Lynton, quoting Peter Drucker (1978), claimed "knowledge has become the crucial economic resource. The systematic acquisition of knowledge, that is, organized formal education, has replaced experience-acquired traditionally through apprenticeship—as the foundation for productive capacity and performance" (p. 40).

### The Field of Concomitance

Wenger (2010) described social learning as an environment that one seeks in order to determine an identity. He described a kind of learning that compelled a person to acquire knowledge in order to contribute to one's community.

This meaning-making person is not just a cognitive entity. It is a whole person, with a body, a heart, a brain, relationships, aspirations, all the aspects of human experience, all involved in the negotiation of meaning. The experience of the person in all these aspects is actively constituted, shaped, and interpreted through learning. Learning is not just acquiring skills and information; it is becoming a certain person—a knower in a context where what it means to know is negotiated with respect to the regime of competence of a community. (p. 2)

In the third decade of the twenty-first century, the physical boundaries of education are being erased by technology, software, and the internet. A stronger emphasis upon personal and individualized levels of learning will lift education from a transactional to a transformational institution. The forces bearing down on education are no longer national but international. These international forces will reshape education as we know into a transnational system of learning that better serves the broader global community.

### **Discontinuities and Ruptures**

In the twentieth century, educational organizations approached the transmission of knowledge as an industrial task applied to the education of children. Barnard's (1938) description of the business organization's goal of making production efficient and effective was applied to American education. Teaching was an extension of industry's assembly line process for manufacturing. Students were taught to conform to educational expectations that were applied to everyone in the same way. Much as manufacturing organizations produced a product, education created a system of teaching and learning based upon mass production and factory assembly. Children were placed in classes of 30 students and taught within a system that sorted and selected them into tracks according to an ability to perform on exams that focused learning around simple recitation and recall of knowledge. It was, and is, a bureaucratic system of learning taken right out of the manual for twentieth century factory mass production. Bureaucratic learning was, and is, the anomaly. It is only in the last 200 years that learning has been transformed from personal into a mass didactic, bureaucratic, impersonalized learning experience that favored cost over quality. Only in the last 100 years has *H. sapiens* attempted to educate entire countries as productive and educated citizens of a society. Mass education as an extension of a nation state's social commitment to educating its citizens is a recent societal occurrence in human history. A mass on-the-ground bureaucratic learning system will be challenged by a mass in-the-cloud customized learning system that is more personalized.

### **Critical Assumptions**

Students across the world are adapting to a technology rich and internet-driven system that is furthering the evolutionary reworking of the human mind. Demand and need are building, and evolving, within a nascent transnational learning system that can be accessed anytime, anywhere, by anyone . . . if governments invest in a networked system of learning that spans national borders to serve *all* children. And, most significantly, this is a learning system that could reach beyond

formal education and impact lives beyond traditional K-12 and higher education. This is a system that supports learning from the cradle to the grave. It is a robust system that adjusts to meet the learning needs of the learner at any level and at any age. The virtual transnational education system has emerged as a shadow system of the face-to-face brick and mortar education system that has defined formal education for the last 200 years. A critical assumption is that the allied forces of technology, economic efficiency, software capabilities, politics, and a demand for high-quality learning will reshape learning on a global scale.

---

## Introduction

Henrich (2020) describes how the *H. sapiens* brain, through natural selection, has “learned the ideas, beliefs, values, motivations, and practices” that were needed to survive and thrive “in whatever ecological or social environments we end up in” (p. 62). This brain adaptation occurred over two million years of *H. sapiens* evolutionary change and, cumulatively, created a “body of complex cultural knowledge to acquire the skills, practices, and preferences that were crucial for finding food, making tools, and navigating the social world” (p. 67). Education is poised – as a *networked system* – to advance learning as an extension of *H. sapiens*’ cumulative knowledge about how to learn in a connected world.

Consider the impact of an educational system – formal and informal – that is customized and personalized for *all* learners. This educational system is, then, an adaptation to the way in which we will learn in the future and how education – as a global institution – will accommodate this adaptation.

The twentieth century was defined by the rise of bureaucratically efficient schooling across the world. Factory schooling became a model of efficiency for discharging graduates with limited employment skills and marginal citizenship competence all over the world. America became the wealthiest nation on earth by providing exactly the kind of worker needed for the labor market during the twentieth century. The United States not only moved forward, it meshed the mass bureaucratic education system with the work of an industrial society. American education was the foundation for the emergence of the United States as a world power in the twentieth century. Virtually every nation in the world followed the same bureaucratic pattern in developing national systems of mass industrially designed education.

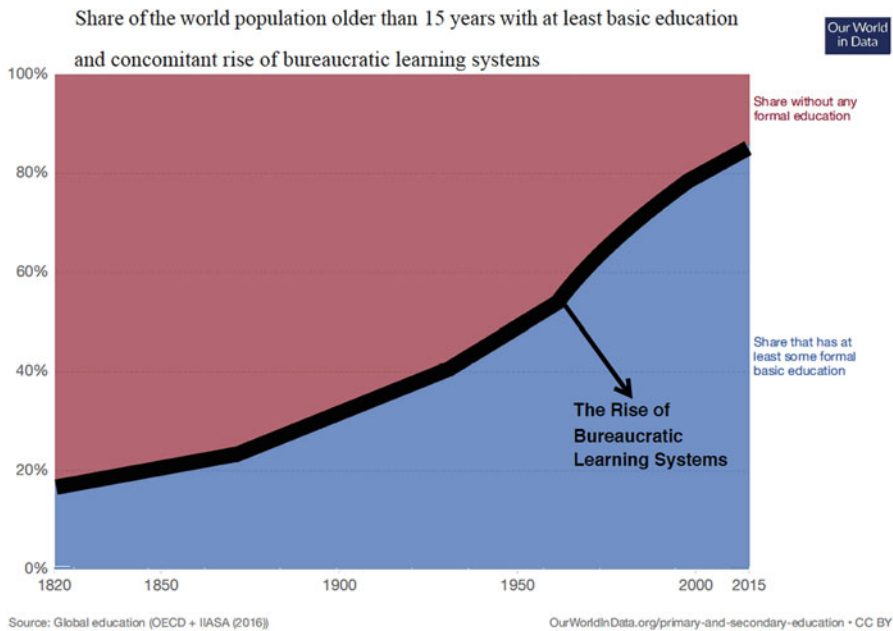

A model of institutionalized learning sorted, selected, tracked, and finally graduated marginally skilled workers after 12 years of schooling to work in factories doing manual labor. What the school was designed to do was graduate the vast majority of students for “blue collar” jobs requiring vocational levels of training or knowledge. This was the factory model borrowed from industry and adapted to education in the twentieth century. Dispense the knowledge to children during 12 years of mandatory education through an efficient system of industrially designed schools. It was a straightforward system that worked for some.

## Current Bureaucratic Education Cannot Deliver the Results We Need

Bureaucracy in education was a socially constructed reality that became institutionalized around the world through its structures, symbols, artifacts, and practices. Yet, industrial education – in its current form – has not been able to deliver on the promise:

Bureaucracy inhibits reform. Its potent informal organizations mobilize resistance and frequently sabotage innovations. Bureaucrats counter reformist arguments by changing their own goals, replacing earlier extravagant claims with much more limited objectives, and asserting that critics misunderstand their purposes. The changes, or goal displacements, are sincerely believed in by the bureaucrats; they provide a sense of success and a buffer against tremors of self-doubt. (Katz, 1977, p. 57)

It is instructive to note that formal education (the curriculum), required by government and supported by government, has also been limited by expectations and outcomes. Yet, Fig. 1 is illustrative of the rising expectations of countries and parents for educating children. Roser and Ortiz-Ospina (2013) outlined the worldwide explosion of students – older than 15 years with at least a basic education – attending school from 1820 to the present. The bureaucratization of education across the world from 1820 to the present was a significant achievement for civilization.

**Fig. 1** Share of the world population older than 15 years with at least basic education and concomitant rise of bureaucratic learning system

The rise of bureaucratic governmental schooling traces, as well, the mass education of children (Fig. 1).

On the face of it, nation states have only been marginally successful as sources of governmentally legislated education. The UNESCO report GEM indicates that at the present time, “Globally, 88% of the children complete primary school, 72% of adolescents complete lower secondary and 53% of youth complete upper secondary school” (GEM, 2020).

The ability to learn has been, and is, how we have advanced the understanding of ourselves and, collectively, for how we cooperate as a species on planet earth. We do not know why *H. sapiens* gained a special brain adaptation to learn, but it is certainly a remarkable variation that allowed for thinking beyond the moment and advanced an ability to bend the natural world to an imagined, and then, an existing, reality that reinforced the *H. sapiens* capacity to shape the twenty-first century. “(T)he brain’s structure and function are not fixed. They change in response to use. It is possible to shape the brain—your brain, my brain, anybody’s brain—in ways that we desire through conscious deliberate training” (Ericson & Pool, 2017, pp. 35–36). Harari (2015) more explicitly writes of the importance of the *H. sapiens*’ ability in separating what could be imagined in the future from what existed in the past:

(E)ver since the Cognitive Revolution, Sapiens have been able to change their behavior quickly, transmitting new behaviors to future generations without any need of genetic or environmental change. (p. 33)

This species-unique *H. sapiens* brain neuroplasticity gave man/woman the adaptability to *learn*. It was an ability that, in an evolutionary sense, was astoundingly successful. For the 60,000 years of hunter-gatherer existence, until the agricultural revolution, *H. sapiens* adapted to the planet by using its accumulated knowledge and skills to gain an advantage over the natural world. Only in the last 12,000 years of the agricultural revolution has the brain’s adaptation for learning been amplified and accelerated to further *H. sapiens*’ ability to master and manipulate the natural world . . . and now, the man-made world of technology.

Table 1 is illustrative of how *H. sapiens* transformed learning into formalized and organized knowledge that was captured over a short span of time to advance civilization.

In the twentieth century, education attained prominence as a socializing, civilizing, and humanizing extension of government. What was a national interest of modest proportions in the twentieth century, has become a global imperative that determines national and international success in an increasingly interconnected world.

In the last 150 years, learning became bureaucratic, institutionalized, and nationalized for educating as many children as possible for the lowest cost per student. The *anomaly in learning is the last 150 years*. Learning that was always personalized and individualized during the last 60,000 years of human evolution was turned into bureaucratic, didactic, and decontextualized in the last 150 years as an extension of the industrial revolution.

**Table 1** Milestones in the evolution of learning

60,000 BCE	<i>H. sapiens</i> began using language to communicate
17,000 BCE	Lascaux cave paintings
11,000 BCE	First evidence of social cooperation of <i>H. sapiens</i> at Gobekli Tepe in present day Turkey.
4,000 BCE	Hinduism founded as first formal religion
2,500 BCE	Evidence of archeoastronomy at Stonehenge
2,400 BCE	First evidence of writing in Egypt
470 BCE	The writing, teaching, and philosophy of Socrates
800 CE	The English Chronicles
1300 CE	The beginning of the Renaissance in Europe
1440 CE	Johannes Gutenberg printed the bible in Latin
1543 CE	Nicolaus Copernicus and the beginning of the Scientific Revolution (publication of <i>On the Revolutions of the Heavenly Spheres</i> )
1820 CE	Beginning of the Industrial Revolution
1947 CE	Invention of the transistor at Bell Labs
1991 CE	The World Wide Web became a functional network for the dissemination, communication, and retrieval of information.

It is only in the last 15 years, the age of technology has ushered in an alternative opportunity for a return to the individualized and personalized learning that worked so well for *H. sapiens* before mass bureaucratic education. Over the next 50 years, learning – across the world – will return to its evolutionary roots of individualized and personalized to better utilize the brain’s ability to adapt to its environment.

Although the curve has been trending in the direction of a technology infused global learning system, there is not a recognition within education – or across nations – that the elements for a different educational system are coalescing around the internet. The sheer magnitude of formal learning delivered over the internet in 2021 further reinforces the expansion and diffusion of an entire *learning system that is transnational*.

---

## A Global Twenty-First Century Educational System Adaptation

In *Democracy and Education*, John Dewey (1922) questioned whether it would be possible to develop an educational system by a nation state to meet “the full social ends of the educative process [and] not be restricted, constrained, and corrupted. .. irrespective of national political boundaries” (p. 102). Cremin (1965) elaborated and claimed, “How we set in motion the dialogue essential to the development of an international culture remains to be seen” (p. 73). Neither Dewey nor Cremin could see far enough into the future to conceive of an independent learner in a transnational learning system.

As Dewey (1922) stated, to “form the citizen, not the ‘man’ became the aim of education” (p. 109). He further described the rise of nations with a vested interest in

education as systems with the “means of recovering and maintaining their political integrity and power” which, then, brought about a diminution of the individual. He further asks, “Is it possible for an educational system to be conducted by a national state and yet the full social ends of the educative process not be restricted, constrained, and corrupted?” (Dewey, 1922, p. 113).

Cremin (1961) also was wary of the national purpose of education and invested his faith in learning at the individual level. “I have become increasingly aware of the mediating power of individual agency as people have participated in educational institutions designed for them by others” (p. 710). He believed the individual should prevail against the prescribed social, economic, moral, and mainstream requirements of the state. The concern of Cremin and Dewey was that the government had created, as Acemoglu and Robinson (2019) claimed, a “cage of norms” in framing the broad goals of society and the “individualistic theory receded into the background” (p. 109).

Dewey and Cremin, conjecturing that schooling in the United States (or any country), as a brick and mortar on-the-ground and real-time learning system, were constricted by an inability to see into a twenty-first century system of education. As well, they recognized the limitations of a system constrained by politics, social conditions, educational practice, cultural beliefs, and the financial limitations shaping the formative education of children. Yet, it is that foundation upon which we are building the future of twenty-first century education. It was in the twentieth century that governments not only recognized, but began acting upon, formal education – in the arc of man’s ability to learn – as a foundational system for advancing economic growth, social cohesion, and political stability.

Countries around the world were on the cusp of building an educational system that would attain higher levels of success for students, information seekers, knowledge purveyors, and institutions of learning. Large K-12 school systems and universities emerged to become the pillars of a kindergarten-through-university system of formal education around the world. Yet, today that system is too limiting.

The next advancement of the nation/state learning system is a high-quality learner-centered system that succeeds through multilevel cooperation on a global scale. This is a learning system that will *enhance learning for all children worldwide*.

A learning system that operates within a framework of freedom of expression, gritty individualism, hard work, and persistence reflects the personal learning *H. sapiens* have refined over the last 70,000 years. The next iteration of formal learning will be an evolutionary extension of an already advanced capability that was acquired by *H. sapiens* as an adaptation to the natural world. This advancement, however, will complement man’s ability to learn. The education journey *H. sapiens* is on, at this moment, is incorporating an adaptation that will complement the brain’s ability to learn. The twenty-first century educational delivery system is expanding not only across local and state boundaries, but across national boundaries and becoming a platform for those seeking an individualized and personalized learning in a transnational education system.

---

## A Transnational Learning System

The transnational educational system is an evolving virtual organization with levels and layers for individualized and personalized learning delivered at the local level but scaled globally through a deployment of technology and software. Dewey made clear the belief that learning should be a sustained personal lifelong growth and developmental journey. He wrote that nothing should be subordinate to one's learning and "that education should not cease when one leaves school. .. that the purpose of school education is to insure the continuance of education by organizing the powers that insure growth" (p. 56). Cremin (1965) further explained a person's growth as a learner:

When he [Dewey] argues that education is a continuous process of growth, having as its aim at every stage an added capacity for growth, he is merely saying that the aim of education is to make, not citizens or workers or soldiers or even scientists, but human beings who will live life to the fullest, who will never stop expanding their horizons, reformulating their purposes, and modifying their actions in light of these purposes. (p. 206)

---

## The Individual Marketplace in a Transnational Educational System

The internet has become a destination for formal and informal knowledge acquisition during the third decade of the twenty-first century by appealing to the *individual*. Transnational learning marks a shift not only in the way individuals learn, but in how each individual is compelled to attend school as a social, governmental, economic, civic requirement, and expectation as a person and as a citizen. In a transnational educational system, the design of the system is focused on the individual and not the direct needs of the nation or state. The marketplace of learning is controlled by the parent at a young age and by the student as he/she ages.

During the twentieth century, the overwhelming impact of education as a source of social cohesion was too great to ignore. More recently, a full understanding of knowledge as a governmental, economic, moral, and global foundation for advanced civilization emerged as political wisdom transformed into political policy that turned into educational legislation. Political and societal wisdom became mainstream educational policy to support schooling because the effect on a nation's economy could not be ignored. Politicians came to realize that industrial education was a relatively inexpensive investment in developing a robust and stable economy:

In sum, both the quality of the institutional environment and the quality of education seem important for economic development. Furthermore, the effect of educational quality on growth seems significantly larger in countries with a productive institutional framework, so that good institutional quality and good educational quality effect of education depends on other complementary growth-enhancing policies and institutions. However, cognitive skills have a significant positive growth effect even in countries with a poor institutional environment. (Hanushek & Wößmann, 2010, p. 250)

The trappings of modern society (the rise of cities, global trade, mass production, instant communication) increasingly depended upon a knowledge economy. The industrial revolution of the mid-nineteenth century became a complete global knowledge revolution that required adaptability, thinking, and an ability to process information to think into the future and make products that corporations could sell across the world. National education systems powered that growth. There are any number of national examples: The United States, China, Japan, Great Britain, India, and any of the emerging nations of the world in 2021 reinforce the importance of national economies benefiting from, operating within, and powering the global society.

Although Dewey and Cremin understood the need for a system of learning that fulfilled the aspirations of each individual student, neither could conceive of a system that offered learning beyond what was possible, for most children, within the neighborhood school or the regional university as a brick and mortar face-to-face system. However, the virtual K-12 school and university were rapidly expanding and becoming stand-alone extensions of the place-bound school and university during the last decade of the twentieth century.

Brick and mortar schooling have been evolving toward a virtual/brick and mortar organization. Education across the globe is at a tipping point where change, fueled by growth within the marketplace of learning, is continually developing structures that support virtual organization in a steady march toward mainstream delivery. “Only when educators have to earn their income in the marketplace by competing to serve consumers who are free to choose where to take their business (and money) will schools, teachers, and other vendors have the incentive to adopt productive technology” (Perelman, 1992, p. 186). Whether one is a proponent or skeptic, the market driven world of learning is becoming mainstream, not only across America, but across the globe.

The challenge for education – in all its emerging hybrid and digital forms – is to meet the needs of a diverse array of individual learners seeking knowledge through a system of continuous learning, anytime, anywhere, and any way. Children, adolescents, teens, tertiary students in higher education, working professionals, blue collar workers, people of color, people of many cultures, genders, races, ethnicities, and nationalities will approach education as lifelong-learners in search of knowledge from a system that satisfies a multitude of needs for the individual because of professional, economic, civic, personal, national, and social reasons.

The issue of educational change in the twenty-first century is not just how to improve education, but how to change education to wring higher quality learning out of the system that exists . . . and is emerging as a transnational system for learning. The forces of social change such as urbanization, economic growth, immigration, social unrest, political polarization, regional conflict, and global pandemics have drawn the world closer together. An educational system that makes high-quality learning complementary to economic and social progress draws upon Lynton’s (1991) belief that education can transform society. According to Lynton (1991),

Modern society must place great emphasis not only on the ongoing creation of knowledge through basic research, but also on the complex task of ensuring the utilization of that knowledge in a highly interactive mode. That task has three overlapping dimensions:

- Initial education which prepares individuals to utilize what they learn in their future occupation, as citizens, and as private individuals;
- Continuing education in all of its forms, especially that which is intended to maintain the knowledge of individuals in the face of rapid change;
- Modern modes of extension through technical assistance, technology transfer, policy analysis, etc. (p. 8)

Lynton's objective was to turn knowledge into a resource, as well as a lever, for civic and economic advancement by making education a strategic endeavor for economic, social, governmental, and personal gain. The educational excellence that society demands, at the present, is focused on test scores and measurable outcomes when, in fact, it is utilization of knowledge for the greater good that should drive educational reform. Education, from Lynton's (1983, 1990) perspective, would see student learning as the result of well-designed educational system that is integral to a healthy and vibrant society. Education is the one indomitable resource upon which society derives benefit.

It is the end of an era and the beginning of another. It is not a paradigm shift but an evolution of the brain's ability to maximize learning. The transnational learning system erases the virtual wall between face-to-face schooling and remote learning. The pace and acceleration of change will require adaptation by the human brain to stay informed and engaged in a global knowledge society. The internet educational system, among its many incarnations, is a formal and informal system for learning. Yet, the most profound change will be not in the way learning is delivered, but in how it is perceived and received by the user as an *immersive learning platform*.

---

## The Development of an Independent Learner

The decentralization of education is an historical precedent that has contemporary implications for learning. The decentralization of learning is not just an American version of education. The locus of learning at the individual level represents the innate *sovereignty of the individual* to learn if given the right set of educational tools and support within the educational system.

American education has baked in "grass roots" involvement reinforced by parents and codified by law that ensures learning begins at home. Citizen responsibility for learning became an embedded feature woven within the fabric of America's approach to decentralized education of, by, and for the people. As Cubberley (1929) wrote:

It is primarily the function of the State to set standards, rather than to give directions; to fix by law the general minimum educational requirements that every school system should meet, leaving minor details to school boards and executive officers to determine by local regulations; to open the way by authorization and stimulation to communities to exceed the minimum requirements of the State, and to undertake new and desirable forms of educational effort; to avoid rigidity in requirements, so as to leave opportunities for progressive communities to do differently; and to desire, above all things, results, rather than to force the following of any prescribed method or plan of procedure. (pp. 86–87)

What the Massachusetts legislators did to operationalize a need for reading the Bible by creating local control of education is, today, a system of learning that reinforces, and fuels, an emerging *decentralized internet educational system*. An organizing feature of colonial education to legislate “local control” is an idea that is functionally relevant in 2021 and serves as an organizing characteristic of the transnational learning system. The structural responsibility for controlling one’s education closer to the student served as foundational template and serves, as well, for organizing individualized and personalized learning in the twenty-first century.

Without knowing they were doing so, a structure for learning in the twenty-first century was made “the law of the land” by the Massachusetts colonial legislature in 1642 and 1647. The Old Deluder Satan Acts of 1642 and 1647 (Eberling, 1999) were significant because of the precedent these laws set in establishing parents and the local citizens of a community as the locus of learning for the organization and control of education. The laws that were enacted not only determined the organization of American education as a decentralized system but also established the *primacy of the student as a learner within that system*. By so doing, it set up and framed learning as a learner-centered responsibility in the twenty-first century.

---

## A Transnational Learning Archetype

As remote instruction became more accepted as high-quality learning during the first and second decades of the twenty-first century, a gradual transformation of teaching and learning began. In 2021, the teacher and learner were being drawn into, and at the same time, adapting to an electronic system of worldwide education. Although technology-infused education has been accelerating, the rate of adoption has slowed as technology met the real world of analog infrastructure and analog instructional pedagogy. The original barrier to e-learning was the belief that face-to-face instruction was the ideal form of knowledge transmission and there could be no other alternative that rivaled it in quality.

In fact, there will continue to be solid reasons for continued face-to-face instruction between teachers and children in a brick and mortar school. The skills required for maintaining social contact in a high touch world are as important to learning as the content. However, as much as in-person learning met a need for socializing children *and* transmitting knowledge, conditions for formal education and learning changed in the second decade of the twenty-first century. Ubiquitous (u-learning) opened the door to a form of learning that did not exist before the age of technology.

---

## Ubiquitous Learning in a Transnational Educational System

E-learning was the very early adoption of internet-based learning. Serious e-learning did not become an accepted form of delivery until the late 1990s and early 2000s. M-learning (mobile) can be traced to the introduction and adoption of laptop computers, tablets, and cell phones. Mobile meant learning was no longer anchored

to a desk or connected to the cables, ports, and electrical outlets that defined computing in the hard-wired era. Mobile freed the user to connect anytime and anywhere as long as there was Wi-Fi or cellular connectivity. It is, however, u-learning that opens the door for anytime, anywhere, and any way learning. Ubiquitous learning helps to understand the transcendent approach of a transnational educational system that challenges the superiority of time and place-bound learning.

In 20 years, internet learning has gone through its own evolution from e-learning to u-learning. It is an evolution of pedagogy, technology, and learning aggregated to show and explain how educational delivery, teaching pedagogy, and student learning were adapting to an emerging virtual educational system. Peng, Chou, and Chang (2008) stated, “Computing devices and applications are now used beyond the desktop, in diverse environments, and this trend toward ubiquitous computing is evolving” (p. 54). It is evolving to such a degree that it is difficult to keep up with the amalgamated, interconnected, and intertwined parts of the emerging virtual learning system. It is in the virtual delivery of teaching and the acquisition of information – transformed into learning – that upends what instruction means in context to a technology and software environment of ubiquitous learning.

Walkington and Bernacki (2020) identified the more personalized learning environment as coalescing around the characteristics of meaningful, relevant, interest-driven, and self-initiated (p. 238). Yet, personalized learning does not encompass, or account for, the expanding possibilities of ubiquitous learning. Ubiquitous is an evolving, yet amorphous, “anytime and anywhere” learning that accelerates the technology, software, and learner/system nexus. Kinshuk (2008) wrote that u-learning supported “learners through embedded and invisible computers in everyday life. Such environments allow students to learn at any time and any place, encouraging them to more experiential learning such as learning by doing, interacting and sharing, and facilitates on-demand learning, hands-on or minds-on learning and authentic learning” (p. 333). Hwang, Tsai, and Yang (2008) described ubiquitous as a context-aware feature of a computing environment that allowed the learning system to better understand the learner’s behavior by using technology to monitor and adjust to the learner as he/she is learning.

To develop context-aware and seamlessly integrated Internet environments, a variety of new techniques and products concerning ubiquitous computing have been developed in recent years, such as sensors and actuators, RFID tags and cards, wireless communication, mobile phones, PDA (Personal Digital Assistant) and wearable computers. (p. 82)

The student who emerged from the socially constructed structures, philosophies, beliefs, economic conditions, and daily challenges of living in an interconnected world is poised in the twenty-first century to launch a new period of pedagogical practice and acquisition of knowledge through a much more dynamic approach to learning. As educators look at designing education for the future, mass education for many students is being displaced by an emerging *archetypal template for individualized and personalized learning for all students*. Significantly, this means learning for each student is a return to how *H. sapiens* has learned across its species-specific

evolution as thinking individuals. It is a return to personalized learning as we have practiced it for thousands of years. It is immersive learning within an updated virtual learning system shaped by bureaucracy but customized to the learner.

Ubiquitous learning adapts to the learner. Zurainee, Haryani, and Jasber (2018) outline the way in which this more robust form of learning is emerging. Ubiquitous learning is “(l)earning that happens in anytime and anywhere in the right way with the right content using ubiquitous computing technology” and incorporates the following qualities:

1. Accessibility: Learners can access the system in various ways.
2. Adaptability: Learners learn at the right way with a right content in a right place.
3. Context Awareness: By accessing the database, the system can sense the learner location, personal and situation using ubiquitous computing technology.
4. Immediacy: Learners can get the information immediately when they want it.
5. Interactivity: Learners can interact with educators in virtual and physical environment settings.
6. Permanency: Learners can never lose their work unless it is being deleted. (Zurainee, 2018, p. 32).

Software and hardware are being adapted for learning much as *H. sapiens* altered the world by learning to use fire, knives, books, and automobiles as tools for advancing civilization. Ubiquitous learning is dynamic in that it senses one’s context and learning motivation and adjusts to the learner to support learning. Unlike learning in the twentieth century, twenty-first century students will look upon the way they learn as a first step in developing a responsibility-based form of learning. The system will adapt to the learner in ways the present system of bureaucratic learning cannot.

---

## **Adaptation and Innovation: Slow Adoption**

In *Diffusion of Innovations*, Rogers (2003) elaborated upon the anthropological approach of participant observation as a basis for understanding how *H. sapiens* have adapted to modern innovation. In the context of learning since the advent of the information age, it is clear technology and the internet are innovations that have shaped, and will continue to shape, how we learn. It is evident a structural change to education and learning are underway in a global interconnected system. Events like the pandemic of 2020–2021 accelerated these changes.

According to the UNICEF study *COVID-19: Are children able to continue learning during school closures?* (2020), there was an urgency for shifting resources to a new structure for education. The once-in-a-generation pandemic was one of those transitional moments in history because of the abrupt changes it brought to education across the world.

- More than 90% of countries implemented some form of remote learning policy.
- At the global and regional levels, most students (about 70%) had assets at home that would allow them to learn remotely via digital or broadcast classes.

In its call to action, the report indicated that nations around the world “sought to reach more than 1 billion students globally” (p. 14). It is notable that reports on learning prior to 2020 often qualified and questioned the importance, quality, and need for building the structural support system required for remote learning. In this, and other reports, that discussion has become moot. The diffusion of educational innovation has become a priority on a global scale.

Policies must focus on modernizing both the infrastructure and delivery methods used by education systems and producing accessible, safe and secure remote learning resources based on the national curriculum. (UNICEF, 2020, p. 14)

Learning is the one quality of the human brain that makes us who we are. “(N)atural selection has shaped our primate brains to allow us to most effectively learn the ideas, beliefs, values, motivations, and practices that we’ll need to survive and thrive in whatever ecological or social environments we end up in” (Henrich, 2020, p. 62). It is in exploring these elements, qualities, and characteristics through the educational lens that we gain insight into the literate mind, or more importantly, the qualities to motivate the adaptive mind. Learning is being changed in the twenty-first century by the expansion of knowledge that reshapes how we govern, communicate, socialize, participate, live, and learn.

Henrich (2020) explains that culture “can and does alter our brains, hormones, and anatomy, along with our perceptions, motivations, personalities, emotions, and many other aspects of our minds” (p. 5). As he elaborates, there are psychological adjustments that the brain makes as the individual is raised within a culture. The adjustment of learners at all levels to a personalized learning system compels nations around the world to adapt their outdated bureaucratic brick and mortar educational system. The quest for more information, improved learning, and better access to knowledge has only accelerated in the last 5 years and will continue to accelerate. Learning is personal and derivative of an innate desire to support and sustain the *H. sapiens* need to learn.

---

## **A Transnational Marketplace or Government-Structured Educational System**

The transnational educational system is in its infancy and will be shaped by the assimilation of the marketplace for education in a remote environment. Will this market be controlled by schools? By corporations? By governments? By some neutral international body? As the hegemony of a transnational education system emerges, do the countries of the world relinquish governmental control to educational, for profit, and independent organizations located beyond their national boundaries and beyond

their political control? Does the right of the individual allow citizens from any nation the freedom to participate in formal and informal schooling beyond, within, or in concert with national educational goals? The issue of national hegemony and the student's right to choose a customized education in the global educational marketplace will soon become an economic, political, educational, and personal question.

Milton Friedman and Friedman (1990) was a free-market economist who believed education would benefit from a system that sought the "freedom of individuals to pursue their own objectives with extensive cooperation and collaboration needed in the economic field" to produce their own basic needs (p. 21). The key argument of Friedman was first explained by Adam Smith (2003), in the *Wealth of Nations*, as a symbiotic relationship between the individual in pursuit of economic and personal freedom and a nation's goals to provide a stable and prosperous society. The key insight in the pursuit of a person's goals, according to Friedman, was that society and the individual had to have a voluntary agreement to share and mutually benefit from their relationship or a fair exchange of goods and services "will not take place" (p. 45). In the context of transnational learning, pursuing one's personal goals invokes a fundamental change in who and where this "negotiation" between the individual and the system takes place. It is the challenge that countries face in dealing with global corporations such as Facebook, Amazon, Google, and Apple that rival the power and wealth of entire nations.

Technology and the internet have generated economic and multimedia behemoths that rival nations as influencers of wealth, power, and social convention. Consider that Apple computer has a market capitalization that equals or exceeds the gross domestic product (GDP) of large nations. There are 14 countries that have GDPs that surpass the "worth" of Apple which places it below Australia and Spain and just ahead of Mexico, Indonesia, and The Netherlands (Silver, 2020). Will the transnational reach of knowledge become a national form of political and economic influence that opens or closes doors?

Can a transnational educational system be developed that guarantees all children anywhere in the world the right to an education? Is Horace Mann's vision for Massachusetts in the 1830s a vision for a transnational learning system in the 2030s? Can the common school of Massachusetts be an open school for all children across the world? The United States educational system is linked to an emerging networked system of decentralized schooling. Each nation's goal to educate its children challenges the current bureaucratic time and place-bound system to be something it was not designed to do. In the evolutionary history of *H. sapiens*, forces are in play that will reshape learning as we know it through transnational ubiquitous learning.

---

## Conclusions and Reflections

The twenty-first century educational system is in the throes of historical change. The hegemony of the capitalist economic model is being woven into education as – and not just an American or Western imperative – an economic priority for all countries across the globe. Just as *All children can learn*, it is becoming clear in the twenty-first century that the more important international mantra should be: *All countries must learn to learn*.

Anderson (2006) claimed that the “convergence of capitalism and print technology on the fatal diversity of human language created the possibility of a new form of imagined community, which in its basic morphology set the stage for the modern nation” (p. 327). Global learning is in its infancy as an imagined community. It will remain embryonic for the foreseeable future, or until the educational marketplace is supported by the governance and policy making functions of nations seeking to reimagine education as a transnational learning system. In the twenty-first century, nation states will be compelled to explore convergence around digital technology and digital capitalism that make learning accessible to a global community. This sets the stage for a global education system that transcends the hegemony of the nation state. It also sets the stage for a more individualized and personalized form of learning.

Transnational learning is an internet-based educational system that conveys formal and informal individualized and personalized learning delivered anytime and anywhere. Ubiquitous learning is an emerging technology and software enhanced approach to information and knowledge acquisition that will adapt to, complement, and engage the learner that accomplishes (1) a higher degree of meaningful learning for the individual and (2) stability as a contributing member of a national and international global society.

In the third decade of the twenty-first century, we know more, and understand more, about the delivery of learning as a societal function. The science of learning “has met the enemy and it is us.” In the applied day-to-day world of “boots on the ground” teaching and “meet them where they’re at” schooling, *H. sapiens* is on the frontier of artificial and machine learning. Advances in individualized and personalized learning will alter education and knowledge acquisition if education is advanced as a transnational system for *all* children and *all* nations.

The fundamental nature of learning is not changing in the abstract, it is changing at the rate of internet speed, artificial intelligence integration, technological advances, machine learning expansion, and software utility, utilization, and function. If education is, as Whitehead wrote, “the acquisition of the art of the utilization of knowledge,” education will look very different in a few short years. The transnational learning system will be as meaningful to governments, educators, and learners (not just K-12 and postsecondary students) if ubiquitous learning can be developed as a driver of educational quality for social and economic good.

## Abstract

To prepare for success in a global, technologically-driven economy, PK-12 students need real-world opportunities and authentic experiences throughout their educational programs. Educational leaders – administrators, curriculum specialists/coaches, and other school and district level leaders – must create a learning environment that facilitates problem-solving and critical thinking for all students to be ready for futures in the workplace and in higher education. Elementary and secondary education curricula in science, technology, engineering, and mathematics (STEM) fields have evolved to be taught in interdisciplinary,

transdisciplinary, and multidisciplinary forms. Although much information about developing and implementing STEM education curricula is available to teachers, educational leaders need more guidance regarding how to effectively lead, facilitate, and support integrative STEM education methods and practices for life-long learning and career exploration. This chapter presents information and methods to be shared between educational leadership and integrative STEM education leaders for use with educators, community partners, and school stakeholders to improve students' access to meaningful preparations for future work and education opportunities. While individual subjects include specific knowledge and skills, leaders must work with stakeholders in their educational organizations to develop innovative and diverse approaches to integrating STEM subjects in curricula and teaching and learning methods for student success.

Integrative STEM education · Multidisciplinary education · Educational leadership · Professional learning · Leader development · STEM disciplines · Transformative education · Career and college readiness · School leadership · Collaboration

**The field of memory**

Historically, science, technology, engineering, and mathematics are regarded as separate subjects not to be combined in PK-12 courses with humanities subjects (e.g., art, reading, and music). Because traditional educators often do not relate technical or science-related subjects with non-stem subjects, only certain groups of PK-12 students are availed opportunities in STEM-related careers and higher education programs. The one-room schoolhouse ideology (e.g., one teacher with many students and teacher-centric instruction) is expanded to serve an exponentially growing student population. STEM disciplines are encased within content silos, and students are responsible for transferring content, skills, and attitudes among the disciplines to make sense of the scientific and technological world. Systemic inequity in school programming segments the student population into groups who are prepared to succeed in institutions of higher education from students who are not prepared. Those students then must find alternative means for providing for themselves and their families. Teaching and instruction, as related to the opportunities for student success, are often underestimated and underappreciated within communities.

**The field of presence**

Science, technology, engineering, and mathematics subjects can be integrated in PK-12 courses. Integrative humanities and science curricula can lead to metacognitive experiences. Leaders can facilitate integrative STEM experiences to prepare all students for personal and professional decision-making. Content silos are deconstructed. Integrative STEM supports the process of collaboration of science, technology, engineering, and mathematics as foundational disciplines of

interdisciplinary content toward curricular study. This reform movement seeks to depart from the “silo” mindsets of separate fields and maintain a common content standard in the PK-12 educational system. Several elements of each disciplines are usable to assist integration.

### **The field of concomitance**

Educational leadership in integrative STEM should, by definition, be collaborative. STEM leaders should build connections with professionals in other subjects, and refer to social constructs to provide equitable integrative STEM opportunities for all students. Educational systems are innovated to prepare students for work and to be well-informed in decisions affecting self, family, and the community. In a scientifically and technologically driven society, student knowledge and skills must be transferrable to real-world applications. A pragmatic approach is reflected in the developing cultural patterns of schools and districts to develop the “modern” child. A modern classroom is idealized as a platform that positions students to engage in innovation that preceding platforms could not. This blossoming of opportunity can be looked as a modern “Age of Enlightenment.” Integrative STEM advocates challenge traditional dogma. Educational leaders, stakeholders, teachers, and students are encouraged to take risks as problem-solvers do in the real-world.

### **Discontinuities and ruptures**

Leadership in integrative STEM education is collaborative in nature, and cannot solely be a top-down approach. In PK-12 school systems, the teachers, students, families, and community members have voices that are valued and their messages are integrated into program planning and implementation. Changes to the organizational system are the responsibility of all, and all stakeholders are accountable for students’ success. As leadership is not a top-down approach at the school level, the top-down approach is also disrupted at the classroom level. The educational experiences of teachers 10, 15, 30, or 50 years ago should not be the same experiences of students today. Teachers must diverge from how they were taught as ethnocentric values inhibit the open-mindedness needed for integrative STEM. Unless collectively strategized by all voices, organizational culture may be disrupted as integrative STEM educational practices shift learning from teacher-centric to student-centric classes and educational options support quality science, technology, engineering, and mathematics experiences for all students.

### **Critical assumptions**

Leaders of integrative STEM schools and programs must be STEM-literate to lead and guide others in integrating STEM curricula and facilitating STEM learning. Though educational leaders do not take the role of formal STEM instructors in a majority of programs, they must be capable of clear communication to disseminate the mission and vision for integrative STEM programming and be well-informed to evaluate outcomes. Students will continue to live in a scientific and technological world that requires them to be STEM-capable citizens. Adults will continue to challenge youth to solve pervasive global problems, such as the planet remediation,

freedom from harmful human conditions, curing of diseases, public health crises, and transcendence of human rights and justice. Global connections of STEM experts will continue to fabricate innovation yet widen the competency gap in stem fields of average citizens unless robust STEM curricula that is motivating and engaging to all students are introduced into PK-12 curricula. Programs that are pioneering integrative STEM will continue to expand career, education, and training opportunities for youth to prepare them for global citizenry.

Relate the school to life, and all studies are of necessity correlated. (Dewey, 1910, p. 32)

---

## Introduction

In 1986, the National Science Board in the United States recognized “the deterioration of collegiate science, mathematics, and engineering education is a grave long-term threat to the Nation’s scientific and technical capacity, its industrial and economic competitiveness, and the strength of its national defense” (National Science Board, 1986, p. 1). This report is often credited as a catalyst for national policy changes to reform science, technology, engineering, and mathematics (STEM) education at the PK-12 and undergraduate levels, thus increasing the number of students to pursue careers and higher education in STEM fields, broadening participation of underserved groups of students, and building a STEM-capable citizenry throughout the United States.

In *Charting a Course for Success: America’s Strategy for STEM Education*, the Committee on STEM Education of the National Science and Technology Council (2018) in the United States noted:

Now more than ever the innovation capacity of the United States – and its prosperity and security – depends on an effective and inclusive STEM education ecosystem. Individual success in the twenty-first century economy is also increasingly dependent on STEM literacy; simply to function as an informed consumer and citizen in a world of increasingly sophisticated technology requires the ability to use digital devices and STEM skills such as evidence-based reasoning. (p. v)

Becoming STEM-capable is now a critical skill in a world where fields of science, technology, engineering, and mathematics continue to contribute significantly to the local, national, and global economic landscape, and employment opportunities in STEM fields are bountiful in this everchanging and technologically-focused society.

Educators, leaders, and policymakers are shifting paradigms to support instructional strategies that ensure PK-12 students are college and career ready throughout the world. Integrative STEM education is one approach to this multi-tiered issue, as the pedagogical method addresses vocational and higher education preparedness for students to experience success in a STEM-driven world. Integrative STEM education differs from STEM education, which will further be deconstructed in this chapter. While other definitions of integrative STEM exist, the authors define

integrative STEM education for PK-12 students as the combination of at least two STEM areas (i.e., science, technology, engineering, and mathematics) with other content areas (e.g., language arts, social studies, and visual arts) in teaching and learning experiences.

---

## Reverse Engineering Integrative STEM Education

Often utilized in the engineering fields, reverse engineering is the deconstruction of the larger components of a structure or system to better understand how it works. With reverse engineering, one can gain new knowledge of each component, better understand the role of each component within the larger structure or system, and consider innovations that may not have been initially visible when looking at the structure as a whole. In this chapter, integrative STEM education programming will be reverse engineered into domains. The innerworkings of this convention will be separated, analyzed, and critically considered as contributing or inhibiting factors toward learner-driven education. This chapter will first provide a contextualization of integrative STEM education and then address the domains of educational leadership for integrative STEM education.

Integrative STEM education is not a new manifestation of pedagogy, skills, or mindsets; the wheel is hardly reinvented, but refurbished to fit a more desirable look and performance for current educators and learners. Integrative STEM is an ethos and continuous pursuit of best practices for collaborative learning to prepare students to work and make informed choices in a technologically and scientifically-driven society. “Integrative science, technology, engineering, and mathematics (I-STEM) education provides direction for teaching, leading, and learning practices related to students’ abilities to identify, think critically about, and propose solutions to real-world problems” (Rose, Geesa, & Stith, 2019, p. 42). The following are characteristics of integrative STEM student experiences:

- Students are no longer passive recipients of content. Integrative STEM students are active scientists, technologists, engineers, artists, and mathematicians.
- Students no longer move from class to class or lesson to lesson to engage in content within one discipline. Integrative STEM students move fluidly through multiple disciplines, similar to cars changing lanes on a highway.
- Students no longer solely sit at a desk and take notes. Integrative STEM students use tools and instruments, read and analyze data, make scientific and mathematical inquiries, and design and innovate solutions.
- Students no longer work alone. Integrative STEM students work collaboratively among themselves, their school community, and their community-at-large.

These characteristics emphasize a shift to more inclusive and engaging learning environments to prepare learners to be productive contributors in a future where STEM literacy is needed to reach individuals’ self-actualization.

## Tracing Philosophical Contexts

Although the term and concept of “integrative STEM” is recent, philosophies of the need for real-world and authentic teaching and learning experiences were present in earlier periods of history. John Dewey (1859–1952) was an educational reformer, philosopher, and psychologist in the United States. Influences on integrative STEM education’s inception into modern educational systems can be seen in Dewey’s progressive educational philosophies steeped in pragmatism – lessons focused on real-world applications and learning through experiences (Glancy & Moore, 2013; Johnston, 2013; Sharma, Devi, & Kumari, 2018).

Dewey, in turn, was influenced by William James (1842–1910) who was a trained medical doctor but more well-known as a psychologist and philosopher (Seel, 2012). James, known as the “Father of American Psychology,” taught courses in psychology and established the first psychology laboratory in the United States (Seel, 2012). In James’ 1899 publication, *Talks to Teachers on Psychology and to Students on Some of Life’s Ideals*, he expressed “psychology is a science, and teaching is an art; and sciences never generate arts directly out of themselves. An intermediary inventive mind must make the application, by using its originality” (James, 1962, p. 3).

James’ perspectives were influenced by Aristotelian naturalistic thought – the existence of a dynamic relationship between nature and man (Buxton, 1984; Reck, 1984; Snarey & Coleman, 2011). Aristotle (384–322 B.C.E.) was a Greek scientist and philosopher who studied for 20 years in the school of Greek philosopher Plato. Aristotle’s work has guided philosophy for centuries “from Late Antiquity through the Renaissance, and even today,” as it is seen as current and relevant (Shields, 2020, para. 1). To Aristotle, “human beings live well only if they live a life of reason, which involves both excellence in intellectual pursuits and excellence of character and judgement, shaping an entire life” in his view of naturalism (Brandhorst, 2020, p. 92).

In a recent study, Pavlis and Gkiosos (2017) connected Aristotelian naturalistic thought and Dewey’s view of educational pragmatism:

On a simple biological level, humans as rational beings respond to problems arising from their relationship to nature by implementing analogous instinctual behaviors. Nevertheless, on a mental level there lies a moment of rational thought and deliberation between a problem posed by an objective situation and the response directly dictated by instinct. This results in the individual suspecting and predicting a variety of possible solutions, eventually selecting the one that feels more satisfying and correct. (p. 25)

Arguably, integrative STEM is the most recent iteration of Aristotelian naturalistic thought. However, Dewey’s work in curriculum and instruction serves as the theoretical underpinnings and guiding ethos for educational leaders to provide constructivist-centric learning environments (Corlu, Capraro, & Capraro, 2014), and those who share related paradigms realize the potential and the need to prepare students for society.

In 1916, Dewey published *Democracy and Education: An Introduction to the Philosophy of Education*. He expressed, “It is the office of the school environment to

balance the various elements in the social environment, and to see to that each individual gets an opportunity to escape from the limitations of the social group in which he was born, and to come into living contact with a broader environment” (Dewey, 1916/2015, p. 16). Even before the explosive growth of science and technology that is observed today, the philosophy of pragmatism was simmering within United States democratic education. Predominately, the branching of education into the fields of study observed in contemporary schools (e.g., humanities, sciences, mathematics) was initially introduced in the 1800s in the American educational system (Tobin et al., 2016). Disciplinary perspectives on STEM and humanities subjects are often addressed separately with their own individualized pedagogies, and integrative approaches to teaching and learning multiple disciplines within a lesson or unit are not common.

In addition to studying philosophy of pragmatism, the formal discipline approach to education should be reviewed when considering the historical path to integrative STEM education. In a formal discipline perspective, one should study specific subjects (e.g., world languages and mathematics) to exercise and advance the brain (American Psychological Association, 2020, para. 1). John Locke (1632–1704), an English philosopher and political theorist, was a well-known supporter of the doctrine of formal discipline. In *John Locke and Formal Discipline*, Frederick Arthur Hodge (1911) explained the doctrine emerged “in the effort to readjust classical training to the demands of the renaissance” (p. 3). It was believed that the brain’s performance could be augmented through mental exercises (Leberman, McDonald, & Doyle, 2006, p. 9). Training that strengthened a particular faculty (e.g., memory, imagination, judgment, and reasoning) was thought to benefit performance on any task that relied on that faculty.

Thorndike denounced formal discipline and indicated that school curricula should “include tasks similar to those that students will perform when they leave school. Thus the study of mathematics should not be included because it strengthens the minds but because students will actually use mathematics when they leave school” (Olsen & Hergenahn, 2016, p. 61). While the doctrine of formal discipline has been discredited, many educational systems continue to perpetuate the separation of academic disciplines (e.g., humanities, sciences, and mathematics) and, thus, lack of content integration.

## Shifting to Learning by Doing

Integrative STEM education emphasizes the importance of students having authentic experiences to create, experiment, and take risks to solve real-world problems through combining knowledge and skills from various disciplines. Charles W. Eliot (1834–1926), president of Harvard University from 1869 to 1895, was a supporter of science teaching in schools. In 1869, he expressed the need for science education to be hands-on and not solely lecture-based in schools to:

develop and discipline those powers of the mind by which science has been created and is daily nourished – the powers of observation, the inductive faculty, the sober imagination, the sincere and proportionate judgment. A student in the elements gets no such training by studying even a good textbook, though he really master it, nor yet by sitting at the feet of the most admirable lecturer. (Massachusetts Teachers' Association, 1869, p. 443)

The transition from teacher-centered lectures to a shared focus of laboratory practices was first documented in the 1880s in Harvard University's departments of chemistry (Tamir, 1976). This hand-on approach to learning led to the incorporation of laboratory practices in other disciplines for students to have opportunities to observe, test hypotheses, and stimulate learning. As other universities adopted this approach, high school programs closely followed suit. By 1892, the National Education Association mandated laboratory science in high school science curriculum (National Education Association of the United States, 1893; Vázquez, 2006). Results from a national longitudinal study of participating high school students in the United States over a century after the National Education Association mandate for laboratories indicate that laboratory instruction positively correlates with higher student performance levels (Von Secker & Lissitz, 1999). Additionally, laboratory learning minimizes gaps of achievement among students of different socioeconomic status (Von Secker & Lissitz, 1999).

While laboratory instruction is meaningful for science fields, other hands-on opportunities have been introduced in a wide range of disciplines. For example, active learning experiences may take place with manipulatives in mathematics (Gutiérrez, 2013), enzyme implementation in biotechnology (Ketpichainarong, Panijpan, & Ruenwongsa, 2010), school gardening (Waliczek & Zajicek, 1999), and adventure learning (Veletsianos & Kleanthous, 2009). When students have opportunities to explore in learning by doing activities and using materials, they are able to make more authentic connections within and across disciplines.

A catalyst for change in the direction of intentionally integrated subjects, as opposed to confinement of content to silos, was the former Soviet Union's launch of the world's first artificial satellite, Sputnik, in 1957 (Powell, 2007). Cold War tensions propelled a boost in attention to combined knowledge and competencies in STEM fields in the United States. Significant national resources were made available to advancing in technology and education at this time. The National Aeronautics and Space Administration (NASA) team of scientists, engineers, mathematicians, and other employees became a model for educational leaders and policymakers to refer to as they strove to enhance science education in the United States (Dick, 2015). The spirit of innovation that was necessary to succeed in the international competition to advance in space travel and reach the moon continues to echo in a broad spectrum of industrial and educational entities.

Since the 1960s, inquiry learning, or learning through discovery, has become a popular approach in STEM disciplines. Haury (1993) states "inquiry involves activity and skills, but the focus is on the active search for knowledge or understanding to satisfy a curiosity" (p. 8). Rather than students completing worksheets with subject matter they cannot relate to, students have opportunities to explore, create, and ponder about relevant topics within their school and community while gaining or building upon knowledge and skills from a variety of disciplines.

## Exploring the Ambiguity of STEM Education

STEM instruction is actualized in different structures in formal and informal learning environments. Judith A. Ramaley, former director of the United States National Science Foundation's Education and Human Resources Division, has been credited with giving the abbreviation "STEM" in 2001 (Koonce, Zhou, Anderson, Hening, & Conley, 2011); the National Science Foundation conventionally utilizes the acronym as science, technology, engineering, and mathematics fields and the inter-, multi-, and transdisciplinary interconnections of those fields.

The United States Congressional Research Service defines STEM education as "teaching and learning in the fields of science, technology, engineering, and mathematics. It typically includes educational activities across all grade levels – from pre-school to post-doctorate – in both formal (e.g., classrooms) and informal (e.g., afterschool programs) settings" (Gonzalez & Kuenzi, 2012, p. 2). However, Sanders (2009) argues that the *STEM education*, as an educational practice, is reflective of a century's worth of practices where the disciplines are taught separately within "sovereign territories" (p. 21).

With the futility of redefining STEM education after the acronym was popularized in mainstream education, Wells and Ernst (2012/2015) shifted conversation to integrative STEM as technology and engineering design-based instruction serving to bridge science and mathematics and is "...equally applicable at the natural intersections of learning within the continuum of content areas, educational environments, and academic levels" (para 4). However, their definition is designed to guide classroom teachers and does not take into account the need for integration of other content areas, such as social studies, visual arts, and world languages.

Integrative STEM education, instead of a practice for STEM teachers, should be practice for all stakeholders within a school ecosystem. Educational leaders, as guiders of programs, are well-positioned to bring a community of practice among the stakeholders for the ecosystem to evolve. Connections between integrative STEM teaching and learning within the school, and throughout the community, are needed for leaders to foster positive integrative STEM culture.

## Shifting Leaders to Integrative STEM Education

Current PK-12 students are entering a fundamentally different post education environment compared to previous generations. To prepare educators and leaders for needed modifications in curricular models to incorporate twenty-first century skills, context for the current state of integrative STEM education reform is necessitated. As student interest in science and mathematics typically dwindles as they move from elementary to secondary levels, leaders, educators, and school stakeholders need to deploy resources to develop and sustain student interests in these disciplines (Sanders, 2009). Integrative STEM education combines knowledge and explorations of at least two STEM areas and other content areas as a more wholistic approach to

learning and teaching in an effort to retain more student interest in STEM-focused future occupations and higher education programs.

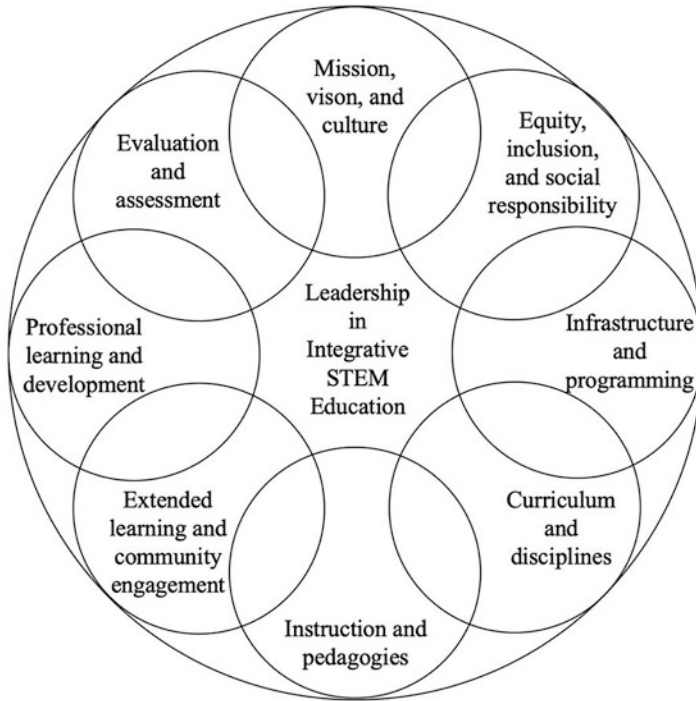

Effective educators must gain deeper understanding of how students learn and especially how they learn STEM concepts (Kelley & Knowles, 2016). Additionally, educators and leaders must understand students need a supportive and safe learning environment in order to thrive, and recognize that each student brings unique learning and developmental differences to the learning process (Council of Chief State School Officers, 2013; National Research Council, 2000). As disciplines are integrated, educators are confronted with needing a greater “toolbox” of strategies that can meet the needs of these diverse learners as they build key understandings in multiple disciplines.

In contrast to a teacher-centered classroom, interdisciplinary approaches require learner-centered environments which focus and build upon students’ needs, strengths, and interests (National Academies of Sciences, Engineering, and Medicine, 2018). When students are engaged in integrative STEM education, collaboration is essential. While group work is often included in classrooms, the traditional approach to group work falls short of the need for students to collaborate in ways that bring about both individual and collective learning accountability. It is common to hear students proclaim “I hate group work” because working in a group often means one or two students doing most of the work while others sit back or are relegated to the roles of notetakers or timekeepers. Building the necessary skills to incorporate effective collaborative learning strategies brings yet another area of learning for educators and leaders who seek to bring about a rich, integrative STEM learning environment.

## **Embedding Integrative STEM Education in Schools**

Integrative STEM education calls for leaders and educators to implement new skills and diverse approaches to curriculum and instruction while also requiring school stakeholders to develop deeper conceptual understanding within the STEM disciplines (Shernoff, Sinha, Bressler, & Ginsburg, 2017). Considering how students learn leads to culturally responsive and relevant teaching that respects the impact of students’ language, race, gender, ethnicity, culture, and other identities in their learning. It is critical for educational leaders, teachers, and staff to understand students – how they learn and what they bring to the learning – to effectively integrative STEM education.

Successful family-school-community partnerships in schools provide students meaningful integrative STEM learning opportunities, generate stakeholder support, and promote connections between PK-12 education and future careers. Leaders should include school stakeholders in shared decision-making processes to ensure all students can engage in integrative STEM programs. Though interrelated, the following domains build a significant foundation for leaders, educators, and school stakeholders to cultivate a comprehensive, equitable, and sustainable integrative STEM education program for students: (1) Mission, vision, and culture;

**Fig. 1** Integrative STEM Education Leadership Domains

(2) Equity, inclusion, and social responsibility; (3) Infrastructure and programming; (4) Curriculum and disciplines; (5) Instruction and pedagogies; (6) Extended learning and community engagement; (7) Professional learning and development; and (8) Evaluation and assessment (see Fig. 1). These domains are refined from Rose et al.'s (2019) study of skills, competencies, and qualities needed in integrative STEM leadership.

**Mission, vision, and culture.** To develop contributing STEM-citizens, the school vision, mission, and culture should drive the need for integrative STEM programs and culture. Within an integrative STEM culture, teachers, students, families, community members, and other stakeholders have opportunities to explore and prepare PK-12 students for future local and global STEM careers through workforce development and higher education readiness. The needs of students and the community are the focus of promising shifts in teaching and learning in schools to support integrative STEM education.

School stakeholders, including integrative STEM leadership team members, can build trust among one another through collaborative decision-making and sharing a vision of STEM education (Geesa et al., 2020; Owen, 2018; Rose et al., 2019). Educational leaders foster an integrative STEM mission and guide a school to work towards collectively determined integrative and inclusive STEM goals. As part of the culture, leaders, teachers, and students create environments and structures to

integrate STEM and other disciplines while also building transportable skills, such as problem-solving, collaboration, communication, ethical behavior, critical thinking, and STEM literacy, to follow the vision of the school.

**Equity, inclusion, and social responsibility.** As shared earlier in the chapter, traditional STEM education practices can lead to equity, diversity, and inclusion challenges through a siloed approach to teaching and learning in schools. Students' identities are unique to individual students, and may include gender, age, race, ethnicity, socioeconomic status, religious or spiritual affectation, sexual orientation, dis/ability, language, and other forms of how students identify themselves. Integrative STEM school and programming decisions must be socially responsible and entail inclusive practices that welcome and celebrate PK-12 students' diverse identities (Geesa et al., 2020; Rose et al., 2019).

School stakeholders need to develop family-school-community partnerships and participate in STEM education data sharing meetings, discussions, and decisions to best support the needs for the students and community. Integrative STEM offers equitable opportunities and increases all students' participation in career and higher education pathways (Huston, Cranfield, Forbes, & Leigh, 2019). Students will bring unique individual strengths to the program, and educational leaders systematically and collaboratively work with teachers, families, and community members to develop, implement, adapt, and enhance integrative STEM programming to address the cognitive, creative, affective, and concomitant needs.

**Infrastructure and programming.** Educational environments provide space for collaboration, teamwork, and critical thinking in integrative STEM education. Classrooms and school buildings are designed for students to invent, create, engineer, and explore in their learning. Makerspaces, innovation labs, and outdoor spaces are available to students, teachers, and school stakeholders during the school day and support extended learning activities outside of school hours for further student engagement in STEM. In addition to the educational space, teachers and students should have input regarding resources and materials they need to solve real-world problems and gain practical skills with tools, technology, and building supplies.

School schedules in an integrative STEM culture allow for teachers of various disciplines to meet, plan, and co-teach during the school day. Leaders work with teachers and staff to ensure schedules are designed to provide all students equitable accesses to learning and engagement in STEM disciplines. School and classroom designs must include learning spaces for collaboration and group project work, and laboratory spaces with the proper technologies for students to work as scientists, inventors, and engineers (Geesa et al., 2020; Rose et al., 2019). Modern materials, tools, and technologies facilitate multidisciplinary learning which allow students to experiment, test, and build items to prepare for their futures.

**Curriculum and disciplines.** A teacher's development and implementation of content and practices can shape students' academic and affective development (Callahan & Hertberg-Davis, 2013), therefore the quality of curriculum and integration of STEM disciplines in learning are paramount to developing STEM-capable citizens. Grade-level state and national standards should be referenced, and teachers need to think creatively as they develop curricular lessons and units

which incorporate STEM and non-STEM disciplines. In integrative STEM education, students have a voice to drive the curriculum forward in authentic and meaningful ways. While students need opportunities to act as scientists, technologists, engineers, and mathematicians, it is also necessary for them to experience knowledge and skill-building as artists, historians, writers, and other roles that prepare them for their futures.

As a goal for positive integrative STEM educational outcomes, educational leaders set expectations with teachers and stakeholders that curricular units allow students to “engage in designing, engineering, making, testing, and reflecting, and documenting” (Rose et al., 2019, p. 52). Inter-, multi-, and transdisciplinary experiences in all disciplines (e.g., mathematics, performing arts, social studies, and technology) in school are needed. Additionally, lessons and units should focus on real-world problems and allow students to explore solutions and needs to support and enhance the local and global community (e.g., Stith & Geesa, 2020). All stakeholders can engage in providing interactive and challenging integrative STEM curricular opportunities to promote lifelong learning for all students as they prepare for adulthood.

**Instruction and pedagogies.** Integrative STEM instructional approaches should address the diverse needs of students. The preferred learning modes of students may vary as they develop interests and passions in different fields. Teaching and learning strategies to allow students to explore, create, discover, and work as a team can be nearly inexecutable when a teacher stands at the front of the classroom and lectures to all students as a homogenous group. Instead, attention to the instructional approaches should augment student engagement in curricular contents and skills. Students have ownership in their learning, and teachers and leaders are facilitators in educational practices to support students’ goals through student-centric pedagogical approaches.

To a student who has only known the traditional curriculum approach, as discussed with the doctrine of formal discipline earlier in the chapter, the knowledge becomes the final product and not a tool to solve problems (Herrington & Oliver, 2000). Many students are also graduating without appreciating the interdisciplinarity of fields and how to integrate knowledge and skills in the workforce. Integrative STEM instruction may address these issues, when part or all of instruction is positioned as design-based, problem-based, and project-based. Additionally, teachers from different or similar disciplines need opportunities to collaborative, co-plan and co-teach lessons, develop and implement communication plans, and assess their instructional goals and outcomes.

Educational leaders can support teachers with time and resources to pursue these instructional approaches to support integrative STEM education access for all students. According to Combs and Silverman (2016), “the value of co-construction is that each participant contributes his or her own experience and thinking in a way that can lead to synergistic insight” (p. 22). Developing and sustaining integrative STEM activities and programs should be collaborative with leaders and teachers from a variety of disciplines sharing knowledge, planning events, fostering stakeholder relationships, and reaching out to community partners to cultivate the interdisciplinarity of real-world STEM problems.

**Extended learning and community engagement.** Learning and the pursuit of knowledge should not solely take place during the school day. Educational leaders should provide multiple opportunities for students to engage in STEM education. Through activities, programs, and clubs outside of regular school hours and/or during days when school is not in session, students have opportunities to expand their skills and understanding in critical thinking, teamwork, collaboration, and communication with fellow students, mentors, educators, and school and community stakeholders. Additionally, students focus on refining leadership and teamwork abilities, working with and serving their community, and reflecting upon and solving real-world problems through the use of STEM mindsets in inquiry-, problem-, and project-based teaching and learning approaches.

As discussed previously in the chapter, community engagement and stakeholder involvement are critical components of effective integrative STEM education programs and schools. Educational leaders, STEM leadership team members, and family-school-community partners cultivate an integrative STEM culture with shared a vision, mission, and goals. According to Afterschool Alliance (2020):

Nationwide, states and schools are engaging diverse partners like afterschool programs, libraries, museums, universities, and businesses to ensure that students have access to high-quality STEM education. By fully utilizing the hours outside of school, and taking an all hands on deck approach to maximize collective impact, we can ensure that our students are prepared for the future. (para. 2)

School and district leaders can foster partnerships with local community organizations and businesses to support the connection between learning in schools and students' homes, communities, and workplaces during and outside of typical school times.

**Professional learning and development.** Integration of STEM content areas requires knowledge and pedagogical skills that teachers and leaders may lack. In schools, professional development is often tailored in the theories of andragogical learning (Kalogirou, Theophanous, Theodosiou, Karagiorgi, & Kendeou, 2008); however, these theories are to disseminate content to students in teacher-centric contexts. For secondary teachers trained in one academic discipline, the challenge to integrate subject areas and build understanding of concepts outside their areas of expertise arise. Elementary teachers often lack confidence or experience in one or more of the STEM disciplines. Ongoing professional learning opportunities, such as longitudinal coaching and mentoring, can enhance teachers' and leaders' knowledge, skills, and experiences in a variety of disciplines.

Through integrative STEM education professional learning, teachers must experience learning in the way they expect their students to learn (e.g., solving ill-defined problems). Educational leaders facilitate opportunities for teachers to experience professional learning through providing time during the school day or during the summer for teachers to meet and observe others. Additionally, leaders can identify methods to fund supplies, resources, and professional courses for teachers to implement integrative STEM education. Integrative STEM

professional learning experiences should challenge teachers to innovate curricula based on student responses to learning. When teachers experience student-centric STEM-based learning approaches, they are more likely to implement integrative STEM teaching and learning models within their own lesson plans (Shively, Stith, & Rubenstein, 2018). Learning collaboratively through professional learning can open mindsets of teachers for sharing practice, planning together, observing one another, and collectively solving problems (Darling-Hammond & Oakes, 2019; Huffman & Hipp, 2003).

**Evaluation and assessment.** “To assess is to make judgments about students’ work, inferring from this what they have the capacity to do in the assessed domain, and thus what they know, value, or are capable of doing” (Joughin, 2009, p. 16). Through assessment and evaluation of integrative STEM learning and programs, a variety of sources, materials, and tools are utilized. Student capabilities are traditionally measured in disciplines, in classrooms, in schools, and by states. However, integrative STEM education assessments support students to create their own responses to learning through platforms beyond traditional testing methods, while aligning with grade-level state standards.

Educational leaders encourage teachers to develop and implement authentic assessments for STEM learning activities (e.g., design-based, problem-based, and project-based) and evaluate students’ engineering design process knowledge and skills in a various ways (Rose et al., 2019). Teacher evaluation processes in STEM education are transparent, and school and district leaders need to provide “actionable feedback to teachers that enhances STEM instruction” and model “how to provide actionable feedback to students that enhances their STEM learning outcomes” (Rose et al., 2019, p. 56). Through shared knowledge and learning in schools, more individualized forms of student, teacher, and program assessment and evaluation can be utilized.

---

## Conclusions and Reflections

Although the doctrine of formal discipline has been long discredited, the artifacts of this doctrine remain as disciplines often are taught in content silos. Educational leaders can position school programs to prepare students for a scientifically and technologically-driven society with innovative and collaborative instructional approaches. Much like Dewey, who argued for the value of situated learning to advocate for student successes in society, educational leaders can bolster relevant and engaging problem-solving and instruction into schools and districts through integrative STEM education. As educational domains are interrelated, educational leaders must consider shifting several aspects of programming to build integrative STEM education praxis and practices into a school, district, or educational organization.

Integrative STEM requires spanning across multiple disciplines for real-world learning and transitioning from teacher-centric to student-centric learning, a pedagogical approach that many educators lack. Educational leaders are faced with needs for

professional learning experiences that differ greatly from traditional approaches. Traditional professional development for teachers, leaders, and school stakeholders does not provide the elements of effective professional learning that call for greater duration of learning experiences, the need for collective learning through professional learning communities, and supportive conditions that include time and resources.

A fresh look is needed to consider impactful ways to bring about the professional growth necessary for educational leaders and educators to make changes to their current practices. Creating a culture of learning within the classroom also means building a culture of learning for all educators to meet the demands of this ever-changing global society. Future professional learning should encourage collaboration among teachers and school stakeholders to integrate STEM contents in instructional practices that support student ownership of their learning, in addition to implementing meaningful lessons and units to solve authentic problems within the local and global community.

By referring to the domains of integrative STEM education, educational leaders have a guide to better meet the needs of the students and community to prepare all students for success in a global society. Mission and culture indicate the importance of leadership teams, stakeholder involvement, and collaborative decisions related to the direction and desirable outcomes of learning for all students through integrative STEM programming in a shared vision. Inclusive practices by leaders and teachers ensure students engage in equitable and socially responsible integrative STEM education programs, and teachers adapt curricula to build on the unique strengths and needs of diverse student populations. Integrative STEM curriculum and instruction supports students solving real-world problems by students thinking and doing as scientists, technologists, engineers, artists, and mathematicians in their lessons and units. Extended learning further enriches student experiences in integrative STEM content and practices beyond the classroom. Lastly, evaluation and assessment approaches support students to provide their own responses to real-world problems that provision evidence of content and practice mastery.

In this chapter, the reverse engineering of integrative STEM education revealed that leaders, teachers, and school stakeholders must be intentional and collaborative in their decisions to build strong foundations for students' engagement and learning that include increasing diversity, equity, and inclusion in STEM education and preparing students for success in a STEM-driven society. In order to meet these expectations, impactful ways to build the capacities of the STEM education leadership domains should continue to be explored.

## Abstract

Teacher professional standards such as those developed by the Australian Institute for Teaching and School Leadership (AITSL) have emerged out of a neoliberal ecology that promotes a technical rationality at odds with the ontological concerns of teacher professionalism. This neoliberal ecology anchors teacher quality to epistemologically focussed teacher standards on contested ground between the desire for quality improvement and the desire for quality assurance. A Foucauldian analysis of professional standards illustrates how powerfully rationalizing they are, the degree to which the discourse of quality assurance and its concomitant

depowering effects dominate, and how this works against the betterment of teachers and their teaching. This leads to an argument for the development of an audacious reflexivity in teachers and their approach to their profession, an approach which liberate teachers to *believe in* and *act on* their capacity to make fine-grained professional judgements that best serve the needs of their students in ways that go beyond the limiting contingencies of technically organized professional standards. If teachers are deeply conscientized in an understanding of the things that bind them, they will be better placed to orchestrate a power over their work, to reconfigure the norms of professional standards in ethical terms that guide, not bind.

### Keywords

Foucault · Teacher professional standards · Neoliberalism · Technical rationality · Normalization · Pastoral power · Ethics · Care of the self · Desire · Seduction · Audacious reflexivity · Teacher professionalism

### The Field of Memory

A whole generation of teachers have known nothing but regulatory and compliance regimes dictated by teacher professional standards. Yet teachers know that while standards identify what a teacher must know and be able to do, those standards have little or nothing to say about the personal dispositions that are quintessential to the making of an exemplary teacher. The portrait of a teacher revealed in professional standards focuses on the epistemological domain of knowing and doing but is silent on the ontological domain of the human person that the teacher is always in the process of becoming as a professional. Without attention to the ontological domain, teacher professional standards fail to resonate with teachers' experience of what makes the exemplary teacher and may diminish rather than contribute to professional identity and agency.

### The Field of Presence

There is a consensus that teachers and the quality of their work are the in-school factors that make the most difference to the education of school-aged children. This consensus has led to a strong public discourse tightly coupling teacher quality to the notion of continuous school improvement (Mockler, 2018). OECD studies of the 2010s encouraged governments around the world to see teacher standards as the means to improve teacher quality and thus improve nations' standings on international league tables such as the ones constructed in response to PISA testing (Call, 2018). Contemporary teacher professional standards privilege the epistemological domain – what teachers know and are able to do – to the exclusion of other domains that complete the portrait of the exemplary teacher.

### The Field of Concomitance

School education is replete with examples of systems, structures, and processes borrowed from large, high-risk fields such as financial institutions, health services,

and high-stakes public infrastructure projects. Strategic planning, auditing, and quality assurance have been borrowed from the corporate sector in efforts to improve schools. Neoliberal governance has taken education in the direction of the technical rationalization of teaching, starkly illustrated in teacher standards. Technical rationality was first applied, appropriately, to industrial production, and thereafter applied, inappropriately, to human relations such that it has “standardized the world” (Marcuse, 1941, p. 419). Technical rationality, however, denies and diminishes the messy complexity of human relationships that inhere teaching and demands that phenomena be understood in simplistic, readily definable, repeatable, and measurable ways.

### **Discontinuities and Ruptures**

A demand for excellence and equity in education comes from all quarters. Teacher standards in their current form measured against improved excellence (better student outcomes) or improved equity (a closing of the educational opportunity gap for all young people) have not realized the kinds of improvement promised. The ongoing stagnation of improvement in student outcomes is, in and of itself, a challenge to the technical rationality of teacher standards. The transformation of teacher practice and improvement in teacher quality cannot be achieved through teacher standards that lack teacher voice and which are not deeply embedded in an ethical narrative borne of teachers’ ontological concerns.

### **Critical Assumptions or Presupposition**

Teachers remain unconvinced of the efficacy of teacher professional standards that are constructed around only the epistemological concerns of teaching (Day & Gu, 2010). Teachers understand that exemplary practice is inextricably bound to the exercise of a set of ontological dispositions, like passion, love of learning, and care for young people, which are elemental to the personhood of the teacher. When teacher standards exclude the ontology of teaching, they miss the heart of the story. Problematizing and analyzing teacher professional standards using Foucauldian tools can help to give clarity and direction to this lacuna.

---

## **Introduction**

From the rise in the 1990s of the moderate left – Tony Blair in the UK, Bill Clinton in the USA, and Paul Keating in Australia – widespread adoption of neoliberal policies created a world where other ways of organizing society became unthinkable and undoable. While these neoliberal governments believed in small government on a tight budget, they nonetheless wanted to maintain power, control, and influence, thus the rise of an audit culture (Power, 1997) and the risk management of everything (Power, 2004). Tools in the service of control for “small government” are regulation and standardization, not least of all in education (Reid, 2020). Standards serve governments’ and organizations’ need for quality assurance but are imperfect. As Power (2004) notes, “such systems have been criticised for being excessively

bureaucratic and for concentrating on auditable process rather than on substantive outputs and performances. Worse still, they distract professionals from core tasks and create incentives for gaming” (p. 26).

Teachers have not been missed in the standardization industry. Teacher professional standards such as those promulgated by the Australian Institute for Teaching and School Leadership are now commonplace. While these standards serve the quality assurance purposes of governments and educational governors, how do they serve teachers? This chapter seeks to explicate the public discourses that gave rise to the AITSL teacher professional standards (the AITSL Standards) as a case study example. These discourses will then be situated in the neoliberal ecology within which they exist. Situating teacher standards thus will enable problematization and analysis through a Foucauldian lens.

The Foucauldian archive provides a set of intellectual tools to revisit practice, ask questions about power, knowledge and freedom, and the formation of the subject. Foucauldian tools unsettle taken-for-granted realities. They can help to generate new insights and discomfiting perspectives for those experiencing an unease about standards and the way in which they have been imposed on professional lives. In particular, the tools of problematization (Foucault, 1988), normalization (Foucault, 1995), pastoral power (Foucault, 2009), care of the self (Foucault, 1986, 1987), and the relationship between desire and pleasure/power (1985, 1996b, 1996d) will be employed in an attempt to resignify teacher standards as the possession of an audaciously reflexive profession which should work towards the control of their own ethical narrative. Some of the Foucauldian analytical tools to be utilized such as pastoral power, care of the self, and desire are rarely employed in discussions about education, and thus offer the promise of fresh insights.

---

## **Dominant Discourses About Quality, Teachers, and Standards**

That quality matters is an article of faith in education. The rhetoric of quality translates to the raising of the quality of teachers. In a country in which the dominant educational discourse is standardization (Reid, 2020), raising teacher quality takes the form of professional standards for teachers (Petty, Good, & Heafner, 2019), with Australia following the emerging orthodoxy on teacher standards (OECD, 2005) and the trend in other Western countries (CEPPE, 2013).

### **Teacher Quality**

In the Australian context as elsewhere, there is an unchallenged assumption that teacher standards “describe what teachers should know and be able to do” (Productivity Commission, 2012, p. 174) and that teacher quality is synonymous with teacher standards. Within the discourse on the pursuit of quality in education, teachers are seen as central, irrespective of the perspective or context. While not the greatest effects, nonetheless, teacher effects have been recognized as powerful

ones (Hattie, 2012), and are infinitely more appealing as a target for government policy than socioeconomic reform (Parr, 2010). It is in this context that professional standards for teachers emerged in many jurisdictions. Among other purposes, professional standards have been used as a strategy of neoliberal governance intended to raise the quality of teachers and teaching (Mockler, 2018). The rhetoric of a drive for the greater supervision of teacher quality through quality assurance mechanisms on the one hand, and an empowerment of teachers through greater access and exhortation to attend to their own ongoing professional learning on the other, has been a feature of the broad discourse on teacher professional standards (Thomas & Watson, 2011).

## Teacher Standards

The proposition that teacher professional standards would contribute to improvements in teacher quality has a genesis in Australian political life that originated in the 1980s (Mowbray, 2005). Contesting discourses about the purpose of professional standards for teachers arose from the outset and have persisted. The tension had already been noted by the Australian College of Educators (ACE) at their 2002 national meeting on teacher standards (ACE, 2002). On the one hand, standards were seen as providing the guiding principles to assist teachers in better understanding their work and how they might deepen their professionalism. On the other hand, professional standards were seen to hold the promise of operating as the measure against which teacher credentialing could be established – essentially a teacher accountability system. The tension had not been resolved on the eve of the release of a set of national professional standards for teachers by AITSL in 2010.

The establishment of AITSL was a significant change in education policy direction in Australia. AITSL replaced Teaching Australia, which had been represented by members of various professional teacher and school leader peak bodies. AITSL had a very different membership to Teaching Australia. AITSL Board comprised of employed representatives of government educational authorities in the eight states and territories, as well as Catholic and Independent school employer representatives, and union and professional organizations representatives. Established by government as an independent company, nonetheless its sole member is the Federal Minister for Education. The company is under the control of the Minister, as the constitution of the company makes clear. This is a prime example of an institution presenting itself as independent of political power but in reality, being deeply contingent upon it.

The lack of direct teacher voice in AITSL's makeup was starkly illustrated through the National Forum meetings and workshops that it held over the course of June–August 2013, in which 174 stakeholders were consulted about the AITSL Standards; not a single person was a classroom teacher. The shift of power in the national conversation about standards from teachers' professional organizations to government and employers saw the rhetoric of teacher standards being about quality improvement continue, but the reality of teacher standards being about quality assurance ramp up.

## The Neoliberal Ecology of Teacher Standards

Professional teaching standards are situated within the framework of a pervasive neoliberalism that dominates the global metropole, an approach to modern life that has spawned an audit culture which uses standards as a key tool within its regimes of accountability. Understood within this context, policy documents are ideological artifacts. The neoliberal ecology in which professional standards around the world have proliferated is essential to an understanding of the standards themselves.

Neoliberalism emphasizes market competencies and a style of managerial accountability that has given rise to an audit culture (Taubman, 2009). The ubiquity of neoliberal ideology in the Australian context has been successfully argued by Pusey (Pusey, 2010) and its ubiquity in all levels of education and across all political imaginaries is well documented (Reid, 2020). It hegemonically finds its way into educational discourses, threatening to silence debate as if there was no alternative view of the world available (Denniss, 2018). The COVID school closures crisis of 2020 did little to shift neoliberal educational thinking, typified by the newspaper-reported remark from a Sydney University educational don: “We need to ask really big questions about why we haven’t had any economies of scale and quality assurance [during remote learning]. The teachers are killing themselves doing lesson planning, why they should be given materials that’s quality assured” (Baker, 2020).

Some of the phenomena of neoliberalism that are recognizable in education are outsourcing; accountability regimes; efficiency drives based on an argument of scarcity of resources; emphasis on lifelong learning; reductionism; privileging of quantitative “evidence”; and an individualism that inheres the teacher quality discourse. The neoliberal paradigm follows a recognizable pattern of loosening direct control and replacing it with onerous audit and accountability mechanisms that bind institutions to the policy intentions of government. An aspect of neoliberal discourse is constant reference to the scarcity of resources and the need to introduce efficiencies (Denniss, 2018). Of course resources are scarce – precisely because the audit society invests so many resources in surveillance. Lifelong learning is strongly emphasized in neoliberal policy discourses, which construct the learner as a unit of production in the knowledge economy, a unit which must retrain frequently to maintain the requisite agility to move into different work as the needs of the economy change (Biesta, 2008). Neoliberalism eschews complexity, seeking simple, reductive answers and solutions to problems. An example of oversimplification is the proliferation of “what works” research (Auld & Morris, 2014) and “evidence-based practice” (Webster-Wright, 2010, p. 39), de-emphasizing the contextual complexity of teaching. Contemporary research approaches in education reflect neoliberal sensibilities, where randomized controlled trials are considered to be the research “gold standard” and are privileged in the evidence base, even in arenas where qualitative research may be more instructive (Smyth, Down, McInerney, & Hattam, 2014). International metrics like PISA, TIMSS, and PIRLS have become the basis for measuring a competency-based approach to professionalism which stands as a synonym for teacher quality. Finally, individualism is evident within the teacher quality discourse. The capacity of the individual teacher

to make a heroic difference to the life of students is emphasized, while the unequal distribution of education resources and support that exacerbates disadvantage and which can be shown to have a significant impact on educational outcomes is downplayed or even ignored.

Neoliberal ecology pervades contemporary educational settings and teacher professional standards can be understood as one element of this prevailing neoliberal audit culture. Teacher professional standards, as a regime of accountability, are a part of the contemporary landscape which teachers need to negotiate as they become teachers. Professional standards understood in neoliberal terms construct the teacher as compliant officer (Groundwater-Smith & Mockler, 2009), bound to the epistemological fields of knowing and doing. They beg the ontological question of the human person that the teacher is constantly *becoming* in pursuit of their professionalism.

## Teacher Standards and Technical Rationality

Technical rationality is a taken-for-granted term connected to the direction in which neoliberalism has taken education. Technical rationality was first applied, appropriately, to efficiencies within industrial production, and thereafter applied, inappropriately, to human relations such that it has “standardized the world” (Marcuse, 1941, p. 419). The price of technical rationality is the rights of the individual and the discounting of ethics (Giroux, 2001). Schön (2005) argues that technical rationality is the mental frame which has most heavily influenced the development of the professions. He takes technical rationality here to mean “instrumental problem solving made rigorous by the application of scientific theory and technique” (p. 21). From outside the educational field, Lanier (2010) offers scything insights into why technical rationality matters. Technical rationality denies the messy complexity of human problems and demands that phenomena be understood in simplistic, readily definable, repeatable, and measurable ways; but “can you tell how far you’ve let your sense of personhood degrade in order to make the illusion work for you” (p. 32)? It is a concern for this *diminishing* nature of technical rationality, a key strategy of neoliberalism which in turn gives birth to technologies such as professional standards, which makes reflection on technical rationality important for any critique of teacher professional standards.

---

## Problematizing Teacher Standards

The evolution of the standards movement has carried with it an ongoing and unresolved tension; on the one hand, standards are seen as providing the guiding principles to assist teachers in better understanding their work and how they might deepen their professionalism. On the other hand, professional standards are seen to hold the promise of operating as the measure against which teacher credentialing should be established – essentially a teacher accountability system.

As accountability measures, standards can hamper rather than drive school improvement (Mockler, 2020). When standards are used by governments and their regulators as regimes of accountability in education, they form a kind of panopticism that has constricting effects on the work of teachers. The dominance of one or another of these conceptions of teacher professional standards – as tools for quality improvement or as tools for quality assurance – will determine the success of professional standards in contributing to an improvement in teacher quality.

Santoro and Kennedy (2016) speak of “the globally accepted premise that teacher quality can be enhanced through professional standards” (p. 11). It is precisely such an assertion that is challenged by problematization. Teachers face pressure from increased levels of accountability to maintain their professional status. The strong accountability context of teacher standards places one of their stated aims – the quality improvement of teachers – at risk. While “power over” dominates the professional standards, their power to have an impact is ironically nullified. An element of responding to power asserted over us, Foucault believed, was to resist its immobilizing force by “the refusal to accept as self-evident the things that are proposed to us” (Foucault, 1988, p. 11). Problematization is the questioning of taken-for-granted assumptions about the world. The Foucauldian approach seeks to make the familiar strange. It is the gut feeling that the present is not quite right. In education policy research, problematization challenges “a pervasive logic that maintains educational *problems* can be *solved* in, with, or through policy” (Webb, 2014, p. 364, emphasis in original).

While research on education has made wide use of the critical Foucauldian tool of governmentality, the lesser utilized Foucauldian tools of pastoral power and care of the self have the potential to cast new light onto the problem which is here under consideration; namely, that the strong normalizing accountability context of the AITSL Standards places one of their stated aims – the quality improvement of teachers – at risk. In addition, a consideration of the curious nature of desire and seduction that systems of accountability like standards engender in teachers will be considered from a Foucauldian perspective. An analysis of the teacher standards, using the AITSL Standards as a case study, and utilizing these Foucauldian tools may help to shed light on an ethic for teachers as they deal with the contemporary dissonance that they now face: between the accountability that others want of them and the professional improvement agenda that they want for themselves.

---

## A Foucauldian Analysis of Teacher Standards

### Normalization

Professional standards can be understood as a technology of surveillance in the process of normalization in education. Within the Foucauldian paradigm, normalization is the chief means of the exercise of power. Normalization is a process of categorization according to the dictates of a dominant discourse that determines acceptability on a continuum. Normalization is coercive in as much as deviation

from the norm provides the necessary rationale within a discourse for intervention to correct the “abnormal.” There is a pernicious dimension to this: Whereas the binary distinction of permitted and forbidden provides a clear demarcation point for intervention, normativity conceptualizes deviancy as merely matters of degrees from what is considered normal – thus intervention and the exercise of power can be justified at virtually any point and is enacted through technologies of surveillance (Foucault, 1995). Normality conceived this way is, of its nature, limiting of human potential. The neutering of educational politics by a neoliberal discourse that emphasizes standardized technical competence and transforms education into merely an entity of the knowledge economy is a prime example of the limiting and normalizing action of discourse.

Discourses are the means by which normalization is actualized and technologies of surveillance are justified. They are sufficiently powerful to determine what is sayable and unsayable, doable, and undoable. Neoliberalism is a discourse that fits into this Foucauldian paradigm, whereby its dominance is such that many of the people responsible for the construction of policy and strategy cannot conceive of an alternative way to imagine the world. Consistent with Foucault, Ball (2012) contends that the State, too, is under the control of various discourses – not least of all the neoliberal discourse.

Teachers as much as any other group, perhaps more so, unconsciously foreclose on the application of a critical lens to policy and in so doing become captive participants in the imaginary that neoliberal policies perpetuate. Stickney (2012) illustrates well, in his own educational jurisdiction of Ontario, how word games like “brain-based learning” and “authentic assessment-for-success” are dealt with as authoritative texts that are not questioned. The AITSL Standards are replete with these word games. Stickney argues that teachers do not often seek to *know* about the “evidentiary bases” for these phrases, but “perform the rhetoric superficially” (p. 655) that satisfies their auditors that they *know how*. In so doing, teachers contribute to the construction of monolithic, normalizing discourses.

Normalizing discourses are seductive, because “good” teachers can be convinced that working hard at getting things “right” within the limiting parameters that discourses construct provides its own taste of power and the pleasures that this brings (Foucault, 1996a, 1996b). More will be said about this below in the discussion on desire and power.

Deviation from the norm is a matter of degrees along a continuum; normative disciplinary structures typically assign grades, divisions, awards, and honors and dishonors which allow for discrimination, surveillance, reward, and punishment, to ensure conformity (Foucault, 1995). Professional standards, with their accreditation processes leading to levels of attainment, promises of higher status, and threats of deregistration, neatly fit this profile of normativity. Teachers have been, in general terms, highly subject to normalizing disciplinary structures over the entire course of modern mass education. Professional standards for teachers are but a recent innovation in a deep archaeology of normalizing technologies in education (Foucault, 1995). Despite their increasing pervasiveness, however, experienced Australian teachers have not yet been persuaded of the necessity or importance of professional

standards (Taylor, 2016). The situation is little different elsewhere. In the USA, where the National Professional Board of Professional Teacher Standards provides voluntary certification, only 3% of US teachers have been certified in over 30 years. A hermeneutic of suspicion persists in the face of normalizing pressures.

## Power Through Discourse

Paraphrasing Fischer (2009), power relations are always produced in connection with discourse. A discourse, in the Foucauldian sense, can be said to exist when a set of rules can be discerned that cover all the objects, operations, concepts, and options of a field (Foucault, 1991). Discourses involve “practices that systematically form the objects of which they speak” (Foucault, 2002, p. 54). In addition, every discourse “contains the power to say something other than what it actually says, and thus to embrace a plurality of meanings” (Foucault, 2002, p. 134). A constant refrain in Foucault’s work is seeking to understand the ways in which power operates within the discourses that direct the institutions of society and the actions of citizens (Rouse, 2005). The privileging of one discourse suppresses others. The Foucauldian concept of power operating discursively, however, should not be understood crudely as an attempt at domination by the government or its agencies or anyone else specifically – it has its “own specificity or independent standing” (Scheurich & McKenzie, 2008, p. 332). Discourses have a life of their own that run in parallel with a shifting matrix of ideologies within the wider society.

## Pastoral Power

In his 1978 Collège de France lecture series, Foucault notes a particular form of power over the individual which he calls “pastoral power,” with its roots in the self-conduct and influence over conduct in Christian and pre-Christian history (Foucault, 2009, p. 123). In these lectures as well as at Stanford the following year, Foucault outlines the way in which pastoral power focuses on the individual through the power of personal confession to impose a self-sustaining discipline (Foucault, 2014), as well as through the utilization of “self-examination and the guidance of conscience” (Foucault, 2000a). Governmentality, Foucault reasons, emerged from pastoral power, utilizing “apparatuses of security as its essential technical instrument” (Foucault, 2009, p. 108). In a later piece written in 1982, Foucault provides a corrective that does not place pastoral power as prior to and superseded by governmentality, but rather situates pastoral power as the form of power that is oriented to the subjugation of the individual, rather than a particular group, class, or the population in general (Foucault, 2000b). It is contended here that the strong sense of personal commitment that imbues teachers and teaching and writing about it (Day, 2004) makes pastoral power a more useful lens, gadget, or tool for the analysis of teacher standards than the more typical appeal to the concept of governmentality, the latter concept nonetheless having been much more widely utilized

in studies on education. Pastoral power finds ready root in teaching, with teachers who, as carers of children, resonate with pastoral power's appeal to "zeal, devotion and endless application" (Foucault, 2009, p. 127). The analytical tool of pastoral power prompts reflection on the possible ways in which professional standards self-discipline teachers through the power of confession, revealing the conscience of the teacher; provide "continuous vigilance over oneself" (Foucault, 2014, p. 324); and employ discourses that are constructed as caring for teachers, for their own good.

## The Relationship of Power to Ethics

As teachers' professional identity is so bound to who they are as a human person, it is deeply ontological and must shoulder a robust ethical dimension. The ethical dimension of teacher professional identity centers on what is distinctive about teaching and why it matters. It follows that as the formation of the teacher is deeply ontological, and professional standards are seen to be axiomatic to professional identity, then the ontology of professional standards is of critical importance. Despite these connections, however, the ontology of professional standards is largely ignored in the literature (Webster-Wright, 2010).

The importance of the ontology of teaching was elucidated in the Australian context very early in the debate about professional standards. The *Australian Standards of Professional Practice Discussion Paper* which pre-dated the AITSL Standards noted that "teachers teach according to their 'being': who teachers are is absolutely the foundation of how they teach" (Mackay, ACE, ACSA, & AARE, 2000, p. 10). Somewhere along the way to the construction of the AITSL Standards, this point was lost.

In Foucauldian terms, ontological formation – the process of becoming – is a process of liberating self-formation that is neverending. Close to the end of his life, when his own thinking was most formed, Foucault commented: "Liberty is the ontological condition of ethics. But ethics is the deliberate form assumed by liberty" (Foucault, 1987, p. 115). Foucault made the following comments about the relationship of freedom (liberty) to power:

In the relations of power, there is necessarily the possibility of resistance, for if there were no possibility of resistance—of violent resistance, of escape, of ruse, of strategies that reverse the situation—there would be no relations of power. This being the general form, I refuse to answer the question that I am often asked: "But if power is everywhere, then there is no liberty." I answer: If there are relations of power throughout every social field it is because there is freedom everywhere. Now there are effectively states of domination. In many cases the relations of power are fixed in such a way that they are perpetually asymmetrical [sic] and the margin of liberty is extremely limited. (Foucault, 1987, p. 123)

If "ethics is the deliberate form assumed by liberty" (Foucault, 1987, p. 115), then care of the other (before care of the self) is the deliberate form assumed by pastoral power – "pastoral power is a power of care" (Foucault, 2009, p. 127). It is the nature of teachers' work that they are attuned to the politics of care in relation to students,

but perhaps less so in relation to the way *they* are “cared for” by strategies, like the implementation of professional standards, ostensibly put in place to advance the profession. Care of the self is the Foucauldian tool to which we now turn.

## Care of the Self

It is perhaps an unremarkable piece of teacher wisdom that self-knowledge precedes knowledge of one’s students. As Palmer (2007) reflects:

Knowing my students and my subject depends heavily on self-knowledge. When I do not know myself, I cannot know who my students are. I will see them through a glass darkly, in the shadows of my unexamined life – and when I cannot see them clearly, I cannot teach them well. (p. 3)

Foucault terms the process of liberating self-formation “care of the self,” the title of his last major volume (Foucault, 1986). In his late reflections, he affirms that one must take care of the self first in order to be able to care for others in a way which is not dominating but liberating (Foucault, 1987). Pastoral power uses care of the other as a technique of control and subjugation; care of the self, on the other hand, makes mastery over the self the *prior* responsibility. Consequently, a teacher who cares for the self correctly will “by that very fact, in a measure... behave correctly in relationship to others and for others” (Foucault, 1987, p. 118).

Care of the self involves the development of a self-referential “critical ontology,” which Foucault (1997) describes as “an attitude, an ethos, a philosophical life” in which the critique of what we are is at one and the same time the historical analysis of the limits imposed on us” (p. 319). The ethical self, then, is the antidote to subjugating pastoral power, an antidote whereby the limiting portrayal of teacher which inheres professional standards is recognized and teachers experiment in moving beyond it. The free ethical self is able to question the rationality of professional standards and critique their threat. In the process, the creative, transformative ontological shift is made from knowing “what we do” to knowing “who we are.”

Foucault describes the transformative ontological shift through the exemplar of Socrates (Foucault, 1986, 2006, 2011), who exercises an “art of existence” (Foucault, 1986, p. 238) and is authentically ethical “because what he says accords exactly with what he thinks, and what he thinks accords exactly with what he does” (Foucault, 2006, p. 42). Care of the self adopts a critical outlook on the world and asks the question, not only of professional standards, but of all policy instruments in operation in education, “In whose interest is this?” Where a dissonance between word and deed exists, Foucault notes the historical precedence of “pastoral counter-conducts” (Foucault, 2009, p. 204), especially effective in organized groups. As a community of subjects, a depowered teaching profession often lacks a collective care of the self sufficient to mount counter-conducts, leaving the direction and promotion of their profession to others. A shared ethics narrative of teachers and teaching, created by teachers, is one possible way in which to nurture

care of the self. A shared ethics *narrative* matters because it is through the faculty of narrative that one is able to give “an account of oneself” and, as such, narrative is “the prerequisite condition for any account of moral agency we might give” (Butler, 2005, p. 12). It needs to be a *shared* ethics narrative because “we are constituted in relationality” (Butler, 2005, p. 64). A shared ethics narrative is the care of the self that teachers require to resist the distorting effects of pastoral power and to create the dialogic relation with the neverending process of becoming.

Awareness of the formation of our own subjectivity in relation to power and freedom was, Foucault came to resolve, at the heart of all his philosophical endeavors (Foucault, 1996c, 2000b). The subject has a history; it is constituted by its context (Butler, 2005). Therefore, professional standards matter to teachers’ professional identity. They are a part of a teacher’s history of the self and, where they are mandated, contribute to constituting a part of what a teacher becomes. Professional standards such as the AITSL Standards encourage reflexivity, but not innocently. Self-assessment is constructed as a technology, not an instrument of self-care. Surely, an act of authentic self-assessment engages the teacher in the ongoing process of the formation of the self. But self-assessment undertaken within the limiting contingencies of the construction of professional identity inhering professional standards begins its work on reconstituting the professional identity of the teacher. Care of the self is identity-creating in a more critical and constructive way (Foucault, 2011), involving a more artful and activist awareness of the strategies, techniques, politics, mechanisms, and apparatus governing teachers’ conduct (Ball & Olmedo, 2013).

Foucault’s framing of the concepts of pastoral power and the care of the self offers tools with which to analyze teachers’ relationship to professional standards. Firstly, the potential effects of pastoral power upon teachers through the mechanism of professional standards “caring” for them, seeking to raise the standard of the profession, seeking to develop their teacher quality, offers a lens through which to analyze how professional standards work on teachers. Secondly, care of the self offers a lens through which to imagine how teachers might work with professional standards in ways which do not diminish them.

## Concerning Desire and Power

Power, constructed as positive feedback loops within normalizing discourses, produces a desire to continue to participate in the acts which perpetuate a normalizing discourse, reifying it and strengthening it (Foucault, 1996d). The check on this closed loop is the derivation of pleasure and power from within the teacher, rather than from external sources, through a care of the self. Teachers face pressure from increased levels of accountability to maintain their professional status. There is an apparent dissonance between the accountability that others want of teachers and the improvement agenda that teachers want for themselves. The reluctance of teachers to take up voluntary professional standards accreditation suggests that classroom teachers may not find, within standards regimes, all that they need to guide and drive them professionally.

Despite the reticence of teachers to run with professional standards, they have proved to be remarkably seductive, revealing the phenomena of power and desire at play. In Australia as elsewhere, we now have a generation of teachers that have known nothing other than professional standards governing their profession. The proposition is that many teachers come to desire the model of teacher that inheres the AITSL Standards and the compliance actions that necessarily follow, even though those actions may be limiting to their conception of the exemplary teacher.

A consideration is made of the relationship between desire and pleasure/power in various formulations by Foucault (1985, 1996b, 1996d). In normalizing professional standards, teachers undermine the importance of the ontological dimension of their work and thus do violence to the aspirations of the teaching profession. While a degree of resistance from teachers to the limiting effects of professional standards is apparent, teachers themselves, in accepting the AITSL Standards in their current form, contribute to a hollowed-out portrait of what the exemplary teacher might be, with commensurate threats of negative impacts on teacher professional identity, and a more aspirational and agentic teacher ethical narrative. There is a need for teachers to become more reflexively aware of these dynamics at play in professional standards. The reflexivity encouraged by the AITSL Standards apparatus is not enough, as it is reflexivity only to the standards themselves.

## Seduction

The seduction of professional standards discourses is that the teacher stands to gain the power and the pleasure of the expert, high-status teacher and this produces its own desire, conviction in the truth of the standards, and so on. Many teachers view the AITSL Standards as unproblematic and normative (Taylor, 2016). These teachers reflect a desire to act in accordance with the dictates of the AITSL Standards, thus valorizing the epistemological dimension of teaching that the AITSL Standards highlight. From a Foucauldian perspective, the ethical experience of teachers in this instance is not led by the teaching acts which they prioritize, nor their desire to do the “right thing” as determined by others and codified in the AITSL Standards, nor the pleasure which conformity to the AITSL Standards brings but is rather the expression of all three – desire, pleasure, and acts – working as part of a positive feedback loop that is self-sustaining. As Foucault writes, it is a dynamic circle, evincing “the desire that leads to the act, the act that is linked to pleasure, and the pleasure that occasions desire” (Foucault, 1985, p. 43). Elsewhere, Foucault, in a 1972 conversation with Gilles Deleuze, notes the complex relationship between “desire, power, and interest” (Foucault, 1996b, p. 80). In Foucault’s first conference appearance in the USA three years later, again in the company of Deleuze, he stated that “power induces and produces desire” (Foucault, 1996d, p. 158). The pleasure/power that is derived from compliance to professional standards is the sense of the kudos and professional rewards that will issue from adherence to them – the knowledge that one is an expert teacher as defined in the standards. The pleasure/power of compliance feeds the desire which is perceived to be bound up in one’s interests (Foucault, 1996b) and so on.

The relationship between pleasure/power and desire/interest suggests the seductiveness of mechanisms such as professional standards for teachers, with their promises of expertise, quality, and status. When the “soul” becomes seduced, it goes “beyond what the body demands and what its needs dictate” (Foucault, 1986, p. 135). Perhaps teachers being seduced by a professional standards discourse has led to the conduct of intensified actions implicit in professional standards that have exposed the “body of the teacher,” such that “education has increasingly become the ‘battered profession’” (Dinham, 2013, p. 98).

The notion of teachers and other agents engaged with the AITSL Standards being seduced by them highlights that we are, or at least might be, the architects of our own domination. These insights lend some prescience to Sachs’ (2003b) warning: “There is a danger that, with teachers accepting the challenge of using a standards framework as a source of professional learning, they become complicit in their own exploitation and the intensification of their work” (p. 184).

In teachers’ normalized responses to the AITSL Standards they succumb to the technical rationality of professional standards which dictate to them what a teacher looks like – what a teacher must know and be able to do. When the ontological dimension of being a teacher is ignored, a violence is done which may well be masked by the seductiveness of professional standards and the neoliberal ecology into which they neatly fit. In this instance of seduction, teachers have developed a desire to adhere to a set of professional standards that determine and narrow the definition of what it is to be a teacher and ultimately impact on their professional identity and their concomitant agency.

The neoliberal ecology of professional standards has created such a dominant normative environment that teachers find it difficult to imagine that the world could be structured otherwise. The concept of desire suggests that teachers are not simply allowing the technical rationality of professional standards to be imposed on them but face the threat of becoming active participants in the perpetration of a technical rationalization of their work. Through their compliance with regulation and their acquiescence to self-controlling mechanisms like maintenance of accreditation regimes, they become the surveilled docile body that cedes power. “A body is docile that may be subjected, used, transformed and improved” (Foucault, 1995, p. 136).

A reflexive awareness of these dynamics at play in professional standards is key to teachers’ exercise of greater power and thus greater agency in relation to them. Foucault notes that docile bodies emerged from the development of the “Disciplines” of the seventeenth and eighteenth centuries, which relied on a shift from the physical disciplinary power over the body to a subtle pastoral power over the soul (Foucault, 1982, 2000a). Utilizing self-examination and confession, pastoral power commands control over the individual, creating a self-regulation far beyond what disciplinary power was ever able to achieve (Foucault, 1978). In the workplace, the confession of pastoral power occurs through the sophisticated practice of the “self-appraisal.” Self-assessment in performance appraisal, accreditation, and re-accreditation processes is entrenched in the modern workplace and no less with respect to the performance and development cycle apparatus supporting the AITSL Standards, which specifically notes the importance of teacher self-assessment as evidence of

adequate performance. AITSL's *Performance and Development Framework* does not specifically mention Likert-scale-type self-assessment, but such instrumentalist tools can be found in AITSL's promotion of the *Self-Assessment Tool* for teachers and the *360° Reflection Tool* for school leaders. Contrasting with AITSL's development of appraisal instruments is research that has called into question the efficacy of business practices around performance appraisal (O'Neill, McLarnon, & Carswell, 2015) leading some multinational performance management companies to drop them (Buckingham & Goodall, 2015). There is more than a small irony that a global trend away from the use of instrumentalist performance management technologies emerged just at the time that AITSL was introducing them.

AITSL documents supporting teacher professional standards encourage teacher reflexivity. There is no objection to teacher reflexivity per se in any quarter; the issue is that teachers are encouraged to normalize their reflective gaze inwards to the professional standards document. Given the arguments that have been presented to this point, namely that the AITSL Standards almost entirely lack an ontological dimension that addresses the teacher dispositions that teachers know to be important, reflection on the present form of the AITSL Standards is more likely than not to foster the reproduction of the teacher as a compliant technical officer, contrary to the aspirations of the teaching profession.

---

## Teacher Professionalism Driven by an Audacious Reflexivity

Professional standards are not going to go away. Indeed, it is a reasonable proposition that teacher professional standards are necessary, but they are not sufficient. The AITSL Standards do indeed capture a part of teachers' work – the technical competencies of the epistemological domain – what the teacher must know and be able to do. What the AITSL Standards do not capture, however, are the dispositions of the ontological domain – the human person that the teacher becomes – which are critical to the portrait of the exemplary teacher. In other words, the AITSL Standards measure the knowledge and skills of the teacher – things that matter – but they do not measure *everything* that matters. The dominance of the accountability discourse of teacher standards is problematic. That professional standards are seen mostly if not completely as an accountability tool is a problem for at least five reasons.

Firstly, it is a problem because there is a dissonance between professional standards and lived experience, and there is a dissonance between standards-based professional learning and the need for ontological nurturing (Webster-Wright, 2010), but there is no current way of addressing these dissonances which obviously or intentionally enhance teacher quality. Secondly and relatedly, it is a problem because of the association between excessive accountability and low morale. Literature from across the global metropole reports the association between teacher negativity and declining morale (Bourke, Lidstone, & Ryan, 2013). Thirdly, it is a problem because poor morale is antithetical to strong professional identity, considered essential for a high-quality teaching profession (Monteiro, 2015). Fourthly, professional identity is closely bound to teacher autonomy, that is, the ability for the teacher to make fine-

grained professional judgements about their work so that they are best able to promote the needs of individual students (Groundwater-Smith & Mockler, 2009). Fifthly, professional identity also connects to the ontological dimension of “becoming and being teacher” (Beijaard, Meijer, & Verloop, 2004, p. 113). These five connecting points draw one to the conclusion that the greatest promise for actualizing professional standards in the service of improving teacher quality is in an active professionalism (see Sachs, 2003a) which strengthens teacher agency, facilitates a teaching culture where self-identified professional learning and growth is supported, and which challenges excessive, externally imposed accountabilities.

Perhaps the greatest promise for an active professionalism of teachers is its potential to liberate teachers to *believe in* and *act on* their capacity to make fine-grained professional judgements that best serve the needs of their students in ways that go beyond the limiting contingencies of technically organized professional standards. This is a form of agency that allows teachers to speak with *authority* about the various discourses that constitute the overall ecology of education. This leads to a proposition for an audacious critical reflexivity of the kind that Foucault (1984) suggested.

There is an extensive discussion about teacher reflexivity in AITSL’s documentation, but it is a reflexivity that seeks compliance to an imposed notion of what the teacher-as-self should be rather than a deep, transformative reflexivity. Audacious reflexivity is reflected in Foucault’s words when he says: “I don’t say the things I say because they are what I think, I say them as a way to make sure they no longer are what I think” (Foucault, 2013, p. 44). Paulo Freire expressed a similar intention in his lifelong theme of a pedagogy of liberation: “We can struggle to become free precisely because we can know we are not free!” (Freire & Shor, 1987, p. 13). Giroux (2010) expands on Freire’s ideas in more recent times, referring to a critical pedagogy that proposes “a way of thinking beyond the seemingly natural or inevitable state of things” (online); or again, Freire’s (1970) notion of conscientization as “the process in which men (sic), not as recipients, but as knowing subjects, achieve a deepening awareness both of the socio-cultural reality which shapes their lives and of their capacity to transform that reality” (p. 452). Parr (2010) is arguing in this same arena when he argues for “transgression dialogic potential” in teachers which, through critical reflexivity, challenges and destabilizes conventional thinking and acting (2010, p. 161). In being bold and taking risks, in “cultivating dissent” (Smyth et al., 2014, p. 15) and being imaginative and creative in thought, audacious reflexivity can create not just competent teachers but “transformative intellectuals in the classroom” (Baltodano, 2012, p. 502). Audacious reflexivity is more artfulness than technical expertise. It can achieve what Foucault (1985) principally sought to examine in his relational work: the extent to which “the effort to think one’s own history can free thought from what it silently thinks, and so enable it to think differently” (p. 9).

An audacious reflexivity would not narrow its gaze to professional standards but look holistically beyond them. Such a reflexivity would allow teachers to orchestrate a power over their work to reconfigure the norms of professional standards. Such a reflexivity is within the means of teachers right now, as noted in the research of

Singh, Heimans, and Glasswell (2014), who recognized in their study of teachers' policy enactments not just "hope or resistance" but teachers who "actively engage with a completely different set of ideas about what schooling might be about" (p. 834). The reflexivity of the authentic and emancipated self stands as an ideal for the teacher-practitioner as active professional (Webster-Wright, 2010).

Audacious reflexivity can be framed as a part of care of the self. Audacious reflexivity provides the insights and the resilience for a teacher to maintain the ethical self, the "work one does on oneself" (Wain, 2007, p. 167), necessary to create a bulwark against the limits to professional identity imposed by the technical rationality of professional standards such as the AITSL Standards. An audacious reflexivity might be bold enough to challenge "selective inattention to practical competence and professional artistry" (Schön, 2005, p. vii) and heighten teachers' sense of professionalism so that teaching becomes a part of their "art of living" (Foucault, 1986, p. 45).

---

## Conclusions and Reflections

The Australian Institute for Teaching and School Leadership (AITSL) Standards are typical of technical professional standards for teachers generally (Call, 2018) and are lauded by all Australian State and Federal governments as a "significant national reform" in education (Education Council, 2019, p. 3). The commonality that inheres technical professional standards for teachers is the focus on the epistemological dimensions of teaching – what a teacher must *know* and be able to *do*, to the exclusion of the ontological dimension of teaching – the human person that the teacher *becomes* in order to be an exemplary teacher in a deeply interpersonal profession. Ontological capacities are hard to measure and so, consistent with the preoccupation with technical abilities in the modern neoliberal educational ecology, they are largely if not entirely ignored in professional standards. The non-epistemological nature of tacit ontological phenomena such as teacher dispositions is virtually unrecognized in the literature – only knowledge is privileged. Ignoring that which teachers hold to be central to their work asserts limits to what they can *be*, contributing to their sense of powerlessness. A form of professional standards that fails to resonate with teachers' experience of the exemplary teacher will diminish rather than contribute to professional identity and agency.

The disconnection between the intentions of policymakers and teachers' enactment strategies limits the potential impact of teaching standards on the profession. For teachers, in focusing on what a teacher should know and be able to do, professional standards omit the significant question of who the teacher *becomes* in the course of committing to the community whom they serve, their school leaders, their colleagues, their students, and their parents.

The normalizing tendencies of professional standards are consistent with the power of other normalizing neoliberal technologies. Education currently operates in a noosphere so constricted that teachers cannot imagine another way in which teaching might be constructed. Yet teachers' nagging concern with respect to

professional standards is a yet to be fully articulated sense of the critical importance of the ontology of teaching – the human person that the teacher presents to the world and the associated dispositions which enable exemplary teachers to be distinguished from those around them. That articulation will be unleashed only through an audacious reflexivity which challenges the normalizing effects of teacher standards and boldly asserts the ontological dimension – a set of teacher dispositions if you like – which teachers know, in their heart of hearts, is the essence of great teachers; that is to say, not what they know and can do, but the human person they are constantly in the process of becoming to those whom they teach. Foucault’s work on the ethics of the care of the self addresses these lofty concerns and provides a starting point for the development of an alternative to codification mechanisms for the nourishment of teacher dispositions (Foucault, 1985, 1986, 1987).

### Abstract

This chapter traces the evolution of Response-to-Intervention (RTI) in the United States, focusing on the discourses that undergird its conceptualization in implementation and scholarship. Discourse on RTI began with concerns about student equity in special education. Its early conceptualization focused on mitigating the problematic nature of the special education designation process and attempted to shift the practice to providing early intervention supports within the general education setting. Current practices and perspectives continue to build on medical models of intervention and implementation approaches rooted in technical-rational methods. Critiques about RTI research and practice reflect broader analyses of policy implementation and large-scale school reforms described as overemphasizing the technical dimensions of change and underestimating the influence of the socio-cultural, cognitive, and political contexts.

**Explanations****The Field of Memory**

RTI models were directly developed in contrast to the dominant discrepancy model, sometimes derisively referred to as the “wait to fail” model. A discrepancy model is used to identify students by assessing the difference between a student’s academic performance and standardized achievement and IQ test results. Criticism emerged within a decade, across several fronts, all of them psychometric in nature. The first criticism is that achievement scores are unstable over time, with variance in performance from one grade level to the next. A second area of criticism is in regard to the other part of the formula: the intelligence test, which are found to be culturally bias, especially for racially, linguistically, and ethnically diverse students. In practice the discrepancy model has not been an accurate tool for determining the difference between low-performing students who have been underserved and students with processing difficulties.

**The Field of Presence**

In its current basic iteration, RTI is typically presented as a three-tiered model, outlining processes for diagnosing and supporting student academic progress. The focus in Tier I is overall classroom instruction, ensuring that high-quality evidence-based instruction is accessible to all students. In Tier 2, students who are not benefitting from Tier 1 instruction are targeted for supplemental instruction, usually in small groups. Those students in Tier 2 who continue to make little progress are then considered for Tier 3 interventions which emphasizes personalized and intensive supports. If learning difficulties continued, then evidence of a lack of responsiveness to interventions may be submitted, along with other documentation, that the student may have a specific learning disability. Should it be determined, the student would be eligible for special education services.

**The Field of Concomitance**

RTI borrows from medical terms and models. As with many other educational terms, “response to intervention” emerged from the medical field as a way of describing a patient’s reaction to an emergency treatment. In contrast to previous diagnosing learning disabilities, advocates of RTI models believed that it would lead to reduction in identification bias, and earlier identification and academic supports for students. Scholarship on RTI is dominated by a focus on RTI’s diagnostic and monitoring processes, and research-based interventions within the fields of special education, school psychology, and reading education. Critical scholars observe that there is an overemphasis on technical-approaches to understanding RTI implementation and research and argue for analyses that attends to social, cultural, structural, and political conditions that mediate its enactment and student outcomes.

---

### **Discontinuities and Ruptures which Form the Different Viewpoints of this Area or Field**

RTI is both an educational practice and a diagnostic tool for disability. Nowhere else in special education does this dual definition exist – diagnosis and intervention are separate processes that are not comingled. This version of response to intervention offers a newer set of presumptions. RTI was guided by several assumptions representing a paradigm shift from previous determinations of SLD eligibility, born out of dissatisfaction with the discrepancy model. Instead of first assuming that a student’s learning difficulties reside in their individual ability, it focuses on instruction, curriculum, and the classroom environment as influencing student outcomes. These shifts reflect a new and ongoing analysis of learning opportunity gaps as a key influence of student outcomes as opposed to practices that start with individual deficit frameworks.

### **Critical Assumptions or Presupposition**

RTI models emphasize the use of evidence-based interventions, frequent progress-monitoring of student learning using curriculum-based assessments, and data-based decision-making. The discourse surrounding RTI, because of its history and coupling with special education, remain very much rooted in disability labels and sorting of students as evidenced by the language of tiers. These practices reflect broader reform trends centered on technical-rational approaches to improving schooling and student outcomes in the U.S.

---

## **Introduction**

This chapter traces the evolution of Response-to-Intervention (RTI) in the United States, focusing on the discourses that undergird its conceptualization in implementation and scholarship. First, the philosophical roots of RTI and its relationship to discursive practices about special education and learning disabilities are presented. Next, a discussion of the initial emergence of RTI as a new educational innovation, followed by an analysis of its present conceptualization, implementation efforts, and consequences. In the conclusion, implications for future practice and research are discussed.

---

## **Philosophical Roots of Response to Intervention and Disability**

As with many other educational terms, “response to intervention” emerged from the medical field as a way of describing a patient’s reaction to an emergency treatment. Notably, it is used in toxicology, where pulmonary and respiratory measurements provide immediate feedback to the technician on “the interaction between a given stimulus and the central nervous system” (1976, p. 5). The term sits adjacent to dose-response curves, which are an illustration of the relationship between the dosage of a drug and a patient’s physiological response.

The use of a medical model in education, especially in disability, has long been viewed as problematic (Bank-Mikkelsen, 1980; Finkelstein, 2001; Wolfensberger, 1972). There has been a centuries-old tradition of viewing people

with disabilities as “abnormal, burdened with difficulties resulting from organic dysfunction requiring expert help in order to ameliorate undesirable effects” (Simmons, Blackmore, & Bayliss, 2008, p. 733). In this stance, disability is deviance and the role of special education, a modern form of addressing disability, is one of diagnosis and treatment to reduce the deviance. Disability rights theorists, on the other hand, have argued that disability is largely a social construct that is informed by the organizational structures of society. Foucault’s work has been a consistent influence on disability studies (Anders, 2013) especially as a seminal source for the argument of impairment as a social construction that obfuscates the true work of “diagnosing the forces that produce them” (p. 2). Instead, the focus remains on ameliorating their results.

This tension between a medical and a social model of disability is apparent in the creation of a new category of disability that is unique to schooling: specific learning disabilities. The discursive practices invoked by Foucault (1972) remind us that it is not language and words themselves, but the systems created to match the language, that must be attended to, noting that discourse yields to “practices that systematically form the objects of which they speak” (p. 49). Learning disabilities are uniquely academic in nature and are manifested within the realm of reading, writing, language, and mathematics. As such, they are defined in educational law as a “disorder” resulting from “perceptual difficulties, brain injury, minimal brain dysfunction, dyslexia, and developmental aphasia” (IDEA, 2004, 20 USC 1401(30)). However, they are not otherwise readily apparent when these skills are not being utilized.

Special education is predicated on assumptions of “normal” and the contrastive “abnormal” and therefore relies on a relationship with psychometrics as a means to quantify each (Reid & Valle, 2004). In this discursive practice, difference is pathologized (Skrtic, 1995). This analysis of the philosophical roots of response to intervention and disability should not be misinterpreted as an argument that specific learning disabilities do not exist, or that students with specific learning disabilities should not be served. Rather, they illustrate critical assumptions that undergird policy and practice.

---

## Initial Emergence of RTI and Shifts

The application of Response-to-Intervention (RTI) in United States education became widespread as a result of its inclusion in the regulatory notes of the Individuals with Disabilities Education Act of 2004 (IDEA, 2004), which allowed its use as an alternative for special education eligibility. It is notable that it does not appear in the law itself, only in its implementation. Further, RTI is limited to use for identifying students with a specific learning disability. Therein lies a conundrum, because RTI is both an educational practice and a diagnostic tool for disability. Nowhere else in special education does this dual definition exist – diagnosis and intervention are separate processes that are not comingled. Before it was codified into educational policy and evolved into a broader intervention model for students, RTI had its roots in

special education practice, where to this day, a major concern is the process of identifying students with specific learning disabilities. As such, since its inception in special education it has been as a means for identification.

Vaughn and Fuchs (2003) trace the origins of RTI as an alternate means of identification to a 1982 National Research Council report, *Placing Children in Special Education: A Strategy for Equity* (Heller, Holtzman, & Messick, 1982) which proposed three criteria for identify students for special education. The criteria included considering the quality of the general education program, whether the special education program in place could actually improve student outcomes, and whether the tests uses to identify students were valid and accurate (Vaughn & Fuchs, 2003). All three criteria needed to be met for specific learning disabilities (SLD) qualification.

As scholars began to operationalize the criteria laid out in the report, they highlighted the potential benefits of RTI approaches. The dominant discrepancy model, sometimes derisively referred to as the “wait to fail” model, did not serve young students well, as it requires demonstration of a lack of academic progress. Additionally, primary students do not take standardized tests. As a result, a child might be in second or third grade before being identified as having a SLD. In contrast, RTI was viewed as holding promising benefits such as the “(1) identification students using at risk rather than deficit model, (2) early identification and instruction of students with LD, (3) reduction of identification bias, and (4) a strong focus on student outcomes” (Vaughn & Fuchs, 2003, p. 140). The argument for response to intervention as a means for identifying students with SLD was that it considered classroom factors in advance of qualification for special education supports and services.

In this early iteration, RTI was guided by several assumptions representing a paradigm shift from previous determinations of SLD eligibility, born out of dissatisfaction with the discrepancy model (Vaughn & Fuchs, 2003). A discrepancy model is used to identify students by assessing the difference between a student’s academic performance and standardized achievement and IQ test results. As outlined in the early years of federal oversight of special education, regulations for SLD identification required demonstration of “a severe discrepancy between achievement and intellectual ability” (U.S. Office of Education, 1977, p. G1082).

Criticism emerged within a decade, across several fronts, all of them psychometric in nature. The first criticism is that achievement scores are unstable over time, with variance in performance from one grade level to the next. Therefore, the use of an unstable metric against a more stable one (general intelligence) yields capricious results (e.g., Braden & Weiss, 1988), and a child’s qualification would be dependent on how he or she performed on a standardized test. A second area of criticism is in regard to the other part of the formula: the intelligence test. Problems of cultural bias abound when it comes to intelligence testing, especially for racially, linguistically, and ethnically diverse students (e.g., Reschly, 1984). In practice the discrepancy model has not been an accurate tool for differentiating between low-performing students who have been underserved and students with processing difficulties. This has led to some researchers arguing that low achievement should be enough to qualify for services and that intelligence testing is not necessary or valid for discerning between poor readers and dyslexic readers (Siegel, 1992; Stanovich, 1991).

The discrepancy model for identification of SLD is still in widespread use, and contemporary research of its shortcomings continue to emerge. Others have noted that the process neglects to consider factors beyond the individual child's performance nor does it question the validity of such tests in determining ability and performance (Artiles, Bal, & Thorius, 2010; Sabnis, Castillo, & Wolgemuth, 2019). In addition, Francis, Fletcher, and Stuebing (2005) demonstrated that 39% students who were identified as having a specific learning disability in third grade did not meet the same qualification in fifth grade.

The discrepancy model's tendency toward variance is amplified further because of the lack of specificity about the nature of the gap, as most any gap will do. If tested, most children would show some gap between performance and potential (McGill, 2018). This weakness appears to have been exploited in the 2019 college admissions scandal, where high school students obtained a diagnosis of a specific learning disability in order to petition the College Board for a testing accommodation (Lovett, 2020). Notably, the private psychologists who gave the diagnoses were not involved in the deception, as the person at the center of the scandal knew that virtually any tested student would show some discrepancy. As an added measure, according the FBI records, parents were advised to tell their child to "act stupid" or "act slow" in order to feign a disability (Lovett, 2020, p. 126).

In 2004, the RTI statute appeared in the IDEA legislation regulations. While it preserved the discrepancy model as a means for identification, it added through "additional authority" the option that a student could be identified through alternate means – response to intervention:

*In determining whether a child has a specific learning disability, a local educational agency may use a process that determines if the child responds to scientific, research-based intervention as a part of the evaluation procedures described in paragraphs (2) and (3). [20 USC 1414(b)(6)]*

In doing so, the shift to RTI as an alternate means of identification introduced new possibilities as well as new challenges. What exactly does "scientific, research-based intervention" mean? With this came the introduction of new discursive practices that "systematically form the objects of which they speak" (Foucault, 1972, p. 49).

Overall, the discourse in the early conceptualization of RTI focused on mitigating the problematic nature of the special education designation process and attempted to shift the practice to providing early intervention supports within the general education setting. In addition to focusing on high-quality classroom instruction, RTI approaches emphasized the use of evidence-based interventions, frequent progress-monitoring of student learning using curriculum-based assessments, and data-based decision-making. These practices reflect broader reform trends centered on technical-rational approaches to improving schooling in the USA (Datnow & Park, 2009; Kramarczuk Voulgarides, Fergus, & King Thorius, 2017), paralleling the national policy push in the early 2000s for "gold-standard research" (often narrowly defined as randomized experimental/quasi-experimental designs) in order to establish "what works." At the

same time, scholarly debates about what counted as valid and reliable research evidence to influence educational practice and policy were also at the forefront (Berliner, 2002; Eisenhart & Towne, 2003; Erickson & Gutierrez, 2002; Feuer, Towne, & Shavelson, 2002). As federal policy privileged narrow definitions of what counted as evidence for teaching and learning, assessments and accountability data became critical tools for decision-making in schools. In the following section, the current discourse on RTI implementation and research is analyzed.

---

## **From Emerging Innovation to Established Practice: Continuities and Disruptions in Discourse and Practice**

A decade after its codification into federal policy, all 50 states allowed RTI as an alternate means for identification of a specific learning disability (Fuchs & Vaughn, 2012). In its current basic iteration, RTI is typically presented as a three-tiered model, outlining processes for diagnosing and supporting student academic progress. The focus in Tier I is overall classroom instruction, ensuring that high-quality evidence-based instruction is accessible to all students. In Tier 2, students who are not benefitting from Tier 1 instruction are targeted for supplemental instruction, usually in small groups. Those students in Tier 2 who continue to make little progress are then considered for Tier 3 interventions which emphasizes personalized and intensive supports. If learning difficulties continued, then evidence of a lack of responsiveness to interventions may be submitted, along with other documentation, that the student may have a specific learning disability. Should it be determined, the student would be eligible for special education services.

This version of response to intervention offers a newer set of presumptions. Instead of first assuming that a student's learning difficulties reside in their individual ability, it focuses on instruction, curriculum, and the classroom environment as influencing student outcomes (Artiles et al., 2010; Fuchs & Vaughn, 2012). In other words, the target of initial intervention is the classroom rather than an individual student. Furthermore, identification measures are directly linked to instruction. It rests on a key assumption is that "responsiveness to treatment can differentiate between two explanations for low achievement: poor instruction versus disability" (Fuchs, 2002, p. 521). These shifts reflect a new and ongoing analysis of learning opportunity gaps as a key influence of student outcomes as opposed to practices that start with individual deficit frameworks. At the same time, the discourse surrounding RTI, because of its history and coupling with special education, remain very much rooted in disability labels and sorting of students as evidenced by the language of tiers.

Although the unit of intervention has changed from an initial focus on an individual student to instructional practice, both discourse and practice on RTI remains centered on medical models and standardized practices. Ferri (2012) notes that "terms such as standard, universal, protocol, and treatment predominate in the literature on RTI. Envisioning the classroom as a laboratory, under RTI, everyone follows the same standard treatment protocol, which is understood to be universally

applicable and effective” (p. 865). Scholars from a critical tradition have questioned the central assumptions of RTI, especially its exclusive centering of student ability issues (Artiles, 2015; Thorius & Maxcy, 2015), arguing that this narrow analytic focus ignores the socio-cultural nature of learning and the intersectionality of student identity and experiences beyond ability labels (Artiles et al., 2010). For instance, lack of attention is paid to how race, gender, and/or language identities intersect with institutional factors in understanding student outcomes. Thus, RTI follows educational policies and reform efforts that are colorblind and neglects to directly grapple with the needs of diverse student populations (Artiles et al., 2010; Kramarczuk Voulgarides et al., 2017; Thorius & Sullivan, 2013).

The critical discourse surrounding RTI reflects broader equity concerns in education, especially the overrepresentation of minoritized students in special education (in both learning disabilities and behavioral disorders programs) and how best to serve diverse students. It also critiques the lack of attention paid to structures, history, politics, and the socio-cultural contexts in which reforms are implemented. Critical scholars continue to raise questions about RTI implementation and the lack of attention paid to social, cultural, structural, and political conditions that mediate how it is enacted in schools (Artiles et al., 2010; Thorius & Maxcy, 2015). These scholars argue that there is an over emphasis on a technical-approach to RTI implementation and research such as concentrating on procedures and categorization. Scholarship on RTI is dominated by a focus on RTI’s “essential components (screening, school monitoring, research-principled general education instruction, and supplemental intervention)” within the fields of special education, school psychology, and reading education (Fuchs & Vaughn, 2012, p. 2). RTI research and practice tends to either emphasize its use narrowly for special education identification or a whole school reform approach (Sabnis et al., 2019) with multiple discourses about its description and implementation processes ranging from a focus on services for students with disabilities to more expansive systemic change that reconfigures the relationship between special education and general education (Artiles et al., 2010).

In addition to placing a premium on evidence-based instruction and intervention, RTI also stresses fidelity as a critical element of implementation (Ferri, 2012; Kramarczuk Voulgarides et al., 2017; Thorius & Maxcy, 2015). The emphasis on fidelity is another reflection of the technical-rational approach to policy implementation and educational administration. Traditional models of policy implementation and school improvement tend to assume the trajectory of the change process as linear or presume that it occurs in steps (Datnow & Park, 2009; Honig, 2006; Kuipers et al., 2014). In reality, change trajectories may be more spiral or open-ended (Weick & Quinn, 1999), especially if change is expected to be continuous rather than an episodic event (Todnem By, 2005). The technical-rational perspective focuses on the administrative and procedural aspects of reform implementation while downplaying the influence of context, tending to view local variation in implementation as a problem rather than as inevitable or potentially desirable (Datnow & Park, 2009; Snyder, Bolin, & Zumwalt, 1992).

Thorius and Maxcy (2015) note that much of the RTI research focuses on implementation efficacy and fidelity which are important to assess but neglects to consider

the complexity of the policy enactment process which influences both implementation and student outcomes. RTI practices suggest major shifts for the role of teachers, who are the main agents of its implementation. They are not only expected to be instructional experts who are well versed in scientifically based evidence for teaching and learning, but are also called to have ability to use data and understanding of curriculum-based assessments to diagnose and support student learning needs. When implementing reforms, individuals and groups engage in sensemaking processes that mediate how they conceptualize and act out policy, constructing understandings within the confines of their current cognitive frameworks and enacting their interpretations in ways that create new ways of thinking, relational patterns, and practices (Coburn, 2006; Spillane, Reiser, & Reimer, 2002). Because sensemaking occurs in a social context, there can be different interpretations of the same message even within a single organization such as a school (Coburn, 2006; Siskin, 1994). This is also the case for RTI as evidenced by multiple varying definitions and processes enacted by states and schools (Berkeley, Scanlon, Bailey, Sutton, & Sacco, 2020).

Both explicit and implicit notions of teaching and learning is especially relevant to RTI as the model rests on the assumption that the first tier of intervention lies on ensuring high quality instruction. Ferri (2012) observed, “Surprisingly, given the discourse about teacher fidelity, there is much about RTI that is a bit of a moving target at this point. For example, there is little consensus on what constitutes the “R” in RTI—an issue that is largely left to those implementing the model” (p. 866). In general, ongoing questions and challenged remained about progress monitoring, what counts as effective Tier 1 and Tier 2 instructional strategies, and highly quality professional development to support teacher implementation (Fuchs & Vaughn, 2012). What does high quality instruction look like? What would it look like to seriously consider culturally responsive pedagogy instead of universal, acultural, and colorblind practices? As scholars have noted, research on effective and appropriate instructional practices for culturally and linguistically diverse student populations remain underdeveloped with regards to RTI studies (Ferri, 2012; Klingner & Edwards, 2006; Thorius & Sullivan, 2013). Although some scholars observe that “RTI’s greatest accomplishment to date may be the dramatic increase in school’s routine reliance on screening to identify students at risk for reading and increasing math difficulties” (Fuchs & Vaughn, 2012, p. 2), on the whole, evaluation of RTI itself as a means to improve student academic outcomes remains mixed and limited (Fuchs & Fuchs, 2017). Beyond RTI, knowing how to scale up and sustain systemic reform that improves instructional practice and student learning has been rare (Cohen & Mehta, 2017).

Research on school reform, especially those focused on equity issues, have shown that without directly confronting taken-for-granted assumptions about schooling and learning, practices will revert to the status quo. Schooling contexts as well as existing capacities and ideology of reformers and practitioners have consistently shaped the implementation process of new education programs and policy (Firestone, Fitz, & Broadfoot, 1999; Fullan & Pomfret, 1977; Honig, 2006; Lipman, 1997; McLaughlin, 1987; Oakes, Wells, Jones, & Datnow, 1997; Tyack & Cuban, 1995). Educators have been found to implement the surface level aspects of reform by changing the structure of their classes, instructional routines, and materials without understanding the theories and

principles that drive those practices (Coburn, 2006; Cuban, 2013; Oakes, 1995; Spillane et al., 2002). Given the complexities of reform expectations, as well as the lack of attention to capacity building and professional development in policy, this is unsurprising. This is also borne out within RTI implementation and research. Taking a critical qualitative approach, Sabnis and colleagues (2019) studied six white elementary school teachers about serving Black students using RTI. The teachers in their study had a compliance approach to implementing RTI and defined it as a four-step process to help students with reading problems before they qualified for special education services. They note that, “the tiers thus came to be a typology to ability in a way that paralleled the traditional typology of special education student and general education student that RTI proponents meant to eliminate” (Sabnis et al., 2019, p. 18). The researchers found teachers used deficit thinking (Valencia, 2010) to evaluate students and make sense of data. Similarly, Thorius, Maxcy, Macey, and Cox’s (2014) case study of RTI implementation in an urban elementary school found that educators used pre-RTI processes to determine special education eligibility and engaged in deficit discourse about students and families for diagnoses. These findings are in line with the broader research on policy implementation, which underscores how teacher’s beliefs about students’ backgrounds and their ideologies on teaching and learning influence how reforms are enacted in every day practice (Bertrand & Marsh, 2015; Diamond & Spillane, 2004; Lipman, 1997; Oakes et al., 1997; Rubin, 2008). Without directly confronting deficit beliefs about students of color, those from low-income backgrounds, or diverse abilities, teachers and schools are likely to recreate existing structures of inequality (Artiles, 2015; Oakes et al., 1997; Valencia, 2010).

---

## Conclusion and Reflections

The discourse on RTI began with concerns about student equity in special education, with solutions and perspectives building on medical models of intervention and implementation approaches rooted in technical-rational methods. RTI discourse attempted to shift away from an emphasizes on individual student learning deficits to that of classroom instruction and curriculum interventions in the general education setting. Attempting to blur the boundaries between special education and general education, “It offers nothing less than re-framing of responses to struggling learners using a public health logic which prevention, early intervention, and ongoing data-based performance are hallmarks” (Artiles, 2015, p. 12). Critical discourse about RTI research and practice reflect broader and historical analyses of policy implementation and large-scale school reforms described as overemphasizing the technical dimensions of change and underestimating the influence of the sociocultural, cognitive, and political contexts. In its early stages of development, scholars expressed concern that without thoughtful consideration of the needs of racially, culturally, and linguistically diverse students, as well as the implementation and support for quality instruction, RTI models will simply reproduce inequities and deficit frameworks (Ferri, 2012; Klingner & Edwards, 2006). There is evidence that RTI practice and research continues to follow larger trends in school reform and educational change, where new reforms fail

to explicitly deal with implementation in ways that challenge dominant ideologies about student learning and day-to-day schooling practices.

In a more recent analysis of state education agencies RTI guides and policies, Berkeley et al.'s (2020) suggests that conceptualization of RTI continues to evolve with variance across contexts. In contrast to 2007 when RTI was the only tier support model, by 2017, 17 states referred to using RTI while 21 referenced Multiple Systems of Support (MTSS) or a combination of RTI and MTSS ( $n = 5$ ) (Berkeley et al., 2020). The use of these terms, however, does not necessarily reflect accurate differences in models themselves. Berkeley et al. (2020) found that some states explicitly articulate MTSS as distinct from RTI while others use MTSS as an umbrella term for numerous initiatives and programs including RTI. The shift towards MTSS may also be a reflection of Every Student Succeeds Act (ESSA, 2015), where it generally references multitier systems of support with regards to K-12 literacy. The evolution of RTI towards MTSS suggests an explicit decoupling of its root from the narrow focus on identification of learning disabilities to broader notions of student supports that are more systemic. MTSS also signals a coupling of student learning support with socioemotional ones, with a move towards a more holistic view of students. It remains to be seen if future research and practice in this area will explicitly pay attention to ideologies and assumptions about equity, student identities, teacher capacity, and implementation processes.

In terms of recommendations, we suggest:

- Moving away from RTI to MTSS, inclusive of the social and emotional learning
- Embrace a more holistic view of students
- Monitor equity issues such as the demographics of students who are referred to RTI or MTSS
- Refrain from labeling students based on the types of support they receive (e.g., do not say that there are “tier 2 students”)
- Design and implement strategies to remove learning barriers such that fewer students need supplemental and intensive interventions

## Abstract

The image of the school principal as a distant authority figure, especially in the eyes of students, belies the complex nature of the role and the potential it has to meaningfully impact students. Further complicating efforts to better understand the immensely relational aspects of the principalship is a large body of research on school leadership that is primarily focused on issues of academic press and the various pathways and mechanisms through which leadership’s effects on student outcomes are manifest. The result is a principal who is often viewed by scholars and laypeople alike as an administrator, a manager of resources and adults, and a dispenser of discipline. While student outcomes (primarily academic) have become a top priority over the years, there remains a perceived distance between principals and individual students, with few exceptions.

J. Kudlats (✉)

e-mail: [jkudlats@uncc.edu](mailto:jkudlats@uncc.edu)

The reality, however, is that many principals indeed prioritize individual positive connections with students, as the interactions not only provide a respite from the bureaucratic and adult-centric responsibilities but also offer the principal direct insight into the lives and experiences of the students for whom the principal is ultimately responsible. This perspective aids the principal in forming a deeper understanding of the many complex programs, characteristics, and human elements of the school. The result can be a more informed, student-centered principal.

As the literature on these meaningful interpersonal connections between principals and students, or the *Principal-Student Relationship* (PSR), is extremely thin, this chapter is devoted to establishing some groundwork to begin to understand and study the phenomenon.

**Keywords**

Principal-student relationship · Principalship · Relationships · Caring school leadership · Positive school leadership

**The Field of Memory**

Due to the lack of scholarly attention paid to the topic of principal-student relationships, the Field of Memory for this particular phenomenon is rather limited – being primarily confined to the principal as the disciplinarian. From its inception in the 1800s, through present times as some would argue, the principal was primarily responsible for maintaining the safe, orderly, and efficient operation of the school. The history of the principalship reveals a role that works through systems and staff in order to impact students.

**The Field of Presence**

A number of theories and ideas support the pursuit of meaningful relationships in schools: Positive School Leadership Theory (Murphy & Louis, 2018) which primarily stems from the field of Positive Psychology; Appreciative Inquiry (Watkins, Mohr, & Kelly, 2011); and Notions of care in schools and caring school leadership (Bryk, 2010; Noddings, 2013; Smylie, Murphy, & Louis, 2020; Starratt, 1991). Additionally, professional standards of practice for school leaders have begun to reflect these emerging positive and caring approaches to school leadership by including much more relational, asset-based, and human-centric language.

**The Field of Concomitance**

Positive School Leadership Theory (Murphy & Louis, 2018) primarily stems from the field of Positive Psychology. Similarly, Appreciative Inquiry (Watkins et al., 2011) focuses on the positive interpersonal aspects of organizations to promote effective collaboration and participation. Notions of care and caring in schools, which have largely been the focus of the *teacher-student relationship* (TSR), incorporate attachment and social-motivational perspectives of relationship theory (Roorda, Koomen, Spilt, & Oort, 2011).

### **Discontinuities and Ruptures**

Beginning in the middle of the twentieth century, a greater attention to social issues and the overall well-being of children resulted in some shifts away from power, authority, and bureaucratic oversight and toward a more supportive and relational view of school leadership. The social justice and students' rights movements that rose to prominence in the latter half of the century further ruptured the field of school leadership and began to reshape the principalship. The standards and accountability movement of the late twentieth and early twenty-first centuries continue to reshape the principalship. All of these ruptures have had small to moderate effects on the relationship between principals and students. The possible rupture that may have the most significant impact on the principal-student relationship may be currently developing. The rise of positive leadership theories and relational leading may hold the most promise to promote healthy and meaningful PSRs. Despite these ruptures, the principalship has remained a context-specific, individualized role, defined differently depending upon the occupant and the setting.

### **Critical Assumptions in Defining the PSR**

The PSR can likely be defined in many ways, as it has yet to be deeply studied. Little is known about the phenomenon. It is, however, important to note that, for the purposes of this chapter, the PSR refers to the human connections between principals and students. It is not to be confused with the many different *comparative relationships* that may or may not exist between principal characteristics, behaviors, actions, etc. and student outcomes. Furthermore, as it is presented throughout this chapter, the PSR is not limited to the type of formal interpersonal relationship that is reciprocal and has been well-established over time. The PSR may also include caring interactions between principals and students that might be too brief and/or one-sided to be called a relationship in and of themselves. These interactions or moments of connection are included in the present definition of the PSR as they are foundational to relational development.

---

## **National Perspectives**

This chapter is written primarily through the lens of the American principalship. While historical underpinnings of the role might vary slightly from one Western country to another, as would some cultural norms, traditions, organizational structures, and degrees of autonomy, many of the issues most school leaders face, along with views about what constitutes effective leadership, tend to be rather similar (see Barrett-Baxendale & Burton, 2009, Creissen & Ellison, 1998, Huber, 2009, or Sammons, Gu, Day, & Ko, 2011 for descriptions of school leadership in the UK, for example). Issues of diversity, testing, efficiency, management, and standards and accountability, for example, are not reserved for American schools. The responsibility that school leaders have to improve student outcomes and well-being, while managing the safe and efficient operations of the school, is relatively universal

expectations. As the premise of this chapter centers on meaningful principal-student interactions as a means of better meeting school leaders' goals and responsibilities, the content is likely relevant and important to all those serving in leadership capacities, regardless of nationality.

---

## Introduction

*On the first day stepping into the middle school math class, the new teacher, nervous about but quite eager to begin his teaching career, gained his energy for the work not from the algebra or geometry, but from each of the students. Getting to know them as individuals – not just their learning styles or procedural fluencies, but also their hopes and fears, passions and beliefs – gave the work its true meaning and purpose for him. It was fun and exciting. It helped him connect with the students and make the curriculum and pedagogy a little more relevant. The teacher-student relationships were a top priority for him, as they are for so many teachers.*

*When he became a principal, which happened much sooner than he had anticipated, he mourned the inevitable loss of those treasured relationships with students. After all, he was now responsible for all the teachers, the entire curriculum, the physical plant, a large budget, and the safety, well-being, and academic performance of every single student. There just would not be time to build those treasured relationships with students anymore.*

*But the mourning was premature. He found ways to build those relationships. Like so many other principals, he carved out time and space to get to know his students. He ate lunch with them. He roamed the halls, chatting with them during class transitions. He sat in the bleachers watching sports, and he joined them on field trips. Just like in the classroom, these relationships helped him connect to the life of the school community and the individuals within it. He believed that the relationships helped him make better, more informed decisions, as well as contributed to many other positive outcomes.*

Principals, like the one described above, are likely present in countless schools across the United States and around the world. These are principals who gain energy and derive satisfaction from interacting with and getting to know their students. These are principals who make every effort to work time with students into their incredibly busy schedules. These are principals who leverage the knowledge they gain about their students in order to better understand their school and how the hundreds or thousands of decisions principals make each day will impact their students. These are principals who recognize that schools are relational, people-centered organizations, and the student is the top priority. These are not the principals many are likely to recall from their own experiences and, until very recently, the student-centered actions and orientations of these principals have not been prioritized in research or professional practice.

The little that is known about the PSR compels us to establish some epistemological foundations for this understudied phenomenon. To do so, this chapter will begin by exploring the PSR within the historical context of the principalship. Next,

current understandings of the phenomenon are presented, followed by the professional and scholarly contexts in which the PSR may be situated. The chapter concludes with reflections on the present and future of the PSR in practice and scholarship.

---

## The Historical Place of the Principal-Student Relationship

Throughout the history of the principalship, school leaders have been pulled further and further away from students by the bureaucratic and managerial demands of the job; the only remotely formal exception to this distance has been with respect to discipline. Over the years, many have called for inspirational, deeply connected, visible, approachable principals who meaningfully know and care about the people in their schools, including the students. But those sentiments, most especially with respect to students, have rarely expanded beyond the bounds of what English and Papa (2015) call *kitsch-like* rhetoric, and into the more practical realms of principal preparation, evaluation, scholarship, and in turn, the overall perception of the principalship. To better understand why this might be, we need to briefly explore the history of the principalship, paying particular attention to the place of the student.

Interestingly, prior to recent years, little understanding on the history of the principalship existed. Historians focused primarily on larger policy history or the history of teachers and students. As Rousmaniere (2013) noted, principals lived in liminal space, “neither players in policy development nor in the day-to-day life of the classroom” (p. 1). However, like Rousmaniere, some historians have now begun to explore the history of the principalship.

The history presented herein begins roughly around the mid-1800s. There is no doubt that schools existed prior to this time period, and no doubt that many of those schools had leaders. The choice was made to begin exploring the principalship at this particular time due to the era’s focus on consolidation and systematizing schools and schooling, and the profound effects it had on establishing the formal role of principal. Prior to this time period, schools were largely independent, sparsely located and attended, widely variable, unstable entities subject to a variety of forces that could quickly and easily change or close schools (Rousmaniere, 2013). In this section, a brief history of the principalship is presented chronologically. As most accounts of the formal responsibilities that would place principals and students in close proximity to one another are largely limited to maintaining order and discipline, a separate section detailing disciplinary context is included following the historical account of the principalship.

### Establishing a Profession and a Growing Divide

The American principal, largely as it is known today, grew to prominence in the mid-1800s. The burgeoning notions of consolidation, bureaucratization, and professionalization taking hold in the urban areas were also beginning to spread

across the country. Populations were growing, and the number of schools increased. Fascinated by new conceptions of order and efficiency – divisions of labor within factories, the hierarchical and coordinated structures of businesses – educators were excited by the opportunities to “systematize” schools and schooling (Tyack, 1974).

As schools grew to house multiple classrooms and multiple teachers, so did the need for someone to “oversee” the day-to-day operations of these increasingly complex entities. Initially, this responsibility fell to a teacher who would attend to the various administrative tasks in addition to performing their teaching duties. Often called the head teacher, principal teacher, or teaching principal, this person worked as both instructor and building administrator, attending to various clerical and janitorial tasks, and implementing specific board policies (Brown, 2011).

Very early on, however, some principals’ teaching duties were being eliminated so that these people could focus on the increasing administrative demands of the job (Pierce, 1935). By the end of the nineteenth century, the typical principal was an administrator, manager, and supervisor and instructor of teachers (Brown, 2011; Cuban, 1985; Kafka, 2009; Pierce, 1935; Rousmaniere, 2007). Until this point, many school leaders still maintained one foot in the classroom, directly connected to students. Unfortunately, however, the growing demands of the role were moving the principal further and further away from the student.

According to Pierce (1935), as teaching responsibilities declined, the principal’s primary duties were to give and enforce orders, to direct, advise, and instruct teachers, to supervise and rate janitors, and to requisition educational and maintenance supplies. With respect to students, the principal “classified pupils, disciplined them, and enforced safeguards designed to protect their health and morals” (p. 39). This more authoritative role was largely reserved for men (Blount, 1998; Brown, 2011).

Within the historical accounts of the principal, what these somewhat vague student-centered job responsibilities actually looked like in practice is even less clear. Schools and districts evolved disparately, as the needs in one school or district would often be vastly different from the needs in another. As a result, there was no overarching plan for the creation and implementation of these new administrative roles. There were few legal parameters, little professional support, and tenuous job descriptions. In many cases, the single prerequisite was that the person holding the position of principal have some teaching experience. Ironically, the job was almost always focused on the efficient operation of the school in the mechanical sense, and not on teaching or learning from a pedagogical perspective.

By the first few decades of the twentieth century, principals had mostly been removed from their teaching duties altogether. Authority and responsibility increased to manage the growing size, scope, and complexity of the schools and school systems. Clerical tasks were offloaded to others, allowing the principal to focus more on supervision and oversight responsibilities (Rousmaniere, 2007). At this time, emerging national preference for “experts” in decision-making positions bolstered the notions of Scientific Management (Taylor, 2011), reinforced the management and bureaucratic underpinnings of the principalship, and helped professionalize the role (Brown, 2011; Cuban, 1985; Tyack & Hansot, 1982).

Great tensions existed in education at this time. Notions of authority and scientific management were often at odds with the noble and spiritual “calling” of the profession and the Deweyan efforts to democratize schools. Cubberley (1923) described the importance of the principal being a role model to students, commenting: “In all his contacts with teachers, pupils, and parents [the principal] must seem both genuine and human. Pompous dignity will count for nothing” (p. 27). Still, Cubberley argued that the principal’s allegiance should lie with the district: “The principal should feel that he represents the administration before the teachers, before the children, and before the parent, and that he acts largely in the place of and in the name of the superintendent of schools” (p. 23).

These tensions often resulted in attempts to reorient principals by clarifying some of the ambiguous directives and emphasizing the need for principals to prioritize the supervisory or relational aspects of the job over the bureaucratic. Pierce (1935) concluded that as early as 1863, the assistant superintendent of New York City schools was advocating for principals to have more time to mentor struggling teachers. Ten years later, the need was reiterated, with the same assistant superintendent providing suggestions as to how to relieve principals of some of their clerical duties. Rousmaniere (2007) revealed that, in 1924, Chicago’s superintendent pressed principals to get out of their offices and into the hearts of their schools. While these accounts suggest how principals struggled to maintain relationships in the face of their rising administrative responsibilities, most accounts describe the principal’s motives as being almost exclusively teacher-centered. Connecting directly with students did not appear to be a consideration, much less a priority.

Interestingly, though likely not surprisingly, Pierce (1935) reported that “A large number of responsibilities of the principal do not appear in rules and regulations of school boards. . . but result from the creative efforts of principals themselves” (p. 53). These “activities initiated by principals” included pupils clubs, school newspaper, pupil activities for promoting courtesy, supervision of playground activities at recess, and providing clothing and food for the poor. Pierce did not elaborate on any of these programs, and it is unclear as to the degree of principal involvement in these types of activities. However, Beck and Murphy (1993) noted that while little is written about the principal-student relationship during this time, what is written indicates that principals “work[ed] with and through the school hierarchy” to meet their responsibilities to students (p. 30).

### **Baby Steps: Toward a More Student-Centered Principal**

In the middle decades of the twentieth century, the principalship wrestled with the seismic shifts in schools and schooling. Following the First World War, the Great Depression, and the subsequent New Deal, American obsession with cherished capitalist business practices and values waned. Ties between business and school administration were undone (as cited in Brown, 2011). The Great Depression reinforced the progressive ideal of caring for the whole child, and schools became more concerned with social issues and the wellbeing of children. Efforts were made

to provide students with medical examinations, hot lunches, and clothing (Goodwin, Cunningham, & Eagle, 2005).

Further reinforced by the patriotism surrounding the Second World War and the threat of Communism and the Cold War, schools were seen as crucial components of a strong democratic society. In addition, the human resources and behavioral sciences movements of the 1940s and 1950s emphasized people over systems and organizational objectives. The principalship reflected this shift in values, and its spiritual motivators and autocratic tendencies were replaced by desires for more inclusive, involved, and relational leadership. More emphasis was placed on constructive and supportive supervision, rather than bureaucratic oversight (Beck & Murphy, 1993; Brown, 2011; Goodwin et al., 2005; Kafka, 2009). Expectations for principal training steadily increased, and programs augmented the managerial and bureaucratic foci with greater attention to the social and human relations facets of organizations (Brown, 2011).

As such, a more direct and meaningful principal-student relationship made a brief appearance in the 1950s. Writers in this period stressed “the importance of principals cultivating personal, friendly relationships with students” (Beck & Murphy, 1993, p. 81) based on a belief that a firsthand understanding of individuals and social conditions would help principals manage their schools. According to Beck and Murphy (1993), this may have been more rhetoric than reality. In the middle of the twentieth century, “Educators’ real concern [was] how to efficiently and economically move masses of students through the system” despite the stated values revolving around “democracy, equality, and meeting social needs” (p. 48).

While most educators likely embraced the managerial tendencies of the role, it is important to reinforce that not every educator bought into this bureaucratic administrative mindset. Rousmaniere (2013) noted, “African American principals in segregated schools and progressive white principals saw democratic leadership and community engagement as a central tenet of their work, and they shaped their role as principal into an advocacy position for civic activism, student and teacher leadership, and labor unity” (p. 58). Many of the schools led by these principals became community hubs, focused on meeting the unique needs of the individuals within that community. Some schools fully embraced Deweyan democratic ideals, placing students firmly at the center of school decision-making. One of these principals “gently supervised student activities, providing dialogic questions that encouraged student exploration and offering technical support” (Rousmaniere, 2013, p. 66). Before *Brown v. Board of Education*, African American principals were also much more than building leaders. All-white school boards all but ignored these segregated and resource-deprived schools, which typically resulted in principals having far more authority and freedom than their counterparts in white schools. This often led to African American principals taking on a much broader role as well-respected community leaders and role models to students and adults alike.

But the second half of the twentieth century gave rise to economic and sociopolitical forces that placed schools and schooling center-stage in major legal and cultural battles. Growing global competitiveness and economic concerns ushered in considerable calls for education reform, and the civil rights movement that gained

significant momentum in the 1960s led to substantial legal reforms that directly affected schools. Principals were responsible for upholding legal rulings in schools and protecting students' rights while facing ever increasing pressure to improve academic performance.

In the 1980s, following the publication of *A Nation at Risk* (National Commission on Excellence in Education, 1983), academic achievement and preparing students for the workforce in a climate of high expectations was of primary concern. Tighter standards, stronger certification requirements, and increased accountability became steppingstones toward the increased efficiency and effectiveness of schools. Knowledge of curriculum, instruction, and supervision were prioritized. The principal became less of a program manager and more of an instructional leader (Beck & Murphy, 1992; Brown, 2011; Goodwin et al., 2005; Hallinger, 1992; Kafka, 2009).

Yet, as Beck and Murphy (1993) indicated, the principal's role at the end of the twentieth century presented a split view regarding relationships between principals and students. On the one hand, the more prescriptive literature points to the principal's role as a setter of high standards and expectations, as well as a role model for those expectations. On the other hand, in the more descriptive accounts, some principals are portrayed "as taking a very personal interest in individual students" (p. 171). In these accounts, principals are described as visiting students who were in the hospital, or taking work home to students who had been suspended in order to show that discipline was not a result of a dislike for students. The authors to which Beck and Murphy referred described principals who "place a high value on sensitive, caring, direct interactions between principals and students" (p. 174). But as Beck and Murphy indicated, these types of interactions "[did] not seem to be a major concern with those who write about the evaluation of educational leaders" (p. 174). Furthermore, these student-centered principals may not have been as common as one might have hoped. As Cuban (1985) pointed out, "While a few principals continue to take over classes when a substitute fails to show up or to teach a demonstration lesson, or even to work with a group of children weekly, such examples are so rare that newspapers will write articles about a principal who teaches students nowadays" (p. 113).

Over the past few decades, improving academic performance has remained one of the principal's primary concerns. In fact, increasing oversight, accountability, and funding mandates from local, state, and federal levels have only increased the pressure principals face. Principals today still wrestle with similar tensions that have plagued the role since its inception, while now also having to contend with the effects of a free-market capitalism mindset that drives a significant amount of school policy decisions. This complicated history of the principalship reveals a long struggle between administratively managing complex bureaucratic entities and guiding an organization that is fundamentally deeply personal, subjective, and relational. Despite numerous reminders attempting to reorient school leaders to focus on the human side of the work, professional expectations rarely heeded the calls. When they did, they were primarily focused on the principal's relationships with teachers. Many principals did indeed interact with students in positive and caring ways, but they did so of their own accord.

## School Discipline: A Brief Overview

The most widely recognized area in which principals are *perceived* to interact directly with students is school discipline. However, the reality is, like many other responsibilities that fall under their purview, principals may choose to rely on the system hierarchy when it comes to discipline. It is widely understood that assistant principals often bear the brunt of managing school discipline (Germes, 2010; Glanz, 1994). Still, one of the principal's primary responsibilities has always been to maintain a safe and orderly environment in which effective and meaningful teaching and learning can take place. While the definitions of good teaching and learning may change over time, as do the methods the principal employs in order to maintain them, his obligation to oversee and maintain them does not.

It is important to note that school discipline is largely shaped by the broad sociological contexts that influence schools and are influenced by schools. Rousmaniere, Dehli, and de Connick-Smith (1997) state that schools are places "where adults [make] competing claims on children's time and space, while attempting to shape the minds and bodies, as well as the 'character' and conduct, of young people" (p. 3). Schools embody a set of beliefs, values, and behaviors that define what teaching and learning should be, and thus result in a set of rules and practices that must be enacted when those norms – or the social order of schools – are violated. Discipline, despite its Latin origins related to learning, has largely been associated with punishment, and the hierarchical, systems-and-efficiency model of modern schooling has only perpetuated exclusionary and punitive disciplinary practices.

Again, many of the beliefs, values, and behaviors that have defined good teaching and learning over the years have changed, but the principal's role has not. For example, early texts on school discipline revealed an evolution in thinking about what effective discipline should support or produce. A safe and orderly school – or "well-disciplined" according to Bagley (1914) – in the second half of the nineteenth century would have been marked by "silence, the rigidity of posture, and the precision of movement" (p. 1). In the early twentieth century, coinciding with the emerging pedagogically progressive notions of democratic schooling, that primary regard for the "physical attitude" was eventually replaced by a concern for the "mental attitude." Bagley pointed to student engagement, curricular relevance, sympathy, and a "spirit of cooperation [. . .] between teacher and pupils" as evidence of a "well-disciplined school" (p. 2). It is interesting to note that, even more than a century ago, there was an understanding of what we still see as critical components to ensuring a positive school environment conducive to teaching and learning. How those noble aims should be achieved was far less clear.

Through the first half of the twentieth century, descriptive and prescriptive accounts of the principalship were scarce. As writings about the profession increased, a fuller picture of the role came into view. In these texts, school discipline was largely presented as a "compassionate" exercise prioritizing the "best interests" of the students. In practice, however, the descriptions of how school discipline was enacted would likely not be considered "compassionate" by today's standards. One of the earliest detailed accounts of the principal's role as disciplinarian was outlined by

Robert Chamberlain in 1959. To Chamberlain, the principal should serve as a systematic and logical investigator in order to make fact-based decisions. It would be “imperative” that a disciplined student “be given an opportunity to tell his story to a *seemingly* impartial and sympathetic audience (p. 141, emphasis added). Immediately following, Chamberlain stated that making decisions based upon the student’s version of events “will generally prove [. . .] unwise” (p. 141). Still, Chamberlain’s hope was for students to view their principal “as a friend and confidant to an even greater degree than he is recognized as a distant and evil monster” (p.141). Although Chamberlain’s suggestions involved somewhat logical and theoretically effective efforts to pursue truth and fairness in maintaining order and discipline (e.g., seeking out all sides of a story, keeping detailed records, involving parents), his report invoked questionable tactics (e.g., inducing shame) and revealed an inherent bias against students.

Bias and questionable tactics aside, Chamberlain was not alone with his noble intentions. In 1947, John Milor, a junior high school principal, gave a talk to his student body. In it, he stated that he believed “that the principal of a school should know his students, and that the students should know their principal, and [. . .] they should like one another” (p. 423). To Milor, that mutual knowing and liking would breed harmony and cooperation. It is important to note that the theme of Milor’s talk was *discipline*, indicating that his purpose for pursuing these relationships was to maintain order and cohesion within the school.

In the second half of the twentieth century, discipline in schools remained a top concern for many (Boyd & Bowers, 1974). The behavioral analysis movement yielded a slight shift toward recognizing the importance of a better understanding of student behaviors, needs, and feelings (Bickel, O’Neill, & Robinson, 1979; Boyd & Bowers, 1974). Yet, little was mentioned about how to actually achieve this better understanding in a meaningful and authentic way. In recent years, discipline issues and concerns have only increased, yet little has been written about the skills and dispositions required for effective discipline (Williams, 2012). One way that schools have attempted to address discipline problems is through police presence (or school resource officers). The now widespread practice of often uniformed officers patrolling schools theoretically shifts some of the burden of responsibility away from school administrators. But the fact remains that the hierarchical structure of schools places the principal at the top. Despite ranked structure and the use of school resource officers, the most serious infractions almost always have the undivided attention of the school principal. Recent calls for discipline reforms have been made to reduce suspensions and expulsions and focus more on positive behavior interventions and supports, classroom management, restorative justice, and better discipline tracking and analyses (Wiley et al., 2018). While these calls are encouraging and have resulted in some changes, such reforms have not eliminated exclusionary and punitive disciplinary practices.

## Historical Summary

Of the principal’s ever evolving and increasingly complex duties, maintaining the organization so that it can operate effectively and efficiently has always been

paramount. The maintenance of order has been so important that the principal as head disciplinarian has been the leading prescriptive responsibility that might require direct student interactions. Thus, with respect to students, discipline has dominated the perception of the role. The history reveals that most other responsibilities, especially with respect to students, can be met by working with and through the system.

It is also essential to recognize other historical notions that help us better understand the place of the PSR in the principalship. The principalship has largely existed squarely in the middle of a massive institutional structure, constantly negotiating the competing demands of the bureaucracy and the people it is supposed to serve. The massive and complex systemic demands for which principals are held increasingly responsible have always pulled them toward the bureaucracy. However, the varying needs of schools and districts, combined with broad and often vague and ambiguous expectations, have led to a wide range of actions and behaviors principals would employ to meet the many needs of their schools. Here, it is important to note the principal's teaching origins. From the earliest days as the head teacher up to now, the dominant path to the principalship has been through teaching. Lastly, there have been regular calls throughout the history of the principalship to recognize that cultivating relationships in schools allows us to better understand and build community, create optimal environments for teaching and learning, and mitigate potential problems.

In this light, it is easy to understand why the PSR has largely been absent from the formal history of the principalship. It is also easy to see why the PSR has not been a foreign concept to many principals and the powerful potential of the phenomenon has likely been recognized by countless principals over the years. Fortunately, prioritizing the human side of schools – and the principalship in particular – has recently expanded beyond self-motivated principals into the realm of scholarship and professional standards, paving the way for a more formal understanding of the principal-student relationship to come into view.

---

## **The Principal-Student Relationship in Contemporary Contexts**

As the history of the principalship reveals little formal concern for meaningful principal-student interactions, some of the more descriptive accounts of the principalship (e.g., Milor, 1947; Wolcott, 2003) indicate that these interactions or relationships were important to principals and did indeed exist throughout history. So how do we define and describe these interactions and relationships? What are they? What is their significance and purpose? This section begins by engaging these questions. The PSR is then situated within the emerging supportive contexts of current professional standards and scholarship.

### **Defining the Principal-Student Relationship**

Very little literature directly explores the PSR (Cranston, 2012), so the phenomenon has yet to be thoroughly defined. At its most basic level the PSR refers to the

interpersonal connection between a principal and a student. Throughout history, these particular interpersonal connections were rarely a focus, and then, often only limited to disciplinary or authoritative encounters. Despite some hints of noble or caring intentions of many school leaders in literature about the principalship, the predominant focus was on the principal's role as a manager of systems and staff whose ultimate responsibility was the safe and efficient operation of an organization in order to maximize student achievement (as narrowly defined as *achievement* tends to be). There was no room for concern about a principal's interactions with students under this model of the principalship.

However, in recent years, some literature has begun to explore these interactions. These texts suggest that the PSR is akin to the teacher-student relationship (TSR), both in its characteristics and its significance. This is unsurprising since most principals were teachers before becoming administrators (Gates, Ringel, Chung, Santibáñez, & Ross, 2003), and it is known that relational schemas form over time and influence the practice of leadership (Fitzsimons, 2012).

The abundant literature on the TSR suggests that supportive TSRs provide the foundation for a strong classroom community, provide teachers with insights about how students learn, and provide security to students in order to confidently engage with classroom activities (Freiberg, 2014; Murray, 2014). TSRs also have important implications for building trust, motivation, and engagement, and improving both behavior and academic achievement (Bernstein-Yamashiro & Noam, 2013; Freiberg, 2014; Murray, 2014). Furthermore, Landrum (2014) noted that forming positive relationships with students can build relational capital, which can be leveraged when challenges arise in the classroom.

The small body of emerging literature on the PSR reveals similar power and potential of meaningful direct interactions between principals and students. Direct engagement and dialogue between principals and students regarding academic issues lead to increased motivation and perceptions of achievement in students (Gentilucci & Muto, 2007; Silva, White, & Yoshida, 2011). Principals who make themselves available to students or are directly involved in student activities are better able to feel the pulse of the school and improve the overall school culture, climate, and identity (Lavery & Hine, 2013; Ryan, 1999). Furthermore, constructive, supportive, and sometimes personally profound and impactful relationships can form as a result of direct principal-student interactions (Cranston, 2012; Hawkes, 2010; Janson, Parikh, Young, & Fudge, 2011). Over the years, many have justly called for principals to get out of their offices and be visible throughout the school. But being visible is not nearly enough. A principal must be directly engaged with students in order to reap benefits. Besides, students can distinguish between principals who are simply visible and those who are "approachable" and engaged with students (Gentilucci & Muto, 2007).

These outcomes were reinforced in one of the first studies directly exploring the PSR. Kudrats and Brown (2020a, b) conducted a qualitative narrative inquiry of the PSR in order to describe more nuanced implications and deeper understandings of the influence and impact of the phenomenon. The findings (presented in detail in Kudrats and Brown (2020a), and then extended toward a conceptual framework for the PSR in Kudrats and Brown (2020b)) revealed relationally oriented principals

who actively pursue any and every opportunity to engage directly with students in positive, supportive, and caring ways. Despite the complex demands on principals' time and the responsibilities of the job that pull them away from students, principals in the Kudlats and Brown study recognize the importance of connecting directly with students as much as possible, even if only for brief moments. To these principals, the well-being of their students and the culture and climate of their schools largely depended on those interactions. These moments of connection – that occasionally develop into strong, lasting relationships – are not only personally fulfilling for principals but also provide principals with insights into students as individuals and as a collective. This better positions principals to make more informed, effective decisions, with a deeper understanding of how those decisions may ultimately affect students. Furthermore, as evidenced by the student perspectives from the study, the various principals' efforts also appeared to have meaningful and profound effects on the students themselves.

A conceptual framework proposed by Kudlats and Brown (2020b) establishes 16 dimensions of the PSR. The dimensions are grouped into four categories: principal characteristics, building the PSR, meaning and purpose, and challenges. Principal characteristics refer to the relational orientation and capacity of principals as well as their prioritization of students despite the many adult-centric and administrative demands of the job. Building the PSR includes some of the actions principals take to build meaningful connections with students (maximizing their exposure, genuinely interacting with students to get to know them more deeply, attempting to balance authority and friendliness). Meaning and purpose refers to the reasons and significance for pursuing the PSR (principal well-being, deeper understanding of individuals and school community, being an additional resource for students, improving disciplinary effectiveness, setting a relational example for other staff). Challenges signify the factors that often impede principals' ability to meaningfully connect with students (time restraints and other job demands, school size, and the often-asymmetrical nature of adult-child relationships).

While the framework begins to capture elements of the PSR, it is important to note that caring relationships are subjective and filled with personal meaning and therefore cannot be clearly defined or captured completely by a specific set of actions or behaviors (Noddings, 2013). That said, the PSR requires concerted and genuine efforts on the part of the principal to meaningfully get to know students. It must be an inherently caring endeavor. To better understand the necessary caring underpinnings of the PSR, a more detailed look at caring school leadership in scholarship and standards of practice is required.

## **Scholarship and Standards: Supporting and Promoting the PSR**

Healthy, meaningful relationships are essential in schools. Starratt (1991) stated that school administrators committed to an ethic of caring must “be grounded in the belief that the integrity of human relationships should be held sacred and that the school as an organization should hold the good of human beings within it as sacred”

(p. 195). As Bryk (2010) notes, building relationships is essential for leadership to drive organizational change. Likewise, Appreciative Inquiry (AI), according to Watkins et al. (2011), relies heavily upon leveraging relational capacities within organizations to enhance the positive elements of a system. It has become increasingly clear, based on a considerable amount of evidence, that caring interpersonal relationships in schools are vital.

As critical as school relationships are, most school leadership literature has been focused on other pursuits, ultimately resulting in the PSR only receiving brief mentions, passing comments, or implicit suggestions. For example, Louis, Murphy, and Smylie (2016) reported that research on school leadership has largely focused on academic elements like raising standards, evaluating teaching, and student testing, noting that far less scholarly attention has been centered on issues of student support, of which relationships are a significant part. Leithwood, Patten, and Jantzi (2010) note that while improving instruction is important, it is not the only way to influence student achievement, and Crosnoe (2011) notes that concentrating mostly on academic elements to improve student outcomes is not enough and possibly even detrimental.

Furthermore, while prominent scholars, like Fullan (2001, 2003), have called for increased attention to principals' interpersonal relationships for decades, much of that literature focuses on principals' relationships with teachers and other adults. Still, until only recently, these calls have largely remained unheard in policy circles, and thus, have rarely become a formal focus of the principalship. However, recent turns in the school leadership scholarship and state and national leadership standards are now framing a legitimate structure in which the PSR might be formally established. The timing of the Kudlats and Brown study is significant in light of recent turns in educational leadership scholarship and standards that appear to provide a strong practical and theoretical structure in which the PSR can be situated.

### **Positive and Caring School Leadership**

Most models of leadership center largely on hierarchical and heavily regulated accountability (Neal, 1999) that tends to favor the individual over the collective good (Arjoon, 2000; Mackay, 2001). Positive School Leadership Theory, as defined by Murphy and Louis (2018), draws from many of the "positively grounded models of organizational management that assume that leading organizations well is invariably a value-based calling" (p. 3). It runs counter to the hierarchical and accountability-based models, reinforcing the recent "positive psychological" push in business literature to focus on relational leading (see Ospina & Uhl-Bien, 2012; Uhl-Bien, 2006 for Relational Leadership Theory). Focusing on the positive elements of individuals and the organization is also a central tenet of Appreciative Inquiry, which relies on collaboration and participation to seek, identify, and enhance "the 'life-giving forces' that are present when a system is performing optimally in human, economic and organizational terms" (Watkins et al., 2011, p. 22). Positive School Leadership highlights this relational orientation to leading. In other words, it is the human connections school leaders must nurture in order to promote trust, organizational justice, and encourage the collaborative efforts necessary to improve the collective good.

Embedded within this relational orientation is the notion of caring, which Smylie et al. (2020) expanded upon, revealing its essentiality in school leadership. Caring is not only about what types of actions one takes but also “involves the matter, manner, and motivation of care” (p. 17). Caring is a “way of being” when in relationship with others. Smylie et al. (2020) state,

Caring involves observing and assessing, identifying with, and responding to the situations, needs, interests, joys, and concerns of others. It involves expressing particular virtues such as compassion, empathy, and respect. Caring does not rest on a contractual obligation, power of authority, coercion, or expectation of return. It is grounded in and driven by motivation toward the betterment of others. (pp. 17–18)

While there is an expectation that relationships cannot be one-sided and the cared-for must choose to acknowledge and receive the care provided by the one-caring (Noddings, 2013), these adult-child school relationships are not completely egalitarian. The PSR is still a professional-client relationship, and “asymmetries exist with regard to cognitive, social, emotional, and moral development and maturity” (p. 47). As such, principals assume the primary ethical responsibility for maintaining appropriate boundaries. Given the need for meaningful PSRs to have a balance of authority and friendliness, principals must take the utmost care to find that balance in what are often ambiguous and complex interpersonal dynamics. The well-being of the student in every sense – physical, academic, emotional, etc. – must always be the principal’s top priority. This concern relies on a meaningful knowing of the other and an understanding that each member of a relationship – and thus, the relationship itself – is affected differently based on the characteristics (e.g., race, gender, cultural background, age, socioeconomic status, other experiences) of each individual in the relationship (Freiberg, 2014; Johnson, 2014; Pianta, Stuhlman, & Hamre, 2002; Roorda et al., 2011). Understanding the individual and the professional and ethical responsibilities that acknowledge the asymmetries and power differentials inherent in the PSR is critical.

### **Professional Standards and the PSR**

The emerging notions of positive and caring school leadership have recently made their way into standards of professional practice. The Professional Standards for Educational Leaders (National Policy Board for Educational Administration, 2015), from which many states derive their own standards, emphasizes a variety of relationship-based constructs or goals. “The Standards recognize the central importance of human relationships not only in leadership work but in teaching and student learning. They stress the importance of both academic rigor and press as well as the support and care required for students to excel. The Standards reflect a positive approach to leadership that is optimistic, emphasizes development and strengths, and focuses on human potential” (p. 3). More specifically, the Standards state that effective leaders “Create and sustain a school environment in which each student is known, accepted and valued, trusted and respected, cared for, and encouraged to be an active and responsible

member of the school community” (p. 13). Additionally, effective leaders “Promote adult-student, student-peer, and school-community relationships that value and support academic learning and positive social and emotional development” (p. 13).

---

## Conclusions and Reflections

The new relationally oriented standards and scholarship hold promise for the PSR. However, what *effective school leadership* is remains heavily influenced by the standards and accountability culture that continues to dominate schooling. The principal’s interpersonal interactions rarely appear to be a concern for principal evaluators (Beck & Murphy, 1993), and some principals note that their superiors’ only care is the school’s test scores (Kudlats & Brown, 2020b). Until recently, calls to focus on meaningful principal-student interactions and relationships had largely gone unanswered – and therefore unexplored – in scholarship. Literature focused on issues of academic press and the principal’s various responsibilities that contribute to improving student academic outcomes. The gaze has generally centered on the principal’s effects on the various mechanisms (teachers, school culture, etc.) that, in turn, contribute more directly to *student success* (a term that, unfortunately, is too often narrowly defined as some measure of test scores). Far less study concerning student support and well-being exists in school leadership literature, but we are beginning to better understand and prioritize this understudied and critical dimension of educational leadership.

The principalship may be changing, as evidenced by the recent turns in scholarship and standards of practice toward an asset-based, relationally oriented, and caring approach to school leadership, but this only opens the door for the PSR. While some research on the PSR has surfaced recently, our understanding is still far too limited. The implications for these important adult-child school relationships are many, and much more research is needed.

For example, what does the PSR look like at the elementary, middle, and high school levels? Does race or gender of the principal influence the PSR? What about the size of the school, the socioeconomic status of the students, or the school’s performance data? Does a principal’s longevity or experience impact the PSR? Can “measurable” student outcomes be tied to the PSR somehow? What are the implications for principal preparation programs? These and many other questions must be explored in order to better understand the phenomenon and place it firmly within the larger construct of effective school leadership.

As was mentioned at the beginning of the chapter, relationally oriented principals who seek meaningful interactions with students likely exist in great numbers. As scholars and policymakers, we must validate and reinforce those principals who choose to prioritize the PSR by directing our gaze on the power and potential of the phenomenon. But caring school leadership, and thus, the PSR, is still “grounded in and guided by the profession, its expectations for practice, its scope of work, and its norms and values” (Smylie et al., 2020, p. 46).

We must dedicate ourselves to a re-visioning of the principalship in order to favor the type of positive, caring school leadership that has the potential to improve a wide range of school and student outcomes. Tremendous potential arises from principals being in direct caring and supportive contact with students. This type of caring leadership must work its way into principal preparation, professional development, and evaluation for the PSR and its benefits to be realized, celebrated, criticized, and improved upon.

From the earliest days, when principals were primarily charged with maintaining order, their fate was largely sealed. Nearly two centuries later, *going to the principal's office* remains a metaphor for getting in trouble. And for many, the image of the principal conjures negative memories or, at least recalls stories of friends who had unpleasant, likely discipline-related encounters. The often-negative image of the principal that has formed in the collective mind of society is not easily changed. But it is not an insurmountable endeavor. The story of the principalship can change direction. As Rousmaniere et al. (1997) noted, "Often the stories that we remember and tell about our own schooling are not so much about what we learned, but how we learned and with whom" (p. 4). The principal no longer need be the antagonist. The PSR has the potential to redraw the image of the principal into a positive, caring, and supportive central character in our collective story about them.

## Abstract

A longstanding history of curriculum in the United States verifies ongoing struggles in curricular decision-making, where questions such as “What is knowledge, who gets to decide what counts as knowledge, and how is knowledge assessed?” have been fundamental sources of debate. Instead of being oriented toward a dynamic, evolving sequence of learning experiences, the curriculum is often conceived as a static entity. However, the effects of the COVID-19 pandemic have presented the education field with an opportunity to remedy obsolete perceptions of the curriculum’s purpose and, instead, reimagine and embrace an asset-based view of its future. Framed by Michel Foucault’s (1971) concept of presenting a discipline’s genealogy, this chapter reviews the field of memory, the field of presence, the field of concomitance, discontinuities and ruptures, and critical assumptions as they relate to curriculum leadership and development. While the field of memory consists of statements that are no longer considered true or valid, the field of presence includes concepts and practices which are acknowledged to be truthful and

resonant, and the field of concomitance represents ideas or theories which have been transferred to other disciplines. In addition, discontinuities and ruptures include shifts in the discourse surrounding particular theories or viewpoints, and critical assumptions refer to theories of objectivity, reality, and truth which require a critical examination to avoid outcomes that result in norms and normalization.

---

**Keywords**

Curriculum · Equity · Critical race theory · COVID-19 · 1619 Project · Dialogic approaches · Neoliberalism · Deficit based views

In this chapter, **the field of memory** traces twentieth-century learning objectives, social efficiency ideology and activity analysis, measures of educational achievement, curricular decision-making practices, and the definition of curriculum as a composite of essential and standardized cognitive, affective, and psychomotor skills.

**The field of presence** traces twenty-first-century globalization, neoliberalism and the role of government involvement in curricular decision-making, the emerging shift toward less standardized and more holistic forms of assessment, and the influence of COVID-19 and technology-mediated learning as a ubiquitous mode of curriculum dissemination.

**The field of concomitance** traces neoliberalism and globalization, philosophies borrowed from economic policy; critical race theory, a theory with roots in legal studies; and The 1619 Project, an initiative that stems from investigative journalism.

**Discontinuities and ruptures** include reforms such as scripted curriculum, high-stakes standardized testing, scientific management, and efficiency in education, elements of “functional” curricular decision-making which dehumanize the holistic educational experience that is sought after in the modern day.

**Critical assumptions** encompass notions of a universal approach to the design and implementation of curriculum, which excludes thoughtful consideration of the diverse perspectives students bring to the classroom, as well as the wide-ranging personal, academic, and professional goals they aspire toward.

Finally, this chapter concludes with a discussion about the interdisciplinary futurities of curricular decision-making and revisits questions such as: What is the purpose of school? Who decides what counts as knowledge, achievement, or success? Who benefits from the current curriculum and curricular decision-making processes? Perhaps most importantly, who loses? Definitions and theorizing of the curriculum will depend on this conception; they will reflect perspectives about what schools are for and who is ultimately served by them. School is not problem-solving; it is a struggle toward collaborative and individual growth.

## Introduction: A History of Curricular Decision-Making in the United States

In 1971, historian and philosopher Michel Foucault developed a categorical scheme, or *archaeology of knowledge*, for analyzing discourses in a given discipline. To better understand what links certain discourses together and which necessities bind disciplinary discourses, Foucault (1971) posed a series of guiding questions: Who is speaking and who has the qualifications to speak about the subject? What are the institutional sites from where the discourse “derives its legitimate source and point of application”? (p. 51) What are the positions of the subject in relation to other subjects or groups? Although responses to these questions may shed light on current narratives in a given discipline, they limit the comprehensive historical perspectives that can emerge through a genealogical analysis, or recovery of what is lost in the past as a new theoretical position is adopted (English, 2013). Underpinned by genealogical analysis is Foucault’s (1971) notion of a field of memory, a field of presence, a field of concomitance, discontinuities and ruptures, and critical assumptions. While a field of memory consists of statements that are no longer considered true or valid, a field of presence includes statements, concepts, or practices that are acknowledged to be truthful and resonant (Foucault, 1971 as cited in English, 2013). In addition, a field of concomitance represents ideas or theories which have originated in other disciplines and been transferred to other areas; in the case of this chapter, curriculum leadership and development. Finally, discontinuities and ruptures include shifts in the discourse surrounding particular theories or viewpoints, and critical assumptions refer to theories of objectivity, reality, and truth which require a critical examination to avoid outcomes that result in norms and normalization. This chapter begins by tracing the history of curricular decision-making and educational equity in the United States. Subsequently, this chapter presents persistent and problematic aspects of curricular decision-making such as outdated curriculum, neoliberalism and the role of government involvement in curriculum decision-making, absence of teachers’ involvement in curricular decision-making, and the continued use of standardized testing to assess curricular effectiveness. Critical assumptions and contentious crossroads related to curricular decision-making are then discussed, with a focus on changing demographics, globalization, critical race theory, The 1619 Project, emerging technologies, and the notion of educational democracy as a lever for social change.

Throughout history, questions such as “What is knowledge, who gets to decide what counts as knowledge, and how is knowledge assessed?” have been fundamental sources of debate (Apple, 1993; Baker, 1996; Egan, 1978; Schoenfeld, 2016). During the 1910s, the curriculum was developed with a focus on improving the quality of instruction through testing and repetition (Ballou, 1916; Monroe, 1917). The curriculum itself cited the following learning objectives, which were assessed through standardized tests: students should demonstrate accurate copying; students should be able to spell a given list of vocabulary words; students should know facts of geography; students should demonstrate the addition of fractions via accurate

copying (Ballou, 1916 as cited in Schoenfeld, 2016). Schoenfeld (2016) referenced the functionality of the 1916 curriculum, whose purpose was to provide students with knowledge and skills deemed necessary to “lead productive lives as citizens and wage earners” (Schoenfeld, 2016, p. 106). A historical look into curriculum development of the 1910s begs the question, who decides what knowledge fosters the development of a productive citizen? Moreover, who decides the measure of a citizen’s productivity?

In 1921, Harold Rugg issued a criticism of curriculum, citing that it does “more harm than good” when curriculum developers recommend courses of study which have not been proven to be effective through experimental methods (Rugg, 1921, p. 694). In that era, Rugg (1921) argued, the curriculum was developed without a scheme of criteria against which the content could be checked; rather, the curriculum was developed based on what committees of educational associations deemed relevant for the preparation of productive citizens. While presented as a progressive view in its time, Rugg’s (1921) critique suggested exclusivity in and of itself, for even a checklist of criteria must be determined by stakeholders with curricular decision-making power.

In 1918 and 1924, Franklin Bobbitt published *The Curriculum* and *How to Make a Curriculum*, respectively, both of which reflected Social Efficiency ideology and profoundly influenced the field of curriculum development. The intention of the Social Efficiency ideology is to “efficiently and scientifically carry out a task for a client” (Schiro, 2008, p. 176). In other words, social efficiency is “the position in education that calls for the direct teaching of knowledge, attitudes, and skills intended to shape the individual to predetermined social characteristics” (Snedden, 1921 qtd. in Bergen, 1981, p. 91). Relatedly, Bobbitt’s theory of curriculum development centered on the concept of “activity analysis,” which represented an assembly line model of education (Bobbitt, 1924). That is, the curriculum was to be developed procedurally and contain progressive stages for students to advance from incompetence (i.e., raw material) to competence (i.e., finished product). In the first of three stages, activity analysis required a clear explanation of the steps necessary to achieve the learning objective; this necessitated a deconstructed list of tasks tied to the objective which, when completed successfully, would presumably result in competence. In the second stage, the set of tasks would be analyzed to determine the most efficient way to perform each task, and the third stage would specify the timeline to completion and associated requirements for the successful completion of each task. Central to Bobbitt’s philosophy was the notion of curriculum as a mechanism to prepare children as productive and socially responsible adult citizens, which reflected a scripted, one-size-fits-all approach to curriculum development. Recognizing Bobbitt’s scientific approach to curriculum-making as one that would perpetuate a social status quo rather than social improvement, Boyd Bode vigorously challenged Bobbitt’s ideology in his 1927 book, *Modern Educational Theories*.

Bode’s criticism of Bobbitt aligned with John Dewey’s definition of education as “a process of living and not a preparation for future living” (Dewey, 1929 as cited in Kliebard, 1975, p. 29). Reflective of the field of memory, discontinuities and

ruptures, and critical assumptions characterized in Foucault's *archaeology of knowledge*, Bode's criticism of Bobbitt illuminated a submerged ideology under the guise of "scientific objectivity" (Kliebard, 1975, p. 30). In other words, Bode accused Bobbitt's promotion of scientific objectivity as a thinly veiled effort to preserve "the tried and true values of the society, as well as [make] explicit the prevailing practical skills of the contemporary world" (Kliebard, 1975, p. 30). From Bode's perspective, a scientifically objective attempt at universal curriculum development threatened democracy; anchored in a constructivist philosophy, he believed the democratic educator must seek "to promote sincere and careful reconstruction in the beliefs and attitudes of pupils, without attempting to predetermine conclusions" (Bode, 1935, p. 43). Although Bobbitt's scientific method of curriculum development continues to pervade contemporary curriculum with its reliance on standardization and high-stakes testing, Bode's call for a broader perspective of what counts as knowledge and who determines what constitutes a meaningful educational experience resonates with today's aspirational postmodern and liberatory paradigms of education. Postmodern approaches seek to deconstruct authoritative sources of power and, instead, teach critical thinking, production of knowledge, development of individual and social identity, and self creation; in postmodern education, teachers facilitate students' discovery of new knowledge (Hossieni & Khalili, 2011). Relatedly, liberatory education is rooted in self-determination, derived from an understanding that all human beings have the right to participate in shaping a world that is constantly shaping them. Collective participation in governance amongst a community of people with shared interests is a mainstay of this concept (Randall, 2018).

Through the mid and late twentieth century, the curriculum was continuously reimaged and redefined, though its basis as a static, transactional, and fundamentally instrumental entity prevailed. Phenix (1962) defined curriculum as *what* is studied and a representation of *what counts* as knowledge; that is, the content or subject matter of teaching and learning. Expanding on this conception, Taba (1962) defined curriculum as content and learning experiences; that is, content as subject matter and learning experiences as mental operations that students employ in learning subject matter (Lunenburg, 2011). This historical period also gave rise to the definition of curriculum as a sequence of objectives classified across three domains: cognitive, which encompasses thinking, knowing, and problem solving (Bloom, 1956); affective, which pertains to attitudes, values, interests, and appreciations (Krathwohl, Bloom, & Masia, 1964); and psychomotor, which includes manual and motor skills (Harrow, 1972).

Contributing to the conception of curriculum as static knowledge defined by the already empowered, in the late 1980s the work of E.D. Hirsch became prevalent. Grounded in the belief that there is a "common core" of knowledge that all Americans need to learn in order to attain "cultural literacy" (Hirsch, Kett, & Trefil, 1988). This approach to curriculum had, and continues to have, widespread appeal. For those with a conservative approach to education, cultural literacy connected to a common core of knowledge is clearly associated with the preservation of existing social norms, as well as relations of power. The kinds of knowledge and skills that are privileged by Hirsch and his colleagues are created by and primarily accessible to

the upper classes. Consequently, schools that engage in curriculum based on a common core associated with Hirsch's determinations of cultural literacy ultimately act to legitimate existing cultural capital, rather than to identify cultural status markers as arbitrary and socially constructed. Complicating matters, for some progressive educators, it was appealing to consider the idea that cultural literacy could be taught as a set of facts and skills that could facilitate social mobility and increase opportunity. These factors serve to conceal the deficit perspective of core knowledge, silencing critical questions such as "whose knowledge?" and "who decides?" that reveal the narrow social, cultural, and racial aspects of cultural literacy. Although rooted in definitions of knowledge and literacy that perpetuate the status quo, conceptions of core knowledge remain persistent in the field of memory and continue to influence the experiences of learners in schools.

Despite numerous and evolving conceptions and definitions of curriculum over time, as well as substantiated criticisms proffered by scholars such as Apple (2001, 2005), Bode (1935, 1972), Eisner (2006), English (1987, 1988, 1996, 1997, 2013), McLaren (2007), Greene (2008), Gilligan (2010), Banks (2011), Giroux (2011), Pinar (2009, 2012), and Reid (2012), the dominant view of curriculum as content or subject matter that is taught by teachers and learned by students has persisted (Brown, 2006; Lunenburg, 2011). However, as argued by the aforementioned scholars, "the world is much more complex, involving subjective, personal, aesthetic, heuristic, transactional, and intuitive forms of thinking and behavior" (Lunenburg, 2011, p. 5). Therefore, the curriculum is not a static entity that can be precisely planned (Gorlewski & Nuñez, 2021), nor can/should any one governing body unilaterally define *what counts* as knowledge; rather, curriculum evolves like a living organism throughout the course of time (Lunenburg, 2011) and must be modified continuously to meet the needs of a society whose citizens depend on far more than economic productivity to thrive.

---

## Persistent and Problematic Tenets of Curricular Decision-Making

As evidenced through review and reflection upon the United States' history of curricular decision-making, competing tenets remain today about what knowledge is, who decides what knowledge counts, and how knowledge is assessed. Examples of problematic issues in curriculum development include, but are not limited to outdated curriculum (Collins, 2017), neoliberalism and the role of government involvement in curriculum decision-making (Savage, 2017), absence of teachers' involvement in curriculum decision-making (Null, 2011), and the continued use of standardized testing to assess curricular effectiveness, despite its role in epistemological erasure (Cunningham, 2019). Moreover, mirroring Rugg's (1921) and Bode's (1927) criticisms with present-day controversies of curriculum exclusivity, the curriculum does more harm than good – particularly among Black, Indigenous, and People of Color (BIPOC) communities – when sociocultural learning perspectives are excluded from curriculum development (Escayg, 2019).

At the crux of challenges related to outdated curriculum, neoliberalism, and teacher and socio-cultural exclusion are the United States' relentless reliance on standardized testing. Individuals and societies have diverse goals and educational needs which necessitate continuous modernization of the curriculum and (re)thinking around the central goals of education. Simultaneously, however, the influence of neoliberalism in education has resulted in increased dependence on standardized testing outcomes that reflect capital enhancement values rather than the capacities of citizens to sustain culture or envision creative futures (Brown, 2015; Savage, 2017). These competing perspectives and priorities prompt questions such as: What is the primary purpose of school? Is it to maintain the status quo as a mechanism of ranking and exclusion, or is it to transform toward educational experiences foregrounded in equity and inclusion? Who benefits from the former? Who stands to benefit from the latter?

Dissimilar to learning objectives of the 1910s (Ballou, 1916) and 1920s (Bobbitt, 1924), the goals of twenty-first-century education have evolved to include the following examples: diagnose root causes and solve complex, real-world problems; deliver persuasive presentations; design systems to accomplish meaningful goals; listen, ask questions, and make sense of different viewpoints; evaluate the credibility of sources; explore timely domains of inquiry such as environmental issues or political history; collaborate and set goals to carry out tasks (Collins, 2017). However, these goals contrast those that are embodied in standardized tests and do not offer easily accessible meaningful measures of progress (Popham, 1999). Moreover, the racist, classist, and sexist roots of standardized tests harm minoritized communities (Ayre, 2012; Stoskopf, 2012; Weissglass, 2001), performance outcomes create unfair metrics for teacher evaluations (Ford, 2018), and there is no evidence to support standardized test scores as predictors of future success in non-disciplinary subjects such as creativity, problem-solving, and critical thinking (Dillon, 2019; Harris, Smith, & Harris, 2011) – that is, common goals of twenty-first-century education that aim to produce active and informed citizens. Therefore, until the landscape of curriculum, policy, and assessment in the United States reflects holistic development and achievement of its students, systemic, socioeconomic, and ethnoracial inequities and barriers will persist, particularly for minoritized communities.

---

## Critical Assumptions and Contentious Crossroads

A longstanding history of curriculum in the United States verifies ongoing struggles in curricular decision-making. While some argue for a prescribed curriculum and contend that there is a distinct set of skills in which students must achieve proficiency (Hirsch, 1987; Bleiberg & West, 2014), others assert that curriculum exists in a third space (Wang & Flory, 2021). That is, learning is fluid, interdisciplinary, and necessitates a flexible, extensible curriculum designed to meet the diverse needs of individual students and communities across academic, cultural, and social-emotional domains (Wang & Flory, 2021). Wang and Flory's (2021) notion of curriculum as a

third space reflects a sociological perspective of education which was first introduced by George Counts in his 1932 work, *Dare the School Build a New Social Order?* As a progressive educator, sociologist, and political activist, Counts viewed education as a moral enterprise and “challenged teachers and teacher educators to use school as a means for critiquing and transforming the social order” (Westheimer, n.d., p. 1). Highly critical of individualism and Social Efficiency ideology championed by educationists like Bobbitt, Counts’ philosophy more closely aligned with Bode’s stance on democracy, which Counts uniquely viewed as a lever for radical social change in the context of a stratified society. Similar to today’s efforts to transform curriculum toward one that is equitable and inclusive of all learners – and not just those students whose identities and experiences reflect individuals with curriculum decision-making power – Counts “wanted teachers to go beyond abstract, philosophical conceptions of democracy and teach explicitly about power and injustice. He wanted teachers and students to count among their primary goals the building of a better social order” (Westheimer, n.d., p. 1).

Common deficit-based perspectives which pervade discussion around today’s curricular challenges include notions of changing demographics, emerging technologies, and globalization (Aydin, Ozfidan, & Carothers, 2017). For example, scholars have linked changing demographics and globalization to a widened experiential gap between the largely homogenous, White, English-speaking teacher force and BIPOC students, especially those whose first language is not English (Aydin et al., 2017). Illuminating a significant cultural shift, The National Center for Education Statistics (Kena et al., 2015) documented 2014–2015 as the first school year where the majority of students in United States public schools were not White; however, between 2017–2018, NCES reported that White teachers continued to comprise 79% of the public teacher workforce (Taie & Goldring, 2019). However, since many teachers are inadequately prepared or experienced in globalization and diversity contexts, the need to integrate culturally responsive and sustaining pedagogies in curricular decision-making has become extremely urgent (Aydin et al., 2017; Santoro, 2009). Moreover, these disparities in representation and concerns regarding professional preparation have led to critical questions such as: How effective can a curriculum that was designed by White stakeholders for White students be in supporting BIPOC students’ learning, especially when it is taught by White teachers? Or, how can middle-class White teachers address the social and emotional needs of BIPOC and economically disadvantaged or working-class White students whose experiences and identities may be vastly different from their own, particularly when inclusive social-emotional learning is an afterthought in curricular decision-making? A critical point to note is that social-emotional learning is never truly absent from the curriculum; rather, it is present and supportive of some students and their cultural backgrounds, but omits and harms students whose cultural expectations may not align (Prest, Bowman, & Rose, 2017).

The aforementioned concerns, while valid (Carothers, Aydin, & Houdyshell, 2019; La Salle, Wang, Wu, & Rocha Neves, 2020; Quiocho & Rios, 2000), may reinforce deficit perspectives at the expense of BIPOC students’ experiences and the culturally responsive development of White teachers who have an ethical and

professional responsibility to continuously enhance their intercultural proficiency while implementing curriculum (Shevalier & McKenzie, 2012). For example, denoting “changing demographics” as an educational challenge in and of itself insinuates racial/ethnic diversity as a “problem” in public schools (Gutentag, Horenczyk, & Tatar, 2018). Moreover, when the public narrative asserts that White teachers are not well-positioned to attend to the academic, cultural, and social-emotional needs of BIPOC students, it risks sending the message that White teachers need not uphold a responsibility to develop intercultural competence skills, as their inherent positionalities prevent them from being relatable or effective educators for BIPOC communities. Such dual deficit thinking affects both teachers and students. It may result in increased professional responsibilities among BIPOC educators not only to improve the academic, cultural, and social-emotional experiences of BIPOC students, but also to compensate for the inadequate and underdeveloped intercultural skills and competencies of their White colleagues and the longstanding whitewashed curriculum (Bernard & Flint, 2020; Dowling & Flintoff, 2015). As such, while diversifying the teacher workforce to better reflect the cultural identities of today’s students is a priority, equally important is ensuring that White teachers are prepared and willing to strengthen their own intercultural competencies, for improving the academic, cultural, and social-emotional experiences of students is a shared responsibility that must not be solely upheld by any singular community of educators. As noted by Perry (2017), “Focusing on [B]lack recruitment insidiously shields white educators from scrutiny and downplays how important it is to provide teachers an anti-racist education before and after they enter the profession.” Perhaps most importantly, regardless of how interculturally proficient a teacher may be, when constrained by the confines of a prescribed curriculum that is not characterized by Wang and Flory’s (2021) notion of the third space (e.g., the alterity of physical and social difference, the necessity for cultural translation, the creativity of dynamic hybridity), how authentically can they foster learning in diverse classroom contexts of the postmodern era? Such questions echo the progressive words of Count (1934), who stated, “An education that does not strive to promote the fullest and most thorough understanding of society and social institutions is not worthy of the name” (p. 537).

Two timely examples of contentious curricular crossroads involve the implementation of critical race theory (CRT) and The 1619 Project in the public school curriculum in the United States. In the spring of 2021, long-standing controversies over how students should learn history and civics in P12 public schools became centered on CRT, a framework for examining systemic racism with roots in academia. Although CRT provides an academic lens for understanding how racial inequality is woven into legal systems and adversely affects communities of color (Iati, 2021), conservative opponents view CRT as a theory that discriminates against White people as a byproduct of the aim to achieve equity (Sawchuk, 2021). The 1619 Project similarly represents an attempt to transform the public school curriculum. Its title refers to the date when Africans first arrived on American soil. Proponents of The 1619 Project seek to authenticate the national narrative surrounding the consequences of slavery and the contributions of Black Americans

throughout history, as well as ensure that a holistic review of United States history is taught in P12 schools (Serwer, 2019). Like CRT, opponents of The 1619 Project view it as an endeavor that aims to rewrite American history and teach students – particularly White students – to feel guilty about the country’s history of slavery. Alternatively, an asset-based view of the value of CRT and The 1619 Project suggests that teaching children the realities of United States history will not teach them to hate the country or themselves; rather, a comprehensive and authentic understanding of history and how it connects to current economic and racial disparities can help students create a better future and serve as a lever for social change (Counts, 1932, 1934). Although some contend that such discussions are too difficult, damaging, or uncomfortable to be appropriate for the P12 context, if the goal is for students to learn about systems and work to change them, then why not help them understand the reality and complexity of systems during their formative years? Moreover, with ever-increasing online access to current events and controversies, might critical classroom discussions around CRT and The 1619 Project be a preferred alternative to learning about the issues through unsubstantiated sources? These questions reinforce critical considerations surrounding the purpose of school, who is served by the current curriculum, and who has a seat at the curricular decision-making table to determine what counts as knowledge.

The contemporary context requires theorizing beyond history-centered racial inequities surfaced by the pandemic. Although the COVID-19 pandemic propelled many educators to enhance their technological proficiency, it simultaneously shed light on the challenges that the public education curriculum faces in keeping up with ever-evolving teaching and learning technologies. For example, schools teach largely the same subject matter they taught in the 1910s (e.g., reading, writing, math, science, and history), yet do not teach students how to critique or create technology in preparation for the automated future (Manyika et al., 2017). Moreover, the COVID-19 pandemic impacted the delivery of education worldwide, and highlighted technology-mediated learning as both “a tool to rectify inequities and a weapon that antagonizes existing divides for vulnerable populations” (Dubois, Bright, & Salimah, 2021, p. 12). Findings from the US Census Bureau (2021) revealed that 4.4 million households with students lack consistent computer access and 3.7 million lack internet access (Dubois et al., 2021). Although education has been described as a powerful lever to bridge socioeconomic divides, the pandemic and associated planning for a future of ubiquitous technology-mediated learning have accentuated the importance of understanding the effects of virtual education on socially vulnerable populations (Dubois et al., 2021). Through reflection on these realities, educators and curriculum decision-makers should consider the following questions posed by Goodson and Schostak (2021):

What else has been learned? How might the COVID-19 pandemic experience stimulate a reimagining of curriculum in the United States? More fundamentally, how might it lead to the development of a knowledgeable, intelligent, effective public, able to engage freely and equally in decision-making at all levels of social, cultural, political, and economic life, as a condition for personal freedom? (p. 1)

## Interdisciplinary Futurities of Curricular Decision-Making

Twenty-first-century changes such as shifting demographics, advanced technologies and technology access, and globalization have presented challenges to theorizing curriculum as transformative. Instead of being oriented toward a dynamic, evolving sequence of learning experiences, the curriculum is often conceived as a static entity. However, the education field currently has an opportunity to remedy obsolete perceptions of the curriculum's purpose and, instead, reimagine and embrace an asset-based view of its future.

With respect to changing demographics, and supported by Gutentag et al. (2018), teachers' perceptions of immigrant students as assets rather than problems were linked to lower diversity-related teacher burnout and higher immigration-related teacher self-efficacy. To ensure asset-based teacher perceptions are developed during teacher education and reinforced throughout the in-service years, it is imperative for all stakeholders to collaborate, share ideas, and create resources and opportunities – which are allocated equally – to serve the needs of all individuals and all communities. Such an approach begins with curriculum making as a sociopolitical process where all organizations and institutions are democratically run (e.g., critical participatory policy analysis). This involves countering narrowly conceived notions of transmission that confine educationalists' voices to a given set of pre-planned guidelines and reimagining a curriculum that can understand and address the uncertainty of the present age (Goodson & Schostak, 2021). Collins (2017) explains,

It is time for educators to rethink what is critical to learn in a complex and changing society. This involves different knowledge from what schools are teaching. In a world where technology is usurping routine work and affecting every aspect of our lives, learning and thinking have become central to leading a productive life. Schools will have to make radical changes if they hope to prepare students for the rapidly changing world they are entering. (p. xv)

As technology-integrated teaching and learning continue to pervade every aspect of education, opportunities for alternative pedagogies simultaneously emerge. For alternative pedagogies – such as critical, technological, relational, antiracist, and liberatory – to be effective, they must center on students' individual interests and learning processes. In other words, the teacher-student role (inherent in pedagogical theorizing) necessitates a change wherein the teacher may make decisions about what to teach, but the student decides what is learned (Goodson & Schostak, 2021). Curricular decisions are thus collaborative, rooted in practice, and dialogic.

Therefore, if an equitable and interdisciplinary future curriculum is the aspiration, curricular decision-making and epistemological considerations cannot be driven by neoliberal policies that govern education and privilege the values of leaders in visible and hidden ways (Gorlewski, Karalis Noel, & Winkelsas, [forthcoming](#)). Through critical participatory policy analysis, teachers, school leaders, teacher educators, policymakers, communities, and other educational stakeholders can continuously revisit the questions such as: What is the purpose of school? Who decides what

counts as knowledge, achievement, or success? Who benefits from the current curriculum and curricular decision-making processes? Perhaps most importantly, who loses? Definitions and theorizing of the curriculum will depend on this conception; they will reflect perspectives about what schools are for and who is ultimately served by them. School is not problem-solving; it is a struggle toward collaborative and individual growth.

---

## Conclusions and Reflections

### Practical Implications for Curriculum (Re)Development

Transformation toward equitable approaches to curricular decision-making requires a collective commitment to reforming and restructuring antiquated schooling models and practices. This means that policies must be interrogated to determine what purposes of schools are reflected in their words and in the practices that develop in existing policy contexts. In schools, as in all social institutions, every interaction influences the life chances of learners, and interactions are shaped by the context created by policies. Like curriculum, which can be both a document and a symbol (English, 1987, 2020), the policy is both concrete and emblematic. In each case, focusing on the documents as representations of philosophical tenets can provide a starting point for transformation. This chapter concludes, in the spirit of collaboration, with a call for participatory policy analysis of curriculum documents and the decisions that contribute to their development and implementation.

Goodson and Schostak (2021) argue persuasively for the potential of curriculum as a vehicle for transformation.

Essential to this aim is cooperative and mutual learning, which unlike the prevailing methods, is inclusive of voices on a principle of freedom with equality. It enables each individual – teacher and student – to engage through reflections on experience and through dialog how each deals with “knowledge” and the circumstances of their lives. In this way, the teacher’s knowledge is not something massive and fixed; it can be challenged and reinterpreted in ways that reveal new meaning for both student and teacher. The mutual education through cooperation is a spiral process. In its initial stages, the students kick the ideas around, bring their ideas to the teacher as the one who claims to know. The teacher may admit ignorance or contribute knowledge to the problem or issue, and thus together they reconfigure the problem/issue and identify pathways toward its solution. Those pathways are scalable through education in ways that can change the world, if teachers are up for the challenge. (pp. 14–15)

While it is certainly true that educational improvement involves teacher dedication to dialogic approaches to curriculum, it is also true that school walls are permeable. Educational institutions simultaneously reflect society and are expected to address its inequities, and those who work within it are shaped by these sometimes conflicting expectations. Consequently, efforts to re-imagine and re-theorize curriculum must include educators, of course, but also involve students, parents,

community members, and political leaders – all of whom participate as policy analysts and policymakers. The recommended resources are for readers and prospective and practicing educators to consider how the curriculum is created, implemented, and critiqued – and how it is experienced as a force for maintaining current power structures or as a means to cultivate learners who will construct a better and more just world.

## Resources for Consideration

**Culturally Responsive Curriculum Scorecards.** New York University’s Metropolitan Center for Research on Equity and the Transformation of Schools brings together researchers, data and policy analysts, and community organizers to provide critical research, data, policy, and strategic support for the education justice movement. One of the Center’s resources includes the Culturally Responsive Curriculum Scorecard, which is designed to help parents, teachers, students, and community members determine the extent to which their schools’ curricula are (or are not) culturally responsive. Seven key steps for analysis include: Obtain the curriculum; select your curriculum evaluation team; choose the grades, units, and lessons to analyze; pull out keywords that represent each statement that the evaluation team can look for; conduct the evaluation; score the evaluation; and discuss with your team (Metropolitan Center for Research on Equity and the Transformation of Schools, 2021).

**Designing Equitable Curriculum.** With the aim of embracing and promoting diversity, equity, and inclusion in all its activities, the University of Maryland created a checklist for selecting and designing an equitable curriculum. Themes for curricular analysis include representation, stereotyping, disparities and structural inequities, structure, context, feedback, and impact (University of Maryland, n.d.).

**Equity Assessment Data Checklist.** Driven by a commitment to build power through collective cultural and healing strategies for racial justice across Minnesota, Voices for Racial Justice created an Equity Assessment Data Checklist to guide and assess district and school-level equity policies and practices. Themes for policy and practice analysis include access to opportunities, chance to learn, inclusive community, fair discipline, community engagement, academic achievement, resources, and shared accountability (Voices for Racial Justice, n.d.).

discontinuities, ruptures, and critical assumptions underpinning theory and practice in these fields. It begins by examining the range of different articulations of “sustainability/sustainable development,” ranging from “weak” to “strong” conceptualizations. It then examines how these ideas have influenced sustainability leadership thinking within the field of EfS.

Additionally, the chapter explores how environment/sustainability disruption transpired and how it has brought the field of EfS to where it is today. It also explores emergent narratives within contemporary education for sustainability discourses. In so doing, the authors call into question several assumptions underpinning conceptualizations of both sustainability and EfS and discuss the implications and possibilities for leadership and management.

The chapter concludes with the implications for educational leaders, arguing for the need to always call into question orthodoxies of the day by recognizing that these have assumptions and histories underpinning them that work to establish their status as truth. Key to this is recognizing the need to constantly ask critically reflexive questions and seek alternatives. Finally, the authors highlight several key considerations for educational leaders working in the field of EfS and leadership.

### Keywords

Sustainability · Education for sustainability · Critical theory · Anthropocene · Behavior change · Individualism · Communitarianism · Postmodernism · Posthumanism · Resistance · Transformation · Change

### The field of memory

The field of EfS has historically focussed on achieving individual environmental behavioral change through increasing individuals’ scientific knowledge about the environment, such as ecology. This was recognized as being too narrow a focus, which saw a shift to include experiential learning in the natural environment, in order to build connection and empathy with the natural world.

### The field of presence

The field of EfS, following recognition of the limits of only educating *about* or *in* the environment, shifted in the 1980s toward a concern with educating *for* the environment. This form of EfS sought to do more than change an individual’s environmental behavior by focussing on the need to change economic, political, and social systems and practices. Following the World Commission on Environment and Development’s (WCED) Brundtland Report in 1987, this further evolved to a focus on facilitating change and sustainability transitions through collective social and environmental action-taking.

### The field of concomitance

The field of EfS is broadly located within the social sciences and has drawn from this context. In particular, it has drawn on social and personal change theories from

psychology and sociology, concepts from educational theory and eco-philosophy, systems change theory from social ecology, political literacy from political sciences, human/nature relations from posthumanism, indigenous knowledges, and postcolonialism.

### **Discontinuities and ruptures**

There have been two major disruptions. The first was the emergence of the concept of sustainability, which disrupted the field's narrower focus on the environment. The concept of sustainability has allowed the field to consider the ways in which humans and natural systems are interconnected, to consider the tensions between these, and to understand that addressing environmental problems requires a whole of system response. The second major disruption was caused by the strength of arguments posed by social change theorists. This resulted in a disruption to the belief that individual environmental behavioral change would automatically lead to broader social change. Rather, the field now understands that change cannot occur without changes in social systems and structures, including political, governance, and economic structures.

### **Critical assumptions**

The authors' assumptions in this chapter are that strong sustainability is a positive goal for educators and society at large; that EfS offers an effective strategy for achieving sustainable societies; that there is a level of change required beyond that which can be achieved through individual behavioral change; that EfS has a role in educating sustainability leaders who are able to facilitate collective social change; that education systems tend toward conservatism and EfS has a role to play in disrupting these systems; and that systems are interconnected, meaning that change can only occur and hold if it occurs at multiple points in the system, more or less at the same time.

---

## **Introduction**

While much has been written on the concepts of leadership, sustainability, and education for sustainability (EfS), in this chapter, the authors take a deep dive into these concepts to make visible the concealed and often contradictory assumptions underpinning, driving and legitimizing influential discourses in the EfS field. They explore established concepts such as “weak” and “strong” sustainability, individual and social change, along with emergent narratives including the “posts,” non-Western knowledges, nature/human rights, and nonlinguistic approaches. A key goal of EfS is disruption, in particular, the disruption of unsustainable systemic discourses and practices, and they argue here that this may be achieved through the formation of leaders who are able to recognize and critically question assumptions about the way the world works and who are able to deploy disruptive change strategies beneficial to future sustainability/ environments.

## Sustainability Discourses

The emergence of contemporary EfS in the West in the 1960s was linked to the idea of a looming “environmental crisis.” Public awareness of this crisis was raised in a number of influential books and reports, highlighting human behavior as the key driver, and advocating for increasing efforts to change this through legislation, social and economic change initiatives, and education. Today, EfS continues to be clearly linked to, and influenced by, the related and underpinning concepts of environment and sustainability, which form part of a “discursive field of presence” for EfS. The concept of sustainability has been increasingly taken up in the field over the last 30 years.

“Sustainability” as a concept – even if this actual word was not used – first appeared in Goldsmith & Allen’s, 1972 text, *Blueprint for survival*. There is also the 1974 US reference to a “no-growth economy” and the first United Nations (UN) reference in 1978 (Kidd, 1992). A number of persuasive authors contributed to the development of the concept of sustainability through the 1960s and 1970s in texts including Barnett and Morse’s *Scarcity and growth: The economics of natural resource availability* (2013), Boulding’s *The economics of the coming spaceship earth* (1966), Ehrlich’s *The population bomb* (1968), Hardin’s *The tragedy of the commons* (1968), Ward and Dubos’ *Only one earth* (1972), Club of Rome’s *The limits to growth* (Meadows, Meadows, Randers, & Behrens, 1972), Schumacher’s *Small is beautiful* (1973), and Lovelock’s *Gaia: A new look at life on earth* (1979). These texts, underpinned by an ecological discourse, maintained that humans are wholly dependent on the natural environment for survival and that human lifestyles have negative impacts on the natural environment. An early voice in this ecological crisis discourse was Rachael Carson, who emotively described the impact of human practices on the natural environment in *Silent spring*:

The most alarming of all man’s assaults upon the environment is the contamination of air, earth, rivers, and sea with dangerous and even lethal materials. This pollution is for the most part irrecoverable. . . [and] for the most part irreversible. In this now universal contamination of the environment, chemicals are the sinister and little-recognized partners of radiation in changing the very nature of the world – the very nature of its life (1962, p. 23).

In the 1970s, environmental models developed for the Club of Rome by the Massachusetts Institute of Technology led to claims that if:

present growth trends in world population, industrialization, pollution, food production, and resource depletion continue unchanged, the limits to growth on this planet will be reached sometime within the next 100 years. The most probable result will be a rather sudden and uncontrollable decline in both population and industrial capacity (Meadows et al., 1972, p. 1).

The message from these authors was clear: Humans are using up finite natural resources and damaging the natural environment at a rate impossible to sustain, and in a way that is becoming impossible to reverse. At the same time, there was also clear recognition that environmental problems do not occur in isolation but rather are

intrinsically linked to social and economic imperatives. Resources are exploited and environments harmed to provide economic growth in order to improve people's lives and alleviate poverty. Nearly 50 years later, the same concerns remain.

The most frequently cited definition of sustainability appears in the World Commission on Environment and Development (WCED)'s 1989 *Brundtland Report, Our common future*. Here, sustainable development (SD) is defined as development that is able to “[meet] the needs of the present without compromising the ability of future generations to meet their needs” (1987, p. 393). Two seminal analyses of environmental/sustainability discourses have been undertaken. The first, by Darier (1999), used a Foucauldian lens to describe the histories and resistances involved in the establishment of environmental discourses. The other, by Dryzak (2013), identified four key discourses related to sustainability – problem-solving, survivalism, sustainability, and green radicalism. Dryzak argues that the sustainability narrative, as articulated in the WCED's *Brundtland Report* (1987), retains its connection to human and societal “progress.”

However, as argued above, SD is a contradictory term as “sustainable” implies a concept of steady state, while “development” implies growth. For this reason, there have been numerous variations on the *Brundtland Report* definition. Common to all, however, is a view that sustainability must address social and economic issues, as well as environmental concerns (Higgins-Desbiolles, 2010; McCool, Butler, Buckley, Weaver, & Wheeler, 2013). These varied definitions are themselves underpinned by a number of what can be termed “environmental discourses.” These include both biocentric and anthropocentric approaches (Rowe, 2011) found across the spectrum from deep ecology, social ecology, and ecofeminism to environmental history, ecological economics, and business and sustainability (Boxley, 2019; Frank, 2017). In Frank's narrative analysis, she argues that despite what appears to be a recent and uniform narrative about sustainability, there are actually major disparities and conflicts ranging from embracing spirituality (deep ecology) to maximizing efficiency gains (business and sustainability). She asserts, for example, that the sustainability “stories” from each of these lines of contemporary discourse have a longer history that reflects the legacies of romantic and social critiques prominent in the seventeenth and eighteenth centuries. These legacies, she highlights, continue to this day, where there exists a critique of modern science and technology and an idealization of ecological and evolutionary science within different articulations of sustainability. Scott and Vare (2020) similarly explored the historical antecedents of contemporary environmental and sustainability *learning* discourses. They argue that ever since humans became conscious, learning has revolved around the surrounding environments. They chart this environmental learning over millennia, highlighting the key people, ideas, events, and discourses: from learning to survive, learning to control, learning to care, and to learning to coexist.

Common to all definitions and conceptualizations, however, is the view that sustainability must address social and economic issues, as well as environmental issues. Some definitions are seen as being “stronger” in addressing environmental and social concerns than others. This is often referred to as “weak” or “strong” sustainability.

## Weak and Strong Sustainability

Weak sustainability (defined as relying on heavy resource dependency) and strong sustainability (strongly ecologically preservationist) lie on a spectrum, with many variations between Cotterell, Ferreira, Hales, and Arcordia (2020); Pearce (1993); Solow (1993); and Springett (2010).

Weak sustainability can be described as tinkering at the edges of current models of human and economic development and is typified by an economic growth orientation, a human/nature binary, stewardship approaches to the environment, human rights as exclusive and prioritized, and unlimited development without realistic ecological boundaries. The moderate “triple bottom line” approach to sustainability espoused by green business champions recognizes environmental, social, and economic dimensions of sustainability but privileges the economy over other aspects (Hunter, 1997; Springett, 2010).

Strong and very strong sustainability encompass an ecocentric worldview and intrinsic valuing of nature, preservation approaches to nature, interdependencies of human and natural capital, and development within ecological boundaries. According to Pearce (1993), sustainability that is strong or very strong ranges from an acknowledgment of economic, social, and environmental dimensions of sustainability to highly preservationist conceptualizations that advocate minimal utilization of natural resources. Contemporary discussions of sustainability are critical of its anthropocentric underpinnings, with calls to ensure nonhuman elements and lifeforms are considered alongside and equal to discussions of human development (Cole & Malone, 2019).

The most recent iteration of sustainability conceptualizations can be seen in the UN’s sustainable development goals (SDGs). These aim to address global challenges including poverty, inequality, climate change, environmental degradation, peace and justice, gender equality, health, and well-being through 17 interconnected goals. Unsurprisingly, given their link to SD, the SDGs have also been critiqued for their anthropocentric rather than ecocentric aims, and their continued pursuit of economic growth as the solution while ignoring underlying inequalities in the global economic system. Kopnina (2020), for example, argues that the SDGs focus on solving sustainability through economic growth and that this exacerbates inequalities, biodiversity loss, and climate change.

## The Anthropocene

“The Anthropocene” is a relatively recent concept underpinning contemporary sustainability discourses. The term – coined in the early 1980s by ecologist Eugene Stoermer and popularized by Nobel-Prize-winning atmospheric chemist, Paul Crutzen – is used to describe the period from the post-World War II Great Acceleration (when negative earth system trends began dramatically increasing); it refers to an epoch when the influence of the human species became so significant such that it began to dramatically reshape the earth and its ecological systems.

Catastrophic fires and extreme weather events around the world in 2019–2021 and the COVID-19 pandemic have made visible the anthropogenic effects of human behavior on the planet and people. Whether or not one agrees that a pandemic is an anthropogenic effect, current conditions, particularly around COVID-19, are a test case for global responses to environmental disruptions and could shape future sustainability efforts.

This discourse is underpinned by a problematization of human progress and development (Pierrehumbert, 2006). Cole and Malone (2019, p. 157) argue the Anthropocene is generally utilized as “a heuristic device for gaining a greater understanding of the role of human societies and the part they have played in changing the planet,” and in so doing, acts to disrupt the contemporary “humanist paradigm.” Thus, it is argued that Anthropocene discourses provide a counterbalance to other sustainability discourses in that they highlight the finite nature of the planetary boundaries that enable life on earth, and highlight the existential crisis posed by transgressing these boundaries.

These various conceptions of sustainability along with the SDGs have shaped educational efforts and, therefore, provide part of a discursive field of presence. Much of contemporary EfS draws on these discourses, as is discussed in the following section.

---

## Education for Sustainability

The *Brundtland Report* (WCED, 1987), and the strategies put in place to enact its sustainability goals, strongly influenced the emerging field of EfS. EfS, as it is known in Australia, or education for sustainable development (ESD), as it is called by the UN and many European countries, did not emerge in a vacuum. Rather, it was established on the theories and philosophies of already existing fields of inquiry, policy, and practice, particularly from the field of environmental education (EE). While the language of EE has, in the last 30 or so years, shifted to EfS and ESD – with debate over the meaning and nature of this shift (Ferreira, 2009; Fien, 2000; Jickling & Spork, 1998) – there is some consensus that EfS seeks to empower individuals and communities to take action to address environmental problems and create sustainable futures.

There have been multiple efforts to determine what the most effective approach is, with Sauv , for example, noting 15 “currents of intervention” (2005, p. 11) in environmental education. While each of these approaches “adopt widely differing discourses on environmental education and propose diverse ways of practising educative activity in this field,” there are nonetheless “zones of overlap” (Sauv , 2005, p. 11–12). These overlaps are no doubt why Lucas (1979) was able to develop a simpler and still more commonly used classification. He categorized the array of EE activities into three broad approaches: education *about* the environment, education *in* the environment, and education *for* the environment. These categorizations continue to shape EE/EfS and ESD learning and teaching initiatives and activities.

## Education *About* the Environment

Education *about* the environment focuses on teaching new knowledge (scientific and ecological) and skills for investigating the physical world; this term came to prominence in the 1970s. Early efforts in EE often adopted this approach, believing that the more knowledge that an individual has about environmental problems, the more this would affect their attitudes toward the environment, and that changes in knowledge would, in turn, lead to pro-environmental behaviors (see, for example, Roth, 1970). This approach can be seen in ecological studies-type programs such as Waterwatch (<http://www.waterwatch.org.au>), Saltwatch ([http://www.vic.waterwatch.org.au/cb\\_pages/saltwatch.php](http://www.vic.waterwatch.org.au/cb_pages/saltwatch.php)), and Sustainable Futures (<https://www.csiro.au/en/education/Programs/Sustainable-Futures>).

## Education *in* the Environment

Education *in* the environment refers to learning and teaching approaches that seek to build an affective connection with nature through experiences in the environment. This approach teaches fieldwork skills but, importantly, seeks to ensure students' appreciation of the natural environment is "awakened" through experiences in the environment. This pedagogical approach is underpinned by a belief that a connection to/with nature can be established through such activities, and that this, in turn, will result in a change in behavior. Influenced by seventeenth-century Rousseauian theories of children in nature and promoted by advocates such as Froebel (in the eighteenth century) and Montessori (twentieth century), education *in* the environment approaches include nature play and nature education. These approaches are still strong in EfS today (Gruenewald & Smith, 2014; Louv, 2008).

## Education *for* the Environment

Education *for* the environment builds on education *about* and *in* the environment. Central to this approach is empowering learners to take action to transform their own behaviors and importantly to lead social change and transformation. Key strategies include learning to lead, building community, and the use of critical thinking and reflection to examine, critique, and change conventional wisdoms (Fien, 1993). This approach has roots in Marxist and Freirean thinking, with a strong focus on liberation and personal and social change. Common strategies used in education *for* the environment teaching include political literacy, real-world issues and problem-solving, reflective methods, and participation in community-building social and environmental change activities. This form of learning has clearly shaped contemporary approaches to EfS with their focus on individual *and* collective change.

Debate continues on the most effective approaches to learning, with recent research on the matter by Kopnina (2020), Evans and Ferreira (2020), and Evans, Stevenson, Lasen, Ferreira, and Davis (2017).

## EfS and Systems Thinking

While education *about, in, and for* are clearly still very influential in contemporary EfS, the field has also been influenced by ecological systems thinking and, thus, has come to recognize the importance of systems in facilitating personal and social change. In brief, systems theory recognizes that relationships are more important than things when seeking to understand how systems work and change. Drawing on ecological and social systems thinking, systems theory in EfS seeks to understand and operate through interconnections and complexity. According to Sterling, thinking with/through/in systems is important in EfS because it helps clarify the difference between a mechanistic and reductionist approach and a complex, ecological, and interdependent approach to EfS (Sterling, 2004).

In EfS, learning activities tracing connections and links in consumption habits (for example, life cycle analysis that investigates where products come from, how they are transported, how they are used, and how they are recycled/upcycled) demonstrate systems thinking. At the broad organizational level, systems thinking is evident through whole-school approaches to sustainability such as “sustainable schools”; such approaches aim for cohesive and collaborative strategies across all school elements – formal and informal curriculum, leadership, management, and community outreach.

---

## A Persistent Problem: Learning for Individual Behavioral Change Versus Learning for Social Change

Despite these shifts toward a systems view, there remains a powerful narrative in the field of EfS about the need for individual behavior change. While a focus on collective and social learning for sustainability is seen as vital by most EfS scholars (Ferreira, 2019; Kopnina, 2014), the field remains wedded to promoting individual behavioral change. There are many more EfS programs about how to consume more environmentally (changing to energy-efficient light bulbs; using renewable energy; and considering food, clothing, and transport choices) than there are EfS programs focussing on transforming school systems and communities. While the limits of individual behavior change in terms of improving environmental outcomes have long been recognized (Jensen, 2002; Kenis & Mathijs, 2012; Uzzell, 1999), it is also known that there are structural impediments (especially by governments and increasingly by corporations) that work to prevent or ameliorate small-scale, individual behavior changes. As argued by many in the field of EfS (e.g., Ferreira, 2019; Fien, 1993; Gough, 1997; Jickling, 1992; Robottom & Hart, 1995; Stevenson, 2007), the primary social mechanisms through which EfS is enacted – schools – are themselves focused on the individual and “correcting” the individual (Hunter, 1994).

This focus on changing the behavior of individuals has, of course, morphed and developed over time (Heimlich & Ardoin, 2008; Kollmus & Agyeman, 2002; Monroe, 2003; Stagell, Almers, Askerlund, & Apelqvist, 2014). Currently, the focus is on educating for environmental citizenship through ecologies of learning (Wals, 2019), an approach that marries a focus on the individual with a systems

approach to learning. In addition, there is a range of emergent approaches that seek to disrupt and destabilize some of these established ideas and approaches in EfS, as discussed below.

---

## **EfS: Where to from Here? Emerging Discourses to Amplify**

New narratives are seeking out cracks in the field through which to emerge and become contemporary orthodoxies or truths. While the discourses discussed below have not yet fully taken up this position, there is beginning movement in this direction. As EfS does not exist in a vacuum, current social movements such as #Blacklivesmatter and #Schoolstrikeforclimate are influencing the direction and speed at which these discourses are being taken up within the field of EfS.

Two key discourses are discussed here. The first concerns human/nature dichotomies; the second shifts how rights and justice are framed in the Anthropocene.

### **Human/Nature Discourses**

As discussed earlier, the Anthropocene is an idea that represents domination of the human species over other species and elements of the earth's ecosystem. At the core is a belief that the human/nature relationship is one of exploitation and degradation. Posthumanism, a theoretical notion aligned with ideas about the Anthropocene, de-centres humanity and its uniqueness. More a constellation of theories, approaches, concepts, and practices than a distinct paradigm (Taylor, 2016), it invites a relational and ethical focus to "the other" – human, nonhuman, and more-than-human (Elliott & Davis, 2018).

The influence of posthumanism (and anti-Anthropocentrism) has challenged beliefs about the centrality of humans over all other elements. This is evident in discussions about the "rights" of nature. Indeed, so influential is this thinking that the legal rights of personhood have been granted to New Zealand's Whanganui River, the first river in the world to be recognized as a living entity. In Maori understanding, the river is a *tupuna*, an ancestor, a person with its well-being directly linked to that of humans, and thus, it now has its own identity and legal protections within human law. Elsewhere, similar recognition of nature follows constitutional change in Bolivia, where the Law of the Rights of Mother Earth (Buxton, 2010) gives nature equal rights with humans. Similar efforts have been made to establish legal rights for India's sacred Ganges River, while in 2019, citizens in Toledo, Ohio, USA, granted legal rights to Lake Erie. Much of the basis of these legal decisions lies in recognizing natural elements and acknowledging Indigenous/First Nations worldviews, where distinctions between humans and nature are less sharp or binary, as is common in Western ways of viewing the world.

Posthumanism has been influential in the field of EfS as it allows for human relationships with the physical and nonhuman worlds to be examined in new ways.

In EfS, this has led to an increase in immersive, place-based approaches (Cutter-MacKenzie-Knowles & Siegel, 2019; Greenwood, 2013; Malone, 2016).

## Rights and Justice Discourses

Overlapping discourses about human/nature relationships are discourses about rights and justice. Ulmer notes that, in approaches where humans are de-centered, “justice involves more than what can be found solely within the realm of human relations. Rather, justice is also material, ecological, geographical, geological, geopolitical, and geophilosophical. Justice is a more-than-human endeavour” (2017, p. 883). As an emerging challenge to discourses of individualism and Western-centrism, the rights of the “unvoiced” – children and young people, First Nations peoples, and non-Western religious traditions – are beginning to materialize.

## Children and Young People

The civil capacities and rights of young citizens in shaping the current world and future possibilities have mostly been ignored and/or diminished. The UN Convention on the Rights of the Child (UNCRC) (UNICEF, 1987) was the first international effort to bring a specialized human rights treaty for people under the age of 18. The Convention recognizes children and youth as “holders” of human rights and not simply as having rights to “protection” because of their perceived physical and mental immaturity. A feature of the UNCRC is the extension of “participation” rights to children, which prepare children and young people for active social roles.

Concurrently, a focus on eco-citizenship and eco-leadership for children and young people is emerging in EfS. Contemporary EfS views children and young people as next-generation partners and leaders who can help construct global eco-citizenship identities. Emerging EfS initiatives such as Jane Goodall’s global *Roots and Shoots* program and Australia’s *Kids-Teaching-Kids* initiative enable young people to practice participation and leadership. In many instances, however, these programs can be superficial or tokenistic, with children manipulated or viewed as decoration in adult activities, not participants or leaders at all. Emergent approaches see children and young people initiating change, including actions such as protesting or campaigning against adult decisions or inactions within a schooling context or more widely in the community (Riberiro, 2021). *School Strike for Climate* and its broader resistance movement are recent examples of children and youth using their participation rights and leadership capabilities to challenge mainstream adult inertia around climate change; in this movement, children are exercising their global citizenship rights to take part, lead, speak up, and act for people and nature. Such actions could be viewed as the success of certain approaches to EfS, such as systems and action-oriented approaches. Alternatively, these actions could be viewed as EfS not meeting the transformative needs of children and young people as a result of a seeming unwillingness to challenge the education status quo.

## First Nations Peoples

First Nations' worldviews and environmental/sustainability discourses are closely linked. As a result, there is emerging recognition within EfS of the importance of First Nations' worldviews (Shava, 2013). Since the 1980s, UN agencies and international environmental organizations have advocated for the recognition and valuing of First Nations knowledges, particularly in bioconservation management. This is particularly so given that Western science seems unable to answer many of the complex "wicked" problems (Rittel & Webber, 1973) of today and First Nations' knowledges are now valued as sources of epistemological diversity (Lotz-Sisikta, 2002; Shava, 2013).

While the UN and other conventions are generally inclusive of and committed to First Nations' knowledges and perspectives, a common critique (O'Bryan, 2004) is that they have a utilitarian view and may lead to appropriation of indigenous knowledges, for the Western good. Nevertheless, these conventions appear to have revitalized languages, epistemologies, and pedagogies that privilege indigenous voices and involve elders in indigenous education while also recognizing the importance of land and connecting with it (Davis, 2019). While there is emerging recognition by EfS theorists and practitioners of the importance of First Nations' perspectives (for example, in South Africa, New Zealand, Canada, and Australia), the field of EfS remains Western-oriented, even in non-Western countries (Ryan & Ferreira, 2019). Therefore, there is a need for EfS practitioners to proactively work to embed First Nations peoples and perspectives in their work for ecological and social transformation.

## Non-Western Cultural Traditions

The roots of sustainability and EfS discourses have largely emerged from Western, Christian religious cultures and traditions (White, 1967), and while not overtly "Christian" in its messaging, EfS cannot help but be overlaid with Christian values and assumptions, especially as they relate to dualistic nature-human relationships. Increasingly, however, these discourses are being questioned as the field of EfS spreads across the world. For example, the nature-human dualism, so common in Western thinking, does not appear in many Eastern religions such as Buddhism, Confucianism, and Hinduism (Dreamson, 2019). This presents an opportunity for the field of EfS, with its emerging discourses of posthumanism and First Nations perspectives, to really transform the current largely Western orientation and underpinnings. As Gruenewald (2004) has noted, EfS needs a greater sociocultural perspective if it is to become culturally inclusive. Perhaps what is needed, as Dreamson (2019) argues, is a meta-cultural education that goes well beyond ideas about cross-cultural, inclusive, and intercultural education. In EfS, a field that has barely scratched the surface of attending to such cultural issues, the idea of meta-cultural education and pedagogies may provide a deeper approach to understandings of sustainability and transformative education.

In summary, the field of EfS has been influenced by discourses of sustainability, as evident in its goals, approaches, and strategies. Like sustainability, EfS ranges from weak to strong approaches. It is the authors' contention, however, that while EfS purports to seek radical social transformation, most efforts remain wedded to mainstream approaches and institutions such as the UN/UNESCO and schooling, not known for seeking such transformation (Ferreira, 2019). However, the emergent discourses discussed above may offer a way for the field to take a stronger approach to its teaching and understanding of sustainability. Key to achieving this is a need to focus on building the capacities of leaders for sustainability.

---

## Learning for Leadership

EfS is an education that seeks to challenge the status quo and, given the challenges of the twenty-first century, its time has come in offering a means for creating change and educating change leaders now and into the future. Indeed, as Orr (2017) notes, the Anthropocene provides EfS with an urgency to “educate a generation of students who grow dangerous to the status quo.” While connections between EfS and leadership seem apparent, with both focusing on (transformative) change, the links are not necessarily strongly made within EfS literature; although, some authors have recognized its importance in societal transitions to sustainability (Corcoran, Weakland, & Wals, 2017; Fien, 2014; Souza, Wals, & Jacobi, 2019). The leadership attributes that are important in achieving sustainable futures are those that are inclusive, democratic, empowering of others, and where leaders have the skills and capacities to work in fluid and uncertain environments (Ferreira, Ryan, & Davis, 2015). Many people need to “unlearn” the traditional, usually hierarchical, leadership styles and patterns they have grown up with, have been educated in, and that dominate much of daily life.

There are particular leadership skills and capacities that, the authors argue, will enable leaders to implement strategies for social and environmental change. As Sutoris (2021) notes, a range of twenty-first-century Anthropocene skills are required by learners and, it is argued, by sustainability leaders. These include:

- Reimagining the world through futures education which, for example, facilitates the envisioning of alternative futures and develops strategies for communicating and implementing these
- Systems-based critical thinking that goes beyond thinking about single issues to grappling with the challenges of complexity and the strategies for addressing these
- A political understanding of issues so there is a shift from a depoliticized, individualized response and instead, a focus on collective, systems-based approaches to leading for change

As the authors' backgrounds are in teacher education and EfS, in this section, discussion is framed toward leadership learning through their research and

experiences in teacher education. Teacher education, these authors argue, is central to shaping future sustainability leaders in schools and other educational settings and institutions; these sustainability leaders are then able to educate the next generation of sustainability leaders and community activists. The authors undertook a 12-year action research project designed to implement a systems-based approach to embedding sustainability into teacher education in Australia. The overarching goal of this project was to develop the sustainability leadership capacity of teacher educators (Ferreira, Evans, Davis, & Stevenson, 2019; Ferreira, Ryan, & Tilbury, 2007). The project was unique in taking a systems-based approach to change, and connected teacher educators with a range of other stakeholders in their system, including professional associations, government curriculum bodies, employing authorities, and students. While the project details and outcomes were multiple, here is discussed just one aspect of the research, a smaller study undertaken on sustainability leadership.

In this study-within-a-study (Ferreira et al., 2015), two key issues of importance were identified in building sustainability leadership skills and capacities: (1) participants' knowledge about EfS and systems change, and (2) their personal leadership capacities.

Regarding the first point, in order to be effective sustainability leaders, individuals need to know and deeply understand the topic of sustainability and/or EfS and its transformative goals. They also need to understand not only how complex systems work, but strategies for effecting change within such systems. In-depth knowledge of one's own organization and its relationships with other stakeholders in this system is essential, as organizations are complex and have their own cultures and practices. To succeed at effecting change, then it is essential to understand how specific organizations function.

With regards to the second point – leadership capacity – the authors' study identified that leadership is not innate, rather it can be learned. Successful sustainability projects require individuals who have learnt how to lead, are able to cope with complexity and uncertainty, and feel confident in their knowledge of sustainability. In this change project, several opportunities to lead change were included as a way of enhancing participants' leadership capacities. The overall finding was that having an interest in EfS did not, in and of itself, prepare one to be an effective sustainability leader (Ferreira et al., 2015). Indeed, the authors argue that leadership is not innate but is rather a “becoming” process – a set of skills to be learned and a set of capacities to be enhanced. While this research was with teacher educators, Davis (2005) has also undertaken research with young children as sustainability leaders. This demonstrates that leadership skills and capacities are not simply adult attributes.

Davis' research shows that even very young children can be sustainability leaders when teachers provide the right conditions for them to be bold and disruptive. For example, the Sustainable Planet Project at Campus Kindergarten, Australia (Davis & Pratt, 2005), saw four-year-old children develop a campaign against abandoned shopping trolleys left outside their kindergarten. The children became involved in discussions with a local supermarket about the abandoned shopping carts and wrote letters to the “trolley thieves” via the front page of the local newspaper. A similar

example, from Sweden, involved children at a preschool who overturned the local council practice of purchasing the cheapest eggs (from battery farms) for their lunches. Instead, they argued for, and were successful in obtaining, eggs from free-range farms because of the better lives afforded the chickens (Arlemalm-Hagser & Engdahl, 2015). In these examples, the teachers demonstrated their own sustainability leadership through the leadership opportunities they facilitated for their students.

Recent examples of youth-led sustainability leadership include the School Kids 4 Climate/School Strike for Climate movement initiated by Greta Thunberg. Many young people led and continue to lead in disrupting their school programs, challenging some of their teachers and principals (although many have also supported and enabled their actions despite significant public and, in Australia, political backlash).

The examples discussed above all illustrate the ways in which EfS can be effective at developing sustainability leadership skills and capacities. They also show how even very young children are capable of reimagining their world, thinking about all the component parts of complex problems, and taking what might be seen as political action through engaging with the media, including social media. The authors argue that learning to lead for sustainability needs to become the key priority for EfS if it is to be successful in facilitating the sort of social and environmental change required for a sustainable society.

---

## Conclusions and Reflections

There is a famous “anthem” by Leonard Cohen, Canadian-born poet, author, and songwriter, in which he wrote/sang that everything has a crack where the light can get in (Werber, 2021). If ever there was a time for the light to get in, it is now, but radical shifts are needed in these difficult and complex times. This includes a shift from a focus on individual change, a quickening of the pace of change, changes to economic and political systems and structures, and engagement with contemporary social shifts. Every part of society needs to engage in big, bold transformations.

While the field of EfS purports to educate for such big, bold transformations, its on-the-ground activities often end up focussing on small-scale, individual, tree-hugging, compliant-type activities that do little to challenge the status quo. The authors argue that a renewed focus of *EfS* on *learning and leadership for change* may allow for greater social critique, critical reflection, and collective action-taking. Below, four ways are proposed in which the field may be able to be transformed so that a focus on learning for sustainability leadership is prioritized.

First, there must be a turn further toward “strong” EfS as this is missing in much of EfS thinking and practice when education for resistance, transgression, and perhaps even rebellion is necessary, as McLaren (2015) contends. While there has been a strong social change/systems thinking narrative in EfS (Fien, 1993; Sterling, 2004), this has remained, for the most part, a theory that teachers have resisted deploying in practice. To address this, the field needs to grapple with its own preoccupation with individual change-focussed programs, understand and challenge the systemic barriers that teachers face in adopting transformative pedagogies, and

grapple with the stultifying effects of generally conservative and hierarchical education systems. This will require an understanding of education as a system, the role of teachers in maintaining the status quo, and strategies to address the multiple parts of the education system. Without this, EfS will not be successful in educating sustainability leaders capable of transforming society.

Secondly, EfS needs to become more interdisciplinary/transdisciplinary rather than simply espousing this as an EfS virtue. EfS tends to look inside itself for answers; however, the authors argue that learning from others must be prioritized. For example, research from health, philosophy, psychology, leadership, and management can provide novel insights and strategies to ensure that students are being educated to be the leaders for change in the future. One example of where potential new ideas might come from is New Sociology of Capitalism (Chiapello & Fairclough, 2002; Wallerstein, Collins, Mann, Derluguan, & Calhoun, 2013), with its critiques of contemporary economic systems which appear to be aligned with the broader EfS goals for social and economic change. Another example is eco-psychology, which can provide new insights into the most effective approaches to address the mental health and well-being impacts of climate change. Such insights will be helpful in the field of EfS as they will broaden sustainability leaders' understandings of what motivates change.

A third way to generate change within the field is to recognize and utilize a wider range of ways of learning and understanding. Using spoken and written language and scientific data in EfS programs is common. However, this focus on traditional communication modes may alienate or marginalize some learners. One example of nonlinguistic learning that is emerging in the field is through the integration of the Arts and EfS. Images, for example, can be powerful and unsettling educative tools, and O'Gorman (2015, 2020) argues that Arts education and EfS have much in common as they can both serve the purpose of stimulating critical thinking, imagination, problem-solving, and transformation. Therefore, use of these kinds of strategies will help broaden the number of people who can learn to be successful sustainability leaders.

A fourth consideration is an expanded focus on *who* is being educated, and the mechanisms for doing this. Despite some forays into community education, the field has remained resolutely focussed on formal education systems, and the education of children and young people. However, witnessing the use of multiple forms of media in educating society at large about environmental issues and the need for social change is a game-changer. For example, there are several highly successful mass media programs such as Craig Ruecassel's TV series *War on Waste* (2018), *Fight for Planet A* (2020b), and *Big Weather and how to survive it* (2020a). Social media is being used effectively by nonformal educator community groups who are successfully engaging and educating others. These include *Australian Parents for Climate Action* (a volunteer-run group of parents, grandparents, and carers of children who advocate "for a safe climate for our children's future"), *Mothers Rise Up* (UK) and *Mothers Out Front* (USA) (networks educating and mobilizing for stronger action on climate change), and *Knitting Nannas* (an international group of knitting grandmothers who "sit, knit and plot" strategies for challenging corporations).

These four considerations, if enacted, could assist with reprioritizing a focus on learning for sustainability leadership. The growing influence of the Anthropocene discourse is likely to continue to highlight the need for strong transformative sustainability approaches and education systems that are up to the task of developing leaders with the capacity to challenge business-as-usual. As discussed in this chapter, although the field of EfS aims for transformative approaches for sustainability, this rhetoric is rarely enacted in practice. Questioning key assumptions and orthodoxies and seeking alternatives are, therefore, important tasks for EfS leaders. A range of emergent discourses, such as those discussed here, may indeed offer spaces and places of rupture within EfS discourses, and provide possibilities for opening a crack for light to find its way in.

## Abstract

Cyberbullying as a behavior among students has emerged in the last 20 years and it seems as difficult to prevent or reduce its occurrence as any other form of bullying. Although policy makers, politicians and researchers now call for a whole of community response, describing cyberbullying as a public health problem, schools seem to be bearing the brunt of the issues and responsibility for its negative consequences. While it is true that schools are best positioned to educate young people, it is also true that it takes a whole village to raise a child. When adults first realized that cyberbullying behaviors were occurring, outside of

school hours and outside of school grounds, many schools were reluctant to involve themselves in managing these incidents. However, as it was increasingly realized that the consequences of cyberbullying were being manifested by students at school and was affecting students while they were at school, schools took a more active role. Currently many schools now advise parents to bring all cyberbullying incidents to the school for staff to deal with. But have schools actually taken on too much responsibility to raise children in our society?

**The Field of Memory**

Bullying among school students has existed since mass schooling was introduced. Bullying was seen as a mostly physical behavior conducted by boys, with an imbalance of power, maintained by strength and physical size to intimidate and belittle younger and weaker boys. Even if the boy who was bullying was not physically strong, he had henchmen to do the work. Examples of this were Flashman in Thomas Hughes' book *Tom Brown's School Days* and Draco Malfoy in JK Rowling's books about *Harry Potter*. Both these boys had power from their fathers' positions as benefactors of the schools they attended (Rugby and Hogwarts) and surrounded themselves with physically powerful boys to do their bidding. The attitude of adults was (and still is in some cases) that bullying at school is a rite of passage; that everyone at school will experience it. This is still sometimes the case with hazing rituals at some university colleges. Adults also believed that being bullied was character building; it made a man out of you; what doesn't kill you makes you stronger. In the 1980s, however, Dan Olweus in Norway, and Peter Smith in England, began researching the consequences of bullying behavior and found that being victimized at school not only led to negative consequences at the time, but also often lasted into later life. It was also realized that girls were involved in bullying behavior, although less physical bullying and more verbal and social exclusion bullying, which produced similar negative consequences in those that they bullied. These realizations gradually changed adults' perceptions to consider bullying behavior among school students to be unacceptable.

**The Field of Presence**

In the last 20 years a new form of bullying emerged called cyberbullying. This form of bullying was enabled by the growth in personal technological devices and the Internet. A controversy arose about this new form of aggression, whether the behavior was a form of bullying or a different stand-alone phenomenon. The debate was centered on whether this behavior met the three characteristics of bullying – that is the intention to hurt, was usually repeated, and there was an imbalance of power. Some researchers argued that the intention to hurt could not be determined as any text or visual could be misinterpreted, while others maintained that as there is such a significant overlap between other forms of offline bullying and cyberbullying, an

intent to hurt could be established. The characteristic of repetition was argued that online repetition was not repetition unless it was from the same person, whereas others argued that sending the hurtful messages to others met the criteria of repetition, whoever sent them. The most important characteristic of bullying, the imbalance of power, was argued by some not to be present in cyberbullying as a stronger physical presence was not experienced. However, others argued that the imbalance of power means the person being victimized is powerless to make the bullying stop, therefore, the presence of physical dominance is not always necessary. There has been no disagreement as to the negative consequences of cyberbullying as there was for traditional (face-to-face) bullying.

### **The Field of Concomitance**

Cyberbullying research encompasses many theories and perspectives from various fields such as psychology, sociology, technology and education. Bullying and cyberbullying have always been associated with young people even though it is known that adults also bully and cyberbully. Research on cyberbullying has followed the research on traditional forms of bullying by firstly concentrating on a psychological individual approach investigating the online behavior with a dyadic lens involving the student bullying and the student being bullied. More recently, however, a sociological approach has been utilized, situating bullying within Bronfenbrenner's ecological model of human development. In this model there are five systems that characterize the social-ecological model that were expanded by Swearer and Espelage to a *social-ecological framework of bullying*. This framework was further expanded by Cross and colleagues to a *social-ecological framework for understanding and reducing cyberbullying behaviors*. The theory of Affordances positions cyberbullying not as a relational problem, as psychology and sociology do, but as a behavior or product of advanced technology. From an educational perspective Redmond and colleagues have very recently developed a cyberbullying conceptual framework for educators consisting of three categories: identification, management and prevention.

### **Discontinuities and Ruptures which Form Different Viewpoints**

The first and somewhat continuing rupture was the controversy about the definition of cyberbullying. At first the behavior was called by many different names, such as e-bullying, tech bullying, or online bullying. However, after some research, a controversy arose with some researchers arguing that the behavior was not bullying at all as it did not always entirely fit with the three pillars of bullying (intention to hurt, usually repeated and an imbalance of power). Other researchers maintain there is no such behavior as cyberbullying, only cyberaggression, or that cyberbullying is a completely different phenomenon from bullying. The second disruption was of attitudes that a person who cyberbullied was labelled a bully, therefore describing a trait rather than a behavior. It is now known, however, that there are very few school-aged children who persistently bully but rather that bullying roles are fluid and changeable over time. Person first language is now preferred, that is, a child who is bullied rather than a victim.

### **Critical Assumptions or Presuppositions**

The major assumption in public discourse is that cyberbullying is becoming an epidemic and is rapidly increasing. This assumption is false as many studies show that traditional bullying is still at least twice as prevalent as cyberbullying, even though all modes of bullying overlap. This assumption can lead adults to a moral panic, which is exacerbated by the fact of the generational digital divide, in which adults make decisions about technology and young people that are not based on facts or evidence. Another assumption by the public is that cyberbullying inevitably leads students who are victimized to suicide. There are many factors which tragically come together for students to take their own lives, and while cyberbullying could be one factor there are always many others. This assumption also spreads unnecessary fear, especially among parents. Many people also assume that any student who cyberbullies is a coward and that popular students do not bully. Neither of these assumptions are correct and these perceptions often hinder adults in seeing cyberbullying incidents clearly.

---

### **Introduction**

This chapter describes the emergence of cyberbullying behaviors and their relationship to traditional or face-to-face bullying in young people. Estimated prevalence rates and consequences are presented. The various theories and conceptual frameworks that attempt to explain this behavior are then examined. Current strategies of school leaders, of policies, legal solutions and prevention programs are discussed. Finally, different strategies that school leaders and managers need to consider are presented.

### **History of the Word Cyberbullying**

Although “cyberbullying” entered the lexicon in the mid-90s, it was yet to populate the vernacular or academia. For example, a presentation to The Children’s Defense Fund by Morino (1997) – although advocating for the education of young people in “cyberspace” and urging caution and discernment online – did not use the term. Similarly, a study emanating from Australia on the effects of being ignored on the Internet (Williams, Cheung, & Choi, 2000) referred to “cyberostracism” not cyberbullying. In the UK, awareness of cyberbullying as a concept appears to have gained currency around 2001 (Smith et al., 2008), with a reference to the sending of “malicious emails or text messages on mobile phones” emerging in government literature in 2002, and the first research on text message bullying appearing in 2003 (Smith et al., 2008).

The origin of the term “cyberbullying” has been attributed to several sources. Bill Belsey, a Canadian teacher and cyberbullying activist, has been credited by many scholars and popular writers with the coining of the term when he launched his website [www.cyberbullying.ca](http://www.cyberbullying.ca) in 2003 (Bauman, 2012). Smith, del Barrio, and

Tokunaga (2012) note the Oxford English Dictionary (OED) added the word to their database in 2010, where it states the first use of cyberbullying appeared in the *Canberra Times* in 1998 (Cyber-bully and cyber-bullying, 2020). It was soon located in an earlier article in the *New York Times* in 1995 by Bauman in 2011 (Bauman, 2012; Campbell & Bauman, 2018), although the OED now claims an appearance of the term “cyber-bully” in 1994 in the San Diego Union-Tribune (Cyber-bully and cyber-bullying, 2020).

One of the first uses of the term in academia appeared in Australia in a discussion of the growing problem of “cyber bullying” and its virtual absence from the literature (Campbell, 2005). Since this time, use of the term in research and in everyday parlance has become commonplace. For example, a Google Scholar search performed on 21 April, 2020 for articles with the keyword “cyberbullying” yielded 54,500 results, with 1660 articles published in the year to date alone. A similar search on Google yielded 16,900,000 results.

## Controversy in Defining the Behavior of Cyberbullying

There has been vigorous debate regarding whether bullying through technology is a separate phenomenon or another form of bullying (e.g., Antoniadou & Kokkinos, 2015; Dooley, Pyżalski, & Cross, 2009). The crucial debate on bullying among researchers is about the applicability of the three features of traditional bullying (i.e., intention to cause harm, repetition, and power imbalance) in the context of cyber space.

Recently, there seems to be agreement that cyberbullying has all three of the characteristics of other forms of bullying (e.g., Gladden, Vivolo-Kantor, Hamburger, & Lumpkin, 2014; Hemphill et al., 2012; Olweus, 2012; Smith et al., 2012). The unique element distinguishing cyberbullying from traditional bullying is that cyberbullying is performed through technological space (Langos, 2012).

The definition of cyberbullying is an important question not just for research and theoretical reasons but for the implications it has for prevention and intervention strategies. If cyberbullying is a completely different form of aggression, then it could be necessary to have different strategies and programs than for traditional bullying. If cyberbullying is the “fourth” form of bullying, along with the traditional forms of physical, verbal, and social exclusion bullying, then should these strategies be based on what we already know about reducing traditional bullying, which have not been particularly successful to date (Ttofi & Farrington, 2011).

## Prevalence

One of the main reasons that there are so many differences in studies of the prevalence rates of cyberbullying is age. Most cyberbullying prevalence studies have been conducted with adolescent populations, where it has been found that, unlike traditional bullying, cyberbullying does not seem to diminish as much

from younger to older adolescents and it has even been argued it increases from primary to high school (Schenk, Fremouw, & Keelan, 2013). Rates of cyberbullying victimization in adolescents range between 12% and 25% (e.g., Lazuras, Barkoukis, Ourda, & Tsozbatzoudis, 2013), and rates of perpetration between 3% and 15% (e.g., Li, 2008), with cyberbullying incidences peaking between the ages of 11 and 15 (e.g., Tokunaga, 2010). There is also evidence cyberbullying continues into adulthood. In a study of university students, approximately one in six (17%) reported cyberbullying by a peer and one in 13 (8%) reported they had cyberbullied another student in the past 12 months (Wozencroft, Campbell, Orel, Kimpton, & Leong, 2015).

Culture also influences the rates of rates of cybervictimization with some countries having higher prevalence rates than others. This has been shown in school and tertiary populations using the same measurement tool. For example, a study involving nearly 5000 students aged from 7–19 years from eight European countries found cyberbullying and cybervictimization were most prevalent in Bulgaria and Hungary and least prevalent in Spain (Sorrentino, Baldry, Farrington, & Belaya, 2019). Gender, however, does not seem to influence cybervictimization rates. Boys were found to be more globally involved in cyberbullying in seven out of eight countries but there were no significant gender differences in rates of cybervictimization (Sorrentino et al., 2019). A similar finding was reported by Baroncelli and Ciucci (2014) in research on 669 pre-adolescent children with a mean age of 12–13 years in Italy and in a study on 2582 adolescents in Hong Kong, mainland China, and Taiwan (Chen & Chen, 2020). Khong et al. (2020) also report that systematic review of the literature has established trivial effect sizes for gender differences in victimization.

What is also important to realize is that usually cyberbullying is not the only form of bullying individuals experience. Many studies have shown that being victimized by cyber-means indicates individuals are being victimized by traditional means at similar times (e.g., Barlett & Gentile, 2012; Wright & Li, 2013).

## Consequences

The consequences of being cyberbullied seem to be similar as for traditional bullying. Cyberbullying has been linked with anxiety (Navarro, Yubero, Larrañaga, & Martínez, 2012) and depression (Olenik-Shemesh, Heiman, & Eden, 2012), loneliness and low self-esteem (Brewer & Kerlake, 2015), suicidal ideation (Bauman, Toomey, & Walker, 2013), and reduction in academic attainment and performance (Eden, Heiman, & Olenik-Shemesh, 2013; Yousef & Bellamy, 2015).

However, some studies suggest cyber perpetration and victimization have more negative consequences than traditional bullying (Campbell, Spears, Slee, Butler, & Kift, 2012). For example, a study comparing the experiences of adolescents of both forms of bullying found those in the cyber bully/victim group in particular had the most negative scores on most measures of psychological health, physical health and academic performance (Kowalski & Limber, 2013).

## Theoretical Perspectives

As was noted in the preceding discussion on the history of the term “cyberbullying,” the emergence of this new form of aggression sparked a great deal of interest in both the public and academic domains. Research commenced in the latter around the turn of the millennium, with the first empirical research on cyberbullying victims occurring as early as 2001 (e.g., Mitchell, Finkelhor, & Wolak, 2001), and studies on cyberbullying perpetration appearing several years later (e.g., Campbell, 2005; Li, 2006; Patchin & Hinduja, 2006; Thomas, 2006). Much of this early work is now considered descriptive (Barlett, 2019; Espelage, Rao, & Craven, 2012) – a result of studies that aimed to address or shed light on the problem and scope of cyberbullying rather than develop our theoretical understanding of it. Research in the cyberbullying space has therefore been described as *atheoretical* (Barlett, 2019; Espelage et al., 2012) – that is, not based on or concerned with theory. Moreover, that an emerging field might be characterized by a lack of phenomenon-specific theory is not uncommon. As Barlett (2019) notes, a similar effect can be observed in early research on video game violence, which drew on the literature of film and television violence in much the same way cyberbullying research looked to that on traditional bullying. This kind of activity lays a foundation for the building of theory particular to the emerging field.

Bullying is not a contemporary phenomenon – it has been noticed throughout history (Saracho, 2016). Emerging in recent times in line with advances in technology, cyberbullying can in many respects be viewed as the modern day outplay of otherwise age-old behaviors. Yet unique features – such as the capacity for anonymity and repeatability, the eroding of the kinds of strength differentials that characterize traditional bullying, and the lack of physical aspects in general (Barlett, 2019) – distinguish cyberbullying from its traditional counterpart. That the two forms of bullying are “same, but different” is an aspect that has shaped the history of the theory of cyberbullying.

Although cyberbullying has characteristics which distinguish it from traditional bullying, both share many aggression-related constructs. Unsurprisingly, this has led to the use of traditional bullying theory to explain cyberbullying, with both positive and negative effects. That traditional bullying theory provided scholars with a platform from which the problem of cyberbullying could begin to be explored was an advantage. However, a lack of contextual specificity was less so, along with the fact that although bullying in its traditional form has been observed for more than five centuries (Saracho, 2016), systematic study of it commenced as recently as the 1970s – and particularly in the late 1970s following the publication of the seminal work *Aggression in the Schools: Bullies and Whipping Boys* (Olweus, 1978). Therefore, it too is a relatively new discipline and has faced the same kind of atheoretical and descriptive teething problems as the cyberbullying domain (Kowalski, Giumetti, Schroeder, & Lattanner, 2014). Moreover, these “problems, disputes and unsettled issues” (Saracho, 2016, p. 14) have carried over to cyberbullying.

Two disciplines that have contributed substantially to bullying and cyberbullying research and theory are social psychology and sociology. A theory widely used in

bullying research emerged from the latter arena with the work of Bronfenbrenner (1977), who proposed an ecological model of human development and produced several iterations of his model including bioecological and chaos theory-driven models in 1998 and 2000, respectively. These were adopted by aggression scholars and named the *social-ecological model* (Espelage, 2014). The five micro-, meso-, exo-, macro-, and chrono-systems that characterize the social-ecological model were expanded by Espelage and Swearer in 2004 to add to provide a framework for understanding “how individual characteristics of children interact with environmental contexts or systems to promote or prevent victimisation and perpetration” (Espelage, 2014, pp. 257–258). Their *social-ecological framework of bullying* was expanded in 2015 for the cyberbullying context (Cross et al., 2015). Drawing on research on the safe use of the internet by young children (Valcke, De Wever, Van Keer, & Schellens, 2011), Cross et al.’s (2015) *social-ecological framework for understanding and reducing cyberbullying behaviors* identified five interacting ways in which young people use online environments: the online *contexts* in which they spend time; the *contacts* they make; the extent to which they manage their *confidentiality*; their *conduct*; and the *content* they upload, use and access. It has since been utilized in empirical research (e.g., Cross et al., 2016; Redmond, Lock, & Smart, 2020).

Another sociological theory, *routine activity theory*, developed by criminologists Cohen and Felson (1979) to explain the link between positive, macro-level change, and crime statistics, hypothesized that changes in routine in daily life can lead to antisocial behavior. Applied to crimes such as stalking in the late 1990s, it has been used in the cyberbullying perpetration and victimization context by scholars for the last decade, from Mesch (2009) who examined parental mediation, online activities, and cyberbullying, to Wachs et al. (2020) who used the approach to investigate cybergrooming victimization among adolescents internationally. *General strain theory* (Agnew, 1992) also emerged from criminology (albeit with a social psychological focus) and is used to predict antisocial behavior and now cyberbullying perpetration. A strain is a stressor that increases the likelihood of negative emotional and affective states and leads to antisocial behaviors. It has been applied to bullying for the last decade – commencing with research by scholars including Hay and Meldrum (2010) and Patchin and Hinduja (2011). It entered cyberbullying research at the same time, commencing with Hay, Meldrum and Mann in (2010). Recently, Torres, D’Alessio, and Stolzenberg (2020) examined the effect of social, verbal, physical, and cyberbullying victimization on academic performance through a general strain theory lens.

Social psychology theories of bullying draw on aggression and related literatures to focus on the personal and situational factors that influence behavior at the individual level. As Barlett (2019) has documented, the *theory of reasoned action* (Ajzen & Fishbein, 1980; Fishbein & Ajzen, 1975) and *theory of planned behavior* (Ajzen, 1991) have been applied to a range of topics including cyberbullying (e.g., Barlett & Gentile, 2012; Festl, Scharkow, & Quandt, 2015; Pabian & Vandebosch, 2014). More recently, a comprehensive *general aggression model* (Anderson & Bushman, 2002) emerged as a social-cognitive model to predict aggression and

was adapted for the cyberbullying domain some 8 years later by Ang and Goh (2010) and others (e.g., Ang, Tan, & Talib Mansor, 2011; Barlett & Gentile, 2012; Çetin, Yaman, & Peker, 2011).

---

## School Leadership Practices at Present

School leaders are usually committed to preventing and managing cyberbullying behavior in their students. The first and supposedly easiest way to do this is with an anti-bullying policy and procedures. Rarely do schools use the law to reduce cyberbullying but prefer an educational approach such as delivering programs.

## School Policies

Most schools have an anti-bullying policy, usually mandated by the Education Department in their country. A policy is a framework, mostly written, which contains the principles that guide the actions of an organization. Procedures to enact the policy are usually separate so they can be kept updated but most schools combine procedures with their school's anti-bullying policy. Anti-bullying policies are intended to keep students at school in a safe learning environment. Some schools use these policies for marketing and recruitment purposes or to avoid litigation (Cornell & Limber, 2015). Avoiding litigation for not having a school anti-bullying policy is, however, a double-edged sword as schools have been sued when they do not follow their own policy.

It is interesting to note that many school policies only described traditional bullying until recently, even when cyberbullying behavior was known to be conducted by the students at the school. The controversy over definitional aspects of cyberbullying (mentioned before) of whether cyberbullying was actually a form of bullying or other phenomena could have accounted for this, or the perception that as cyberbullying was mainly conducted outside of school then it was not the school's responsibility. However, in the last few years most school policies now include cyberbullying as the fourth form of bullying and have procedures in their policies to prevent and intervene. In fact, many schools now demand that students and parents bring the evidence of cyberbullying to the principal to be dealt with. This of course poses a problem which schools have not really thought through: that the availability of evidence for cyberbullying makes it easier for students to "prove" they have been bullied but what evidence is therefore needed to "prove" other forms of bullying?

Despite the legal and educational obligations of schools to create an anti-bullying policy there has been scant research to show that these policies actually reduce bullying. Those studies which have been conducted have mixed results with most showing no association of a school's anti-bullying policy and a reduction in bullying behavior (Cross et al., 2011; Lambert, Scourfield, Smalley, & Jones, 2008). This could be because of the poor dissemination or poor implementation of the policy (Campbell, 2018).

## Legal Solutions

Most Anglo-American countries have legislated against cyberbullying behavior (Campbell & Završnik, 2013). However, these laws seem to have failed to curb this behavior among young people at school. Although teachers and parents and the public expect that the criminal law will provide a legal response to cyberbullying conducted by school students (Kift, Campbell, & Butler, 2010), most schools take a more educational and school disciplinary approach rather than resorting to the law.

In addition, the civil law which allows students and parents to sue a school for inadequate anti-bullying policies or non-compliance to their own policy, concerns schools. Schools are often confused by the complex legal environment and often fear the civil law rather than considering the law as societal support for their community (Pennell, Campbell, & Tangen, 2020).

## Programs

Many schools and parents advocate that stand-alone programs on the topic of cyberbullying are the best way to prevent cyberbullying behaviors among students (Ttofi & Farrington, 2011). For example the Cyber Friendly Schools program has been shown to reduce cyberbullying in Year 9 students by 30%, however, there were problems with fidelity of the intervention as teachers could not always find the time to implement the program in an overcrowded curriculum (Cross et al., 2018). There are also problems with programs of cost effectiveness and sustainability. Students do not learn and retain knowledge with one program delivered once. Nor do they change attitudes and behavior unless there is a spiral curriculum each year which builds on the lessons of the previous year. If teachers are to work towards preventing cyberbullying then these lessons and behavioral changes need to be included in the regular curriculum.

---

## Conclusion and Reflections

Perhaps educational policy makers and managers need to consider the conflicting messages that schools are being given – on the one hand to return to basics and make sure the three Rs of reading, writing and ‘rithmetic are prioritized, but on the other hand to ensure that students are good digital citizens; to keep them safe online as well as offline; to educate them about social relationships; and to instill values of respect and kindness. This fourth R of relationships is just as important as the other three Rs but schools are not resourced to do this.

Schools are a microcosm of society and bullying in all its forms is a deeply embedded social relationship problem. Cyberbullying is a form of bullying which has been observed for most of human history. There is some controversy whether it could be an evolutionary behavior or a learnt behavior (Campbell, 2017). As bullying is now seen as a public health problem, schools require assistance from

health departments with psychologists and social workers, public health campaigns against bullying and buy-in from technological platforms and social media companies.

Whatever viewpoint is taken as to whether cyberbullying is learnt or not, children do model adults' behavior and adults bully each other. We cannot expect schools to reduce cyberbullying without adults taking responsibility for their own behavior as well. Parents are crucial role models for children and are their first teachers. Parents need to take much more responsibility for guiding their children's Internet experiences from a very young age. It is no longer acceptable for parents to say they are digital immigrants and do not know anything about technology. They are the ones who buy the devices for their children and need to teach them how to use them safely and not abuse their peers through technology.

**Abstract**

*Historically, professionalism has been defined in ways that are detrimental to union organization. (Kerchner & Caufman, Elementary School J 96, 107–122, 1995, p. 110)*

Teachers are central to education; they stand at the crossroads of education. It is chiefly through their efforts that the goals of education are achieved or thwarted. Susan Moore Johnson, Harvard Graduate School Professor of Education, sagely wrote just over 30 years ago, “Who Teaches Matters” (Teachers at work: Achieving success in our schools. Basic Books, New York, 1990, p. xii). Eric Hanushek concurs writing, “First, teachers are very important; no other measured aspect of schools is nearly as important in determining student achievement” (The economic value of higher teacher quality. National Center for Analysis of Longitudinal Data in Education Research, Calder The Urban Institute, Washington, DC, 2010, p. 3). The COVID-19 pandemic with its shutdown of many schools brought to the forefront the importance of teachers interacting with their students in classroom settings. Try as the teachers may, their virtual presence was a questionable substitute for the personal dynamics created by teachers with their students.

Teachers consider themselves to be professionals, providing a fundamental service, and seek to present themselves to the public as professionals. Juxtaposed to the critical importance of the teacher is the fact that public school teachers are part of a heavily unionized workforce.

For some, there is a challenge between being a professional educator and being a member of a union. Dana Goldstein, in *The Teacher Wars: A History of America’s Most Embattled Profession*, asked, “Could unionized teachers fight for their own interests as workers for the educational interests of the city’s children? Or were those two priorities at odds?” (The teacher wars: a history of America’s most embattled profession. Doubleday, New York, 2014, p. 74). Essentially, is unionization organized in a way that supports the professionalism of teachers? DeMitchell and Cobb, in their study of unions and teacher professionalism, ask, “[Are] teacher unionism and collective bargaining compatible with teacher perceptions of professionalism?” (West’s Educ Law Reporter 212:1–20, 2006, p. 19).

This chapter explores the challenges of unions and teachers in developing and sustaining the union, which balances the traditional and legitimate responsibility that unions owe to the educators they represent while supporting the professional responsibility of the teachers to act in the best interests of their students.

The discussion will begin with an exploration of professionalism – what does it mean to be a professional. Next, the rise of teacher unionization and the divergent paths of the National Education Association and the American Federation of Teachers in relation to professionalism and unionization will be discussed. The organizing principle of the emerging state collective bargaining laws formats public sector laws consistent with the industrial union model of private sector unionization and the impact of industrial unionism on teachers

and teaching. The chapter concludes with a review of DeMitchell and Cobb's research on the tangled fit of being both a union member and a professional educator.

**Keywords**

American Federation of Teachers · Bread and butter · Collective bargaining · Industrial union · National Education Association · National Labor Relations Board Act · Professionalism · Public sector unions · Unionism · Wagner Act · Working conditions

**Field of Memory**

Unions and collective bargaining are important elements of the broader field of labor relations. Labor relations is the relationship, interaction, between the employer and employee. It includes legal mechanism, policies, and practices and their formal and informal maintenance. The basic elements, for purposes of this chapter, remain, but the actual structure ebbs and flows given the changing political and economic conditions. This is especially noteworthy in the last couple of decades accelerating around 2010 and the passage and aftermath of the Wisconsin Budget Repair Act. Attacks on teacher unions were ratcheted up, teachers were denigrated, tenure and agency fees were attacked in the courts, and legislatures were rolled back bargaining rights (DeMitchell, 2020).

**Field of Presence**

Toward the end of the second decade of the twenty-first century, the tide of criticism started to ebb. Teachers garnered public support in response to statewide strikes in states that do not have collective bargaining laws. Elected state officials were turned out of office, and the movement toward right-to-work legislation appeared to have reached its apex and had begun to recede, and courts turned back suits seeking to eliminate tenure.

**The Field of Concomitance**

The field of labor relations is supported by the study of law on such fields as labor law and discrimination. Industrial psychology and research on negotiations also informs the study labor relations.

**Discontinuation and Raptures**

The most noticeable recent change is the absence of discussions on the contours of professional unionism. Practicing educators, policymakers, and scholars may have abandoned the exploration of replacing the industrial union model with a professional union model.

**Critical Assumptions**

Critical assumptions of labor relations in education include the necessity to perceive the organization as people intensive. It is the relationship between actors that defines

the quality of service rendered. The assumptions also include that web of rules (state bargaining laws, collective bargaining agreements, and labor laws) characterizes the environment in which employees and administration interact.

---

## Introduction

*Teachers want to be respected, want to be thought of as professionals, yet are members of strong labor unions.* (Schuman, 2004, p. 89)

The conundrum for teachers is that while their union advocates and bargains for their self-interests, teachers are professionals who provide a valuable service in the best interests of their students. Teachers tend to see themselves and describe themselves as professionals. Typically, they do not define themselves as union members, but they become union members when threats to their work, their livelihood, and their security arise. How do teachers fit these two roles, of professional and union member, together?

For the great majority of teachers, the crush of the workday in the classroom consumes their time and energy with little room left for union activities. Cooper and Liotta write that while “teachers in many communities are union members, they still see themselves and their work as primarily professional—helping children to learn. They identify with their students and the needs of their students” (2001, p. 109). For most teachers, the reality of the classroom forces the role of the professional front and center. Comments such as “I am a professional, this is my professional judgment, and I need to be treated as a professional” are heard more often in schools than the comment “I am a union member.” Teachers seek to present themselves to the public as professionals. Professor Wendy L. Poole characterizes this conundrum of teacher self-interest and professional interest as a paradox (2000, p. 117).

Professionalism is built around expert knowledge. The work of the professional teacher is complex and not routine. It involves the exercise of discretion. Teaching involves a standard of practice recognized and adhered to by the practitioners but applied in varying contexts, even within the same school district. Professionals use their judgment and take actions within the accepted standards of the profession that are in the best interests of the client, patient, or student. The focus of the professional is the best interests of the “other” and not the “self.” Unions seek to secure the self-interests of members. Professions are predicated on acts designed to further the interest of the patient, client, or student, and not the professional. Both the interests of the professional and the interests of the “other” are legitimate, and both are in tension with the other.

There is evidence that teachers do not perceive their union membership to be related to their teaching. DeMitchell and Barton (1996) found that teachers were not aligned with their building union representative on issues of the impact of collective bargaining on educational reform even though the building representative was a

colleague in their school and not a faceless bureaucrat. They offered in the analysis of their data that “teachers may not see unions and collective bargaining as being related to activities that are at the core of teaching” (p. 376). Similarly, a RAND study of teacher unions and educational reform revealed that teachers expect their union to stick to their knitting, which is obtaining the bread-and-butter issues usually associated with industrial style collective bargaining. If a union does not secure these essential items, any foray into professional issues is risky. McDonnell and Pascal (1988) in the RAND study found that “union efforts to obtain status benefits such as increased participation in school-site decision making often engender teacher suspicion and a feeling that the union is ‘falling down on the job’” (p. 53).

The challenge of providing an important public service as a professional emerged with the passage of state collective bargaining laws that defined teachers as members of a collective bargaining unit. The adopted legal definition of a public sector union, in many ways, placed teachers in both the professional classroom and the union labor hall.

---

## What Is a Professional?

Professionals hold a special place in our society. William J. Goode in his study of professions asserts that there are two generating qualities/principles that define professions. The first is a “service orientation.” The second pillar of professional is the acquisition of a specialized body of knowledge (1960, p. 903). Simply put, professionals exercise the standard of accepted practice acknowledged by the profession within the structure of a recognized code of ethics that is developed in the best interests of the client/patient/student. He asserts that professionals fashion solutions based on the needs of the client, “not necessarily [on] the best material interest or needs of the professional himself” (1969, p. 278).

To be a professional means the professional must act in the best interests of the person receiving his/her services. Noted educational policy researcher Linda Darling-Hammond writes, “Professionals are obligated to do whatever is best for the client, not what is easiest, most expedient, or even what the client himself or herself might want” (1989, p. 67). Therefore, the predicate of a profession is the best interests of the client, not the needs, interests, and desires of the professional.

Professionalism is built around expert knowledge. The work of the professional teacher is complex and not routine. It involves the exercise of discretion. The work involves a standard of practice recognized and adhered to by the practitioners but applied in varying contexts, even within the same school district. Professionals use their judgment and take actions within the accepted standards of the profession and in the best interests of the client/patient or student. The focus of the professional is on the best interests of the “other” and not the “self.” Unions seek to secure the self-interests of members. Professions are predicated on acts designed to further the interest of their patient/client/student and not the professional. Both are legitimate, and both are in tension with each other.

## Unions and the Rise of the NEA and the AFT

What is a union? According to Tannenbaum, “unions are organizations designed to protect and enhance the social and economic welfare of their members” (1965 p. 9). A union is “a continuous association of wage earners for the purpose of maintaining or improving the conditions of their working lives” (Webb, 1920, p. 1). They are a voluntary organization, which offers a service designed to meet its members demands for a level of benefits, working conditions, and representation with management.

Essentially, unions exist to represent the interests of the employees in the bargaining unit mainly through bargaining and implementing an enforceable employment contract through grievances, arbitration, and unfair labor practices. Those bargainable interests, often called bread-and-butter issues, include terms and conditions of employment, and wages and benefits. “Teachers join a union in order to secure more tangible benefits than they would without the union” (DeMitchell, 2020, p. 29). The union must provide a service securing benefits and security that the teachers (members of the bargaining unit) believe that they could not get on their own. Potential consumers of union service judge the value received by what is secured through bargaining and other activities, which enhance the interests of the employee.

### The Rise of the NEA and the AFT: Association or Union?

Teachers began to organize well before the rise of public sector collective bargaining. Low pay and low status were precipitating factors. The two major teacher unions, the National Education Association (NEA) and the American Federation of Teachers (AFT), arose in response to these two forces. In some ways, the difference between the two unions can be attributed to which one of the two forces the NEA and AFT focused their energy. The NEA, dominated by male college presidents and administrators, focused on professionalizing the teaching force, which did not include pursuing the welfare interests of teachers for better wages and benefits.

The American Federation of Teachers (AFT), from its inception, was a union of teachers. “It was organized by teachers, the membership was composed of teachers, and, most important, the leadership came from classroom teachers” (Streshly & DeMitchell, 1994, p. 9). The AFT aligned itself with national labor. Nicholas Murray Butler, president of NEA at the turn of the century, called the Chicago Federation of Teachers, the forerunner of the AFT, “insurrectionists” and “union labor grade teachers” (Murphy, 1990, p. 54).

When public sector collective bargaining marched across the educational landscape in the 1960s, the NEA thought it would destroy professionalism and would erode the teacher’s status in the community. For example, in 1958, Theodore Martin, the National Education Association (NEA) director of membership, proclaimed just prior to the advent of public sector collective bargaining:

Unionism lowers the ideals of teaching, by emphasizing the selfish, though necessary economic needs of teachers—salary, hours, tenure, retirement—unionism misses altogether the finer ideals of teaching and the rich compensation that do not appear in the salary envelope. (Kerchner & Mitchell, 1988, p. 57)

In contrast, the AFT embraced collective bargaining arguing that teachers would gain respect because their salaries would finally be commensurate with their preparation. In the 1960s, the NEA started losing members to the AFT primarily over the issue of which union could better represent and protect the self-interest of teachers. The NEA's long-cherished concept of professionalism was seriously challenged. "Teachers wanted higher salaries and better benefits, not necessarily a higher standard of respect" (Streshly & DeMitchell, 1994, p. 10). In order to remain competitive with the AFT, the NEA changed its philosophy and tactics. It came to look and act more like the AFT. Reflecting on this sea-change by the NEA in the 1960s, Bob Chase, the president of the NEA in 1997, stated, "we took a rather quiet, genteel professional association of educators, and we reinvented it as an assertive--and, when necessary, militant--labor union" (Chase, 1997, p. 2).

The transformation of the NEA to a labor union was prompted by the passage of public sector collective bargaining laws. When these public sector-collective bargaining laws were passed, the predominant labor-management mold was the industrial union of the teamsters, autoworkers, and coal miners. The procedures for conflict resolution, the definition of management and labor, and their respective rights were all borrowed, in many cases word for word, from the private labor sector, which embraced the industrial model.

The job of the union is to "get" those things for its members. Unions provide a collective voice that seeks to enhance and secure the social and economic well-being of its members. This initial choice of models to use for the public sector has had major consequences for education, given the uniqueness of public schools and a work force that struggles with the issue of professionalism.

---

## Public Sector Industrial Unionism: The Organizing Principle

Congress in 1935 passed the National Labor Relations Act (NLRA), commonly called the Wagner Act, which established the right of private sector employees to collectively bargain with their employer through an exclusive representative of their choosing. The act created substantial rights for private sector employees but left the states free to regulate labor relationships with their employees. However, starting in 1962 with President John F. Kennedy's Executive Order 10988, public sector bargaining took root. The resulting public sector collective bargaining laws were largely grafts from the NLRA and the Taft-Hartley Act. This reliance on the NLRA as a model for state-collective bargaining laws developed for the private sector, largely industrial union workplace, has had and still has wide reaching ramifications for teachers and school districts. Most states followed the NLRA lead several decades later granting similar rights to their public employees.

Public sector bargaining is a creature of legal mechanisms. It is through individual state legislation built upon the foundation of federal legislation on private sector labor relations (the NLRA) upon which public sector labor relations rest. Courts and public employee labor relation boards' decisions give substance to the law which guides labor relations in education and other public activities performed by a unionized work force (While charter schools are considered public schools, several unfair labor practices have been successfully brought through the NLRA. For a short discussion of these cases, see Jacob Bennett, *Sidebar: NLRB and Charter Schools* (DeMitchell, 2020, pp. 41–43)). Another important legal aspect of the legal framework for public sector collective bargaining is the United States Constitution.

When the public sector-collective bargaining laws were passed, the predominant labor-management model was the industrial union of the teamsters, autoworkers, and coal miners. The procedures for conflict resolution, the definition of management and labor, and their respective rights were all borrowed, in many cases word for word, from the private labor sector, which embraced the industrial labor model. This initial choice of models to use for the public sector has had major consequences for education, given the uniqueness of public schools and a work force that struggles with the issue of professionalism.

## Us and Them

The industrial union model is essentially an adversarial process that fosters an “us” and “them” mentality. Collective bargaining assumes a conflict of interest and a community of interest. The interests of teachers are pursued by their union, while the interests of the students and the community are the province of the school board. Both sets of interests are legitimate and both are separate. Not everything in the work setting that is good for teachers is good for students and vice versa. Without a conflict of interest, there is nothing to bargain; agreement has already been achieved. If there is no community of interest, reaching agreement may be difficult to impossible. How to find and expand the sweet spot of community is the challenge.

When the industrial labor model is applied to education, teachers become labor and administrators become management. The fact that both groups are educators with common goals and values is lost in this model. It takes the broader, inclusive concept of educator and sharply splits it into “us and them,” fostering and reinforcing a schism between teachers and administrators. “The separateness of some work activities performed by teachers and administrators is emphasized, and not commonality of purpose, roots, interests, or overlapping functions” (DeMitchell & Fossey, 1997, p. 21). Consequently, the emphasis on separateness places a great premium on conflict management within the labor relations and bargaining the contract. A relationship predicated on conflict and adversity has consequences for the long-term goals of the institution. Linda Kaboolian writes of this consequence, “adversarial relationships between teachers and school management significantly impede change efforts required to improve student achievement” (2005, p. 24).

This focus on conflict management is further enhanced because collective bargaining is a system for creating agreement when trust is low and the union members believe that they must be protected by a legally binding instrument that spells out in some detail the rights and responsibilities of their employment. Labor contracts, therefore, must be explicit, unambiguous, and provide for enforcement. These requirements may emphasize the conflicts of interest and diminish the community of interest. This is so fundamental that the absence of conflict actually “arouses anxiety and uncertainty among both union leaders and school managers who fear that they will be seen as having ‘gone soft’” (Kerchner & Mitchell, 1988, p. 237).

Separateness of educators, teachers, and administrators is exacerbated and central to bargaining a labor contract. Professionalism embraces their practitioners’ differentiation of tasks and responsibilities. Whereas, “[i]ndustrial unionism assumes permanent adversaries” (Kerchner & Cauffman, 1993, p. 15). How to move from the “them” of bargaining to the “us” for educating students is the challenge.

## Policy Restrictions

Workers relinquished control over the outcomes of the product of their work with the advent of industrial unionism. Decisions about what is produced and how it is produced passed into the hands of management. Industrial workers are divorced from the formation of policy; all they can do is implement it. Under the industrial union model, teachers, like factory line workers, are only supposed to perform a labor function; they are not supposed to influence the outcome of the product. However, we know that this is not the reality of teaching. Classroom teachers’ daily work with students is a translation and reconfiguring of policy to meet the highly individualized contexts of their classroom. Educators do not turn out mass-produced widgets; teaching is a highly complex process calling for the use of judgment. Classroom teachers fashion and adapt policy with the myriad decisions they make daily. Teachers are not divorced from policy, as the industrial union labor model would have us believe; they influence, adapt, and implement policy. They are one of Michael Lipsky’s street-level bureaucrats (1980).

Excluded from public sector bargaining are issues of policy. Policy issues, such as what shall be taught, are reserved for the school board as the elected representative of the community. The New Jersey Supreme Court in the early years of public sector collective bargaining in *Ridgefield Park Education Association v. Ridgefield Park Board of Education* supported policy matters as a prohibited subject of bargaining asserted, “Matters of public policy are properly decided, not by negotiation and arbitration, but by the political process” (1978, p. 287).

Because teacher unions are prohibited from bargaining the educational policies of the school district, it does not mean that they do not exert political influence. Both teacher unions have become powerful participants in the state, and national arenas as well as a leading interest group in school board policies (Cowen & Strunk, 2014; Moe, 2011). Education policy professors Wirt and Kirst asserted nearly 25 years ago,

but with the same salience today, that no other group has had an “increased influence on education policy in recent decades as much as have teachers. The timid rabbits of 30 years ago are today’s ravening tigers in the jungle of school systems” (1997, p. 181). From elections of school board members to the President, from curriculum issues to school responses to the COVID-19 pandemic, unions are players in policy debates. Consequently, the reach of teacher unions extends beyond the bargaining table in the school district to acting as issue partisans seeking to influence items on the public agenda.

---

## The Union Member and the Professional: Research on Teacher Perceptions

Professors DeMitchell and Cobb conducted a single study on the fit between union membership and a member of a profession but reported their findings in two articles. The two studies will be briefly reviewed. The overarching question was, “Are teacher unions and collective bargaining compatible with teacher perceptions of professionalism” (DeMitchell & Cobb, 2006, p. 19).

The survey included 24 Likert-style items that asked respondents their level of agreement with a variety of statements relative to their perceptions of the teaching profession and teacher unions. Fifty-one percent ( $N=103$ ) of the 200 educators who were contacted responded to the two-part survey. The survey was developed to discern respondents’ understanding of how they reconcile the apparent contradiction of the role of unions predicated on furthering their self-interest and their role as a professional grounded in service to the student (e.g., *professionalism is compatible with union activity*).

The survey items were constructed around seven categories: (1) the intersection of professionalism and unionism, (2) the legacy of the industrial union, (3) the tension between self-interest and professional interests which focus on an ethic of care to one who receives the professional service, (4) the separation of educators into us and them, (5) the elements of professional work, (6) the intersection of teaching and the contract, and (7) serving the professional needs of teachers.

The second part of the research asks teachers to respond with short answers to two prompts. These prompts sought to gather more in-depth knowledge about teachers’ perceptions of professionalism and the role of the union by asking whether unions support or harm professionalism. While it uses qualitative analytical tools, it is not, strictly speaking, a qualitative design. The two prompts are as follows: *Unions support professionalism in the following ways*, and *unions harm professionalism in the following ways* (DeMitchell & Cobb, 2007).

The respondents were given the following definition of professionalism in an effort to provide clarity and consistency in responses for both the quantitative and short answer sections.

For purposes of this survey, please use the following definition of professionalism or professional work:

- Professionalism involves the use of expert knowledge gained through extended study
- Professionalism involves the use of expert knowledge in unique and problematic situations.
- Professionalism is bounded by a code of ethics that emphasizes service to a client/student.
- Professional work is essentially intellectual and varied.
- Professional work requires the autonomy to control one's work.
- Professional work is not routine work. (Ibid., p. 28)

Only a few of the more salient findings of the 2006 quantitative portion of the study (DeMitchell & Cobb, 2006, pp. 11–18) will be reported here leaving the reader to go to the original if greater depth of understanding is warranted. The Likert scale used the following responses: (1) strongly disagree, (2) disagree, (3) neutral, (4) agree, and (5) strongly agree.

## The Profession and the Union

- Ninety-nine percent of the respondents agreed/strongly agreed that teaching is a profession ( $M = 4.91$ ).
- Two-thirds of the teachers agreed/strongly agreed ( $M = 3.63$ ) with the statement, "Professionalism is compatible with union activity." The next question asked whether the union supports my ability to provide a professional service to my students. The mean was the same ( $M = 3.63$ ) for the question on union activity.

This set of responses points to a belief that teachers are professionals and that there is a good fit with being a professional and the general work of unions.

- However, when asked whether they consider their union to be more of a professional association or a traditional industrial union, nearly 75% agreed/strongly agreed that their union was not a traditional union but was a professional organization ( $M = 3.80$ ). They apparently saw a difference between their association and the teamsters and united autoworkers in which both bargain for its unit members and enforce the contract for them.
- The following question plumbed this relationship further asking whether "Hardball tactics, such as work-to-rule or strikes, associated with industrial unions conflict with my sense of professionalism." The mean for agreeing/strongly agreeing dropped to 3.34 with less than 50% agreeing that these union tactics conflict with their sense of professionalism, and 24% took a neutral position. Why this number of respondents took to a safe harbor of neutral is not known. Almost one-third of the respondents strongly disagreed/disagreed thus believing that there is no conflict. Union office holders scored significantly different than nonoffice holders holding that there is no conflict with hardball tactics and professionalism. It is important to note that teacher unions have used both hardball tactics.

We next will review the questions that juxtapose the actions of unions to serve the interests of the teachers with the tenets of professionalism.

### **The Work of the Union**

- Unions are predicated upon serving the self-interests of its members. Yet, less than half of the respondents in this research (42.5%) agree or strongly agree with the proposition ( $M = 3.10$ ). Why would teachers not acknowledge this essential truth?
- The respondents seemed similarly conflicted about the role of the union protecting the interests of the students ( $M = 3.15$ ) and the interests of the public ( $M = 3.01$ ). These latter two statements are more consistent with the role of professionalism, protecting the “other” over self.

This question tends to lay bare the issue of unionism versus professionalism. If unions do not protect the public’s interests, can teachers lay legitimate claim to being part of a true profession since teachers tend to find unionism and professionalism to be compatible? It also appears to be in opposition to the question above about the compatibility of unions and professionalism – can the work of the union be compatible if it does not serve the interests of the other (students or the public). The question is, do teachers understand the responsibilities and the work of the union.

### **Teaching and the Contract**

This section goes to the heart of professionalism and unionism. Five questions sought to understand how the contract supports or inhibits teaching, the core professional activity. Teachers believe that the contract protects their professional activities, but the mean response to the statement that the contract fosters quality teaching is on the other side of neutral; thus, the contract does not foster quality.

While the teachers believe that the contract supports their ability to make independent decisions regarding their teaching, they also believe that the artistic/creative elements of teaching cannot be addressed in the contract nor can quality teaching be standardized into a contract ( $M = 2.45$ ). Teachers in this study perceive that teaching may be too complex to fit neatly into the strictures of collective bargaining. The responses to this section underscore how tangled the relationship is between a union member and a member of a learned profession. The contract, according to the responding teachers, supports professional decision-making, but it does not seem to support quality teaching.

### **Short Answer**

A total of 77 teachers responded to the prompts of harm and support. Most responded to both prompts, but not all did. All responses were transcribed, and an

iterative process of reviewing each response was conducted. Categories of responses were developed and then refined several times. Three themes emerged from the support prompt, and four themes emerged from the harm prompt. The theme of protection was found in both prompts but with opposite meanings.

### **Prompt #1: Unions Support Professionalism in the Following Ways**

A total of 71 teachers responded to this prompt. There was a strong sense in some of the responses of harbored past wrongs. Specific resentments were directed at administrators, whether at past or present administrators is unknown. For example, an elementary school teacher wrote, *“Provide support to abused teachers (those unfairly reprimanded),”* and a high school teacher stated, *“They protect my legal right from being trampled.”*

Three themes emerged from the data: protection, advocacy, and support.

#### **Protection**

The major thrust of this theme is that teachers would be in deep trouble without the union protecting them from administrators who are often characterized as mean, venal, and petty. For example, teachers write:

- *“I feel that teachers would be taken advantage of by administrators in their district if not protected by our union”* (elementary school teacher, union office holder).
- *“Protect you from inept administrators and Protect teachers from the whims of administrators”* (elementary school teacher).
- *“Protection from arbitrary actions by incompetent administrators who stifle the creative professionalism possible in our career”* (high school teacher, union office holder).

These written responses are consistent with the responses to a question in the section *The Profession and the Union*. (“Without a union school administrators would diminish my professional decision making.”) The mean was 3.49 with 55.3% agreeing or strongly agreeing that the union protects teachers from administrators.

#### **Advocacy**

The theme of advocacy includes how the contract attracts, retains, and frees up teachers. A number of these comments describe a powerful union that “assures” and “allows” teachers to perform their professional duties without interference from administrators. The comments tend to give the impression that the union is not just a restraint on administrative action but that it may compel administrative action.

These comments describe a proactive union and not a reactive union. These elements focus on one of the major duties of the union, bargaining a contract.

Another related concept is that unions enhance teaching through their advocacy that teaching is a profession. The comments on the contract as advocate include the following: *“bargains for teachers to be paid like they are professionals”* (elementary school); *“guarantees competitive wages, etc. to keep good individuals in this profession”* (middle school teacher, emphasis in original, union office holder); *“Union contract speaks to a variety of important conditions that make professionalism prosper”* (high school teacher, union office holder); and a middle school teacher provides a good summary, *“Allow[s] teachers to pursue their profession with less concern for contractual issues, which they would otherwise dedicate valuable time pursuing if they negotiated individually.”*

The concept of enhancing teaching within the advocacy theme includes such comments as *“In this era of ‘scripted teaching,’ I am assured my right to teach students in creative & effective ways”* (elementary school, union office holder) and *“My union allows me to try things without long term censure from my administrators”* (middle school teacher, union office holder).

However, the union’s advocacy for teaching autonomy may be questioned in the responses to two survey questions. The first statement reads, “The artistic/creative elements of teaching can be addressed in a contract.” The mean is 2.66 (disagreeing) with only 26.8% agreeing or strongly agreeing with the statement. Furthermore, just over 61% of the respondents strongly disagreed or disagreed with the following proposition, “If I had a professional issue/question, unrelated to the contract, I would first turn to the union for assistance.” It is questionable whether the responses to these two questions are aligned with union advocacy of teaching if teachers do not believe that unions through the bargained contract cannot address the creative/artistic aspects of teaching. These critical aspects of teaching appear to be beyond the normative reach of a collective bargained contract. Furthermore, is the union the resource for professional issues unrelated to the contract? The other finding may demonstrate a distance that the responding teachers perceive that the union and the work of the union have from their core professional responsibility, teaching.

## Support

The last theme concerns in-service days and professional development. The respondents credit the union with securing time for these important pursuits. There are a total of 14 (eight elementary school teachers, four middle school teachers, and two high school teachers) responses constituting 20% of the total written comments. Offering workshops, peer collaboration, promoting activities to support best practices, encouraging professional development, and *“require[ing] professional development as part of the contract”* (high school teacher) are cited as examples of how unions support professionalism.

The teachers, who responded to this prompt of support, believe that not only is union membership compatible with professionalism but that it is also associated with providing a professional service to students. The responses comprising these three themes reflect the quantitative responses that the teachers need the protection of the union and that they are better-off working under a union contract than working without a contract.

## **Prompt #2, Unions Harm Professionalism in the Following Ways**

A total of 23 (seven union office holders) elementary school teachers, 23 middle school teachers (four union office holders), and 15 high school teachers (five union office holders) responded to this prompt. The views expressed are not as hard-edged as some of the comments cited above. While there are some frustrated commentators, the comments, by-and-large, do not contain the same emotional content of suffered personal wrongs. The comments appear to be more disagreements with and lamentations about the current state of affairs. However, one middle school teacher's comments may have captured the tone of the most strident criticisms of unions and summed up for many their concerns about unions. The middle school teacher wrote in the prompt for how unions support professionalism, "*Unions are the antithesis of professionalism!*"

Four themes emerge from the analysis – blind protection, the work of unions, divisiveness, and the union label.

### **Blind Protection**

The issue of protection was the strongest theme of how unions support professionalism. It is also the strongest theme of how unions harm professionalism. Clearly, the issue of union protection is central to many teachers, and it is also a cause of great concern for many other teachers. Protection appears to be a double-edged sword: The union provides needed protection from the powerful and sometimes less than professional administrators versus protection of incompetent teachers, which demeans the profession. Protection of the least capable teacher is a challenge for unions because most teachers are "troubled by the presence of incompetent teachers in their school building."

For some, union protection is almost an unthinking genuflection of protection of the least worthy, while for others the protection of a union member is important for all teachers regardless of the fitness of the individual. One high school union leader wrote of this conundrum for unions in the harm prompt, "*Sometimes we have to support people who we think are poor teachers.*" An elementary school teacher and union office holder stated, "*Automatically defending teachers whether they are right or wrong.*" However, one high school teacher placed the blame on administrators for the retention of incompetent teachers writing, "*If administrators would do their jobs there has always been ways provided in contracts to help these teachers or eventually remove them.*"

## Work of the Union

Two subthemes comprise this theme: union activities (“*Unions focus on money, making teachers seem self-serving and unprofessional.*”) and pressure to conform (“*Also, if the union member does not wish to participate in certain activities, such as refusing to do activities after the school day, other staff members will sometimes try to apply pressure to conform*”). The larger connection of the two subthemes is found in an elementary school teacher’s response: “[*The union*] *totally disregards the work ethic teachers choose to put into their job and instead places trivial issue sat the forefront of their day-to-day business.*” This comment incorporates the pressure to conform – the disregard of the effort teachers put into their job – and what the teacher chooses is immaterial if it does not fit the viewpoint of the union on what should be done as part of the work. This is opposite to the positive theme of advocacy discussed above.

## Divisiveness

Some of the comments are purely descriptive – “*Creates a ‘them’ and ‘us’ atmosphere*” (middle school teacher), while some respondents see conflict in the divisiveness – “*Often promotes an antagonistic relationship between teachers and administrators and school board*” (middle school teacher) and “*Interfere w/ positive interactions between admin & teachers • Create adversarial atmosphere*” (high school teacher, union office holder).

Interestingly, the responses to the survey instrument paint a different picture. The responses to the statement “Unionization institutionalizes conflict between teachers and school administrators” can be separated in the following manner: 45.8% (strongly disagree/disagree), 29.2% (neutral), and 25% (agree/strongly disagree). And the same analysis can be applied to “The contract separates educators into us (teachers) and them (administrators)”: 30.4% (strongly disagree/disagree), 22.5% (neutral), and 47% (agree/strongly agree).

The responses to these two questions are consistent with the other in this subset of us and them. Sixty-four percent of the respondents agreed or strongly agreed that their professional activities are enhanced through collegial relationships with administrators.

## The Union Label

The union label theme refers to a belief that association with a union harms professionalism in the eyes of teachers and possibly more importantly in the eyes of the public, which one can argue confers the honorific of professionalism. One elementary school teacher stated “*just the paradigm of ‘union’ causes hostility.*” A middle school teacher wrote, “*Unions harm professionalism in the negative feelings/opinions that some have of unions.*” Another elementary school teacher may have

summed up this theme with the comment “*I don’t hold banners/pickets . . . it’s not what I do if it’s for self interest.*”

Teachers in this study want the protection of a union and a collectively bargained contract. They, however, note that there are limits to what the contract and the union can do to support their professional activities, especially when it comes to bargaining the professional contours of teaching. Union leaders and nonleaders differ significantly on several specific issues. However, they appear to be united as to whether they are better off with a union and a contract. While their responses as to how unionism and professionalism fit together may be tangled, they are clear that ambiguity is preferable to working without a union and a collective bargaining contract.

---

## Conclusions and Reflections

“The problem, of course, is that schools are utterly dependent upon teachers not acting like industrial workers.” (Kerchner, & Koppich, 2000, p. 284)

This section starts with the following assertion, “Both roles of union member whose interests are being served by a union and a professional who serves the needs of others are legitimate and both may be contradictory at times” (DeMitchell, 2020, p. 93). Teachers are professionals; they struggle for ways to find a fit between their union membership with its emphasis on pursuing self-interest with their possibly greater identification as a professional providing service in the best interests of their students. Their daily work is a translation and reconfiguring of policy to meet the highly individualized contexts of their classrooms. The industrial union model ill-serves a profession that thrives on the collegial relations necessary for educators. “The industrial union paradigm fits uncomfortably on the shoulders of educators” (DeMitchell, 2010, p. 39). How their professionalism meshes with union membership and bargained contracts is tangled.

The policy knot is not unraveled through the call to “weaken or eliminate union power over schools” (Moe, 2006, p. 230). Neither a rigid, reflexive response by teacher unions and teachers that what is good for teachers is what is good for students nor an automatic demonizing of unions and teachers should be the response. However, words and deeds from all parties that enhance professionalism and reduce the obstructive elements of the industrial union model must be pursued by all parties. Changing labor relations is hard work involving heavy lifting for all parties. Teachers are not just served by a union; they also serve a learned profession.

## Abstract

This chapter explores the history of the common school movement in the United States in order to understand the origins of and the shifting landscape of education and public schooling over time. Two major historical challenges to the common school ideal are examined, and contemporary challenges including school choice are considered with a particular framing within the perspective of diversity, inclusion, and social justice. Finally, the idea of a new common school that is “radically democratic” is considered in light of the economic, social, civic, political, and global realities facing education and school leaders today.

## Keywords

Busing · Charter schools · Democracy · Equity · Magnet schools · Parochial schools · Privatization · Radical education · Vouchers

### **The Field of Memory**

In the field of memory, the idea that the common school in the United States is one that equitably and appropriately served the educational needs of all citizens is easily challenged with an inspection of history. Indeed, even the idea of the common school as a source for ensuring the continuation of democracy among citizens must be scrutinized carefully through the lens of history and which groups were bestowed vs. denied citizenship and civil rights. As noted by Goodridge (2019), too many authors have positioned the issue of school choice in an ahistorical context that is firmly rooted in the language of contemporary education and economic policy, ignoring the historical antecedents and lived experiences of marginalized communities that have led to its emergence during the latter part of the twentieth century.

### **The Field of Presence**

The field of presence demands a re-analysis of the common school from its inception through the current time with a clear understanding that while a majority in the United States may be well served by the common neighborhood school and that these schools are even places of democracy, intellectual development, academic excellence, and humane treatment, this ideal continues to elude many marginalized groups even today. It is within this field of presence that a solution must be sought for those who have been and continue to be left outside of the school walls, both figuratively and literally.

### **The Field of Concomitance**

The field of concomitance for analyzing choice and the common school tends to center on those ideas borrowed from or otherwise absorbed from business and economics. In particular, notions of the school as a factory model, the management styles of educational leaders, and capitalism and the free-market have been invoked to problematize and delegitimize the public school and to argue in favor of both nonprofit and for-profit models of school choice.

### **Discontinuities and Ruptures**

Discontinuities and ruptures in the idea of the common school have existed since the very beginning, as the question about the role of government in the daily lives of citizens is pondered. Indeed, questions regarding the very nature and purpose of schooling as well as who is to be served and by whom are as old as schooling itself and continue unabated today. It is therefore imperative that when considering the seemingly contradictory ideas of a common school vs. school choice, these discontinuities and ruptures be kept well in the forefront of any discussion and analysis.

### **Critical Assumptions**

A primary critical assumption centers on the idea that families, communities, and democratic societies generally want to enjoy a good life and that education is a fundamental human right. However, another critical assumption is that what is

meant by education and what constitutes a good life vary tremendously. Therefore, assumptions about the nature of school choice and its influence, both positive and negative, on public education must be considered.

---

## Introduction

“Dreams are impartial, spontaneous products of the unconscious psyche, outside the control of the will. They are pure nature; they show us the unvarnished, natural truth, and are therefore fitted, as nothing else is, to give us back an attitude that accords with our basic human nature when our consciousness has strayed too far from its foundations and run into an impasse.” (Jung, 1970)

Dream (n.)

Dream in the sense of “that which is presented to the mind by the imaginative faculty, though not in sleep” is from 1580s. The meaning “ideal or aspiration” derives from the earlier sense of “something of dream-like beauty or charm.” (Online Etymological Dictionary, 2005)

As the quotes above indicate, a dream represents a vision of an ideal, an aspiration to a perfect state. However, as the history of the ideal of the common school in the United States reveals, the dream and aspiration of a publicly funded, truly common school system that serves all citizens equitably has often fallen quite short. The purposes of this chapter are to first delve into the history of the common school movement in the United States in order to understand the origins of and the shifting landscape of education and public schooling over time. Two major historical challenges to the common school ideal are explicated, although a multitude of challenges historically existed. Next, contemporary challenges to the common school, especially that of school choice, are considered with a particular framing within the perspective of diversity, inclusion, and social justice. Finally, the idea of a new public education that is “radically democratic” is considered in light of the economic, social, civic, political, and global realities facing education and school leaders today. This chapter explores the question of whether school choice has signaled the end of the dream of the common school, or whether it is, in fact, a dream that is still in the making.

---

## Education Before the Common School Era

Before the United States was fully formed as a nation, education and schooling existed in a multitude of forms but generally in the absence of any cohesive system. The first schools opened in the early to mid-seventeenth century and included the first and now oldest public school, the Boston Latin School, in 1635 (Boston Latin School [BLS], n.d.) and the Mather School, the first tax-payer supported public elementary school, in Dorchester, Massachusetts, in 1639 (Sacchetti, 2005). The Boston Latin School “. . .centered in the humanities, its founders sharing with the ancient Greeks the belief that the only good things are the goods of the soul.” From its inception, the school emphasized dissidence and persistently encouraged dissent with responsibility (BLS, n.d.).

Dissent, however, was not generally encouraged in early forms of education in the colonies. Indeed, most scholars recognize the education policies of the Massachusetts Bay Colony and the 1647 “Old deluder Satan” laws as a precursor to the public school system in the United States. This law required towns to establish schools that would teach reading and writing in order to maintain religious values and obedience to authority. Grammar schools (precursors to modern high schools where Latin, Greek, and advanced subjects were taught) and college were the means by which elite social status was maintained or gained. Schooling in the southern colonies, on the other hand, relied much more heavily on private tutors, studying abroad, or attending institutions operated by the Anglican church (Spring, 2018). In all of the various forms of schooling in the early colonies, however, there was little in the way of a democratic theory of education, and the purpose of schooling was primarily aimed at maintaining the existing social and religious order (Welter, 1962).

By the middle of the eighteenth century, there was a somewhat global shift toward revolutionary thinking that placed the state rather than the church at the center of the social order. Postrevolutionary America, with its newly formed independent government and steady influx of immigrants, increasingly viewed mass schooling as a primary means by which to stabilize the nascent nation, persuade those English colonists who remained loyal to the English government to shift allegiance to the newly formed American government, and ensure the loyalty of European Americans and immigrants alike (Spring, 2018).

In fact, this idea of linking mass schooling to the building and maintenance of a nation-state was the original impetus for the common school and was eventually replicated around the world. While this movement was designed to unify a multicultural society under the common principles underlying the ideals of the newly formed nation, it also served as a means by which the stripping away of languages, cultures, and religious traditions that diverged from the overwhelmingly Anglo-Protestant founders was legitimized (Feinberg, 2007). While many factors and individuals contributed to the development of the common school era, two in particular stand out. Noah Webster’s work throughout the late 1700s and early 1800s is considered to have laid the groundwork for later developments toward the common school ideal. His textbooks, for example, were written and designed to unify a multicultural society while defining a new American language and culture (Litto, 1985; Spring, 2018).

Thomas Jefferson, on the other hand, viewed schooling somewhat differently and proposed a three-tiered system in which a common grammar school education at public expense would be provided to all children at the first level while increasingly smaller, select groups of male students would go on to obtain higher levels of education. In essence, Jefferson thought that a public education had two goals: to prepare ordinary citizens for life and liberty and to prepare political leaders who would emerge as a “natural aristocracy” from this selective process. In any event, by the beginnings of the nineteenth century, there was a general movement toward a more comprehensive model of schooling that would be some form of education to citizens and that would not rely exclusively on private benefactors nor the initiatives, financial means, and connections of individual families (Spring, 2018).

## The History of the Common School

Common (adj)

c. 1300, belonging to all, owned or used jointly, general, of a public nature or character; from Old French *comun* “common, general, free, open, public” (Modern French *commun*), from Latin *communis* “in common, public, shared by all or many; general, not specific; familiar, not pretentious.” The second element of the compound also is the source of Latin *munia* “duties, public duties, functions,” those related to *munia* “office.” (Online Etymology Dictionary, 2005).

Horace Mann is generally credited as being the father of the common school era. However, as noted above, Mann’s work did not take place in isolation, and several social, political, and economic factors converged during the early to mid-nineteenth century that resulted in what is now referred to as the common school era. Education reformers at the time had a vision of a system of publicly funded compulsory schooling that would further solidify a common American language and culture and that would be administered by state and local governments in order to address and remedy social, political, and economic problems facing the country. To this end, Mann and other education theorists looked to the Prussian model of education, which had been laid out by Frederick the Great in the mid-eighteenth century (Spring, 2018). Prussia was one of the first countries in the world to implement a compulsory education system that would be fully supported by taxes and administered by the state.

This relatively novel idea of requiring, at minimum, an eight-year program of study for all citizens would include instruction in basic skills such as reading, writing, and arithmetic, but also the arts and citizenship before select students went on to study at the gymnasium, which functioned largely as a university preparation school. In addition to the idea of an eight-year program of compulsory study for all citizens, the Prussian model of education also contributed the ideas of a standard, national curriculum; a largely secular approach to education; professional training for teachers in specialized, dedicated colleges; professionalization of teaching, including higher salaries; funding to build schools; and administration and oversight of schools by the government (Jeismann, 2006).

The Prussian model of education increasingly captured the attention of high-ranking educators and policy drivers in the United States in the early nineteenth century, and several states began to make way for a more comprehensive, publicly funded system of education during this time, although southern states were much slower to follow suit. According to Spring (2018), “The major difference between schools before and after the common school movement was their goals” (p. 90). To achieve these goals, the common school reform ushered in the idea that schools should serve the public goals of the government and required a new organization as well as a new ideology.

Spring (2018) asserted that there were three distinct features of the common school movement: (1) to educate all children regardless of economic status or religious, cultural, or linguistic heritage in a common schoolhouse in order to build a common American culture and to ameliorate social class conflict;

(2) common schools were seen as necessary to provide a public good in the reduction of crime and poverty, to improve the morality of citizens, and to provide equal opportunity to all citizens; and (3) in order for a comprehensive, common system of schooling to work efficiently and effectively, it would need to be administered by state and local agencies designed for that purpose (pp. 91–92). One important notation regarding the influence of the Prussian model of education on the development of the American common school is that Mann in particular advocated that not everything about the model was desirable, and that its positive aspects should be implemented while its negative aspects, such as its overt emphasis on obedience to authority, should be discarded (Phillips, 2001).

Interestingly, much later, Michel Foucault's term, *biopolitics*, would be used to criticize the Prussian educational model as an important force in nineteenth- and twentieth-century nation-building. Biopolitics "examines the strategies and mechanisms through which human life processes are managed under regimes of authority over knowledge, power, and the processes of subjectivation" (Garrison, 2013). Indeed, as many authors have noted, the primary goal of the common school movement was to protect an American culture that was based largely on Protestant ideology and mores (Burke, 2012; Carper, 1998; Halstead, 2007; Kaestle, 1983; Spring, 2018).

---

## Historical Challenges to the Common School

In his discussion on the development of the common school in the United States and, later, in Britain, Pring (2007) noted that "The fight for the common school was essentially a moral one in terms of achieving greater social justice and equality, respect for persons and preparation for citizenship within a democratic order" (p. 504) that required a common culture to overcome divisions arising from economic status, social position, and religion. He further noted,

On the other hand, the common school brings together people from different communities, maintained through different cultural traditions that are central to their sense of identity and that embody distinctive visions of the life worth living. How is it possible to reconcile these two- creating a common culture whilst respecting and supporting the distinctive cultures within the school community? (p. 511)

This is indeed a question worth considering in analyzing both the successes and failures of the common school model in the United States.

However, as many authors have observed, there are at many examples of those who were never adequately or even marginally served by common schools of the nineteenth and early twentieth century. For the purposes of this chapter, two primary examples will be examined: that of Irish Catholics and that of Black and African Americans. However, it is important to note that while these two examples will form a basis for analysis of the common school and its limitations, it is not in any way meant to deny or otherwise ignore other groups in the United States that have been

historically and systematically denied equal educational opportunities, including but not limited to those of Latino (MacDonald, 2013; Moreno, 2008; Tashakkori & Ochoa, 1999), Asian (Bow, 2007; Hinnershitz, 2017; Spring, 2018), and Native (Spring, 2018; Steineker, 2016; Takaki, 1993) ancestry as well as students with disabilities and special needs (Osgood, 2007; Spaulding & Pratt, 2015; Winzer, 1993).

## **Irish Catholics and the Common School**

As has already been noted, the common school movement was not a singular, unchallenged movement wherein a state-supported system of education was smoothly implemented. Even among Protestant groups, the idea of a secular system of education was viewed with skepticism, as noted by Gaither (2012). Added to this was anti-Catholic sentiment, fueled by a large influx of immigrants from Ireland, and who – along with other minorities, including those of African, Asian, Mexican, and Native descent – were viewed as morally, culturally, and intellectually inferior to Whites (Takaki, 1993). Indeed, as noted by Spring (2018), anti-Catholic hostility ran deep, and the Catholic religion was considered to be, at best, a threat to Protestant values and communities and, at worst, the instrument of Satan himself (Brinig & Garnett, 2014; Takaki, 1993).

As a result, the common schools of the nineteenth century were not really common to all, as Catholics felt excluded by the overwhelmingly Protestant values and anti-Catholic sentiment expressed through the curriculum and school policies. In fact, it was not just a feeling of exclusion but one of being alienated from deeply held religious, cultural, and family heritage (Walch, 2003). For example, Brinig and Garnett (2014) highlighted several instances in which Catholic students were punished severely and even expelled from public schools for refusing to recite from the King James Bible or observe other Protestant traditions. Ultimately, these clashes escalated to violence and rioting as the struggle for control of the common schools – or at least of recognition and accommodation of differing religious texts and viewpoints within the newly established, publicly funded schools – continued. As a result of the ongoing clashes and conflicts, the Catholic church issued a mandate via three plenary councils in Baltimore in the years 1852, 1866, and 1884 that would establish a system of parochial Catholic schools that would largely be funded by local parishioners in the absence of much hoped-for public funding (Spring, 2018; Brinig & Garnett, 2014).

In the ensuing years, battles for public funding for Catholic schools took place in several cities across the nation, as Catholic families were strongly urged by the church to send their children to parish schools rather than the local public school. This resulted in a sense of being double-taxed for schools (Kaestle, 1983), and efforts to secure public funding for the burgeoning system of Catholic schools continued to fail at both state and national levels although attempts to secure public funding in the form of vouchers and other state support have continued to this day (Brinig & Garnett, 2014). Despite the lack of public funding, however,

the determination to maintain schools that would align with the community values, norms, and teachings of the Catholic church resulted in the development of the largest system of private schools in the world at the time, a system that was loosely organized and built, financed, and operated largely by local parishes (Walch, 2003).

According to Brinig and Garnett (2014), parochial Catholic schools proliferated throughout the latter part of the nineteenth and early twentieth centuries, especially in urban areas. To some extent, the structure and curricula of these schools were modeled after that of public schools. However, other parish schools took a different approach, maintaining a curriculum that would emphasize the ethnic culture and native language of the local parish in an effort to sustain cultural and linguistic heritage and resist assimilation into the broader American culture. By the end of the 1960s, Catholic school enrollment in the United States was at its peak, exceeding five million students (NCEA, 2012).

However, due to a complex array of social and economic factors that changed the demographics of urban areas and shifted the work of parochial schools to a largely lay population, thus causing significant economic hardships for parochial Catholic schools, enrollments steadily declined after the late 1960s. As Burke (2012) ironically noted, despite the pride of self-management, independence from government interference, and nearly 200 years of educational service to American – especially urban – communities, Catholic schools and neoliberal school reform policies have become “strange bedfellows” in the school choice movement:

The move to align Catholic schooling, Catholic teacher preparation and Catholic educational lobbying with marketized neo-liberal reforms in the United States is perhaps not surprising given the abject fear that comes about from extreme contraction. . . . Lost, however, amidst this fear, is any sense of nuance or any turn to larger structural inequities that might be adversely affecting schooling on a whole and Catholic schools specifically. That is, what if we were to consider the broad disinvestment in the public social contract. . . rather than focusing in on how to better compete for a shrinking pool of money for education? What good might be done to advocate for better services for all children rather than leaner models perpetrated on a notion that winners and losers are necessary in a market system?. (p. 194)

## **Black and African Americans**

Watkins (1996) cautioned that “The schooling or miseducation of African Americans has been inextricably connected to the politics of colonialism, slavery, and the subsistence labor practices of the corporate-industrial United States” (p. 6). The long and deplorable history of racism and the treatment of African American and Black individuals in the United States is well documented and ingrained systemically in nearly every institution of society, and schooling is no exception. Not only was citizenship and naturalization denied to both enslaved and freed individuals until the civil rights act of 1866 and the ratification of the 14th amendment in 1868, this amendment did little to squelch the racism and segregation that was endemic throughout the county and fell short of actually ensuring civil rights and equal

protection under the law. It was, at various times and places – notably in the southern colonies and states – illegal to educate African Americans but even in the northern states, education was difficult for free Blacks and African Americans to access, either due to exclusion or overt hostility and racism.

As early as 1787, African American leaders in Boston petitioned the state legislature for a separate Black school due to the hostility and prejudice faced by their children the existing schools. The legislature tasked a committee, the Boston School Committee, with making a determination, and the request was denied based on concerns that such a concession of establishing and funding a separate school system would lead to other groups demanding similar accommodation. By 1806, however, the committee reversed its position and opened a school for Black students using a combination of public funds and philanthropic contributions, and the movement gained momentum across several cities in the USA (Grant, Brown, & Brown, 2016).

Similarly, in several southern states, Black schools were established by Black communities during the reconstruction years and thrived with high enrollment (Foner & Mahoney, 1995). For example, Butchart (1980, 2002) noted that, in Georgia, private benefactors in the north and the federal government aided efforts to establish Black education, but the primary impetus and sustaining force came from the state's African Americans as literate Black men and women opened new, self-sustaining schools that predated the state mandate to establish a state-wide system of public schools. In a move that would be repeated in several areas of the country, states would eventually absorb these schools and ultimately deprive them of their fair share of public funding and resources necessary to sustain them while concomitantly, private and philanthropic contributions declined (Foner & Mahoney).

As would be seen during the postreconstruction era and continuing throughout the first half of the twentieth century, several states enacted laws that required “separate but equal” educational facilities, and even where no such laws existed, schooling became largely de facto segregated as White families resisted sending their children to the same schools where Black children would attend and so-called white flight bifurcated urban areas from newly sprawling suburban areas (Spring, 2018). Despite the landmark decision of *Brown vs. the Board of Education* in 1954, which ruled segregated schools unconstitutional, schools tended to remain segregated and a variety of policies were put into place across the country, especially in urban areas, that would theoretically remedy the continued inequities.

Two pervasive policies that were implemented in numerous cities across the nation included “one grade at a time” approaches to desegregation and busing students from one location to another in order to achieve greater integration. However, as noted by Woodward (2001) in her analysis of desegregation policies and practices in Nashville, the “one grade at a time” policy of desegregation was implemented in part so as to render the process so slow and limited that the White communities would have time to find alternatives via private schooling, newly established open enrollment policies, or relocation. Further, Delmont (2016) noted that the forced busing of the 1960s and 1970s not only placed significant burden on

Black students in terms of time and distance traveled as well as safety considerations, it also rendered the ideal of the neighborhood common school nearly obsolete in some areas.

Delmont (2016) also pointed out that busing as an issue was often used as a “dog whistle,” a means of hiding racist agendas behind a seemingly common issue that faced oppositions from both Whites as well as Blacks and other minority groups. However, the media largely focused its attention on White opposition to busing while marginalizing or ignoring the goals of the Black community. In fact, the opposition from the Black community was not uniformly about the issue of busing per se but, rather, focused on hopes and desires for public schools in Black neighborhoods to provide quality, culturally relevant education and allow families the choice to access better funded schools beyond the officially zoned neighborhood.

Many black parents wanted to see more black school board members, more black teachers, and black history and culture included in the curriculum. Various currents on black thought – Black Nationalism, Pan-Africanism, and grassroots educational traditions – fueled calls for black community control of schools, and in each case, racial integration was not on the horizon of educational equality or black freedom.” (Delmont, 2016, p. 169)

In other words, members of black and minority communities wanted full integration but first and foremost demanded high-quality education and representation in all public schools.

Nevertheless, as a result of misguided policies, half-hearted attempts at school integration, and more often, outright resistance to achieving equity and integration in public schools across the country, Black neighborhood schools were often ultimately left even more underfunded, understaffed, and underutilized and too often ultimately slated for closure. The issues of school desegregation and busing are complex, and it is easy to oversimplify the issues. However, the significance of attempts at desegregation and the subsequent resistance in the form of protests, riots, school boycotts, political maneuvering, hostility, and outright violence cannot be overstated in understanding the entrenched racism that continued to plague American society and, thus, that of public schools. It is this complex interaction of political, social, and economic factors that ultimately resulted in the de facto resegregation of schools (Formisano, 1991) that led to a burgeoning phenomenon in the form of alternative approaches to schooling.

---

## School Choice and Contemporary Challenges to the Common School

### Choice (n.)

Mid-14c., “that which is choice,” from choice (adj.) blended with earlier *chois* (n.) “action of selecting” (c. 1300); “power of choosing” (early 14c.), “the person or thing chosen” (late 14c.), from Old French *chois* “one’s choice; fact of having a choice” (12c., Modern French *choix*), from verb *choisir* “to choose, distinguish, discern; recognize, perceive, see,” which is

from Frankish or some other Germanic source and related to Old English *ceosan* “to choose, taste, try” (from the root \**geus-* “to taste; to choose”). Late Old English *chis* “fastidious, choosy,” from or related to *ceosan*, probably also contributed to the development of choice. Choice replaced Old English *cyre* “choice, *free will*.” (Online Etymology Dictionary, 2005)

As noted by Levinson (2007) in her outlining of the four justifications for the common school, “Common schools stand as public symbols of our civic commitment to diversity, mutual respect, social justice, equality and solidarity” (p. 636). However, as stated in the previous section, while public schooling in the latter part of the twentieth century generally moved away from *overt* attempts to bar specific groups from attending or benefitting from public education, inequities in school funding and allocation of resources as well as residential segregation continued to result in a system of schools that did not serve all students equitably (Logan, 2018). As a result, the 1970s saw spate of innovations that were designed to achieve greater racial integration and to ameliorate inequities, especially in urban schools (Goodridge, 2019).

### **Magnet Schools, Charter Schools, and the School Choice Movement**

The controversial nature of forced busing as a means of achieving school desegregation during the 1960s and 1970s prompted school districts across the nation, mostly in urban areas, to consider other models that would attract a more diverse student body, offer a variety of educational alternatives, and reconceptualize the idea of school zoning. Funding for alternatives was included in Emergency Schools Aid Act (ESAA) of 1972, which authorized local education agencies and nonprofit organizations to develop and implement innovative school options. One particularly popular model of early school choice was the magnet school (Peters-Lambert, 2015). The primary driving force behind the development of magnet schools was to achieve a level of racial integration that previous legal challenges, court orders, laws, and policies had largely failed to realize by providing specialized curricula, programs, or pedagogy and competitive admissions that would attract White students into schools that were serving predominantly minority students (Kryczka, 2018).

While secondary magnet schools tended to have specialized areas of focus, such as performing arts, STEM (science, engineering, mathematics), business, health care, etc., elementary magnet schools tended to have specialized pedagogical approaches or organizations such as a Montessori or an open schools approach (Rossell, 1979). As the idea of alternatives to the neighborhood school gained traction in the 1970s, magnet schools proliferated across the country with some districts going so far as to mandate that every school become a magnet school of some kind. However, the level of desegregation that was ultimately achieved by the magnet school movement varied tremendously across different cities and contexts (e.g., whether the magnet school was only one vs. the primary component of a more comprehensive desegregation plan), and many districts ultimately abandoned the idea of magnet schools due to unsustainable costs and innovations and a concomitant lack of data to demonstrate increased integration and effectiveness in educational outcomes (Peters-Lambert, 2015).

Another alternative model of public schooling that became more widespread is that of charter schools. As with every aspect of education and schooling, the story does not unfold in a neat, easily digestible narrative. While many assume that charter schools are a relatively recent phenomenon, springing up only during the early 1990s in the post-Reagan years (Cohen, 2017), charter schools actually have an ideological basis that predates the market-driven school choice movement of recent decades. According to Moses (2017),

... charter schools represent an important juncture in the history of Black people's continual struggle for meaningful education. Specifically, charter schools have served as one avenue for the evolution of the Black independent school movement that developed in the late 1960s and early 1970s during the Black Power and Pan-African Nationalist movements. The Black independent school movement came on the heels of a largely failed push for substantive integration. As it became clear that the federal and state implementation of post-*Brown* integration orders had little real effect on the majority of Black students who were still trapped in highly segregated, under-resourced, and academically substandard schools, community members shifted their focus to gaining control over their local schools. When this movement for community control met staunch resistance from teachers and administrators, the Black community, influenced by the era's burgeoning emphasis on Black pride and African cultural consciousness, turned their attentions toward developing autonomous institutions. (para. 3)

What is important to note here is that the idea of choice was borne of a lack of effective schooling brought about by systemic racism, underfunding, and policy decisions that reproduced and sustained the hegemonic power hierarchies in place since the beginnings of the country.

As noted by Hedgecoth (2019), the original philosophy of charter schools was not so much about achieving racial integration but was centered on empowering teachers and communities with the agency and greater freedom to implement innovative curriculum and instructional methods. It was essentially an experiment to allow select public schools to operate independently under the auspices of the charter authorizer, usually a university, nonprofit organization, or other government agency. This idea was not new. For example, some argue that while Dewey was a strong proponent of education as public good, he viewed public schools as narrow-minded and undemocratic, and his notions of progressive education were implemented largely in small laboratory schools attached to colleges of education rather than public school systems (Reese, 2001).

Nevertheless, several factors including the publication of *A Nation at Risk* (National Commission on Excellence in Education, 1983), increasing calls to apply free-market approaches to counter the "monopoly" of public education by Milton Friedman and other proponents of school choice, and the continued failure of schools to improve performance on standardized tests, especially in large urban districts serving predominantly lower SES minority students (Goodridge, 2019), led to the eventual implementation of the first voucher system in Milwaukee which would ostensibly allow families to break free from poorly performing neighborhood

public schools and access better opportunities for education, including nonsectarian private schools. As Goodridge further noted,

The Milwaukee policy brought to the surface the historic tension between the state and the individual. The common school ethos predicated in large part on the desirability of social engineering was being challenged by the seemingly antithetical nexus of the traditionally marginalized African American community and libertarian leaning conservatives. (p. 292)

However, there was still a pervasive and deep distrust of an unregulated voucher system that threatened to destroy public education (Jacob, 1986). Nevertheless, the voucher movement provided a gateway for what would ultimately become a burgeoning charter school movement following the first state legislation in 1991 in Minnesota (Goodridge, 2019). There have been a plethora of studies investigating the quality and efficacy of charter schools compared to traditional public schools, with results varying tremendously (Logan & Burdick-Will, 2015). What is clear is that charter schools have paved the way for reduced per-pupil funding, alternative routes to teacher certification, restricted access to schools, and market-based, for-profit models of schooling that threaten the very core notion of education as human right and public good (Fiddiman & Yin, 2019; Hedgecoth, 2019).

In his discussion of the idea of choice as a foundation for schooling, Hedgecoth (2019) draws upon the work of Barry Schwartz and noted, “[he] goes on to deconstruct this seemingly innocuous, straightforward syllogism and lays out a compelling position that we as a society should be skeptical of politics that promise to improve our lives simply by giving more options” (p. 197). And yet, as of this writing, several states are ushering in or expanding legislation that provides public funding for tuition at private schools as well as parochial and religiously oriented schools (Fiddiman & Yin, 2019) although the Tennessee State Supreme Court recently ruled the voucher program unconstitutional (Aldrich, 2020). As noted by Fiddiman and Yin, these voucher and scholarship programs pose an inherent risk to civil rights as public tax dollars are diverted to nonpublic schools that, because of their private or parochial status, are allowed to implement racially and culturally discriminatory dress codes, exclude students based on disability or ESL status, gender identity or expression, and deny admission to students of differing religious faiths.

## **Toward the Future and the Continuation of the Dream of the Common School**

*What Happens to a Dream Deferred? Does it dry up Like a raisin in the sun? Or fester like a sore – And then run? Or crust and sugar over – Like a syrupy sweet? Maybe it just sags Like a heavy load. Or does it explode?*  
(Langston Hughes, “Harlem,” 1951)

In his famous poem, *Harlem*, Langston Hughes asks a poignant question about a dream deferred. In his analysis of the poem, Challenger (2019) observed that,

It would not be an exaggeration to say that every time the ‘American dream’ is invoked, Hughes’s question is there, asking what that dream is, what conditions make it possible, and why for so many it seems little more than a trap, or an illusion, or a promise that no longer meaningfully obtains.

We might similarly apply this analysis of the poem to the idea of the dream of the common school and ask why, for so many, access to fully funded, quality public schooling has seemed more like an elusive dream, one deferred but not dead. However, public schooling is continuing to face significant challenges, including the proliferation of online charter schools, the continued reduction in funding for public education, and concomitant increase in voucher programs that divert funding from public schools to private and religious-based schools, for-profit corporate controlled schools, and perhaps the newest challenge, that of social entrepreneurship. As stated by Dees and Anderson (2003), “We live in an age in which the boundaries between government, nonprofit, and business sectors are blurring. This blurring results from a search for more innovative, cost-effective, and sustainable ways to address social problems and deliver socially important goods, including education” (p. 25). The ethical point to consider with the advent of social entrepreneurship as a driver of education policy is the extent to which education, by its very nature as a human right, differs from that of other corporate ventures. Is it ethically defensible to profit from a public good in general, and the education of children in particular? Is it even ethically possible for a for-profit corporation to balance the “double bottom line” of ensuring profits for shareholders while simultaneously focusing on the social good without compromising either? (Tewksbury, 2016).

For many educators, the answer is a resounding no, and the privatization of other forms of public good involving human rights such as the prisons (Austin & Coventry, 2001) and health care (Williams, 2020) have often led to crises and failures. As English (2013) observed, the corporatization of public education has led to the “. . . loss of any humane vision for the purpose of education as a common good by helping humans to become more human instead of salable commodities in the contemporary work force as the sole measure of successful schooling” (p. 50). Indeed, Duarte (2012) held firm in his insistence that the common schools must remain *res publica*, a place that is held and shared equally by all. “Ideally, the common school represents a counter-hegemonic symbol of a not-for-profit education, a place of learning that refuses to be a business selling a commodity to consumers in a competitive market” (p. 492) and that resists the cult of privatization. Fielding and Moss (2011) suggested that it is not only possible but absolutely paramount that the idea of choice and the maintenance of education as a public good coexist in a democratic society and are not be considered mutually exclusive. Instead, they propose a radical education that attaches “. . . strong value to parental choice, but to a particular understanding of choice: parents participating in the democratic life of a common school, including *collective* choices or decision-making as opposed to the *individual* choice of the market model” (p. 131).

## Conclusions and Reflections

As noted by Spring (2018), different historical interpretations of the common school movement reflect not only the conflict surrounding the movement's origins, methods, and purposes, but also reflect the debates that continue today about the role of public schools in the United States. Indeed, Spring stated,

On the one hand, there are those who see the common school period as a battle between liberals and conservatives for the establishment of a school system that would be of great benefit to all members of society. On the other hand, some historians argue that the common schools were established to protect dominant economic and cultural elites. These broad differences in historical interpretation contain elements of the debate that continues to this day about whose interests are served by the public schools. (p. 112)

This chapter attempted to trace the history and development of the common school movement, including some key historical and contemporary challenges. Of particular concern, both historically and currently, are the inequities in access to quality education, inequities in funding of public schools, and the ability of the common school to meet the hopes, needs, aspirations, and dreams of the public in a plural, multicultural society.

The question becomes not whether public schools can and should be reshaped and re-envisioned to empower communities with agency and the ability to share input into the nature and form of education their children receive but, rather, how to achieve this while maintaining education and schooling as a public good that serves all. In the words of Duarte in his discussion of the radical education proposed by Fielding and Moss (2011), "Democracy is a lived experience, fulfilled in the present. Not to be postponed for later, education and school where it takes place must be the lived experience of democracy as a way of being in the world, a shared community where democratic fellowship is both a condition and an aspiration" (p. 493).

## Abstract

K-12 educational management ideas continuously devolved into demands to run a school like a business, namely, to find ways to reduce the tax burden on individuals and corporations that were the main revenue streams of public schools. The business principle of operational standardization in the name of increasing shareholder profits did not work for a school operation as it ran counter to the purpose of the democratically run public schools. That purpose was to prepare the next generation of citizens for active participation in the federal republic.

Managing schools like a business with the values and practices of a private profit-making enterprise tore at the fabric of a public school as well as interfered with the primary educational goal of teaching all students to learn. This chapter brought awareness of the past, present, and future of the corporatization of educational management as well as the needed resistance of the neoliberal

political agenda that was pushed on schools and school leaders. Public awareness of the assault on democratic institutions in the United States such as public school districts created a call to action to stop billionaire philanthropists, elected officials, managerial trained leaders, and think tanks who were all trying to remove the public from the management of education.

## The Foucauldian “Enunciative Field”

### A Field of Memory

The call to run a school like a business had been an enduring idea of the late nineteenth, all of the twentieth, and into the twenty-first century. The prohibitive costs of mass education in the early to middle 1800s in the new United States meant that the only education that existed were in private schools or with individual tutors hired by elite rich families who had the means to pay. There was no formal schooling for anyone else. The beginning of mass education in the United States was in the form of the Lancastrian plan that began in Lancaster, Pennsylvania, in 1801, and this ineffective type of school employed one teacher for up to 1000 students. Later, the Boston school model was adopted as the father of public education; Horace Mann returned from a visit to German schools and duplicated their model in order to standardize schools. Mann’s goal was to better assimilate immigrants under a melting pot ideology of dropping native cultural norms in favor of the development of a one America anglicized identity (Tharp, 2008).

### A Field of Presence

The standards based movement of education was an idea to repair the purported broken system of education by ensuring all students were taught a set of minimum concepts and skills in each class and grade level. This movement had origins in 1957 when the Union of Soviet Socialist Republics (Soviet Union or USSR) launched the first satellite into orbit, named Sputnik. The existing Cold War between the United States and the Soviet Union moved to a space race, and in the United States, the public schools were rated as failures by US officials who decided that schools were not adequately teaching students well enough to keep up with the technological advances of the USSR (Spring, 2008). In 1983, the United States executive branch of the federal government under President Ronald Reagan issued a report titled *A Nation at Risk*, a publication that declared public education as a failed enterprise that did not fulfill its mission of educating the nation’s youth (Spring, 2011). Still

later school reforms of the 1990s and 2000s called for government-funded student tests administered to all students to measure their success or lack thereof in schools, coupled with punitive measures for teachers and school administrators if the test results were deemed unacceptable (English & Steffy, 2001).

Running parallel to the standards movement was an ideology that schools were not operating effectively because they lacked business principles and the school leaders lacked basic business acumen to serve as effective stewards of these taxpayer-funded enterprises (Broad, 2003). The business principles of raising capital, investor relations, managing contracts, and brand management (Davis, 2009) were included in the corporatization of educational management by education influences from business. In addition, at the beginning of the twenty-first century, the American corporation was moving away from actual production of finished products to subcontracting that work out and instead focused on designing and marketing their products (Davis, 2009). These corporate business ideas also moved into public education management by billionaire businessmen who through their philanthropies funded and promoted new school leadership training programs and non-educator personnel for school management positions (Spring, 2014).

### **A Field of Concomitance**

Ideas on school and school district leadership pulled from the social sciences, business, and think tanks that compared managerial expertise from other fields like business and medicine as examples for school leaders to emulate to improve their leadership (Peck & Reitzug, 2012). Educational leadership training provided by schools of education in universities received criticism for the purported lack of preparation for leaders versed in business-minded principles of leadership. Independent organizations such as the Broad Foundation, Chiefs for Change, and New Leaders were funded by captains of industry with stated missions of improving student learning outcomes and providing business efficiencies to public schools at a reduced cost to taxpayers with new school management ideas and managers trained under their own auspices.

### **Critical Assumptions**

The movement to change who worked in education was by the training of teachers and administrators under business type organizations and out of the hands of university schools of education. This was a way to change the landscape in schools with companies like Teach for America, the Broad Foundation, Chiefs for Change, and New Leaders as well as university business management schools at Rice University, Milwaukee School of Engineering, Yale University, and others leading the charge. The newly minted leaders from both within and outside the ranks of education were willing to focus on corporate business ideas (Moeller, 2020) such as the marketing and branding of their product of education instead of a school leadership role of nurturing and supporting families, teachers, and schools in the development of the students (English & Ehrich, 2016). “OEMs (original equipment manufacturers) such as Nike or Hewlett-Packard typically focus on design and marketing and contract out most or all of the actual production tasks. One of the OEM’s signature strengths is in building and managing the brand” (Davis, 2009, p. 184). For public schools, this model looked to education

technology and publishing companies to design the products (Moeller, 2020; Spring, 2014) and the new generation of leaders to market their brand (the school and school district), according to the political slogans of the day as opposed to the relational and technical leadership aspects of teaching and learning. This followed the path of the turn of the twentieth-century university leaders and their leadership shift from education principles to business principles (Veblen, 1918). The non-education leaders were seemingly willing participants in using taxpayer dollars to increase the footprint of corporate principles in schools (Moeller, 2020).

### **Discontinuities and Ruptures**

The US corporation of the twentieth century was described as a corporate welfare model that provided workers with a lifelong position, career ladder advancement opportunities, full health and dental medical benefits, and a defined-benefit retirement pension. The corporate model changed by the twenty-first century with a shift to an Original Equipment Manufacturer (OEM) model that reduced employer costs for worker salaries, benefits, and retirement costs by contracting out the manufacturing work to other companies that created the finished products, instead, but did not offer good salary and benefit plans. In this manner, large corporations avoided the enormous past costs associated with employing a staff to manufacture products. In following the new corporate model, the welfare model of public education of salary, benefits, and pensions for teachers and staff were targeted by neoliberal ideologies that promised cost reductions for taxpayers. Some success had occurred by 2021 with an increase in charter schools and voucher schools, organizations that provided lower salaries, reduced benefits, and no public pensions plans, instead shifting to 403b plans. The 403b retirement plans were defined-contribution plans that were less expensive for the employers. With the OEM model as the corporate example to follow, neoliberal leaders were looking to find additional methods to reduce the high costs of employing teachers and administrators. Teacher unions and loosely organized citizen groups fought back against the corporate takeover attempts, but charter and voucher schools continued to increase nationally in the beginning of the twenty-first century (Spring, 2008) and into 2021.

---

## **Introduction**

The corporatization of K-12 educational management was a movement to reshape the \$800 billion dollar public education enterprise and mold it along the lines of a corporate business model of operation under the neoliberal mantra that private business enterprises and their people are more efficient and effective than government and its actors. The goal of many business leaders was to gain a foothold in this industry to make money and train future workers based on the needs of their company (Moeller, 2020). One method used was to change who worked in leadership positions in education to people from business, finance, and the military who were trained in business-type organizations and not in university schools of education. While running a school like a business did not improve school operations, the

consideration of business management expert Peter Drucker's ideas on leadership and management provided a road map for present and future school leaders.

The Oxford English dictionary (OED) reported the earliest usage of the word corporatize was in 1947 by Grunchy in *Modern Economic Thought*. In the chapter, the meaning was to associate the principles of a big business in order to increase profits.

Businessmen have found it profitable to "corporatize" economic activities. They have found it to their economic advantage to use the interlocking directorate, the multiple holding company, no-par and nonvoting common stock, and many other corporate devices for centralizing the control of industrial assets.

Further, the OED dictionary definition of corporatize as a verb was the following, "[t]o make corporate by introducing or imposing the structures, practices, or values associated with a large business corporation. . ." as well as in specific terms of business and economics, "[t]o convert (a state-run company or organization) into an independent commercial company; to privatize." As a noun, the term corporatization was defined in the OED dictionary as, "[t]he introduction or imposition of the practices or values associated with a large business corporation; commercialization; the loss of independence or individual character, homogenization." The earliest known use of corporatization was in 1958 in the publication *Patterns of Government* by Eckstein, who stated the following public entities in Britain changing into a private business model, "Seventeen such semi-official monopolies were created, and British agriculture, which previously had been ruggedly. . . individualistic, was to a very large extent brought up to the industrial level of corporatization" (corporatization, 2020). The corporatization of a public run operation meant that the entity was adopting the principles of business operations as well as a bottom-line goal of increased profits from sales with reduced production costs.

The nineteenth-century Industrial Revolution ushered in the factory as the primary work setting to manufacture products on a mass level and schooling followed suit, adopting the same organizational model (English, 2008). Frederick Taylor introduced the assembly line and the job specialization process into manufacturing in the beginning of the twentieth century with the purpose of efficiently producing finished products from raw materials in the least expensive manner possible (English, 2008). The rise of the factory led to a systems approach to the work as well as an ideology to manage the workers. Taylor was known as the father of the assembly line process that standardized production with "scientific management" to increase efficiency in the operations of mass production (English & Bolton, 2016). Further, Elton Mayo developed a management theory to use language to convince workers that they had voice and choice in their work lives, but this contrasted with the reality of management decision-making practices that remained autocratic and hierarchical. Mayo was an immigrant who rose up the ranks of the Harvard School of Business by creating what management leader Peter Drucker believed to be a subversively paternalistic management style for leaders to run a factory based on

what Mayo called “scientific management” and to control the workers to fit the needs of the owner (Hoopes, 2003a).

At the same time, Thorstein Veblen of the University of Chicago and later Stanford University wrote about the selling out of the foundational ideals of the university, the journey of exposing students to deep and novel ideas and concepts that they could wrangle with and create new solutions for and instead favored more superficial work to produce higher rankings for prestige in order to attract wealthy donors as well as more students for additional revenues. Veblen (1918) in *The Higher Learning in America: A Memorandum on the Conduct of Universities by Business Men* stated:

It appears, then, that the intrusion of business principles in the universities goes to weaken and retard the pursuit of learning, and therefore to defeat the ends for which a university is maintained. This result follows, primarily, from the substitution of impersonal, mechanical relations, standards and tests, in the place of personal conference, guidance and association between teachers and students. (p. 111)

This focus on bottom-line business management goals ran against the goals of what Veblen believed as the role for university leadership, the promotion of scholarship.

The roots of marketing and the production of slogans, catch phrases, and competitions to raise money and achieve greater acclaim found its roots in the turn of the century university presidents that Veblen (1918) termed the “captains of erudition,” a play off of the captains of industry descriptor used for the monopolistic minded business leaders of that era (p. 111). Luminaries in university leadership such as Presidents C.W. Eliot of Harvard, William Rainey Harper of the University of Chicago, and others reconceptualized the job of the university president in the late nineteenth and early twentieth centuries from a lead professor concerned with the details of curriculum, instruction, and student learning to a business and marketing manager with a focus on popularizing their institution to increase student enrollment as well as on generating additional revenue streams (Moser, 2014, p. 9). Veblen believed it was misguided overemphasis of marketing and bottom line financial ideas by university presidents and their administrative teams instead of their time spent on crafting and cultivating experiences for students to further the intellectual mission of the university. Veblen wrote,

The fact that the universities are assumed to be irreconcilable competitors, both in the popular apprehension and as evidenced by the manoeuvres of their several directors, is too notorious to be denied by any but the interested parties. Now and again it is formally denied by one and another among the competing captains of erudition, but the reason for such denial is the need of it. (p. 45)

The idea of running a school like a business was contrary to the mission of the universities according to Veblen.

## A Description of School Districts and School Leaders

In the United States, there were over 13,500 school districts (Institute, 2014), and the districts varied in the number of schools and students under their supervision. Some school districts had schools with students from kindergarten through twelfth grade, others only went from ninth to twelfth grade, and some districts had hundreds of students, while others were hundreds of thousands of students in size. The New York City Public Schools enrolled almost one million students, the largest school district in the country based on student enrollment (Institute, 2014), while the largest school district in terms of square miles was the North Slope Borough School District in Alaska, that covered over 94,800 square miles (Proximity One, 2014). There were school districts that consisted of only high school aged students such as New Trier High School, a one school district of over 4000 students in grades 9–12 in Winnetka, Illinois. There were also school districts that served only elementary-aged school children and school districts that had students from early childhood education through eighth grade such as the Franklin Special School District in Franklin, Tennessee, with over 3800 students. Some school district boundaries were an entire county like Wayne County Public Schools in North Carolina that made up the entire county with a land area of over 550 square miles, a total resident population of over 120,000, and a student population of approximately 20,000. Contrast this district to the Greendale Public Schools in Greendale, Wisconsin, that served students in the Village of Greendale as well as students from other municipalities in Milwaukee County as a result of alternative attendance programs. The village was five square miles in land size, with just over 14,000 residents and about 2600 students in the public school system (Tooms Cyres, 2017).

The roles, descriptions, and titles of educational management positions varied based on the configuration as noted above and the needs of schools and districts. At the district level of a public school district, the nomenclature for the top leader was superintendent, district administrator, or the chief executive officer. In most school districts, a democratically elected Board of Education hired, oversaw, and evaluated and renewed or non-renewed the superintendent's contract for employment. School management under the direct supervision of the superintendent included positions with the following titles: deputy superintendent, chief of staff, assistant superintendent, executive director, director, chief operations officer, chief academic officer, chief equity officer, chief technology officer, associate superintendent, chief of school administration, chief of teaching and learning, chief of human resources, director of curriculum and instruction, director of human resources, chief finance officer, and director of finance, among others.

The most common administrative title was school principal, with the role of day-to-day operations management of a school. The history of the principal had its roots in nineteenth century schools when a school designated a lead teacher to be the principal teacher. The role of the principal included managing the staff, day-to-day operations, the budget of the school, oversight of the physical plant, student conduct

and achievement, sports, fine arts productions, and the drop off and pick up of students to and from school. In 2020, the principal was also charged with oversight of online education, ensuring that students attended and received education both asynchronous and synchronous in an online setting on a computer while at home as a result of the Covid-19 global pandemic that closed school buildings.

---

## University Preparation Programs

The preparation of school leaders for administrative positions in K-12 schools and districts rested in the universities and their schools of education. In these preparation programs, candidates enrolled in course work that provided students with foundational knowledge in preparation for school administration positions. The courses included training in school leadership such as leading teachers in the alignment, delivery, and assessment of curriculum; the politics of education; working collaboratively with school boards and state elected officials; the basic principles of school finance including the funding laws and regulations of a particular state government; the management of educational resources; special education co-teaching models, best practices, and federal regulations governing the education of students with disabilities; case law in schooling and legal practices for school management; and as a culminating activity, a practicum experience conducted under the supervision of a current leader of a school for practical experience. The completion of the course work for this degree signaled that the graduating student had devoted sufficient time and effort studying to attain the necessary credential to qualify for an administrative license to lead a school.

The generally stated goals of a program of studies for the preparation of school leaders was to equip candidates with foundational knowledge and skills practice in order to prepare them for future school leadership roles. With intensive study as well as reflective questions and discussions, the students developed the background knowledge and transferable skills to gain the necessary state license that allowed them to serve as a public school administrator. The purpose of education seemingly was to prepare students as critical thinkers and problem solvers who tackled the problems in education novel to the time.

The School of Education at the University of North Carolina at Chapel Hill (UNC) had a conceptual framework with principles and dispositions to prepare students for participation in a democratic society. From the UNC website in the fall semester of 2020, the principles were “that candidates will become leaders supporting and promoting the development, teaching and learning of all students in multiple contexts” (n.d., <https://ed>). Students gained content knowledge, leadership ideas, skills to interpret assessments, and effective communication and collaboration dispositions to work effectively with students and stakeholders. Training included research results and demonstrations that all students learned, given appropriate schooling conditions, along with personal development of continuous reflective thinking that was necessary in school leadership. These broad goals ensured that

the future leaders were trained in order to provide teachers and students with a collaborative work approach to succeed.

In addition to teaching the courses in educational management, university professors conducted research in the field of education to answer questions related to what worked for leadership in schools and school districts. Papa (Papa & English, 2011) found essential components of a successful educational leader in what she described as the “accoutrements” of a good leader. The accoutrements included the following: adult learner, human agency (one-size-fits-all does not work for students), ignored intended skills (such as good listening), intellectual curiosity, futurity (awareness of educational fads), and imaginativeness (pp. 106–107). School leaders developed as social justice advocates and viewed schools as training for future participants in democratic society, not just as job preparation factories. School leadership was about more than the business details of managing resources, budgets, and standardized test results. The qualities, experiences, and developmental ideologies of effective school leadership contrasted with the people and organizations that advocated for leaders who were from fields outside of education (Papa & English, 2011, pp. 123–125).

---

## University Course of Study in Educational Management

In order to become a school administrator, a person had to qualify for a license from the particular state to work. The license certified the candidate met the established criteria, and it granted permission to serve in a supervisory capacity in a school. University schools of education served as the organizations that provided the program of study for candidates to receive a school administration license. An example of a program of study was at the University of Wisconsin at Milwaukee (UWM) that offered a program that included 33 h of coursework with a school-based practicum experience counting for one course. A school administration candidate needed prior experience as a licensed teacher for at least 3 years to qualify for the administration program of study. The Educational Administration and Supervision program at UWM was similar to other programs at universities around the country.

The minimum criteria for admissions included a bachelor’s degree from an accredited university with a 2.75 minimum grade point average, proficiency in the English language, and the successful completion of a criminal background check. In addition, requirements also included a minimum number of years as a classroom teacher prior to acceptance into a school leadership master’s degree program as listed on the fall semester, 2020, University of Wisconsin-Milwaukee School of Education website. At UWM, a student began the program with a cohort of other students with the goal of moving through the coursework together and the majority of the students worked in education as classroom teachers or other K-12 roles and therefore attended on a part-time basis in evening class sessions and the summer after regular school day hours. The cohort path was for students to take two courses per semester and complete the program in 2 years.

University programs for aspiring school leaders provided foundational knowledge that was characterized as significant and useful for future school administrators. In general, the programs of study were often taught by professors with prior experience in K-12 teaching and school leadership and the curriculums focused on topics pertinent to preparation for political, instructional, and school managerial leadership experiences. The coursework for a master's degree in educational administration and supervision at UWM included the following courses, Leadership in Educational Organizations (ADLDSP 702), Organizational Change and Team Leadership (ADLDSP 710), Instructional Leadership (ADLDSP 712), Foundations in Student Services and Special Education Administration (EXEDUC 861), Curriculum Planning and Ideologies (CURRINS 701), School Law (ADLDSP 752), the Politics of Education (ADLDSP 732), Management of Educational Resources (ADLDSP 762), and a Principal's Field Practicum (ADLDSP 792), experience, and two electives related to the student's interest in curriculum, special education or the business office aspects of the job. In addition, students completed a portfolio of their work that was reviewed by professors and then submitted to the Department of Public Instruction in the state of Wisconsin as the final check in order to attain a license to serve as a public school administrator (n.d., <https://uwm>).

The coursework prepared students with the requisite foundational knowledge necessary to lead a public school. The School Law course helped students understand key legal theories and practices related to K-12 education with a focus on the role of a school principal as well as gaining an understanding of identifying and providing appropriate responses to legal issues administrators commonly dealt with in schools. Students also completed an analysis of school legal issues and applied critical analysis in concrete situations to develop skills that were useful in future education leadership positions.

The Politics of Education course's purpose was to increase students' understanding of the politics of education with an examination of ideology, the political landscape, the framing of educational problems, and decision-making in political contexts. In this course, the reading requirements provided a context for understanding the topics relevant to leadership in education as students participated in collaborative activities as well as writing assignments to enhance their ability to make informed decisions in contexts where multiple stakeholders with competing visions were involved in educational decision-making. The author taught this course at UWM from 2015 to 2017 and had primary knowledge of the information about the program of studies and course work.

---

## **Challenges to the Hegemony of University Preparation Programs**

Business organizations and business schools challenged the hegemony of university school of education leadership programs with criticism that the aforementioned programs lacked the effectiveness to train leaders to improve schools. One such organization was the Broad Foundation that established a non-profit school

leadership preparation organization in 2001. This organization was founded by Eli Board, a billionaire national home builder of KB Homes. The mission of the Broad Foundation was to provide better leaders for schools and school districts through their own training program. This foundation's broad brush clarion call was that university school of education programs was not capable of properly training school leaders. From the Broad Foundation website, the following statement summed up the view of schools of education training school principals: "what one typically learns in a university-based 'leadership training' program – and what a state certification bureau looks for – are a far cry from the qualities that matter most to those actually selecting a school's principal. It's character that matters most, not credentials" (Broad, 2003, p. 29). In terms of a good school district superintendent, the Broad Foundation's manifesto included the following: clear vision, strong leadership, relentless focus, political acuity, personal accountability, effective management, and fortitude (Broad, pp. 27–28). While the accoutrements from Papa served as research-based skills and dispositions needed for school leaders, the Broad Foundation believed in managerialism as the holder of the values, knowledge base, and dispositions needed to be an effective educational administrator. The Broad Foundation's manifesto was dismissive of any university preparation training for future school leaders in the schools of education.

Today, graduate schools of education, responding to legislative and regulatory demands, offer a menu of courses that may or may not be relevant to the day-to-day realities of school leadership. People who dine from that menu then get hired as principals, regardless of whether their skills, experience, and academic courses have readied them for the issues they will confront on the job. (Broad, p. 33)

A Broad-trained school superintendent candidate reached the finals for the East Baton Rouge, Louisiana school district's top job in June 2020. The transcript from the Broad Foundation that was included in the candidate profile listed the courses taken from the foundation. The titles were as follows: Foundations of Urban Education, Residency Application of Learning, Leadership Development, Residency Application of Learning, Organizational Change, Strategic Transformation of Educational Systems, Practicums I and II, and a Master's Thesis. The transcript further stated that the Broad Center staff determined passing grades (n.d., <https://ebrschools>). While the Broad organization and its foundational document called for a change in educational leadership preparation, there were no substantive criteria upon which formed the basis of this call for change or for the creation of their own leadership preparation program. No research base supported their anecdotal assertions.

---

## **Running a School Like a Business in the Push to Advance Globalization**

Managerialism was a private sector theory that a manager was trained in the basic principles of leadership in terms of accountability and hierarchy of leadership. This training meant the person had the requisite knowledge to serve in a management role

of any entity, business, non-profit organization, or even a public school, because they possessed the basic understandings of finance, law, human capital, and motivation, and this foundational knowledge allowed them to serve effectively as the leader (Hoopes, 2003b). In the Broad Foundation Manifesto, the concern was that there was a “pipeline problem” which meant that more non-traditional candidates who did not rise through the ranks of education were better served to lead schools. In order for our most challenging schools to have a good shot at engaging the very best leaders, this “marketplace” needed to become as vigorous and visible as the competition for corporate executives according to the Broad Foundation (Broad, 2003, p. 33).

The managerial training model for school leadership was a master’s in business administration (MBA) program where a candidate learned all of the business principles necessary to operate an organization. Self-purported school reforms in the beginning of the twenty-first century believed schools of education were ineffective in improving schools (Spring, 2014) with their training in curriculum leadership, school finance, operations, community relations, and social justice (English & Ehrich, 2016). Brand management, the principles of accounting, marketing, and entrepreneurship were the cornerstone ideas that managers needed expertise to successfully lead schools according to this line of reasoning (Hoopes, 2003b).

The impact of running a school like a business and adopting the principles that underlay a corporate business philosophy were twofold. First, the focus of school management shifted from cultivating a culture of nurture and support for student development, and the shift away “exacerbates existing structural inequities across race, gender, class, and nation” (Moeller, 2020, p. 238), to a culture of bottom-line test score results that actually measured poverty of the families and set aside the reality of the systemic inequality in society (Heilig, Brewer, & Pedraza, 2018). From English and Bolton (2016), the description of the original principles of managerialism from Frederick Taylor was the following:

the preoccupation of management is control of the worker and the rigid subdivision of the worker into smaller tasks to reduce the costs of high-priced labor and permit application of rigid cost controls and profit maximization. (see Kanigel, 1997) (p. 100)

Second, positions were added to a school district, not additional teaching positions or teacher pay raises, but rather central office district-based roles with the job descriptions that in general terms were for finding ways to increase accountability measures and supervision of schools based on test score results. These positions included family specialists who planned meetings to connect with the community, communications department staff to produce marketing materials with good news, additional academic coaches to focus attention on test scores to increase them, and additional managerial staff to pay attention to bottom-line high stakes test results. None of the aforementioned served to help families, students, and teachers to develop, inspire, and motivate students to improve cognitive development and become well-rounded persons, but rather to market the good news of the district while at the same time devaluing educators as a result of seemingly low standardized test scores (Heilig et al., 2018).

The branding and marketing of an education organization following a business model approach diverted resources away from teachers and classrooms and paid for services to boost the good news of the district. In a corporate style of communication, how a school district communicated to the public was termed a public information model. Grunig and Hunt and Moore, Bagin, and Gallagher (2012) created descriptions of communications models that organizations used. The four models were press agency-publicity, public information, two-way symmetric, and two-way asymmetric (p. 13).

Grunig and Hunt estimate that 15 percent of the organizations practice press agency-publicity, 50 percent public information, 20 percent two-way asymmetric, and 15 percent two-way symmetric. (p. 14)

Grunig and Hunt stated that a two-way symmetrical communication model was the best for schools (Moore et al., 2012). The two-way symmetrical model sought to create a communications plan that responded to input from stakeholders and acted accordingly instead of merely acting and communicating out. The practice of some school districts for the branding and marketing followed the path of the Original Equipment Manufacturers and away from a recommended two-way symmetrical communications plan that engaged with families and students in authentic ways, engagement that served to build relationships between educators and families so students gained self-confidence and competence throughout their schooling.

Neoliberal theory posited that a private company more efficiently and effectively performed the work of a public service better and at a lower cost to taxpayers (Spring, 2008). An example of neoliberalism in public education was the Edison Schools organization and their goal to take over underperforming public schools and turn them into high functioning schools with dramatically increased student scores on high stakes tests with reduced operational costs and equity payments to shareholders. The Edison Schools takeovers never bore the fruit of their promises and eventually became a school technology software company with the name of Edison Learning in 2021.

## Edison Schools

Edison Schools began in 1992 under billionaire publisher Christopher Whittle of *Esquire* magazine. They marketed their school improvement services of higher student learning outcomes with the take over and management of high poverty, high minority, and low-performing schools such as two schools in the Wayne County Public Schools, North Carolina. The two schools were Carver Heights Elementary and Dillard Middle School in Goldsboro, North Carolina. Edison Schools efforts later expanded into tutoring, after school and summer school programming funded from the federal government's reauthorization of ESEA, known as No Child Left Behind Act, 2001, with their related company known as Knewton Learning. While Edison Schools promised to achieve marked improvement for the schools under

their purview, no data showed that any improvement ever happened, including at Carver Heights and Dillard in North Carolina.

Edison Schools developed their after school and summer school programs in districts across the country when the federal government offered up billions of dollars for these types of ancillary school programs under the No Child Left Behind Act of 2001 (Spring, 2008). They offered programming for students outside of school hours to increase the time students spent in school, but no marked improvements on state tests were ever recorded (Gill et al., 2005). The idea that additional time in a school building after school hours and in the summer improved student learning outcomes was the impetus behind NCLB federal legislation and its outlay of taxpayer dollars to private organizations such as Edison Schools and Knewton Learning. Edison Schools struggled to financially turn a profit and shares fell precipitously on the Nasdaq exchange in 2002 and later Edison Schools were not able to turn a profit (Spring, 2008, p. 207). The company was sold off and rebranded as Edison Learning and became an educational technology company (Gill et al., 2005); however, associated individuals seemingly personally profited, in the neighborhood of millions of dollars each from the above taxpayer-funded schemes.

### **American Legislative Exchange Council (ALEC)**

The corporatization of educational management was also intertwined with political entities that sought to dilute the power and influence of public school districts in favor of a privatized model of education that was less expensive for taxpayers. The American Legislative Exchange Council (ALEC) was a conservative leaning organization that influenced legislative policy at the local, state, and federal levels. The online agenda from the July 15–17, 2020 ALEC conference in Orlando, Florida, had several position papers related to public education. Under the Education and Work Force Development task force, these ideas included the following titles: Digital Teaching and Learning Plan, Resolution Supporting Homeschooling Freedom, Homeschool Credential Recognition Act, Statewide Education Online Act, and the Virtual Public Schools Act. In the midst of the Covid-19 global pandemic and the shutdown of schools across the United States, ALEC sought to lobby and influence legislation that further expanded the rights and reach of homeschooling at the expense of the public schooling enterprise across states as written on the American Legislative Exchange Council website.

The mission of the ALEC Education and Workforce Development Task Force is to promote excellence in the nation's educational system, to advance reforms through parental choice, to support efficiency, accountability, and transparency in all educational institutions, and to ensure America's youth are given the opportunity to succeed. (American Legislative Exchange Council [ALEC], 2020)

Further, the taskforce issued a state report card annually for its measurement of education in each state, with the statement, “[t]he status quo is not working. Whether

by international comparisons, state and national proficiency measures, civic literacy rates, or career preparedness, American students are falling behind” (ALEC, 2020). The goal of ALEC was to improve public education and the learning outcomes of students through the privatization of public school operations, namely, by supporting charter and voucher programs.

---

## Neoliberalism and the Reduction of the Role of Government

The job losses, homelessness, and desperation created as a result of the Stock Market Crash in 1929 and subsequent Great Depression of the 1930s led to unprecedented government activity and federal intervention in the economic system. Beginning in 1933 with the inauguration of President Franklin D. Roosevelt, the US Congress and executive branch began taxpayer-funded public works programs under the moniker, the New Deal. The goal of these programs was to increase and improve the infrastructure of the country while providing jobs for unemployed people in hopes of accelerating consumer spending. The growth in public sector jobs began on the premise that private sector businesses were not able or willing to increase spending to employ workers and continue production during the economic downturn. As a result, new government programs were created to benefit mostly men with jobs, unemployment benefits, and a supplemental pension system for retired workers known as social security.

Neoliberalism, also called neoconservatism, was an economic theory that arose in Europe following World War II that assumed private enterprise ran public entities more effectively, efficiently, and at a lower cost to taxpayers. From Spring (2014) neoliberal belief was in private sector superiority over government-run entities:

The basic assumption of neoliberalism is that governments services, such as schools, water and sewer systems, electric power, and so on, can be better provided by private companies and nonprofit organizations. This assumption is based on the unproven idea that corporate bureaucracies are more efficient than government bureaucracies and that the free market is more responsive to the public interests than governments. (p. 41)

Education was a publicly run enterprise that neoliberals viewed as an expensive and ineffective system and called for the takeover of schools. University of California Irvine Law Professor Mehrsa Baradaran in her July 2, 2020, New York Times opinion article, *The Neoliberal Looting of America*, stated:

By the 1980s, neoliberalism was triumphant in policy, leading to tax cuts, deregulation and privatization of public functions including schools, pensions and infrastructure. The governing logic held that corporations could do just about everything better than the government could. The result, as President Ronald Reagan said, was to unleash “the magic of the marketplace.” (Baradaran, 2020)

Neoliberal methods for the privatization of public schools were in the form of charter schools and voucher programs, the latter that provided families with money

for private school tuition. From English and Bolton (2016), the accepted rationale for the privatization of schooling was:

Public education is a protected monopoly and therefore restricts the consumer from obtaining the best price and services. The solution was the marketization of public education and all social services to incentivize agencies within a specific sector to offer better services at lower costs. (p. 110)

Trends in education in the twenty-first century included the contracting out of services to private businesses under the ideology that services provided in this manner were better and cheaper.

When lawmakers wanted to decrease the burden of taxes, they focused on cutting public services. Public sector job examples such as school teachers, police officers, firefighters, water works, road building and maintenance, and the military were taxpayer-funded personnel positions in government organizations that provided salaries, healthcare benefits, and retirement pensions. In the state of Wisconsin, the Wisconsin Policy Forum published reports that showed over 30% of the state budget was spent on K-12 education (Wisconsin, 2020), and further in school districts in most states, around 80% of a K-12 school district's budget went to the salary, healthcare, and pension payments of the workers (Sorenson & Goldsmith, 2013). One major way to reduce costs in K-12 education was to not increase salaries at the rate of inflation. Other examples included the outsourcing of custodial work to private companies to clean and provide general maintenance of the buildings and outsourcing bus transportation. First Student was the largest school-aged transportation provider in the United States, as it was a part of an international transportation conglomerate, FirstGroup PLC, a company with corporate offices in Aberdeen, Scotland, and traded on the London Stock Exchange. More radical ideas came from the private charter school business such as Rocketship, a for-profit charter school company that replaced teachers with less expensive computers to stand in their place in order to decrease operating costs and increase their personal salaries and sell software contracts to technology company contacts (Bacon, 2014).

---

## The World Bank and Globalization

Neoliberal reforms followed the guidance of the World Bank and its influence toward increasing globalization and the defined role it gave for education across continents and nation states. From Spring (2010), "The World Bank's educational ideology contains a particular vision about how society should be organized... a good society is one based on the mass production of consumer goods within a global economy" (p. 40). In terms of education, the World Bank's concept of lifelong learner meant workers in a global economy were constantly flexible and learning new skills as they were disrupted and shifted from job to job based on irrational market demands as well as global political and environmental conditions. "New skills have to be constantly learned. In addition, workers needed basic literacy and

math proficiency to constantly learn new occupational skills” (p. 40). Education was viewed as the training ground for the global, consumer-based, corporate-controlled, and irrational market economy, and continuous re-learning was needed as the market demands changed.

Reform of schools based on neoliberal principles accelerated under the federal administrations of George W. Bush and Barack H. Obama. Under Bush, *No Child Left Behind* rated schools and students as successes or failures based on standardized test score results with sanctions on schools for low results such as students choosing new schools with transportation provided by the district, mass firings of school personnel to turn around the school and make it successful with higher student test scores, and the outright closing of schools if overall test scores were determined to be consistently too low (Spring, 2008). Under Obama, the high stakes testing era continued with the *Race to the Top* Federal Department of Education grant opportunity that provided additional federal funds to school districts as long as they adopted what were termed “turnaround” ideas, such as firing all teachers and administrators in schools with low test scores, creating teacher quality ratings based on students’ test scores and more school closures in high poverty, ethnic minority neighborhoods (Spring, 2011). By erasing all other quantitative and qualitative measures of schools and students outside of the results on the high stakes tests, neoliberals controlled the conversation on school reform backed with their sloganeering such as “education is the civil rights movement of our times” (Robinson, 2016). If the scores remained what they determined to be too low and unacceptable, then the solution given was to replace the adults in the schools and hire different people (Peck & Reitzug, 2012). The replacement adults included non-traditional persons from business backgrounds who operated under the theory of managerialism.

When a school leader was trained under a managerial framework, the person focused primarily on standardized test score data; used formative district data incorrectly (Popham, 2008) as summative data; used resources to hire staff who further dissected, supervised, and communicated the data; led in an authoritarian manner under the nomenclature of data driven decision-making; and hired, fired, and moved staff around under cover of low test score data. The flaw in the logic of these management practices was that it cancelled out all other information about students, staff, and schools and deemed yearly state tests results as the only authority in determinations of success or failure and schools and students did not perform better, but actually worse when measured longitudinally (Popham, 2008). Predictably, schools with high SES (socioeconomic status) were rated as successful as their norm referenced test scores were above average and schools with low SES were rated as failures for comparatively lower overall test results. The binary success or failure label was inescapable as this school rating system excised the social factors of the racist, misogynistic, and exploitative capitalistic society that created economic, gender, and racial disparities and instead blamed educators for students’ low scoring test results. The Obama administration ramped up this blame game with the marketing slogans of turnaround schools. This term turnaround was used as an attempt to disguise a corporate based cutthroat leadership strategy of firing staff and hiring

new teachers and administrators in a school deemed low performing as measured by state standardized test results in order to give an appearance of school reform and improvement (Ravitch, 2010, p. 248).

Education management under this type of leadership ideology did not improve student learning, but in some instances led to local community members coming together under a united cause to protect their schools. A mobilized community effort against neoliberal reform occurred in Texas when a local community fought to keep their school when the superintendent and school board attempted to disrupt the school by continuously changing principals, renaming the school, reconstituting the staff and then attempting to close the school, all without community input or advance notice. The plan was to turn the operations over to a for-profit charter school company (Pazey, 2019). The community mobilized to fight back against the takeover of their school as members considered it an integral institution in their community, and many disputed the negative labels that state test score results pinned on their school.

Neoliberal reforms create an achievement-gap master narrative that (a) categorizes schools as good or bad, (b) differentiates the educational quality of one school over another school as academically acceptable versus academically unacceptable, and (c) dichotomizes the students who attend them as a success or failure. (from Pazey, 2019, p. 1897)

In speaking to the school board on the night of the vote to turn the school over to the for-profit charter school organization, the parents, students, and community members spoke out against the takeover as well as told their stories about the positive role that the school played in the lives of the people and for the community. One student talked about the full ride scholarship he received to college (Pazey, 2019), another stated that “Our children are not orphans... We should not be putting them on the auction block to the highest bidder” (p. 1896), and a teacher stated the following about the school, “as accepting, caring, family-like culture, safe to be themselves, no bullying” (p. 1881). A student voiced to the school board, “Public opinion of those who think HHS students are failures: not true, majority of students work for ‘betterment’ of HHS, what is best for the community” (p. 1882), and the local newspaper reported the following, “District administration does not value feedback from HHS supporters at information sessions” (p. 1883). A community leader, vocally pleaded at the board meeting, “You need to treat and respect our people as humans with respect and dignity!” (p. 1884). The speakers at the school board meeting provided alternative perspectives on the relative success of the school and the role that it played in the community and for its students.

While the Texas school example highlighted the push back against school closure based on Obama administration school turnaround ideas that were from corporate business culture, much of the time schools like the Texas school were closed in low SES neighborhoods without resistance as the community was often powerless to resist. Secretary of Education Arne Duncan’s ideas for the Department of Education came from his tenure as Superintendent of the Chicago Public Schools where he closed

numerous low SES schools on the southside of the city as he believed that schools who underperformed on state tests needed to be closed down (Ravitch, 2010).

---

## Peter Drucker and Educational Management

While this chapter featured unfavorable portrayals of corporate influence in educational management, a final consideration of the business leadership ideas of Peter Drucker served to help educational leaders manage schools. Drucker's 1954 book, *The Practice of Management* was a self-described foundational text for management in the twentieth and now twenty-first centuries. In 1985, Drucker penned the preface of a reprinting of the book and wrote: "The Practice of Management has remained the one book which students of management, young people aspiring to become managers and mature managers still consider the foundation book" (Drucker, 2006, p. xi). While the purpose of a business was to create a customer (p. 37) and while this was not the purpose of a school, there were leadership ideas written by Drucker for education leaders to consider adopting. Drucker was known for the creation of the Management by Objectives (MBOs) idea that "enables a business to get where it should be going rather than be the plaything of weather, winds and accidents" (p. 61). This concept and other ideas served education managers well in school districts in 2021.

In thinking about leadership during a crisis like the Covid-19 pandemic that began in 2020, Drucker wrote about leadership as empowering workers in an organization to reach their full potential and help one another even under difficult circumstances. In Table 1, Peter Drucker Leadership Concepts for Educational Management, a summary was provided of Drucker's ideas as well as applications for education management. If school leaders closely adhered to these concepts, then their leadership was focused in a way that enabled schools to operate in an effective manner for teaching and learning. Unfortunately, the education policy initiatives of top education leaders including superintendents, state departments of education, and the federal US Department of Education usually never followed Drucker's concepts, and instead they launched harmful policies and practices against public education. Below are five key questions about management with answers based on Drucker's ideas as well as transference into educational management:

1. Are leaders born or made?
2. What type of person should not be in leadership?
3. How did a leader ensure accountability for job performance?
4. What were Management by Objectives (MBOs) and how did MBOs function best?
5. How did a leader inspire everyone to work to the best of their ability?

The age-old question for leadership was were some people born to lead as a result of their birthright or were people made into leaders. The qualities of character and

**Table 1** Peter Drucker leadership concepts for educational management

Management by Objectives and Self-Control
MBOs and Self-Control Explanation and Drucker Citation Highlights
<p>Management by Objectives (MBOs) was a lasting contribution to management from Drucker. The idea of MBOs was twofold, to focus the work to combat both complacency and the development of silos within a business and to also provide workers with objective job performance measures based on results instead of the impulsive whims of superiors. From Drucker, "Business performance therefore requires that each job be directed toward the objectives of the whole business. . . each manager's job must be focused on the success of the whole" (p. 121). Drucker emphasized that work was not to be done in silos, but instead the varied departments and workers used their knowledge and skills to ultimately contribute to the entire business operation. He wrote, "Workmanship must be encouraged in the business enterprise. But it must always be related to the needs of the whole" (p. 122). While workmanship can drift away from the overall goals of the business, Drucker stated that "but this striving for professional workmanship in functional and specialized work is also a danger. It tends to direct a man's vision and efforts away from the goals of the business" (p. 123). Therefore, each worker in the organization needed clearly defined goals that were personally established and approved in order to keep the focus on the work. "Each manager, from the 'big boss' down to the production foreman or the chief clerk, needs clearly spelled-out objectives. . . . Right from the start, in other words, the emphasis should be on teamwork and team results" (p. 126). Along with MBOs was self-control defined by Drucker as the ability to have control over the work that a person was responsible for on a daily basis. Self-control as opposed to "domination by bosses," led to greater productivity according to Drucker. He said, "The greatest advantage of management by objectives is perhaps that it makes it possible for a manager to control his own performance. Self-control means stronger motivation: a desire to do the best rather than just enough to get by. It means higher performance goals and border vision" (p. 130). Also, from Drucker, "One of the major contributions of management by objectives is that it enables us to substitute management by self-control for management by domination" (p. 131). It was important for workers to not be controlled by the domination of managers which were their biased perspectives and not objective qualitative and quantitative data. The ability to set and control the work objectives was a major part of MBOs.</p>
MBOs and Self-Control Application in Educational Management
<p>The concept of MBOs was used in schools to measure teachers and administrators; however, it was contrived so that in many cases, only high-stakes standardized student test scores were used to determine the effectiveness of teachers and administrators. Drucker wrote that workers and managers at all levels of the organization needed to set their goals and go about accomplishing them. This was the concept of self-control versus the otherwise oppression – the whims of upper management. In public education in 2021, the only goal that was seemingly set was school year achievement by each new cohort of learners by grade level. Each new cohort needed to improve over the test scores of the previous cohort or the educators at the school level was deemed failures in achieving their objectives. All other metrics were erased. From Drucker, self-control instead of domination meant that by setting goals and going about achieving them, the workers and managers were not beholden to the arbitrary whims of upper management. In education, upper management used cliches such as a lack of a sense of urgency, inequitable practices, turnaround ideas, or the need for more accountability as the reasoning behind personnel changes. MBOs were used in education as SMART goals which were an acronym for specific, measureable, achievable, relevant, and time-bound. As stated previously, the important component of self-control was missing, and teachers and administrators were directed to create goals only based on increased results on high stakes standardized state tests.</p>
Leadership with Integrity
Leadership with Integrity Explanation and Drucker Citation Highlights

(continued)

**Table 1** (continued)

Drucker's idea on leadership determined that the defining qualities that stood out over all others were character and integrity. In his writing, he believed in a principled person to lead people and a business that also provided for the general welfare of the community and society. He wrote, "Integrity may be difficult to define, but what constitutes lack of integrity of such seriousness as to disqualify a man for a managerial position is not. A man should never be appointed to a managerial position if his vision focuses on people's weaknesses rather than on their strengths. The man who always knows exactly what people cannot do, but never sees anything they can do, will undermine the spirit of his organization. . . He should be a realist and; and no one is less realistic than the cynic" (p. 157).

Additionally, in the dichotomous leadership question was a leader born or made was Drucker's answer. "Does it require genius, or at least a special talent, to be a manager? Is being a manager an art or an intuition? The answer is "No." What a manager does can be analyzed systematically. What a manager has to be able to do can be learned. . . Yet there is one quality that cannot be learned, one qualification that the manager cannot acquire but must bring with him. It is not genius; it is character" (p. 349).

Leadership styles varied, and for Drucker, it was not a particular style to judge a leader, but rather a person's character. "If he lacks in character and integrity- no matter how knowledgeable, how brilliant, how successful- he destroys. He destroys people, the most valuable resource of the enterprise. He destroys spirit. And he destroys performance" (p. 158). It was the precarious nature of senior leadership that made or broke organizations. The necessity for organizational strength rested in top leadership, according to Drucker. "If an organization is great in spirit, it is because the spirit of its top people is great. If it decays, it does so because the top rots; as the proverb has it, "Trees die from the top." In appointing people to top positions, integrity cannot be overemphasized" (p. 158).

---

#### Leadership with Integrity Application in Educational Management

---

Leaders were made, and not born and if the leader was not focused on the strengths of the teachers and administrators, based on Drucker's criteria, they were not management material for schools and school districts. Also, educational management had faced criticism and calls for the hiring of people to lead schools and school districts from business, state government, and the military ranks. For example, Wake County Public Schools in Raleigh, North Carolina, hired retired Army brigadier general Tony Tata in 2011, who had 19 months of education experience (Huntsberry, 2012). The idea was that education was well served to hire from other industries such as the military in order to attain better quality leaders than those produced from education.

However, according to Drucker, in addition to character and integrity, experience is a necessary component in order to set the necessary objectives for the business that the person led.

"Traditionally a manager has been expected to know one or more functions. This will no longer be enough. The manager of tomorrow must be able to see the business as a whole and to integrate his function with it" (Drucker, 2006, p. 373). Based on Drucker, people fresh from other professions did not have the necessary experience to serve in leadership roles in education.

---

#### Accountability and Management Decision- Making

---

##### Accountability and Management Decision- Making Explanation and Drucker Citation Highlights

---

Drucker termed the spirit of the organization as the necessary component for high worker performance. It was the practices of the organization that were in place to make people perform. "This is true of the United States Supreme Court with its ability to transform hack politicians into great judges" (Drucker, p. 146). From Drucker, the high performance expectations were set not from above, but rather, "Insistence on high goals and high performance requires that a man's ability both to set goals and to attain them be systematically appraised" (p. 149).

Goals for accountability, based on Drucker, were to be set for more long-term growth as a focus on short-term goals only actually harmed the organization. "It is misdirection of the worst kind to tell managers that they have to balance objectives so as to preserve the long-term earning power of the

(continued)

**Table 1** (continued)

business while basing their pay on immediate short-range profits” (p. 151). Drucker advocated for team work that focused on goals and initiatives for long-term success. “Moreover, the individuals must be organized as a true group organized for working together rather than against each other, rewarded for their joint as well as their individual efforts, identified for themselves as well as for the people around them as a cohesive social unit, proud of themselves, of each other and of their performance” (p. 298).

---

Accountability and Management Decision- Making Application in Educational Management

---

The accountability movement in education included the rating and evaluation of teachers and administrators based on yearly student standardized state test scores, only. Teacher pay was ostensibly kept artificially low as a result of student standardized test scores determined to be low by states’ government education officials. Drucker’s ideas on performance and accountability did not align with the accountability movement in education in 2021 because the hyper focus on short-range goals distracted school leaders from focused work on long-term goals and solutions. In addition, value-added measures for education were created by William Sanders, a professor of agriculture at the University of Tennessee who convinced educational policy makers such as former Tennessee Governor and Senator Lamar Alexander of a way to measure whether or not teachers sufficiently grew students academically each school year and thus grade the teachers. Sander’s formula was previously used to measure the effectiveness of fertilizers on a particular crop, termed “split-plot design” (Strauss, 2011) not students and tests. Sanders created the formula to seemingly determine if teachers provided the instruction needed for students to complete their grade level work at a low, medium, or proficiency level. While the margins of error were too great for the data to be statistically significant, states used student test data to rate the “effectiveness or ineffectiveness” of teachers in tested areas, normally math and language arts and sometimes science and social studies classes were included.

---

The Areas for Business Performance Objectives

---

The Areas for Business Performance Objectives Explanation and Drucker Citation Highlights

---

In a business setting, Drucker outlined the performance objectives that needed to be considered and set in order to grow and experience success. “To be able to set market-standing objectives, a business must first find out what the market is. . .

1. The desired standing of existing products in their present market
2. The desired standing of existing products in new markets
3. The existing products that should be abandoned
4. The new products needed in existing markets
5. The new markets that new products should develop
6. The distributive organization needed to accomplish the markets goals
7. A service objective measuring how well the customer should be supplied with what he considers value by the company” (Drucker, pp. 67–68).

What Drucker concluded was that after all the goals were set the leadership in an organization was the differentiator for success. “Businesses have pretty much the same resources to work with. . . the only thing that differentiates. . . quality of its management. . . And the only way to measure this crucial factor is through a measurement of productivity that shows how well resources are utilized and how much they yield” (Drucker, p. 71).

After setting the performance objectives, it was determined how many years forward for the business to turn a profit with consideration for ebb and flow during the time period of years. “Profitability as such is meaningless and misleading unless we know for how many years the profit can be expected. . . We should always consider the rate of return as an average resulting from good and bad years together” (Drucker, p. 78).

Additionally, Drucker did not advocate for sole reliance on quantitative measures. “Performance and results in these areas cannot be fully measured quantitatively. . . What we need are qualitative standards, judgment rather than data, appraisal rather than measurements” (Drucker, p. 81). As Drucker said about profit, “To emphasize only profit, for instance, misdirects managers to the

(continued)

**Table 1** (continued)

point where they may endanger the survival of the business” (Drucker, p. 62). Most interesting from Drucker was the reality of American economic success: “The economic revolution of the American economy since 1900 has in large part been a marketing revolution caused by the assumption of responsibility for creative, aggressive, pioneering marketing by American management” (Drucker, p. 38).

The Areas for Business Performance Objectives Application in Educational Management

When leaders wanted to implement business-related market objectives in schools, the results were less than what was expected.

Business innovation was for the creation of products or services to expand existing or into new markets, and the innovation departments were new creations in school districts such as Milwaukee Public Schools in Wisconsin and Hamilton County Schools in Chattanooga, Tennessee. The goals of these offices were to purportedly personalize education which meant to offer education in a variety of settings and different means to reach a high school diploma and incorporate the latest technological advances available to accomplish personalization. In reality, innovation was a marketing ploy to reach middle class families and lure them to public schools under the guise of them having a choice of schools.

Test score results were measured year to year and punitive consequences resulted. No business operated in this manner according to Drucker’s ideas. Contributed value in a business provided quantitative as well as qualitative measures. Also, business objectives and results from Drucker were determined based on longer range plans of 5 or more years. Further, test scores best measured the relative wealth of the family of the students. Overlaying Drucker’s philosophy here, continuously rating students from poor families and closing schools in poor neighborhoods as a result, was not an accurate measure of productivity and was the opposite of the mission of public education.

Erasing all other measures and punishing educators based on standardized student test scores did not align with Drucker’s ideas on management decision-making. The Obama era school turnaround idea was to fire school principals and replace the cadre of teachers in a school deemed failing on student standardized test scores with replacements. The schools were always in poor communities with mostly poor, minority students. President Obama’s Secretary of Education, Arne Duncan, closed over 50 schools during his tenure as the Superintendent of Chicago Public Schools, while erasing all of the benefits and stability the school provided to a local community (Strauss, 2020). Duncan’s policies can be characterized as sloganeering such as under the guise of “education is the civil rights issue of our generation” (Robinson, 2016).

Peak Performance

Peak Performance Explanation and Drucker Citation Highlights

Annual reports were released that the best companies to work for were determined based on surveys of employees. Employee satisfaction was a meaningless concept according to Drucker, “It is passive acquiescence” (Drucker, p. 303) and Drucker turned to management practices that encouraged worker autonomy as the way to lead for peak performance. “What we need is to replace the externally imposed spur of fear with an internal self-motivation for performance. Responsibility- not satisfaction- is the only thing that will serve” (Drucker, p. 303). Further, Drucker determined that management needed to lead by example and provide the model for high performance. “Management set and enforce on itself high standards for its own performance of those functions that determine the worker’s ability to perform . . . Few things demoralize employees as much as to sit around waiting for work while management fumbles” (Drucker, p. 305).

“The worker should be enabled to control, measure and guide his own performance. He should know how he is doing without being told. The rules for procedures and information that apply to managers apply to workers as well” (Drucker, p. 306).

Drucker said that people cannot be made to feel proud at work, but rather “People are proud if they have done something to be proud of- otherwise it is false pride and destructive. People have a

(continued)

**Table 1** (continued)

sense of accomplishment only if they have accomplished something. They feel important if their work is important. The only basis for genuine pride, accomplishment and importance is the active and responsible participation of people in the determination of their own work and in the government of their own plant community” (Drucker, p. 308).

---

Peak Performance Application in Educational Management

---

Drucker understood that fear-based leadership and external pushes did not lead to top performance. Peak performance was a personal and internal driver. Pay for performance plans for public schools were implemented in the state of North Carolina beginning in the late 1990s and were rolled out for schools and teachers as an incentive for high student standardized test scores on end of year state tests. For example, test score results were high at Chapel Hill High School in Chapel Hill, North Carolina, as most students were from upper middle class and well-educated families and teachers thus received between \$750 and \$1500 as a yearly bonus for the student standardized test results. This contrasted with teachers at West Mecklenburg High School in Charlotte, North Carolina, who never received bonus pay as the test scores for the high minority, high poverty students never reached the mark. In essence, teachers in schools with high wealth students were rewarded, and teachers in low wealth schools were punished which was counter to what Drucker determined led to peak performance.

---

integrity were the necessary ingredients for leadership according to Drucker. It took a person of integrity who respected others and ensured justice in an organization to hold a top spot (Drucker, 2006, p. 158). Leaders were made, not born (p. 157), and a person learned through careful analysis over many years all of the technical aspects of an operation as well as how to manage people. To effectively lead, people required the aforementioned and developed qualities of character and integrity (p. 158). In addition, “Trees die from the top” (p. 158) was the phrase Drucker used to stress the importance of the leaders of an organization. Top leaders were to be chosen carefully as the entire organization suffered if non-qualified persons ascended to the highest positions.

The major disqualification of leadership was any person who focused on the negative traits of people instead of focusing on the strengths and positive qualities that persons brought to the organization (p. 349). “The man who always knows exactly what people cannot do, but never sees anything they can do, will undermine the spirit of his organization” (p. 157). Never elevating this type of person was Drucker’s non-grata criteria for leadership. In education, a leader needed to understand the work of teachers as well as have the ability to set long-term goals for success and guide that work for accountability. Expertise in the field of education was needed, and the acute understanding of the staff and their strengths were the characteristics to promote upward in education leadership positions, following the ideas of Drucker (2006).

Management by Objectives was a goal set by workers for their own work that provided targets for them to reach and to measure their contribution to the overall organization. The entire Drucker concept was “Management by Objectives and Self-Control” (p. 121). MBOs were used in schools in 2021, but half of Drucker’s concept, “self-control,” was missing from the goal setting procedures. Drucker created “Management by Objectives and Self-Control,” and the self-control was to prevent top leaders from making arbitrary personnel decisions based on faulty

personal assumptions, and instead decisions were based on more objective criteria (p. 130). In education in 2021, however, teachers and administrators were most often required to follow prescribed goals only for the annual high stakes standardized test results of students, with a lack of the “self-control” part of MBOs. Further, these very narrow goals had to result in an increase in the current cohort of students’ test scores on state standardized tests over the previous years’ cohort or the teachers and administrators were rated as failures. This was an example of what Drucker called “management by domination” (p. 131), as it was the opposite of teamwork that he espoused (p. 126), and it led to “friction, frustration and conflict” (p. 121).

MBOs and Self-Control that adhered to Drucker’s ideas were written by teachers and administrators that measured their work in classrooms and schools using a variety of quantitative and qualitative measures of activity and growth over the course of many years. This was the correct method for the use of MBOs and Self-Control versus the more common misapplication as described above.

Finally, the high-quality work in an organization that Drucker coined as “peak performance” (p. 303) occurred when people set and measured their own performance and contributions to the whole of the organization (p. 122). The measures were on a variety of functions and included quantitative and qualitative goals over a period of many years. Furthermore, in setting goals, basic macroeconomic understanding was needed. In business, the foundation of the US economic growth over the twentieth century was not manufacturing genius, but it was the mass marketing revolution (p. 38). Business success where others failed was based on the marketing strategies of management. Also, measuring goals for success or failure only on profit was, according to Drucker, a sure fire way to sink a business as this constricted view was harmful for ultimate growth, success, and existence (p. 62). In public education, the parallel example was the sole focus on yearly standardized test results. School reformer Seymour Sarason said that “knowing a child’s test score tells us absolutely nothing about the context of learning” (Sarason, 2004, p. 7). The performance objectives listed in Table 1 under “the Areas of Business Performance Objectives” highlighted the need for broader goals and objectives for organizational strength and success. In education, more depth of understanding of the complexities of teaching and learning and goal setting with MBOs and self-control improved educational outcomes of students over time.

Organizational leaders empowered people to do their best when they valued individual contributions and promoted teamwork. A leader did not make a person feel proud of their work, according to Drucker, but instead created the conditions for workers to internally develop a sense of pride of accomplishment (p. 306). It was not sufficient to rely on job satisfaction measures to know how people were feeling as these were meaningless and measured something that did not get to peak performance. Job satisfaction surveys measured “passive acquiescence” (p. 303) which meant that people were compliant with the objectives of their job, but there was nothing outstanding that pushed them to do their best work. A leader needed to tap the internal drives of people, and then the sense of accomplishment were the drivers to top personal performances.

## Conclusions and Reflections

Corporate America was the term used to describe business and its work culture in the United States in the twenty-first century. In 2020 and into 2021, the Covid-19 global pandemic led to widespread unemployment with the resulting loss of pay and healthcare benefits for millions of workers in the United States. As a result, the federal government provided some assistance to workers with an extra \$600 per week for unemployed workers from roughly May through July 2020, as well as two stimulus payments to qualifying families. Corporate America, generally speaking, rolled back salary and benefits for workers. Emily Stewart wrote for the Vox news and opinion website on July 23, 2020, described corporate America's Covid-19 role:

When the Covid-19 pandemic took hold in the United States this spring, companies jumped on the opportunity to advertise the ways they were supporting their customers and workers. . . . Now companies have begun quietly rolling back many of the benefits, perks, and allowances they so loudly announced earlier this year. The state of the Covid-19 pandemic isn't materially different than it was a few months ago – arguably, it's now more widespread and worse. But corporations seem ready to move on.

The praise for a corporate bureaucracy seemingly matched the unfavorable criticism of government bureaucracy (English & Ehrich, 2016) even when corporations brazenly made workers expendable under cover of protecting shareholder equity.

The march to globalization and the increasing production of consumer goods created a dilemma for public schools in the United States. Public schools traditionally served to develop young citizens as future active participants in the nation's democratic political system. The goal of a market based world economy was to develop youth with advanced skills to compete in the "faster paced world economy over their less well prepared counterparts" (Spring, 2014, p. 46). The students in the aforementioned school takeover fight in Texas wrote to the school board stating, "I am not a number on a piece of paper! I'm a person. You keep putting me under the bus! And no matter what I do – it's never enough!" (Pazey, 2019, p. 1903). Schooling was about the cultivation, development, and nurture of young students to prepare them for full participation in our democratic society. The high stakes testing game of winners and losers left the most vulnerable citizens without future opportunities as they were considered as deficient based on test results and not worthy of the full fruits of democracy (Ravitch, 2010). The neoliberal school idea was for the benefit of elite business profiteers who enriched themselves off of taxpayer money, ensured their children attended private schools and were able to outcompete the public schools with resources, as well as benefited from elite personal and political connections as the country moved away from democracy and towards an oligarchy of elite rulers. Running a school like a business never improved student learning and success, but the push to upend public education continued.

School leaders in 2020 and 2021 operated schooling during the Covid-19 global pandemic that presented unique challenges as educators figured out how to teach while protecting the safety of their students and themselves. The uniqueness of

schooling during this pandemic highlighted great opportunities when the online learning worked well but also shone a light on great disparities as online learning was not available to all students since Wi-Fi connections, routers, and computers were not standard items in all homes.

The election of Joe Biden as US President in November 2020 also ushered in the opportunity for the national Democratic political party to move away from their neoliberal agenda for public education and adopt a position of backing and support for teachers and schools. This meant a move away from the Democrats for Education Reform (DFER) and market-based educational policy and choosing a Secretary of Education who was not saddled by any organization that espoused neoliberal principles. It also was a new opportunity to end the inequitable and heavy-handed approach to high stakes, zero sum game standardized testing that punished schools who educated high percentages of students from low wealth families.

## Abstract

Foucauldian analyses of history do not seek to create linear narratives of our progression toward greater liberty or enlightenment (Dreyfus HL, Rabinow P. Michel Foucault: beyond structuralism and hermeneutics. University of Chicago Press, 1983; Foucault M. The archaeology of knowledge: and the discourse on language. Vintage Books, 2010). Rather, Foucault was interested in locating systems of thought and the “often aleatory path of descent and emergence” (Garland D. Punishm Soc 16:365–384, 2014, p. 372) that gave rise to current rules, practices, and institutions (Dreyfus HL, Rabinow P. Michel Foucault: beyond structuralism and hermeneutics. University of Chicago Press, 1983; Fadyl JK, Nicholls DA. Nurs Inq 20:23–29, 2013; Gutting G. Foucault: a very short introduction. Oxford University Press, 2005).

The following chapter explores the backlash to the Common Core State Standards initiative. Rather than describing the backlash in the form of a singular narrative of events, the authors discuss three categories of competing discourses

that permeated the thoughts and words of education policy subsystem participants and members of the public regarding the initiative:

- 1) Education policy agendas (i.e., the competing and entangled visions for reform associated with the equity and excellence/standards agendas)
- 2) Federalism (i.e., tensions regarding the appropriate balance between federal and local control)
- 3) Socio-political beliefs (i.e., the opposing values associated with individualism and the common good)

These three categories were derived from an analysis of data from semi-structured interviews that were conducted with 15 members of policy organizations and advocacy groups who had expert knowledge of the backlash to the Common Core. Having identified the categories of discourses from the interview data, the authors conducted a deep reading on these three topics.

The interview participants were recruited and grouped by organization type, using a framework based on Rhodes' (*An education in politics: the origins and evolution of no child left behind*. Cornell University Press, 2012) typology of the major players in contemporary debates over elementary and secondary education reform. There were five overarching groups of organizations: business organizations (e.g., the US Chamber of Commerce), civils rights organizations (e.g., the Education Trust), organizations representing educators and educational leaders (e.g., the National Education Association), educational conservative organizations (e.g., the Thomas B. Fordham Institute), and organizations representing state officials (e.g., the National Governors Association). Three people were interviewed from each of these five groups by the first author in 2017; they were purposively selected based on their participation in the education policy subsystem and proximity to debates on the Common Core.

The inclusion of interview data within Foucauldian analyses of history has been flagged as philosophically and methodologically problematic (Fadyl JK, Nicholls DA. *Nurs Inq* 20:23–29, 2013). Interviewing involves an active form of subjectification that can impose a law of truth and generate texts (transcripts) that (re)produce discourses matching the criteria, or interests, of the researcher. While cognizant of such criticisms, the decision was made to analyze interview data alongside the data from primary texts (e.g., policy documents and transcribed political speeches) and secondary texts (e.g., narratives written by historians) as it offered the authors a means of studying the effects of powerful discourses on current ways of thinking.

The authors' reading on policy agendas revealed a common narrative among scholars of education in which the dominant discourse on reform shifted during the Reagan administration from focusing on targeted inputs for historically underserved students (equity) to a focus on elevated standards for all students, measuring outcomes, and holding schools and districts accountable for results (excellence). Tracing subsequent events, the excellence reforms of the 1980s were followed by a fairly linear policy trajectory that spanned successive

presidential administrations and reinforced the outcomes-focused discourse on standards and accountability. However, a quarter-century of mounting pressures on schools, educators, and students finally reached a tipping point during the Obama administration – sparking a backlash to the Common Core and standardized testing. Tensions stemming from competing and entangled reform agendas is the first focus of this chapter.

The second focus is federalism. The federal government has historically had restricted sway over education policy, due to constitutional law and its limited contribution to school funding. Nevertheless, in recent decades federal policymakers have sought to exert greater influence over education through an array of funding streams and other inducements. In this section, the authors explore discourses on federal versus state and local control and describe how when the adoption of the Common Core was incentivized through the federal Race to the Top program, the standards initiative became a prime target for political attacks by proponents of states' rights and localism.

The third and final focus is the tensions between arguments for common education reforms and the individualistic discourses associated with American culture. The authors explore the deep roots of individualism in the United States and reasons for the widespread disdain for collectivism. Examples are provided of the ways in which the “common” in Common Core gave rise to suspicion and opposition among groups who favored a more individualistic approach to education reform.

The title of this chapter alludes to a statement made by President Donald Trump's Secretary of Education, Betsy DeVos. During a speech that she gave to the American Enterprise Institute in 2018, DeVos presented her own history of recent federal reforms and stated that the Common Core and era of federally driven reform was now “dead.” Her words were used as a starting point for investigating the history of the present.

---

### Keywords

Common Core · Education policy · Discourse · History · Outcomes · Educational standards · Excellence · Inputs · Educational equity · Federalism · States' rights · Localism · State elected officials · Governors · Business community · Conservatives · Teachers' unions · Civil rights · Opportunity-to-learn standards · Performance measurement · Race to the Top · Constitutionalism · Beliefs · Individualism · Collectivism · Common good · Christian right

### The Field of Memory

*Traces of ideas in discourse:* A deep-seated aversion to centralized authority, originating from a distrust of monarchical rule and the desire for localism. A disdain for “commonness” and collectivism, stemming from Cold War anxieties. A valuing of individualism that has been traced back to the founding of the country and settlement of the American frontier.

*Concepts no longer considered viable in the field:* An understanding of equity that emphasized targeted supports (i.e., programs and resources) for historically underserved groups of students only. The concept of opportunity-to-learn standards, which called for equalizing resources, practices, and conditions among schools, districts and states.

### **Field of Presence**

*Big ideas considered valid:* Though the federal role in driving accountability has shifted with the passage of the Every Student Succeeds Act of 2015, the discourse on standards-based reform remains dominant. This discourse asserts that elevating expectations for *all* students, and holding schools accountable for results, will improve outcomes and close achievement gaps.

### **Field of Concomitance**

The discourse on standards-based accountability resembles discourses on performance management, denoting the influence of the business community and modern trends in public administration.

### **Discontinuities and Ruptures**

During the Reagan administration, the policy agenda shifted to focus on student outcomes. Following the backlash to the Common Core and related resistance to federal reforms, the Obama administration oversaw a retreat from federally driven accountability.

### **Critical Assumptions**

Efforts to institute change on a national level will always be constrained by forces with deep histories.

---

## **Introduction**

“I agree—and have always agreed—with President Trump on this: ‘Common Core is a disaster.’ And at the U.S. Department of Education, *Common Core is dead.*”

~ United States Secretary of Education Betsy DeVos, 2018, Prepared Remarks to the American Enterprise Institute.

The above pronouncement from the then-Secretary of the United States Department of Education asserted that the effort to institute a common set of educational standards in English language arts and math was over. DeVos’s statement was meant to be the final word on the Common Core State Standards (herein referred to as “the Common Core”), making good on Donald Trump’s campaign promise to kill the standards initiative (Trump, [n.d.](#)). As DeVos described it, the Common Core and the process by which the Obama administration incentivized state adoption of the standards epitomized all that was wrong with federal involvement in education – and the American public knew it.

The Obama administration dangled billions of dollars through the Race to the Top competition, and the grant-making process not so subtly encouraged states to adopt the Common Core State Standards. With a price tag of nearly four and a half-billion dollars, it was billed as the “largest-ever federal investment in school reform.” Later, the Department would give states a waiver from NCLB’s requirements so long as they adopted the Obama administration’s preferred policies – essentially making law while Congress negotiated the reauthorization of ESEA. Unsurprisingly, nearly every state accepted Common Core standards and applied for hundreds of millions of dollars in Race to the Top funds. But despite this change, the United States’ PISA performance did not improve in reading and science, and it dropped in math from 2012 to 2015. Then, rightly, came the public backlash to federally imposed tests and the Common Core. (DeVos, 2018)

The Common Core was the product of a coordinated effort by groups representing state elected officials, education policy institutes, and philanthropic foundations. Led by the National Governors Association (NGA) and the Council of Chief State School Officers (CCSSO), it began as an initiative supported by a politically diverse range of stakeholders, including business leaders, conservatives, and teachers’ unions (Shober, 2016). During the early 2010s, the standards were adopted by 46 states. However, the unity that existed around the Common Core quickly gave way to a backlash by an assortment of “strange bedfellows.”

Though the Common Core was not a federal policy, members of the Tea Party – a conservative political movement that formed in 2009 to agitate for a reduction in the size and scope of government – believed that the Obama administration’s championing of the initiative represented an egregious example of federal overreach (Wallsten & Layton, 2013). Groups of social conservatives, meanwhile, opposed the Common Core because they viewed it as a nefarious effort by the Obama administration to influence the instructional core of schooling and indoctrinate children with liberal values and a secular worldview (Chiaromonte, 2013; SPLC, 2014). The initiative also became a target for condemnation among liberals and educator groups, including the teachers’ unions, whose initial support gave way to frustration (Simon, 2014). These groups argued that the strong focus on standards and accountability had served to demoralize teachers and depress student test scores – especially for students of color, English language learners, and students with disabilities (Ravitch, 2016). Making similar arguments to states’ rights conservatives, the unions and allies advocated for greater local control of education and the need to empower teachers with the autonomy to decide how best to serve the students in their classrooms (Ravitch, 2015). Moreover, critics on the political left argued that the emphasis on higher standards had not been matched by adequate levels of investment in the resources needed to build teacher capacity and equalize opportunities for historically underserved students (e.g., funding for wraparound services and reducing class sizes) (Strauss, 2014). Within 4 years of the standards first being adopted, this backlash had resulted in multiple states retracting their support and repealing the Common Core.

This chapter examines how the Common Core came to be, its fleeting success, and quick fizzle. The authors contend that its birth was a logical next step of the decades-long entangled equity and excellence agendas that propelled the standards-

based accountability movement, and its demise in popularity came, in part, from the centuries-old fight over federalism and the ethos of individualism that has pervaded politics and culture in the United States.

---

## Competing and Entangled Policy Agendas: Equity and Excellence

Outcome-based accountability has been the norm of school reform efforts for nearly four decades. In the 1960s and 1970s, federal education policies focused on educational inputs to reduce inequities – as embodied in Title I of the 1965 Elementary and Secondary Education Act (ESEA), which was conceived as a categorical program to induce state and local efforts to better support educational opportunities for children from low-income families and historically underserved groups. This emphasis on inputs was displaced in the early 1980s with the publication of *A Nation at Risk* (ANAR) (McDonnell, 2005). Produced by a blue-ribbon committee appointed by Ronald Reagan’s Secretary of Education Terrel Bell, ANAR provided a foundation for the Reagan administration’s signature excellence in education agenda. The types of reforms that ANAR set in motion emphasized educational quality and the raising of expectations for *all* students.

ANAR’s focus on setting high expectations and goals for all students marked a departure from the education policy discourse that had emphasized supplemental services and resources for students impacted by poverty and discrimination (Pink, 1989). Yet the report could still be read as calling for the closing of opportunity gaps: “All, regardless of race or class or economic status, are entitled to a fair chance and to the tools for developing their individual powers of mind and spirit to the utmost” (National Commission on Excellence in Education, 1983, p. 8). ANAR also explicitly stated that a commitment to excellence and reform must not be made “at the expense of a strong public commitment to the equitable treatment of our diverse population” (p. 13). Thus, rather than expunging language on equity from the discourse on education policy, the excellence in education agenda represented a rethinking of how to operationalize equity and improve the nation’s schools.

As described by McDonnell (2005), ANAR became “a focal point for a major shift in education policy that had its roots in other trends prominent at the time” (p. 27). Specifically, ANAR and the displacement of the inputs-focused equity agenda of the 1960s and 1970s were products of public concerns about the quality of education and business leaders’ disquiet regarding the United States’ ability to compete economically. ANAR’s language on excellence was also consistent with broader trends in public administration during the 1980s, which saw an emphasis on performance measurement (Osborne, 1988). Governors across the country were quick to heed the call of ANAR; they recognized that the report echoed existing rationales for reform that the governors and other political entrepreneurs, including business leaders, had been making since the 1970s – particularly the claim that raised educational standards would serve to bolster the economy (Manna, 2006; Rhodes, 2012). In 1986, the National Governors Association (NGA) published a report titled *Time for Results*, calling for results-based accountability in education. And in 1989,

the governors met in Charlottesville, Virginia, and formulated a plan for national education goals. Though the Charlottesville education summit was an event that had been scheduled by the newly elected President George H. W. Bush, the goals-focused agenda of the event was driven by the governors (Manna, 2006). This period saw mounting consensus between state and federal policymakers across the political spectrum regarding the logic of basing the education system around outcomes.

Standards-based reform emerged as an elaboration of the excellence in education agenda during the early 1990s. Standards advocates stressed the need to develop and institute high standards and aligned curricula, assessments, and teaching training (Smith & O'Day, 1990). The Clinton administration's Goals 2000 and the Improving America's Schools Act (IASA) marked the first time that standards-based reform was at the center of federal education policy making. The Goals 2000: Educate America Act of 1994 codified a set of voluntary national education goals and provided grants for states to institute their own aligned standards and tests. The IASA, which was also signed into law in 1994, was the Clinton administration's reauthorization of the ESEA. Under the IASA, states and localities would be granted flexibility in their implementation of federal programs in exchange for the adoption of standards and accountability. The IASA and Goals 2000 served to further propagate a standards-centric discourse on educational equity. As stated by Rhodes (2012), under these two laws, "equity" was conceived as equitable access to high standards and rigorous curricula, rather than merely more-equitable access to school resources" (pp. 96–97). Consequently, the older inputs-based conception of equity remained subordinate to the newer understanding of equity in education that focused primarily on higher standards for all students and accountability for results.

The standards paradigm was reinforced during the W. Bush administration, as the bi-partisan passage of the No Child Left Behind Act (NCLB) increased the federal role in holding states accountable for raising student outcomes. Under NCLB, all schools receiving federal funding were required to administer standardized tests for all students annually in grades 3–8, and once in high school. Moreover, schools receiving Title I funding were required to make adequate yearly progress (AYP) toward the goal of 100% proficiency in reading and mathematics by the year 2014. Achievement data from the tests were to be broken down by student subgroups (i.e., race/ethnicity, socioeconomic status, limited English proficiency, and students with disabilities) in order to make sure that all students were making AYP. Title I schools that repeatedly failed to meet their AYP targets would be met with federally prescribed, escalating sanctions. Another significant provision in the law was the requirement that all states receiving Title I funding participate in the National Assessment of Educational Progress' (NAEP) math and reading tests, at grades 4 and 8, every 2 years. Though student performance on the NAEP assessments would not be tied to the types of consequences that were associated with AYP, NAEP scores could be used as a measure for making state-to-state comparisons and for checking the rigor of the state tests: If student achievement on a state's test was high but NAEP performance for the same state was low, that discrepancy would be made visible to the public and policy makers. In accordance with the excellence agenda's

interpretation of educational equity, President George W. Bush viewed disparities in student achievement as being a product of inequitable expectations (Bush, 2000); thus, by raising standards for all students and holding educators and schools accountable for results, these gaps could be closed.

The iterative agendas of the Clinton and W. Bush administrations amplified the federal government's role in education, with the justification for federal involvement couched in the language of both excellence and equity. At the same time that it attained bi-partisan support, however, the standards-based reform movement continuously received criticism by proponents of the older inputs-focused discourse on educational equity. For example, President Bill Clinton's Goals 2000 was opposed by left-leaning members of the Democratic Party who were concerned about the idea of using student outcomes as the measure of school effectiveness. They wanted the Clinton administration to instead focus on opportunity-to-learn (OTL) standards, which would set the criteria for equalizing resources, practices, and conditions among schools, districts and states (Cross, 2014). Similarly, writing about the impact of NCLB, Darling-Hammond (2004) described how despite its good intentions, the law had undermined the nation's education system by creating unmeetable targets for inadequately funded schools – thus penalizing schools serving the neediest students.

The idea for the Common Core originated due to concerns regarding inequities in state standards that surfaced following the passage of NCLB. The NCLB NAEP participation requirement “provided concrete evidence that states did, in fact, have wildly different educational standards” (Shober, 2016, p. 9), and these differences help build the justification for common standards. Following the same logic as antecedent standards-based reforms, the supporters of what became the Common Core argued that the standards initiative would serve to create equity in education through the setting of high expectations for all students (Rothman, 2011).

Though the initiative's leaders sought to tout the equity objectives of Common Core (Rothman, 2011), part of the backlash to the standards was rooted in equity concerns. As had been the case with reforms during the H. W. Bush, Clinton, and W. Bush administrations (Cross, 2014), left-leaning academics, political actors and advocacy groups criticized the Common Core for raising standards without also focusing on investing in equalizing resources among schools and districts (Karp, 2013; Ravitch, 2016). One of the groups that decried the lack of resources and supports to accompany the implementation of the Common Core was the teachers' unions. The unions opposed the way in which the standards had been introduced as yet another accountability measure without a significant investment in inputs and raising capacity. According to one prominent leader of an educator group interviewed by the first author of this chapter, the combination of new, higher standards and new performance-based evaluation systems that were being introduced at the same time – as incentivized by the Obama administration's Race to the Top program (RTTT) – ultimately resulted in resentment and a backlash by teachers and their unions:

I thought [the Common Core] would help students. I thought it would help create equity in a very inequitable situation for students who faced austerity, a lack of funding, and a lack of resources and other supports that they needed. I thought it would be something that would

help—if there was a common set of expectations for what kids should know and be able to do: standards, not standardization. It would be a basis and a way for getting kids the resources and support they needed for meeting those standards. But instead, it became about blaming and shaming and pointing fingers, and it was used as a way of punishing students, punishing schools. . . . That’s why teachers felt set up. Because a lot of teachers were very supportive of the Common Core; they embraced it and still embrace the underlying idea. They felt set up.

To proponents of standards-based reform, equity in education has typically meant focusing on providing all students excellence by way of common standards and accountability; yet to some critics of the standards movement, equity requires focusing primarily on the inputs, or resources and supports, that schools, educators, and students receive. This tension in discourses fed into the backlash against the Common Core.

---

## **Federalism: The Tug of War Over Constitutional Authority**

Much of the backlash against the Common Core represented a repudiation against the federal government wielding too much power over education. In the words of an interviewed leader of an organization representing teachers, “Education is a state and local responsibility. And there is a fierce commitment in the United States of America to maintain local control over education.” Members of business organizations, civil rights organizations, organizations representing educators and educational leaders, conservative organizations, and organizations representing state officials independently, in interviews with the first author, described public perceptions of the Common Core in terms such as “federal overreach.” Moreover, education policy subsystem participants who worked for conservative organizations and organizations representing state elected officials described having their own reservations about federal influence over state education policy. A member of an educational conservative organization, for example, shared, “I need to be careful because though I support the Common Core, I still do support federalism: a limited federal role in education.” Likewise, a representative from an organization representing state elected officials stated,

[My organization] will always argue for states to have the right to determine for themselves what makes the most sense. If it makes sense, for example, for all the states to have the same standards, that’s up to the states to decide if they want to be a part of that. If they don’t, then that’s their right. . . . Education is explicitly a responsibility of the states through their state constitutions. So, we very much feel like states shouldn’t be encouraged to abdicate that responsibility.

Although the Common Core was not a federal law, as soon as the initiative became linked to the Obama administration’s RTTT – which incentivized the development and adoption of common standards – it came to be viewed as federally derived. This politicized what had originally been a state-led initiative with bipartisan support. Illustrating this point, one member of an educational conservative group acknowledged that the backlash was really in response to *who* was viewed as setting the standards:

If you ask [the public] if they like the idea of having standards so you can compare what a student knows in one state to another state, they do. If you ask them if they think the federal government should dictate curriculum, they say “No.”

There is legal merit to concerns raised about federal influence. The very premise that the federal government holds any level of power in education is an assumption that rests on ambiguous constitutional grounds. The Tenth Amendment delegates all powers not explicitly stated in the United States Constitution to the states. Education, not being mentioned in any of the articles or amendments of the Constitution, is one such power. And for approximately two centuries, education remained firmly under the jurisdiction of the states and local communities. Indeed, the United States Department of Education and the cabinet position of Secretary of Education were not even established until 1979. In addition to the constitutional basis for restricted federal involvement in education, the federal government pumps a relatively limited amount of dollars into the education system making it the junior partner to state and local systems in financing schools. While the percentage of federal funds has oscillated over time, it has always remained lower than contributions by state and local sources. In the past 50 years, the highest amount has been 12.7% in 2009–2010 and the lowest 6.1% in 1989–1990 (NCES, 2019). In the 2016–2017 school year, federal funding accounted for only 8% of school funding, the exact same percentage distribution as the 1969–1970 school year.

At the same time, educational liberals and civil rights entrepreneurs have long been strong proponents of federal involvement in education (Rhodes, 2012). The arguments made by those in favor of federal involvement have typically focused on the need to increase resources and ensure that all students receive equal access to schooling (Black, 2010; Cross, 2014). Advocates of federal involvement in education often evoke the Fourteenth Amendment to argue that no child should be denied equal protection of the law (Baer, 1983). The contest between discourses on safeguarding equality of access/opportunity and the discourses that argue against federal involvement has seen both the expansion of federal influence since the mid-twentieth century and strong constraints on federal policy-making efforts.

The Common Core was certainly not the first policy to ignite protests against federal overreach in education. When, in 1954, the Supreme Court of the United States ruled to end racial segregation in schools in the *Brown v. Board* decision, conservative opponents railed against federal intrusion in local matters. White resistance to desegregation resulted in violent protests and, in Little Rock, Arkansas, federal troops were called in to enforce the integration of schools. Four years after *Brown*, when the federal National Defense Education Act (NDEA) was in committee, it was opposed by states’ rights conservatives from both major political parties. Regarding the NDEA, Republican senator Barry Goldwater wrote, “If adopted, the legislation will mark the inception of aid, supervision, and ultimately control of education in this country by federal authorities” (as cited in Sundquist, 1968, p. 178). The 1965 passage of the Elementary and Secondary Education Act (ESEA) was also viewed with suspicion by proponents of state and local control. Regarding the ESEA, Howard Smith, a states’ rights advocate and Democratic representative from Virginia, is recorded as having said, “We apparently have come to the end of the road so far as local control over our education in public

facilities is concerned” (as cited in Sundquist, 1968, p. 215). Likewise, Republican senator John Williams of Delaware stated, “The needy are being used as a wedge to open the floodgates, and you may be absolutely certain that the flood of federal control is ready to sweep the land” (as cited in Sundquist, 1968, p. 215).

Though states’ rights arguments have typically been considered a pillar of American conservatism, opposition to federal influence over the instructional core of education has by no means been limited to actors and groups on the political right. For example, teachers’ unions, which have traditionally aligned themselves with the Democratic Party, have also favored local control over things like standards and curricula (Walker, 2016; Weingarten, 2019). One educator group leader who was interviewed described how teachers came to perceive the Common Core as a top-down mandate: “The state standards that have been proposed by the business community or by governors were without the support needed by the community. It was done to people, not with people.” She explained that part of the educator opposition to Common Core was rooted in arguments for classroom autonomy and teacher discretion.

The leaders and backers of the Common Core were well aware of the political threat posed by states’ rights advocates and proponents of local control if the standards were perceived as emanating from the federal government. As one educational conservative who supported the Common Core noted,

We always expected that [the Common Core] would become controversial if it was linked to the federal government. And even if it wasn’t linked to the federal government, there was some expectation it would be controversial because it has always been controversial. There is a reason why we never had national standards and tests in this country, just like we have never had national healthcare. There have been strong currents against it.

Speaking to initiative leaders at a workshop on state standards in education, organized by the National Research Council in 2008, Lorraine McDonnell, a political scientist, made the following statement regarding the nascent Common Core: “[F]ederalism is a very powerful idea in this country. I just can’t believe that any kind of common standards option or common standards movement is really going to alter this defining characteristic of U.S. education policy” (as cited in National Research Council, 2008, p. 55). Recognizing the constraints associated with federalism in the United States, the Common Core leaders intentionally made visible the fact that the initiative was state-led, and they were adamant about not conditioning federal dollars on Common Core adoption (McDonnell & Weatherford, 2013). Indeed, an initiative leader, former governor of North Carolina Jim Hunt, deliberately sought to get the standards initiative off the ground without the federal government’s assistance. As an organizational leader and former state elected official shared during an interview,

I thought Governor Hunt was a genius in that what he saw was you’re never going to get anything federally. That’s just not our tradition and lances have been broken in two or three previous administrations trying to do this. So, what he did was to say, “OK, can you do it from the ground up?” And I think that even he was surprised at how relatively quickly it took hold. I was looking at a decade, at least, for this initiative to take off, and it gained traction pretty quickly.

This political actor also shared that the very name of the standards, the Common Core, was a political calculation to avoid anything that had “a federal or national ring to it.”

The Obama Administration’s RTTT complicated the effort to avoid the perception of federal involvement. In the midst of the Great Recession, in 2009, Congress allocated approximately \$100 billion in stimulus funding through the American Recovery and Reinvestment Act (ARRA) for education programs. Established as part of the ARRA, RTTT offered \$4.35 billion in competitive grant funding to the states in order to spur a series of education reforms (Cross, 2014; Rhodes, 2012). To be eligible for a RTTT grant award, states were asked to commit to four core areas that emphasized educational quality: (1) developing and adopting common, high-quality standards and assessments; (2) building improved data systems to measure student growth and achievement; (3) recruiting, developing, rewarding, and retaining effective teachers and school leaders; and (4) turning around the lowest-performing schools. Even though RTTT did not explicitly make funding contingent on Common Core adoption, it did so all but in name by asking states to develop and adopt common standards. This was a double-edged sword. RTTT incentivized states to adopt quicker than they otherwise might have, but it also shifted the perception of the Common Core from an initiative led by the states to one pedaled by President Barack Obama. Furthermore, the Obama administration funded the consortia that developed the common assessments aligned with the Common Core. This added to the perception that the initiative was indeed Obama’s. Speaking about these events, a member of a conservative advocacy group said,

I think that “federally funded” [assessments] really is what really set a majority of people off. This was now not just 50 state governors coming together and thinking this was a good idea; this was now the federal government saying, “Oh, we think it is a good idea, too, so we are going to fund it and you guys are going to implement it” – even though it was entirely voluntary the whole way!

Reflecting on the impact of federal involvement through RTTT, an organizational leader who had worked on the Common Core suggested that the decision to include the language on common standards in RTTT was a miscalculation on Obama’s part:

It made it look like the Common Core effort was a creature of the federal government, of the Obama administration, and it was an attempt to usurp states’ rights. [The Obama Administration] didn’t do a great communications job. They didn’t do a great job of telling the stories so that people wouldn’t continue to believe that it was definitely federal intrusion.

The debate over educational governance is one piece of a deeper discourse regarding what power the federal government should wield in a federal system where authority is distributed between a central government and the states. The history of this debate goes back as far as the founding of the nation – and transcends any one policy area. In other words, the Common Core incited the centuries-old question of whether the federal government should have any power over local affairs. Members of conservative groups, educator organizations, and civil rights organizations addressed the backlash as being a function of our history. As one interview participant from an educational conservative organization explained it,

I mean there is this constitutional history here. [Education] is not in the federal Constitution, it is prominent in state constitutions, and I think that matters to a lot of people. Just the nature of doing this in an enormous continental country like ours, there is this argument that the federal government is just too far removed from the action to try to do this directly. So, I think this is just sort of a given in the United States: [education] is going to be state-by-state.

Interview participants' accounts of distrust of federal control being a function of history revealed a sense that current discourses contain elements of ideas from a field of memory, which can be traced back to the arguments against centralized, monarchical rule. Correspondingly, Corcoran and Goertz (2005) have described the decentralized and fragmented system of educational governance in the United States as being "a legacy of the deep-seated fear of centralized authority that shaped the nation's founders' views of government, the content of the U.S. Constitution, and the design and evolution of the federal system" (p. 25).

The timing of the launch of the Common Core was also a factor in its politicization. The Common Core found itself caught in the middle of a culture war being waged by right-wing populist groups, including the Tea Party, and social conservatives against federal authority and intellectualism (SPLC, 2014). The standards initiative provided a perfect foil for these groups who sought to frame the Obama administration as seeking to influence what children were being taught. A leader from a conservative faith-based organization provided the following account of how the Common Core was perceived by conservatives that he knew:

While there has always been pushback against the federal government controlling too much about education, I think it was especially difficult for conservatives and particularly evangelicals when the thought was that this perhaps was literally driven by Barack Obama. I had hundreds and hundreds of people say that they knew for certain that Barack Obama was the driving force behind Common Core.

Federalism has always been a very powerful idea in the United States, and discourses regarding state and local control of education created constraints for Common Core leaders and contributed to the backlash against the initiative.

---

## **Sociopolitical Beliefs: Individualism versus the Common Good**

The Common Core also stood as an affront to those who believed that a central government – federal *or* state – should not have control over education at all, as it went against a core American value: individualism. The tension between discourses on the common good and individual freedom has been a constant throughout America's history as a democratic republic (Labaree, 1997), and it continues to manifest today (e.g., altercations about wearing masks in public during the COVID-19 pandemic). Yet, of the two discourses, it is individualism that has prevailed as a core tenet of the American Creed (Lipset, 1996) – an ideology or value system that is unique to the United States and based on a "paramount belief in the notion that all people should be allowed to pursue their own desired goals and interests, in a society

that encourages open competition, even conflict, and that is largely free of collective constraints on individual citizen” (Grabb, Baer, & Curtis, 1999, p. 516).

Foner (1998), a historian, defined individualism as “the idea of a sovereign individual who should be beholden to no one but themselves,” has the rights to fulfill their own destiny, and “make crucial individual choices free from outside coercion” (p. xviii, p. 57). Individualistic discourses have served to prop up meritocratic notions of individual success being a product of a person’s abilities and decisions in life (McNamee & Miller, 2009). Moreover, individualism has been described as a key ingredient of American exceptionalism. In 1922, for instance, Hoover (as cited by Hoover.org, 2017) provided the following words of praise regarding individualism:

Individualism has been the primary force of American civilization for three centuries. It is our sort of individualism that has supplied the motivation of America’s political, economic, and spiritual institutions in all these years. It has proved its ability to develop its institutions with the changing scene. Our very form of government is the product of the individualism of our people, the demand for an equal opportunity, for a fair chance.... The American pioneer is the epic expression of that individualism, and the pioneer spirit is the response to the challenge of opportunity, to the challenge of nature, to the challenge of life, to the call of the frontier.

While historians argue about where the individualistic ethos of Americans sprang (e.g., the Protestant work ethic, the American Revolution, westward expansion), it is generally agreed upon by cross-cultural psychologists that American culture is an individualistic one, characterized by a self-reliance and independence and an expectation that everyone looks after themselves and their immediate family (Hofstede, 2011; Kagitcibasi, 1997). The focus on individual advancement over the collective good can be seen in discourses on education, too. Corcoran and Goertz (2005), for example, described the idea of self-made citizens seeking advancement by way of education as having “deep roots in American culture” (p. 25). And education historian Labaree (1997) argued that education has increasingly been seen as a commodity to prepare *individuals* to successfully compete in the marketplace/for desirable social positions, becoming “a private good for personal consumption” (p. 43), rather than a public good to promote strong civic institutions and economic prosperity.

During the early 1980s, a group of conservatives led by the Heritage Foundation, leaders from the Christian right, and other ideological allies pushed for the decentralization of decision-making in education. As outlined by Pincus (1985), these conservatives were motivated by a shared concern that mounting federal control and liberal reforms had resulted in schools promoting secular humanism and values that were antithetical to the traditional values of conservative families. They argued that control over education must be returned to the parents. The discourse promulgated by these “New Right” conservatives stressed diversity in programs rather than a unified curriculum. And, approximately 40 years later, this same viewpoint was articulated by Secretary of Education DeVos during her 2018 speech at the American Enterprise Institute, as she argued for empowering the individual teacher and individual parent to make choices and look after themselves – showing self-reliance rather than relying on government mandates.

Federal mandates distort what education ought to be: a trusting relationship between teacher, parent and student. Ideally, parent and teacher work together to help a child discover his or her potential and pursue his or her passions. When we seek to empower teachers, we must empower parents as well. Parents are too often powerless in deciding what's best for their child. The state mandates where to send their child. It mandates what their child learns and how he or she learns it. In the same way, educators are constrained by state mandates. District mandates. Building mandates. . . all kinds of other mandates! Educators don't need Washington mandating their teaching on top of everything else. (DeVos, 2018)

The strong orientation for individualism has long fed into anti-centralized government sentiments. The founding documents of the United States – including the Declaration of Independence and U.S. Constitution – are rooted in the thinkings of seventeenth and eighteenth century Western philosophers, such as John Locke and Jean-Jacques Rousseau, who argued that all individuals have a right to liberty and a right to overthrow the government when those rights are not protected. Furthermore, for reasons long debated, working class people in the United States never developed the type of socialist class consciousness that emerged in Europe, and a social democratic political party (e.g., the Labour Party in the United Kingdom) never gained a strong foothold within the political system (Foner, 1984). Within this context, socialism and collectivism came to be viewed as foreign phenomena that ran counter to individualistic American capitalism and liberalism. Antipathy toward “un-American” political ideologies grew following World War I and the Russian Revolution, and the “red scare” of the twentieth century saw mass hysteria as government officials and members of the public came to fear the rise of communism and potential subversion of American society and the government (Murray, 1955; Nichols, 2011). For a subset of Americans, “socialism” and “communism” became political smear words, used as code to mean that the government posed an existential threat to democracy and individual liberty (Forman, 2012), and policies that pushed for common approaches or leveling the playing field came to be framed as collectivist – the polar opposite of individualism.

During the Obama administration, the term “Obamacare,” which was coined to disparage the Affordable Care Act, served to evoke images of the government (embodied by President Obama) taking over an individual's right to choose health care. A similar tactic was used for the Common Core, which was dubbed “Obamacore” by the political right and depicted as “a nefarious federal plot to wrest control of education from local school systems and parents” (SPLC, 2014, p. 5).

Reflecting on the opposition to the Common Core, a leader for an organization representing educational leaders said,

I think that the word ‘common’ . . . Folks that are of a right-wing mind think, ‘Oh, you’re talking socialist education, socialism,’ and whatnot. So, I think perhaps the branding and the wording was a little unfortunate. It was exactly right; they were common if it’s a unified understanding, but... I think there were a lot of mistakes in terms of the branding.

An educational conservative dived deeper into how the standards were perceived by social conservatives that he had spoken with—namely, that the standards would impose values on students, rather than giving students and families a choice:

When they found Common Core to be a plank of sorts... it was easy to develop this narrative around it. There became these three or four talking points about Common Core.... These talking points were as follows: [The standards] began with this small group of devotees of Barack Obama; he and others led this charge, and it is an attempt by his government, if you will, and the federal government to impose a value system upon our young people, and they are standardizing educational standards. But beyond that, that's really the ruse. Right? That's the window dressing for a much larger political agenda, and that is to impose upon our young people this secularized view. And if they can impose that and suffuse it into the entire educational system, then, of course, they have won the hearts and minds of our children, and America is no longer America.

*Common*, with a connotation of sameness, uniformity, and average, is an antonym of individual uniqueness and exceptionalism. And, according to several of the education policy subsystem participants interviewed, the word “common” in Common Core came to represent an antithesis of American individualism among opponents of the initiative. Highlighting the negative meaning that stuck to the initiative’s name, a leader from the business community stated, “The word ‘common’ in any way, shape, or form, I think we’ve all learned, is just not helpful to the conversation.” Likewise, another leader from a business group shared,

I don’t think we ever anticipated that the word “common” would have such a negative connotation. And as we experienced resistance—push back—many of the individuals that were arguing against the standards kept saying, “Our children are not common. Our children are unique. One size does not fit all.” And that was not the intent!

The standards were launched at a time when partisan polarization was growing and manifesting in the form of populist movements (e.g., the Tea Party). Tensions surrounding the Common Core were, therefore, part of broader trends in which devolution, localism, and individualism were ascendant. As a leader of an organization for educational leaders observed,

I don’t think that there is any appetite nationally for a common understanding of the good of the nation, period, whether it be in education or anything else.... It’s all about me, as a state or as a locality. There is no public appetite nationally for the common good right now.

Like discourses on state and local control, discourses on individualism permeated ideas about the Common Core and fed into the opposition that emerged. Thus, the backlash to the Common Core can be understood as being, in part, the manifestation of an individualistic and anti-centralized government American ethos.

---

## Conclusions and Reflections

The analysis of texts and interview transcripts outlined in this chapter illustrates how the birth and subsequent backlash to the Common Core contained traces of ideas from history and from other fields. Specifically, the backlash against the Common Core can be understood as a continuation of old tensions related to the purpose of education and the structure and role of government in the United States. Three examples of dueling discourses – some as old as the country – manifested in thinking and political arguments

on the Common Core: targeting inputs versus outcomes in education agendas, federal versus local control, and the common good versus individualism. While not an exhaustive list, each of these dialogues offer a partial explanation for the opposition that surrounded the Common Core as well as previous efforts to institute national education reforms.

The pushback against Common Core and the standards-based reform paradigm, which, in addition to opposition by educator groups and conservatives, included a movement of parents opting their children out of assessments (Harris, 2015), resulted in President Obama calling for a reduction in standardized testing (Obama, 2015). Furthermore, the Every Student Succeeds Act of 2015 devolved decision-making regarding the specific interventions used in low-performing schools back to the state level, curtailing the decades-long trend of federally driven accountability. Across the states, meanwhile, various legislatures moved to pass bills that would repeal and replace the controversial Common Core standards. Another casualty of the Common Core backlash was the centrist coalition of education reformers that had supported the standards-based reform agenda; the Common Core became a political third rail that even ardent backers of the initiative recognized as being unwise to touch in public.

In spite of these events, contrary to Secretary DeVos' assertion, the Common Core did not die: Though many states reviewed, revised, and renamed the standards that they used, major elements of the Common Core remained embedded in state standards, curricula, textbooks, and other educational resources. What is more, standards-based education remained the dominant education policy paradigm in the United States – with annual, statewide assessments aligned with challenging academic standards still being a federal requirement for funding.

As a political flashpoint, the Common Core continues to speak to an entangled set of discourses surrounding unresolved tensions in how to define educational equity, federal involvement in education, and whether the individual should be elevated over the common good. Examining the ways in which such discourses have shaped and constrained past education policy efforts allows for a re-valuing of present values and a re-imagining of the future.

## Abstract

Debate is intensifying in the United States with the rapid spread of charter schools and their domination of the education reform agenda. Controversy surrounds the very existence of public charter schools – an incendiary if not polarizing topic of political discourse – while the sector expands. The authors traced the pros and cons in the discussion by analyzing relevant literature (e.g., empirical research), public documents, and media sources. The complex snapshot presented signals deep discord in the public charter school movement. A creation story underlies how public charter schools came to be and the endless struggle over education reform. A narrative emerged about the past, present, and future of the charter school movement and battles over market-based solutions to public education problems that force the privatization of public education. Informed by both sides of the charter polemic, the authors developed an unusual collaboration as a critic (first author) and an advocate (coauthor). Mirroring the charter debate’s two-sided argument, the intention for this writing was to offer a gateway to productive albeit challenging discourse in a landscape that is deeply divisive and combative. The work ends with reflection on the present and future of public charter schools, and considers where shifts or anticipated ruptures or controversies can be expected to arise. This chapter’s distinctiveness is that it illuminates critical aspects of the charter debate in contemporary times, weighs pros and cons of charter schools, and advances recommendations.

## Keywords

Accountability · Approval · Authorizer · Autonomy · Black student · Charter · Charter debate · Charter proponent · Charter school sector · Choice · Class · Community · Controversy · Curriculum · Democracy · Effectiveness · Equity · Failure · Funding · Governance · Justice · Legislation · Management · Market · Operation · Opponent · Policy · Privatization · Public charter school · Public education · Race · Reform · Regulation · Segregation · Special education · Standardized testing · Standards · Success · Traditional public school · Virginia

## Introduction

### The Field of Memory

A creation story underlies how public charter schools came to be and the endless struggles over education reform. The narrative reveals an irony – teacher unions, the charter “brainchild,” have become the charter sector’s most outspoken foe. In 1988, Albert Shanker, “education reformer and American Federation of Teachers president,” shared his vision for a publicly funded, independently operated school called “charters,” which he described as places where innovative pedagogies would be carried out in teaching laboratories (Cohen, 2017; Kahlenberg, 2009). The idea was for traditional public schools to benefit from the improved practices, not to be replaced or undermined. After Shanker moved his proposal to the public, policymakers acted and charters burst onto the scene. However, Shanker was horrified that his vision was “hijacked” by profit-

seeking marketers and conservatives. As conveyed in a biography of Shanker titled *Tough Liberal* (Kahlenberg, 2009), by the mid-1990s, he rejected his own idea of reform. For-profit corporations had entered the charter school sector as permitted by state laws, and he realized that “charters might actually promote segregation, undermine public education, and be used as tools to destroy unions” (as cited in Cohen, 2017).

### **The Field of Presence**

The Shanker story is “weaponized” by both charter opponents and proponents who use the originating 1988 speech to advance their own ends. Controversy pervades the very existence of public charter schools while the industry continues to grow, emboldened by the governmental and the corporate influence on American education. Entrepreneurial involvement in public education can be seen in charter school expansion, among other markets (e.g., standardized product development targeting school use). Public discussion is generated by multiple entities – legislatures, departments of education, national organizations, teacher unions, scholars, and citizens – that organize meetings, press releases, and protests and disseminate legislation, research, reports, and media stories. Public charter school legislation is justified by supporters as a method for democratizing public education and providing a much-needed, family-friendly alternative to the education of preK–12 populations that utilizes public funding. However, charter schools’ educational quality and performance-based outcomes have long been questioned relative to noncharter or traditional (division/district) public schools, with the charter industry frequently performing unevenly and with mixed results. The charter debate is also fueled by charter advocacy claims of democratic contribution and increasing effectiveness, which opponents confront with countering ideologies, perspectives, and evidence. Arguments for and against public charter school approval and operation and the impact of local and state authorities over charter schools also attract considerable attention. Evidence-based studies expose the realities of charter school trends, particularly performance, compounded by patterns of resegregation, corruption, and fraud. Recommendations from the literature and public domain vary tremendously, stemming from battles over the very meaning of public education and fair and equitable education.

### **The Field of Concomitance**

Charter schools constitute big business – the public education sector is being marketized, co-opting cherished ideas and practices in education and rebranding them. Business and industry, aided by governmental agencies, special interest groups, and educational insiders, use public monies and influence public education. Like vouchers and corporate products targeting school use, charters are examples of highly influential market-based policies endorsing free-market, privately managed schooling. Charter proponents argue that these schools support democratic schooling and citizenry through freedom, choice, and equity and achieve at a high level through differentiated education, crediting them with a private school-like atmosphere through smaller class sizes and innovative learning. Strong critics, typically within academia, counter that the charter sector systemically ruptures democracy through the intentional takeover of the public school sector by philanthrocapitalists and funded right-wing think tanks. Major

criticisms also direct attention to the lining of for-profit investors' pockets, turning citizens into clients, parading customer-driven institutions as community institutions, and draining public systems of goods and services.

### **Discontinuities and Ruptures**

Despite charter proponent claims, investigations of charter schools indicate that they are not outperforming traditional public schools in the United States as a whole. Much of the slight outperformance that is reported is explained by researchers as an overall drop on a particular year in testing in public schools or the fact that the schools outperforming traditional schools were closed due to a mismanagement of funding or failure to meet charter expectations. Earlier studies of charter school effectiveness also typically found a lack of systemic evidence for such claims; further, comparisons were difficult to make, given that, as one major rupture of social justice, charters did not have the expertise or programs to serve English Language Learners (ELLs) and students in special education. Another such rupture is the charter school industry's seclusion of students by race and class, which in effect resegregates society and reproduces educational inequality for African American and Latinx groups and those in poverty. Considerable racial isolation shows up as schools that mainly consist of students of color, with pockets of white isolation. Wealthier parents advance their own interests, in effect exacerbating class differences and the poverty gap. In some states, charter schools are not expected to educate students with the greatest needs (special needs, limited English proficiency, etc.), but charter granters should be holding the schools to racial/ethnic balance guidelines. The lack of public oversight over school choice is another point of rupture. The disruption of racial integration in public education reflects discontinuity with the traditional sector. In a sea of contradictions, public opinion fluctuates between the pros and cons of publicly funded charter schools, with recent polling showing a serious decline in support for charter schools.

### **Critical Assumptions**

Charter school expansion and legislation have influenced the perception that charter schooling is apolitical, despite evidence to the contrary: regional tensions are worsening between wealthier and poorer communities; racial tensions are deepening owing to the resegregation of schools along the lines of race and class; and fiscal tensions are arising from weak safeguards for assuring financial accountability, among other striking contradictions. While unusual, the authors of this chapter represent both sides of the charter polemic while also being strong defenders of public education and democracy.

A charter opponent, the first author assumes that the energies being used to create and sustain charter schools should be going into strengthening the traditional public school system, and that funding from these underresourced schools should not be transferred to charters. Nor should the charter system be allowed to function against the tide of evidence exposing its segregationist patterns, market-based investments, and closing of schools to boost overall performance levels.

However, the charter proponent (coauthor) believes that the charter sector provides a much-needed public service and alternative to (failing and struggling)

traditional public schools that reflects democratic will and choice. While this educator is pro public charters, she is not a fan of for-profit charters.

Assumptions throughout convey these conflicting ideological perspectives with value-laden language in the political discourse (e.g., *industry*, *market-based solution*, *privatization*, and *segregationist*) relative to charter opposition. Charter advocacy is juxtaposed through use of the same and different terminology (e.g., *alternative*, *choice*, *democracy*, and *freedom*), extending to derisive terminology targeted at traditional schools (*status quo*, etc.). Informed by both sides of the charter polemic, the authors turned their dialogue into a rather unusual collaboration. Mirroring the charter debate's two-sided argument bolstered by opinion and evidence, the intention for this chapter was to offer a gateway to productive albeit challenging discussion in a deeply divisive and combative landscape.

---

## Framing the Charter Debate

A basic goal of public education is to provide appropriate and timely education that supports student achievement at a high level through differentiated education, necessary supports, and so forth (Ash, 2013). With claims to this effect, the US-based public charter school sector is showing rapid growth amid controversy over charters – an incendiary topic of political discourse. In the 2018–2019 school year, this industry served “more than 3.3 million students in 7,500 schools and campuses,” which was “6.5% of all public school students.” Charter schools and campuses have “more than doubled, while charter school enrollment has more than tripled.” Just 6 years earlier, it was estimated that “over 6,000 charter schools [served] about 2.3 million students” (National Alliance for Public Charter Schools [NAPCS], 2021; also, US Department of Education [USDOE], 2019). Since 2018, charter laws – in place in 44 states, the District of Columbia, Guam, and Puerto Rico – support charter school operation, with 219,000 charter teachers and \$440 million in federal funding (NAPCS, 2021; also, Mora & Christianakis, 2011).

A variety of institutions, some public, manage charter schools: educators, universities, religious schools that remove religious symbols, previously tuition-charging privates, for-profit firms, parents, and community members. These diverse stakeholders broadcast positive changes resulting from the expansion of charter schools (Mora & Christianakis, 2011). The number of charter schools in each state varies: currently, Arizona, California, Florida, and Texas each have over 500, while states with more restrictive charter laws, like Virginia, have far fewer (USDOE, 2019). As of 2020, charter laws, enacted in 45 states and the District of Columbia, were nonexistent in Montana, Nebraska, North Dakota, South Dakota, and Vermont (Center for Education Reform [CER], 2021).

As stated, in the face of mounting evidence to the contrary, charter schooling is said to be apolitical. The need for this very alternative in public education is proclaimed and images of success are aired, despite uneven performance outcomes and in the face of conflicting reports and data (Berliner & Glass, 2014; Frankenberg,

2011; Mullen, Samier, Brindley, English, & Carr, 2013). These points are expanded on herein.

Set within the context of the charter debate, the purpose was to trace the pros and cons in the political discourse surrounding the charter sector and its governance and operations, and claims and results. The authors were motivated to understand public charter school operations and development, identify charter trends and issues relative to traditional public schools, and “surface” the impact of the charter movement on the public education system and democratic education more broadly. Accordingly, relevant literature (e.g., empirical research), public documents, and media sources were analyzed.

Speculative questions developed for tracing the arguments in sources were:

1. What trends are currently evidenced by the American public charter school sector?
2. How do public charter schools compare with traditional public schools?
3. What processes are used to grant approval to charter schools to operate and continue?

The idea for this writing was sparked by the discovery that the authors both identify as strong defenders of public education and democracy. An opponent of privatization and the public charter school industry is concerned about its impacts on traditional public education, while a proponent supports charter schools as an expression of free-market ideology, choice, and the right to alternative education. Debating the dynamics behind such phenomena as democracy, freedom, and choice in the context of market-based solutions to public education problems, since 2018 the authors have been deliberating over key issues. Meeting as educators in Virginia, the first author is a professor at a public higher education institution and the other a teacher at a public high school. Openly exploring their opinions and perspectives on the charter debate, they proactively monitor their tensions, point out one another’s biases, and share evidence that they often interpret differently. A hope is that their dialogic approach to the charter debate inspires productive exchanges on matters of education and in the public arena.

For this chapter, eclectic sources were reviewed, and definitions set forth to help anchor the overall analysis of important charter-related trends. Reflection is on the present and future of the public charter school sector and where shifts or anticipated ruptures or controversies may arise. As will be revealed, opinions remain deeply divided about charter school options and equity in the education of public school students. Beyond the scope of this discussion, the controversy is well documented in the literature for interested readers.

---

## **Description of Salient Terms**

While terms are introduced at various points throughout, five salient terms central to the charter debate are identified and described in this section.

## Authorizer

The body or group that approves the charter for a charter school to proceed is the *charter school authorizer* (Jason, 2017). Authorizers, depending on the state, can be for-profit companies, local school boards, boards of education, school divisions/districts, intermediate school boards, state public universities, or two or more local educational agencies operating under an interlocal agreement (Shen, 2011). Some states create separate boards that authorize charters. Authorizers, usually nonprofits, may include universities, but in most cases, local school boards authorize charter schools. Charters are authorized by groups defined in state law; in Virginia, for example, authorizers are state and local school boards (Ash, 2013). Virginia-based charter schools are nonsectarian alternative public schools located within a school division under the authority of a local school board (Virginia Department of Education [VDOE], 2021).

According to the National Charter School Resource Center (NCSRC, n.d.), “an authorized public chartering agency” is “responsible for reviewing and approving or rejecting charter applications and monitoring charter school performance (generally considering performance related to both academic and fiscal/organizational metrics as well as compliance with relevant laws).” Also, “state law determines the types and number of organizations permitted to act as charter school authorizers”; examples include “public school districts, state educational agencies, or independent organizations such as statewide nongovernmental organizations or universities” (NCSRC, n.d.). Authorizers of charter schools decide whether charter schools can enter the market and expand or close, and they provide performance oversight (Dynarski et al., 2010).

## Charter

US-based charter schools operate under a contract with a charter school authorizer – usually a nonprofit organization, government agency, or university – that holds them accountable to the standards outlined in their “charter.” Charter schools differ across states with respect to which organizations can charter schools or apply for a charter. The most common are nonprofit boards, although some states do allow for-profit companies to secure charters. An independent organization (some would say business) under contract, charter schools are founded by a *charter*, an agreement that connects site-based administration and an authorizing entity. These privately run schools are established by teachers, parents, or community groups under the terms of a charter between a granting body (e.g., school board) and an outside group (e.g., parents and teachers) (Shen, 2011). They are frequently largely governed by corporations (for-profit or not-for-profit), but even nonprofit organizational arrangements present opportunities for financial gain (Strauss, 2014).

Charter school operations are dependent on limited contracts, with renewal subject to performance. The charter contract describes aspects of the school such as its mission, instructional program, governance, personnel, finance, student enrollment plans, and how all these are measured (Shen, 2011). Not accountable to regulatory forces like traditional schools, charter autonomy for “develop[ing]

curricula, personnel, and budgets results in, for many charter schools, comparably longer days and school years as but one difference with its traditional counterpart” (Jason, 2017).

## Charter School

A type of public school, *charter schools* are “tuition-free and open on a first-come, first-serve basis, or by lottery” (Jason, 2017), and they are subject to regulation by statutory provisions and variations from state to state that define chartering (Green & Mead, 2004). As described by the NCSRC (n.d.), a charter advocate funded by the USDOE, charters are public institutions that operate as a “school of choice.” Three avenues for public charter school approval exist: (1) local school boards (e.g., Virginia), (2) state boards (e.g., Massachusetts), and (3) alternative certification boards (e.g., Louisiana and Minnesota). Independent boards authorize charter schools after state criteria are met (National Association of Charter School Authorizers, 2022).

According to the NCSRC (n.d.), charter schools “commit to obtaining specific educational objectives in return for a charter to operate a school”; “are exempt from significant state or local regulations related to operation and management but otherwise adhere to regulations of public schools—for example, charter schools cannot charge tuition or be affiliated with a religious institution”; “are publicly accountable—they rely on families choosing to enroll their children, and they must have a written performance contract with the authorized public chartering agency”; and “are also autonomous” – they have more flexibility in areas of operations and management than traditional public schools.

Regarding operations and autonomy, publicly funded preK–12 charters have “the freedom to establish their own methods of operation” and, like “many private schools,” determine “their instructional and social practices” (Chen, 2020). Operational latitude includes all aspects, such as hiring, operations, regulations, and rules, extending to academics, typically curricula, classrooms, and programs for meeting student needs (CER, 2018). The public charter sector draws students from across a state or even the nation. As such, charter schools are positioned to function according to “their own standards of conduct and curriculum outside the realm of local public school districts” (Chen, 2020). According to the National Education Association (NEA, 2021), however, “charter school accountability” means that “as taxpayer-funded schools, charter schools must be held to the same standards of accountability, transparency, and equity as traditional district public schools.” While some state regulations may still apply to charter schools, they are governed by a board of directors, without state oversight.

Like traditional public schools, charters are funded from the district and state based on student enrollment, known as “average daily attendance,” and funding varies across states (Center for Education Research [CER], 2018). With greater autonomy than traditional public schools, charter schools are free from some state and local regulations to achieve set goals (Shen, 2011). US state laws and charter

contracts provide schools with varying levels of autonomy from the local school divisions over curriculum, personnel, budget, and schedule.

As public schools, charter schools are prohibited from charging tuition. They must not discriminate or be religious in their operation or affiliation. In cases where there are more applications than available seats, charter school admissions are determined by a lottery. Charter schools are not exempt from federal laws that cover students' rights or safety, including special education and other civil rights protections. They are also subject to state accountability systems, and their students must take required state tests (USDOE, 2018).

## School Choice

Choice “allows public education funds to follow students to the schools or services that best fit their needs—whether that’s to a public school, private school, charter school, home school, or any other learning environment families choose” (EdChoice, 2021).

## Traditional Public School

Publicly funded by the states, these (noncharter) schools are overseen by a school district (“division” in Virginia). *Traditional public schools* serve the local needs of students under the terms of the school board and state authority. Arguing on behalf of the advantages of traditional schools, the description by traditional proponents is rooted in language like *cost advantage*, *equal educational opportunity*, *democracy*, *governance*, *legal*, *regulation*, and *support service*. These schools, which must adhere to education standards for curricular areas set by the state education board, are *not* exempt from any state, federal, or local laws regarding education. They are governed by school districts/divisions and managed by democratically elected school boards (Ravitch, 2014). Moreover, traditional public schools are “legally entrusted to provide equal educational opportunities for all students,” making “support services” like “counseling, special education, and speech therapy available for students who qualify” at “no cost to the child, making this a tremendous cost advantage for some families.” (In contrast, “independent schools generally do not provide these kinds of supports,” and “outside professional support can be an expensive consideration for special needs children.”) (Huson, 2021). Fiscally, the traditional public school sector is tapped in the funding of charters.

---

## History and Growth of Charter Schools

Founded in Minnesota in 1985, the first charter school drew students who had dropped out of school. Developing student responsibility and decision-making within a personalized learning environment were identified as highlights of charter

schooling. Shanker called for higher standards for public education and was a strong voice for the professionalization of teaching through teacher evaluation systems and removing ineffective teachers, and for the protection of civil and human rights (see Kahlenberg, 2009). Former president Bill Clinton named Shanker a great twentieth-century educator (Cohen, 2017; Kahlenberg, 2009). The need for transformation of the K–12 education system through a high-quality charter alternative led proponents to support efforts to offer higher quality education to students across the United States, including those from disadvantaged backgrounds (Brinig & Garnett, 2012).

Amid a “charter battle” and how these schools use their autonomy (Jason, 2017), the country has seen a rise in the popularity of charter schools. Although the charter sector continues to expand, as reported by a poll (i.e., PDKPoll, 2020), support has seriously declined. While approval increased from 51% in 2008 to 70% in 2011 (Reckhow, Grossmann, & Evans, 2015) and was similar in 2013 at 68% (Bushaw & Lopez, 2013), approval was low in 2020, at 40%. Another oddity is that when *Education Next* (Fishman, 2015) surveyed parents, teachers, and members of the public across the nation in 2016, only 28% supported the formation of charter schools, yet when participants were provided a short definition of *charter school*, 52% endorsed the existence of this type of institution.

Support for the growth of charter schools can be partly attributed to Bill Clinton (USDOE, 1995), who urged states to adopt charter legislation in his 1995 State of the Union speech. Then in 1997, he persuaded Congress to appropriate millions of dollars for funding charter schools, subsequently encouraging states to pass legislation that permit these institutions to be created and held accountable for high standards (Arbogast, 2000).

Through the Public Charter Schools Program, the USDOE began funding charter school conferences, state programs, and charter school research (Arbogast, 2000). It was amended by the Charter School Expansion Act of 1998 and the No Child Left Behind Act (NCLB) of 2001 to support charter school “planning, development, and initial implementation of charter schools [in the first 3 years]” (USDOE, 2004, p. 9). Further, in 2001, the USDOE’s Credit Enhancement for Charter School Facilities Program provided competitive grants for entities seeking to enhance their credit to secure loans for operating charter school facilities or even acquiring, constructing, or renovating them (see Temkin et al., 2008).

In 2009, former president Barack Obama and Secretary of Education Arne Duncan launched the *Race to the Top* grant competition totaling \$4.35 billion. This federal legislative initiative also convinced states to adopt policies supporting charter school expansion. During the competition, state applications “receive[d] points based on the extent to which their laws [did] not [impede] the number of high-performing charter schools” (Mora & Christianakis, 2011, p. 95). In fact, the Obama administration underscored the competitive disadvantage for federal funding for states with restrictions on charter schools.

Throughout the history of public education, many education reformers have proposed improvements to the educational process. “Rigor and flexibility” arose as “opposed but equally important needs in schooling” (Hirsch Jr., 1996, p. 2). Perhaps like Shanker, those who look to the public charter sector to fundamentally change

traditional public educational systems envision charter schools as positive reform. They see them as a strategy for ensuring academic rigor and responding to the educational needs of constituents and families (e.g., Angrist, Pathak, & Walters, 2013).

---

## **Charter School Option, Record, and Discord**

Charter schools have been credited with providing an option for public education that supports democratic schooling and citizenry. On the one hand, freedom, choice, equity, and achievement at a high level through differentiated education are all positives. As examples, site-based advantages are said to revolve around a private school-like atmosphere through smaller class sizes and innovative learning (Brighthouse & Schouten, 2014). On the other hand, fallout on multiple levels from the charter school option has been traced.

“Strong” (Republican) and “weak” (Democrat) is a common take on charter school legislation (Hess & Davis, 2000). Advocates critique legislation that is largely “symbolic” as ineffective. In Virginia, for instance, the 1998 “legislation mandated that charters could be granted only by the local school district, ma[king] it difficult for charter schools to escape many state laws and regulations, limit[ing] the number of permissible schools, and requir[ing] that charter schools use certified teachers” (p. 18). In their review of studies investigating charter legislation and contextual factors across states, Hess and Davis also identified catalysts leading to “strong” charter school laws: “Republican strength, a weak teacher union, low . . . test scores, a moralistic political culture, a high median income, and an urban population,” in addition to “choice politics,” “advocate resources,” “the strength of the religious right,” “presence of alternative options,” and “perceived performance of schools”; as well as a “conservative climate, Republican strength in the legislature, a Republican governor, a weakened teacher’s union, and perceived educational inadequacy” (p. 16). Such factors enabled passage of “choice proposals” where charter legislation was considered effective, again from a conservative standpoint.

As is alleged, charter schools foster unique prospects for advancing equity and opportunity, innovative teaching and learning, and excellence and achievement. The nation’s most well-known, largest charter foundation – Knowledge Is Power Program (KIPP), with head offices in Chicago, New York City, San Francisco, and Washington, DC – projects this profile of excellence and is expanding. Self-described as a “[national] network of free open-enrollment, college-preparatory schools in low-income communities,” while “KIPP’s model has been lauded for producing better educational outcomes and test scores than district schools, others have critiqued the organization for its strict discipline, high rates of teacher burnout, and high levels of student attrition” (Baker, 2017). Many charter schools “come under fire for selection bias, [but] KIPP’s student enrollment matches up with its mission by focusing on low-income communities of color,” continued Baker, concluding that “knowledge is power, but at a cost.” Racial and class segregation within the KIPP enterprise is the norm – more members of underserved groups are enrolled

than in surrounding districts, which, in the eyes of charter critics, resegregates public education.

KIPP's character education model (and "character growth card" denoting behaviors associated with traits like grit) has also come under attack. One of thousands, Snyder (2014) paid for KIPP's online course taught by a KIPP cofounder only to discover a lack of rigor and connection with morality, narrow view of the purpose of education, and relentless treatment of character development as self-centered, careerist, and achievement oriented. Character education was apparently "latched onto" by KIPP for eradicating the "achievement gap" and pushing students through school and into careers.

Pondering a different charter's record, principals Cousin and Davis (2019) of Commonwealth Charter Academy Charter School (CCACS) indicated that this Pennsylvania school, with "9,400 students statewide," features a hands-on, K–12 program in an agricultural laboratory. The school's "agworks facility" produces plants, shelters fish, and promotes "job-ready skills" and nontraditional opportunities for personalized learning. The evidentiary trail, however, conveys a different picture. According to the Public School Review's (2021) profile, CCACS serves 8592 students (over 800 less than stated at the school website). Importantly, in the 2018–2019 school year, CCACS failed academically and was "in the bottom 50% of all schools in Pennsylvania for overall test scores." Also, only 16% of the students "achiev[ed] proficiency in math [well below the state average of 45%]"; further, only 41% "achiev[ed] proficiency in reading/language arts [far less than the state average of 62%]." Not to be overlooked, "the student:teacher ratio of 25:1 [was] much higher than the state's level of 14:1," thus inconsistent with charter claims of small classes. And while this school's "minority enrollment [was] 34% of the student body (majority Black)," it only equaled the state average. Thus, the evidence conflicts with this charter's presentation of academic excellence and performance reliability, assuming the accuracy of the Public School Review.

As a domain, charter schools' educational quality and performance-based outcomes are questioned. Different sources indicate that the charter sector frequently performs unevenly or underperforms relative to traditional public schools (Finn et al., Mullen, English, Brindley, Ehrich, & Samier, 2013; Mullen, Samier, et al., 2013; Public Citizens for Children + Youth, 2018). As per the Center for Research on Education Outcomes' (CREDO, 2013) finding, "charter school quality is uneven across the states and across schools" even though "different student groups [Black students, students in poverty, and ELLs] benefit from attending charter schools" (p. 3). Regarding the 2013 CREDO report, 3 years later, Finn Jr., Manno, and Wright (2016) similarly concluded that the charter track record "can best be described as stunningly uneven, although gradually improving" (p. 37). Nonetheless, even the prospect of improvement over time is debatable – the charter enterprise is not governed by the legislative mandate of public education to educate every child.

Earlier studies of charter school effectiveness (e.g., Frankenberg & Lee, 2003) typically found systemic evidence lacking for claims that charters were outperforming public schools. Apparently, comparisons were difficult to make, given that charters lacked the expertise or programs to serve ELLs and students in

special education. As noted earlier, another such problem explained by Frankenberg and Lee, among other scholars, is that the charter industry's separation of student populations along the lines of race and class reproduces "educational inequality" for African American and Latinx groups and students living in poverty. "Substantial racial isolation," a byproduct of the public school charter movement, shows up as "pockets of white isolation as well as schools that are overwhelmingly students of color" (Frankenberg, 2011, p. 102). By advancing their interests, wealthier parents in effect exacerbate class differences and the poverty gap. In some US states, charter schools "are not required to educate special-needs students or accept students with limited English-speaking abilities" (English, Papa, Mullen, & Creighton, 2012, p. 40). Charter school policies have been resegregating education and racially isolating student populations (e.g., Berliner & Glass, 2014; English et al., 2012; Frankenberg & Lee, 2003; Mullen, Samier, et al., 2013; Rubin & Weber, 2022).

Regarding student achievement and success, whether charter school enrollees perform the same, better, or worse than their counterparts in traditional schools remains inconclusive. Both sides of this issue are argued. While one camp argues on behalf of overall patterns of charter school superiority, the other spotlights inferiority on multiple fronts. Extending beyond questions of performance outcomes for charters, manipulation, corruption, resegregation, and other controversial dynamics attract strong criticism (e.g., Bulkley & Fisher, 2002; Chen, 2020; Mullen, English, et al., 2013; Mullen, Samier, et al., 2013; Rubin & Weber, 2022).

Charter school success, as conveyed, relates directly to the features of state policy (Gill et al., 2001; Hess & Davis, 2000). Further, charter school effectiveness has been reported in raising the achievement of low-income and minority students in urban areas, but not ruralities (Hess & Davis, 2000). Pointing to injustices, many scholars fiercely debate charter assertions of success and democratic contribution to equal educational opportunity: "Claims that charter schools will improve educational opportunities for all children have been undermined by the reality of increasing segregation and inequality, and fewer educational resources for the neediest students attending traditional public schools" (Rubin & Weber, 2022, p. 82; also, Mullen, English, et al., 2013; Mullen, Samier, et al., 2013). Debunking charter claims with evidence of contrary trends and disturbing realities, critics, among them Rubin and Weber (2022), argue that the charter movement has "hurt public education," "worsen[ed] inequalities," and made the charter-traditional public school relationship "adversarial" (p. 82). As clarified, "these outcomes reflect the current legal parameters and distorted incentives, particularly at the state level where charter schools are regulated" (Rubin & Weber, 2022, p. 82; also, Bulkley & Fisher, 2002; Chen, 2020).

Elaborating on CREDO's (2013) investigation into charter effectiveness, outcomes were examined in 27 states, revealing mixed results, modest improvement, and questionable practices. Based on performance comparisons between public charter and traditional school students in the "same community," "a quarter of charter schools outperform their local [traditional schools] in reading, and 29% do so in math" (p. 86). The CREDO researchers credit the gains – which they "do not see [as] dramatic improvement among existing charter schools" – to the

“closure of bad schools,” in addition to dialogue bolstered by charter-related advocates that have “raised awareness and commitment to the academic quality of charter schools” and overall school improvement. Almost half the charter schools had “above average growth in both reading and math, but the “‘low-low’ schools are a matter of serious concern [in that they] offer little chance for their students to keep up, much less make up the existing differences in achievement for disadvantaged students” (p. 87).

In charter and traditional settings, the gap in achievement persists, even though “charter school enrollment has expanded among students in poverty, Black students, and Hispanic students,” who, based on the CREDO report, “on average, find better outcomes in charter schools” (p. 85). The 2013 CREDO school evaluation currently stands as the most influential of charter studies, with significant impact on education policy focused on improving outcomes for historically underserved students (see Ackerman & Egalite, 2017).

---

### **“Charter and Choice” in Theory Versus Practice**

The idea behind choice is that parents can exercise different educational options that align with their interests. The charter enterprise espouses choice as a significant benefit by giving families more freedom and control over their children’s schooling. With children not being assigned to charter schools based on where they live, families can apply for admission by the enrollment deadline. The reality, though, is that charter schools give enrollment preference to “students living in the same community school district as the school,” in addition to “returning students” and “siblings of students already enrolled” (New York City Department of Education, 2021).

“Charter and choice” is one thing in theory and quite another in practice, revealed Hirsch (1996). Interestingly, this American educator (who is a primary source for the Common Core movement through his Core Knowledge Foundation) described being a “supporter of public school choice and charter schools” in theory only (p. 61). His opinion changed upon realizing that “charter and choice” break down in practice. At the meta level, he expounded, “parental choice” “introduces competition” in autocratic, controlling “conditions that may cancel out its utility” (p. 61). But at the micro level, parents tend to choose the school closest to home; without a way to judge the quality of different schools in the area, they “keep their child in place” (p. 61). Further complications are that good teachers are in bad schools, and vice versa, and that school missions and philosophies use similar rhetoric (e.g., student-centered education), adding to parents’ confusion and uncertainty. Citing national and international evidence, Hirsch concluded that “parental choice has not greatly improved student achievement in the United States” and that by itself “[choice] is not an adequate principle of reform” (p. 61).

Pattillo (2015) would likely agree with Hirsch that choice is not sufficient as a reform principle. Conducting a Chicago-based charter study, she found that “school

choice” is both an elusive target and ambiguous concept within the African American community. Educational choice, she explained, is “promoted as one strategy to improve educational outcomes for African Americans,” with goals “in Black school choice politics [being] empowerment, control, and agency” (p. 41). However, based on interviews held with 77 Black charter parents (low-income and working-class families), the search for “a quality school” turned out to be complicated and disappointing in that “numerous barriers” arose. These families lamented “limited and weak empowerment, limited individual agency, and no control” (p. 41). This window into the urban charter world from parents’ perspective revealed discomfort around dynamics of power, agency, and control, as well as inequities like lack of agency in the context of choice.

For education reform studies of the charter school movement in action, strengths and weaknesses in actual settings may be examined and recommendations provided. Practical research as such includes Green and Mead’s (2004) work on charter schools and the law, and Miron and Nelson’s (2002) look at choice and accountability. The latter’s analysis of the charter school context in Michigan has relevance for the broader charter movement. Questions about sustainability, and solutions for improving charter schools by addressing deficiencies, are uncovered are part of the mix.

---

## Virginia’s Charter School Approval and Context

In 2021, seven fully authorized public charter schools were operating in Virginia, two in Richmond, the capital (VDOE, 2021). Compared to other states, this is a small number. Ineffective Virginia state law and an onerous charter school approval process were “barriers” named to obtaining charter authorization (Hess & Davis, 2000). An opposing viewpoint is that Virginia’s charter school law is effective in that it does not allow for multiple independent authorizers to grant approval and oversee the schools (Lehnen, 2016). Besides funding, two requirements for charter authorization by a local school board in Virginia are a student population that mirrors the community and political and public support. These “wins” are not easily obtained. Consequently, despite the passing of policy in 1998 that permitted charter school establishment in Virginia, few such schools have been approved (Virginia Board of Education, 2003). As observed by Lehnen (2016), “charter school development” is indeed slow in Virginia even though charters have “swept many states in the nation” (p. 839).

Thus, to obtain approval for charter schools, per Virginia Law (1998), time-consuming steps must be taken, with funding a dominant concern. After the applicant submits the mandatory documentation to the VDOE (2021), it is advanced to the Virginia Charter School Committee Board. The board appoints a charter school committee to examine applications to ensure consistency with existing state law and the board’s approval criteria. To convey a sense of what is involved in charter seeking within Virginia, actual steps follow.

- Applications in the required format are sent to the board's charter school committee and posted on its web page.
- The committee begins its review, and VDOE staff review and comment on each component.
- If criteria are met, the committee meets with all stakeholders to discuss the extent to which the application meets the board's approval criteria.
- The committee votes on each criterion and the application.
- If the committee agrees by consensus that the criteria have been satisfied, the application is presented to the board. In the event of required changes, the applicant is given time to address them and can meet with the committee. If not handled by the deadline, the application is denied.
- Charter school applications approved by the VDOE are forwarded to the local school board for final approval. Once approved, the local school board then decides whether it will fund the new charter school. (VDOE, 2021)

Virginia's charter school law, passed in 1998, was intended to stimulate the development of charter schools, support innovative opportunities for instruction and alternatives to assessment, and offer flexibility and options to families within their school systems. The legislation was also meant to give educators freedom to establish alternative schools and scheduling options that better meet student needs, and develop school models that could be replicated in other public divisions. The bill gave local school boards the ability to approve charters and develop a contract between local school boards and the charter. Each charter school is subject to all state, local, and federal laws, and may not charge fees or discriminate against students.

This charter legislation requires each school to comply with standards of quality, satisfy the VDOE requirements for the state's Standards of Learning, make gains consistent with the Every Student Succeeds Act, meet student needs according to the Individuals with Disabilities Education Act, and observe federal antidiscrimination laws. These policy regulations and procedures from the VDOE have not fundamentally changed over the 2 decades since the charter school law was passed with the local school board as the authorizer (see VDOE, 2018).

---

## **Charter School Advocacy and Opposition**

Publicly funded charter schools and, more recently, charter districts have changed the education landscape for primary and secondary schools (Gawlik & Allen, 2020). To Shen (2011), a main difference between charter and traditional schools is that charters are granted budgetary autonomy in exchange for educational results. As Raymond (2014) urged, if progress is made "improving schools," "proponents and opponents" need to examine "the facts instead of relying on their philosophies" (p. 8).

## Charter Advocacy

Competition and mandates like the choice system under the NCLB give families agency. They can opt out of underperforming public schools and enroll in higher performing districts outside their designated areas (Pattillo, 2015). With the greater flexibility afforded charter schools, they are free to develop innovative programs. While answerable to their authorizers for results, these schools can try different methods for fostering student achievement.

Motivations for support are “the opportunity of empowerment and control by the parent of their children’s education” (Oluwole, 2019, p. 15). Charters that open in predominantly Black pro-school choice neighborhoods have the support of parents and community leaders primarily because of families’ control over what school their child will attend and the staffing, governing board, and curriculum. Privatization, deregulation, and competition do not seem to drive charter support in communities (Pattillo, 2015).

While a charter school is governed by one board, “in the charter school district, there is one appointed charter school board and one superintendent for all K–12 schools” (Gawlik & Allen, 2020, pp. 15–16, 22). Existing in cities like New Orleans and Washington, DC, the charter district is thought to show promise for charter superintendents’ influence “through connections with school board members, building administrators, and the community.” As autonomous “instructional and policy leaders,” these superintendents control “instructional leadership strategies,” policy entrepreneurship, Local Education Agency (LEA) establishment, and choice.

## Charter Opposition

Arguably forcing truths to the surface, charter opponents identify a host of fundamental differences concerning public charter and traditional schools. Among them are that traditional public schools and their superintendents (a) are accountable to governmental regulatory limits in the ways that charter schools are not; (b) can only hire certified teachers; (c) face public scrutiny of their finances in that the Freedom of Information Act applies to them (but not charter schools); (d) must answer to the public (and not have their elected school boards meeting in private), lacking the autonomy of charters; and (e) should address any special needs of students. Unlike charter schools, public schools cannot shape their enrolments by deciding which educational programs and services to offer (or exclude) (Mullen, English, et al., 2013; Mullen, Samier, et al., 2013; Ravitch, 2014).

Charter schools attract opposition from multiple quarters for privatizing public education. The largest American labor union – NEA – voiced that “privatization is a threat to public education, and even more broadly to democracy” (as cited in Reckhow et al., 2015, pp. 13–14). Teacher unions, a strong challenger of marketization, argue that “for-profit” options of education have less accountability and transparency than traditional public schools. In West Virginia, teachers went on

strike twice in 2019 to defeat Senate Bill 451, which “allow[ed] for charter schools to be created in West Virginia for the first time” and “public money to be used for private, online, and home schools through newly created ‘educational savings account [ETA]’” (Breitbart News Network, 2019), essentially “private school tuition” (Yan, 2019). This teacher opposition spoke to the serious level of resistance against charters, considering that the bill also set out “pay raises” for teachers and “[more] funding for public education” (Breitbart News Network, 2019). That same year, Senate Bill 451 did pass the Senate, “introduc[ing] major educational reform for West Virginia” that permitted the opening of public charters “in any school district” and by students on a “first-come first-serve” basis, for whom up to 2500 would receive the ETA (not transferrable to a public school) (West Virginia Legislature, 2020).

Elsewhere in the nation, teacher attacks against the public charter industry continue, among them the Chicago Teachers Union. In 2013, Chicago Teachers Union president Karen Lewis (2013) accused “venture capitalists” of “us[ing] little black and brown children as stage props” to further their fight in expanding school options, adding that by advocating for “equal education” she was not being “radical” (as cited in Chasmar, 2013).

As argued, these schools take away revenue from underresourced local traditional public schools (Jason, 2017; Reckhow et al., 2015). Regarding fiscal management, the lack of oversight can be costly. For example, Ohio charter schools were found to inappropriately spend public dollars four times more often than traditional schools. Teacher unions and school boards are the greatest opponents of charter schools, concerned with the lack of transparency and opportunity to “select” higher performing students (avoiding all others). Lack of transparency; the very minor increase in test scores, if any; and the opportunity for corruption make the investment of charter schools too risky for districts (Carlson, Lavery, & Witte, 2012; Jason, 2017). Another fiscal–ethical objection is that “far too many [charter schools] are cash cows” in that they provide an income or profit to financial companies or individuals utilizing charters as an investment strategy. In Pennsylvania, as but one example, “hedge fund managers” seek charters as “investment opportunities,” and “some top political campaign donors are connected to charter schools” (Strauss, 2014).

“Fraud and corruption” are associated with the public charter movement, which “the industry is rife with,” declared Strauss (2014): “Who can forget the scheme by PA Cyber Charter founder Nicholas Trombetta to steal \$1 million in public dollars? Federal investigators filed 11 fraud and tax conspiracy charges against him and indicted others in the case.” Another scenario cited “is the Urban Pathways Charter School in downtown Pittsburgh,” which was “under FBI scrutiny for trying to spend Pennsylvania taxpayer money to build a school in Ohio.” Exposed was “a history of expensive restaurant meals, a posh staff retreat at [a] resort, and payments for mobile phones belonging to the spouses of board members”; moreover, Philadelphia had an “eighth charter school official plead guilty to federal fraud charges” (Strauss, 2014).

Violations of educational justice are also tied to choice and charters, breaching the inclusion imperative that drives democratic education. The perspective argued is that

charter schools not only make lower socioeconomic status schools less desirable but also perpetuate segregation, or a watered-down version of it. These schools fail to adequately meet the needs of traditionally underrepresented populations; homogeneous white schools lack ethnic diversity and worsen marginally segregated districts, possibly further segregating more diversified districts owing to charter school design and accessibility (Brighthouse & Schouten, 2014; Mullen, English, et al., 2013; Mullen, Samier, et al., 2013; Ravitch, 2014). From a critical view, predominantly public charter school systems indicate what not to do, like New Orleans's with school choice and charter schools in 70% of all occasions. Students with disabilities in these schools have been performing below grade level, whereas those attending traditional schools receive more services and are less likely to be suspended. Similarly, schools in Arkansas, New York, and Washington, DC, report lawsuits alleging violations of federal special education laws and antidiscrimination claims (Mullen, Samier, et al., 2013). All such occurrences of social injustice have led many Virginia lawmakers to bypass public charter school approvals within the state.

ELLs' access to charter schools is another contested issue. Some districts appear to overrepresent their ELL populations in charter schools, whereas others underrepresent theirs. As a public school funded with tax dollars, charter schools are not permitted to discriminate when enrolling students. Examining ELL enrollment in both charter and traditional schools in New York City, Buckley and Sattin-Bajaj (2011) found that most charter schools enrolled a smaller percentage, although there was variance. Winters's (2014) follow-up study similarly found that the underrepresentation of ELLs in New York's charter schools was due to this group being less likely to attend during "gateway" grades like kindergarten and grade 9.

In 10 different states' urban areas with high ELL numbers, 3 districts' ELLs were overrepresented, in 4 they were underrepresented, and in another 3 they were equally represented, found Garcia (2015). The percentage served ranged widely by state and community, which strengthened Buckley and Sattin-Bajaj's (2011) findings. Thus, more data are needed to determine the charter schools in which ELLs are being appropriately served. To avoid over- or underrepresentation in charter schools, design teams would stick to data that mirror traditional school district populations.

Besides ELL representation, policymakers expressed concerns of homogeneity in schools that segregate and isolate races. Some charter advocates, like the Collective Action Coalition (CAC), self-described as "a national network of hundreds of charter school leaders of color who reflect the diversity, challenges and experiences of the students we serve," look to create a student population of color. The CAC, which includes charter investors and democrats, explained its rationale: "By supporting and catalyzing charter school leaders of color, we will facilitate their capacity to liberate marginalized students' ability to pursue thriving, productive lives" (Charter Collaborative, 2015). Opponents express concern, if not (moral) outrage, over the larger charter impetus that drives privatization, perpetuates racial and socioeconomic segregation, and drains traditional public school coffers (Mullen, English, et al., 2013; Mullen, Samier, et al., 2013; Pattillo, 2015). Evidence of support for choice suggests a high demand among Black students (Grady, Bielick, & Aud, 2010), and

Black and Hispanic educators serving as charter school principals are overrepresented (Jacobson, 2017; National Center for Education Statistics, 2017).

Yet many Black legislators (Debray-Pelot, 2007), voters, and organizations oppose charters and vouchers. In 2010, the NAACP passed a resolution calling out the social injustice and inequities of the charter school sector, stating, “Charter schools draw funding away from already underfunded traditional public schools,” and in 2014 passed another stating its organizational opposition to the “privatization of public schools, public money for-profit public schools, and “the redirect of monies from public schools to charter schools.” Then, in 2016, the “NAACP called for a moratorium” on charter schools due to the resistance by charter supporters to legislate accountability and transparency (as cited by Vasquez Heilig, 2017, NAACP leader). In 2017, the NAACP Task Force on Quality Education’s (2017) investigation found that one in eight African American students was attending a US charter school, leading to the call for charter sector reform to bring about educational equity in support of national prosperity. NAACP delegates’ new resolution condemned segregating Black populations in underresourced public charters and schools. Charter segregation is a social justice violation affecting the Black community and the nation. The NEA (2021) announced that it “opposes the failed experiment of largely unaccountable privately managed charter schools” and “supports non-profit public charter schools that are authorized and held accountable by local democratically elected school boards.”

Deficits for democracy have been called out with the business invasion of public schools sponsored by “funded right-wing think tanks and neoliberal philanthropocapitalists” (English et al., 2012, p. 41). A hollowing of the state comes with undermining public education. Ravitch (2014), another vocal critic of market-based policies like charters and vouchers, contended that not only is “privately managed, free-market” schooling overtaking public schools but that the mushrooming of charters systemically uproots democracy through the “deliberate effort to replace . . . the public school system” (pp. 4–5).

Ultimately, the quality of charter schools starts with the authorizers (Jason, 2017). Annually, around 200 charters in the nation closed due to poor management, a decrease in student demand, financial hardship, or mismanagement of finances. Every charter school has a state-sanctioned organization that grants or renews its license, reviews its performance, and provides guidelines (Jason, 2017). In Virginia, the responsibility of granting charter status to a school falls both to the VDOE and individual school districts (VDOE, 2021). According to Angrist et al. (2013) and Jason (2017), the belief that the quality of charter schooling begins and ends with the authorizing organization has prohibited the passing of further bills and legislation in Virginia, enabling individual school boards to maintain control over these charter sites.

Charter schools, as argued, pose a serious threat to democratically governed neighborhood public schools. Questions about their practices, and lack of accountability and transparency in areas of management and finance, resound as they expand. Proponents of traditional public school education like former New York City Public School chancellor Richard Caranza and former United Teachers Los

Angeles president Alex Caputo-Pearl opposed public charter schools as alternate forms of education. In 2016, Save our Public Schools (an alliance of teacher unions, parent–teacher associations, the Jewish Labor League, the Brazilian’s Women’s Group, the NAACP, the mayor of Boston, and Senator Elizabeth Warren) defeated a measure that would have allowed the state to expand charter schools in Massachusetts. In effect, this coalition managed to educate the public about the loss that needed to be prevented of funding and program cuts to traditional public schools (Yan, 2019). To repeat, among the criticisms expressed about charters, they draw money and students from district schools, are not held properly answerable, resegregate public education and spread racial isolation, perpetuate high teacher turnover (24%), and privatize public education under a false guise (e.g., Ravitch, 2014; Yan, 2019).

---

## Conclusion and Reflections

This chapter ends with a reflection on the present and future of the public charter school sector. Where shifts or anticipated ruptures or controversies can be expected is considered. Although chartering started as an approach to reform the education system, charter schools have become extremely polarizing in the political discourse and regulatory environment. Existing data on the performance effectiveness of charter schools are inconclusive and somewhat attributed to the diverse school types in the country. Despite the outcomes afforded by data-based studies, “no consensus” exists “among researchers on charter school effectiveness in the USA,” in part because of “discrepancies in the research methods employed” (Ackerman & Egalite, 2017, p. 363), and because the results support approval and disapproval of public charter schools. This deep divide affects public opinion, shaping policies and politics. With 50 state educational laws and 45 charter approval laws, charter school approval varies greatly from state to state, as do the governing organizations that approve them (USDOE, 2018).

Thus, charter school policies and development are likely to become more deeply partisan and increasingly polarizing: “Support for charter schools by former US President Trump and Secretary of Education DeVos, and the constant stream of charter school scandals, have made [progressive] Democrats increasingly skeptical, if not outright hostile, to charter expansion” (Rubin & Weber, 2022, p. 82). They elaborated,

Most 2020 Democratic presidential candidates opposed for-profit charter schools. US President Biden pledged to support measures to increase accountability for all charter schools. Charter schools will likely continue to have the backing of more conservative Democratic politicians, most Republicans, and many philanthropists. (p. 82)

Regarding policies and practices that would considerably improve charter schools, currently the contemporary American public favors more public school funding, school equity and integration, and a de-emphasis on standardized testing: “More

than half of all Americans and nearly 70% of Blacks and Hispanics believe that school segregation is a serious problem, and 53% of Americans believe that the federal government should take steps to reduce it" (Rubin & Weber, 2022, p. 82). As these charter critics urged, "This confluence of political preferences makes possible policies that increase financial equity and integration in public education while moving away from reliance on high-stakes standardized testing" (p. 82).

As the past 3 decades are looked upon in the context of today's educational climate and the future, one can expect to see ongoing efforts to produce greater accountability, transparency, and equity alongside a growing appetite for market-based competition in the public education sector, despite increasing inequalities and the worsening of segregation. Controversy persists over the privatization of public education and charter schools' expansion, resegregation, and claims of effectiveness. The policy debate is expected to continue around private companies and individuals supporting public charter schools, in addition to the establishment of charter school districts.

Not to be overlooked or underestimated is the growth of the charter school district and the promise of its trajectory, situating charter school superintendents on a different plane as policy actor and political leader (Gawlik & Allen, 2020). For a few decades, some superintendents have sought to make cities "charter districts," with American presidents proposing chartering at all levels of the education system. Former president George H. W. Bush, credited with being an architect of education change, was behind charter reform. Al Gore, former vice president under President Clinton, envisioned charter schools as uplifting distressed urban areas (Hill, 2001).

Based on a study of charter school districts (see Gawlik & Allen, 2020), attention was drawn to how this kind of district model functions as an autonomous public policy landscape in cities like New Orleans and Washington, DC. Moreover, it was found that charter school districts serve as a conduit for charter superintendent's influence "through connections with school board members, building administrators, and the community." As "instructional and policy leaders," they have control over "instructional leadership strategies," policy entrepreneurship, LEA establishment, choice, and more. Unlike in charter schools, each of which is governed by one board, "in the charter school district, there is one appointed charter school board and one superintendent for all K–12 schools" (pp. 15–16, 22). Researchers Gawlik and Allen (2020) called attention to the political role in establishing a vision for a school community as paramount, and the role of superintendents and other key players in providing transparency and accountability for these educational sites.

Unmistakably, charter schooling is hotly contested among interest groups, activists, and scholars. At the local and national level, charters are the site of political competition between advocacy networks and groups clamoring to constrain or expand school choice (Malin, Lubienski, & Mensa-Bonsu, 2020; Zhang & Yang, 2008). "Political and institutional forces" more than "educational needs" are said to propel charter school dissemination, perpetuating the divide on the charter debate among stakeholders (academicians, policymakers, teachers' unions, business groups, activists, philanthropists, etc.) (Zang & Yang, 2008, p. 571). To this end,

Reckhow et al.'s (2015) survey of "public attitudes" found that "charter school opinions diverge along ideological lines among high-information respondents" (p. 207), implying that educated perspectives exist on both sides.

In general, the empirical research reviewed does *not* support the claim that US-based charter schools outperform traditional public schools as a whole. Much of the slight outperformance reported is explained as an overall drop on a particular year in testing in public schools or that the better performing charters were closed owing to mismanagement or failure to meet expectations (Ash, 2013; CREDO, 2013).

Recommendations from the literature and public domain vary tremendously, stemming from battles over the very meaning of public education and what rights to fair and equitable education look like both in theory and practice. Proposals advanced by charter critics range from enacting stronger charter school legislation, to reforming the culture of charters, to strengthening the traditional public school system. Dismantling the charter system is implied by the most extreme opponents. While one camp fights for parents' right to choose the type of education best suited to their children's needs, the other confronts intrusions into the public education sector and market-based solutions to public education problems.

Charter critics seeking constructive ways to deal with the charter sector conflict and threat to its democracy have advanced recommendations. Ravitch's (2014) 11 strategies are aimed at reforming the culture of charters rather than eradicating this system. Importantly, tackling poverty and school segregation and improving charter schools were included, along with better programming, smaller class sizes, and more. Explaining that "the most successful charters follow a [rigid] formula" (p. 178) and are customer-driven institutions (not community institutions), she called for a new type of charter school that would revive the original purpose of charters as laboratories for "bold innovations" in which teachers are empowered to experiment with new ideas and approaches to education. In an older source from the USDOE (2004), the promise of charter schools as a research and development vehicle was recognized and applauded in general terms. The idea was for the public education system to prosper through approaches from the charter sector.

Without a doubt, the public has an important role in holding the charter sector accountable. Frankenberg and Lee (2003) emphasized, "In addition to monitoring student achievement and financial management, charter granters must hold charter schools to racial/ ethnic balance guidelines in those states and districts with such legislation or court orders"; they added that "public oversight over school choice" plays a large role in determining whether "racial integration in public education" is supported by this sector (p. 38). Pressure on charter school laws is needed "to address segregation, prevent additional abuses, and create a more level playing field with traditional public schools" (Rubin & Weber, 2022, p. 82). It has even been theorized that increased competition between public charter schools and traditional public schools would promote better educational programming and improved outcomes for all students (Chen, 2020; Kahlenberg, 2009; NEA, 2021).

This chapter offered analysis of current issues and dynamics embedded in the public charter school industry, adding to the literature. The sources reviewed elicit

ideological perspectives and evidence from both camps: charter proponents and opponents. Their debate is expected to persist around issues of choice, performance, effectiveness, and democratic contribution. Arguments for and against charter approval that allows for the public charter school option in states, in effect propelling the charter movement that opponents view as undermining traditional public schools, will continue to inform the dispute. The spread of district charter schools in US cities, which is furthering the movement, is expected to intensify the conflict. More studies and opinion pieces are likely to expose the realities of charter schools, particularly around performance and resegregation trends and with increasing attention on ethics, corruption, and fraud. Yet more legislation in support of charter school authorization and development is on the horizon given the strong lobbying for charter schools and argument that this option is a necessary alternative to traditional public schooling and that it serves to democratize public education.

The first author sought to raise uncomfortable issues involving charter existence as a marketing scheme in defense of public education and reclaiming it. *Democracy, equity, freedom, reform, social justice*, and other cherished ideas of public education have been co-opted, if not distorted, by the public charter school movement. Activists and strong leaders need to respond with a loud, unified voice in support of public education and the fate of this cherished institution, and on behalf of vulnerable student populations. In her own writing and with colleagues, she advances these perspectives, including on the marketization of public education as a policy peril. Doing so, she expresses deep concern about neoliberal foundations and think tanks' rise and commodifying of education (e.g., English et al., 2012, Mullen, Samier, et al., 2013). Academic results appear to be hyped by the media, politicians, and others amid racial isolation, social injustice, and educational inequity. Even though in some US states elementary and middle school charter schools perform better than secondary charter schools, they are "hyper-segregated." Charter schools promote racial inequality, isolation, and high attrition, while luring the best-performing students from public schools. "Charter schools and voucher programs" have been found to advance "the resegregation of the nation's school systems" (English et al., 2012, p. 40). While charter advocates claim to equitably represent the demographics of local communities, given state law requirements, it is disconcerting that charters fail to enroll their fair share of special education students, ELLs, recent immigrants, homeless people, and refugees (e.g., Mullen, Samier, et al., 2013). Even though charters rely on taxpayer funding for the privilege of privatizing education, this sector lacks accountability and transparency. Citing problematic charter dynamics, elsewhere she (Mullen, 2017) has ventured, "Knowing more about the networked corporate dynamics behind this movement could help to inform the debate around student academic outcomes—and the mixed results in studies of charter schools" (p. 103). She advised following the "moneymaking lobbyists" whose actions advance "reforms that give parents choice and make schools more accountable" but benefit "charter schools that make money, not public schools" (p. 103).

The second author is a strong advocate of equity and choice. An experienced K–12 public school educator, she views the public charter system as a means for fostering equal access for education and an inclusive gateway to equitable learning opportunities. As such, she is constantly on the hunt for ways to help students succeed. While she believes in traditional public education, she does not think that one size fits all, which is how she became interested in public charter schools and the promise they hold as an educational alternative for families. In 2020, she had the opportunity to talk directly with founding members of a public charter school in Virginia – community advocates, parents, retired teachers, and charter school board members. They conveyed that they were looking for ways to improve public education with solutions. She is keen to share information about charter schools, including charter contracts and approval processes, with interested parents and others, as well as strategies for starting schools of their own or improving existing ones.

Finally, if the goal of education is to fulfill children’s potential in an increasingly global context, then unified forces are needed to ensure this outcome. Looking ahead, while charter advocates will understand this vision one way, opponents will interpret it very differently. The uncommon collaboration represented by the chapter authors enabled a more balanced view of the public charter school movement and take on crucial issues at stake in the charter controversy – without one camp holding sway. Readers are encouraged to add to the broader conversation.

## Abstract

Three vectors describe the research about the global challenge of educational reform (Shirley, *J Educ Change* 21(3):385–392, 2020). These vectors address fundamental questions within the field: Who is doing the work and how are they supported? How can reform that is successful in one realm be both sustained within that context and travel to other contexts? Who benefits? These sticky questions are not rhetorical, and yet they also do not have an answer. In spite of decades of practice and research, much of the field of educational reform remains in flux. This chapter builds upon such scholarship, describing the global challenge of educational reform, briefly tracing the history of reform over the last 20 decades in order to frame the understanding of educational reform, and then outlining the obstacles that have been met along the way. These waves of reform and across the waves the vectors of change play a strong role in making sense of the past and highlighting the global challenge of educational reform work. The chapter then describes the challenges of the present moment, including but not limited to the impact of the Covid-19 pandemic on reform efforts.

**The Field of Memory**

The field of memory in global educational change begins with a focus in classrooms, moves to schools, and ultimately lands in larger state and national systems. The memory begins in the 1950s when, as described in Fullan's (2007) classic book *The New Meaning of Educational Change*, reform efforts began in an effort to improve pedagogy to spark student achievement gains in the United States after Russia's launch of Sputnik. At that time, the assumption was that if ideas were good, they would travel on their own (Elmore, 1996). Fullan (2007, p. 5) calls the era from the late 1950s through the 1960s the "adoption era" of reform; the theory of change undergirding this era was that simply getting the ideas out would lead to improvement. Certainly small-scale change occurred as well. Teachers would "tinker" in their classrooms (Huberman, 1989), adapting their own practices in their own classrooms but without a sense of scale or scope in relation to other teachers, classrooms, or schools.

From a leadership perspective, and slightly later, research on improving schools began to explore how leaders could reform schools in order to raise student achievement, particularly in urban schools. This research, typically referred to as school effectiveness research, looked at the relationship between school leadership and school outcomes. Bossert and colleagues' (Bossert, Dwyer, Rowan, & Lee, 1982) review of the literature on effective schools described four areas of effective principal leadership: principals in high achieving schools emphasize achievement; effective principals are more powerful than peers in less effective schools in curriculum and instruction; successful schools are better organized; and effective schools have higher quality human relations due in part to the work of effective principals. Over time, this notion of effective schools transformed into a contested concept of instructional leadership. Instructional leadership situates the principal or school leader as the driver of change, setting high expectations for all in the school, overseeing curriculum, and tracking progress (Marks & Printy, 2003). Much of the criticism of instructional leadership centers on the view of the principal as the lone hero leading change. As Hallinger (2011) points out, while the early research on school effectiveness indicated that strong instructional leadership was characteristic of effective urban schools in the United States, the nature of the work of instructional leadership remained hazy, as did how it contributed to school improvement.

Thus, the field of memory in global educational reform is characterized by two beliefs: "good" reforms will find their way from individual classrooms on their own, and "good" leaders are primarily responsible for "good" schools. These beliefs underscore the notion that educational reform, in order to succeed, needed to find a way to move beyond localized pockets of progress and beyond a vision of reform as an independent effort. The very idea of reform signifies grand scale change, yet

the research at the earliest stages in this arena suggests that change at such a scale was not occurring. The problematic nature of these beliefs became evident as research on reform grew and globalized.

### **The Field of Presence**

As scholars, policymakers, and practitioners – and for the purposes of this chapter, school and system leaders – attempted to understand how reform operates and spreads, a burgeoning field of study grew out of the exploration of schools and school reform. For the purposes of this chapter, the terms change and reform are used interchangeably. The last several decades of research on educational reform can be characterized by the following three concepts. Each of these concepts grew out of lingering questions from the earliest days of reform. While these will be described more in depth later in this chapter, they include:

**Sense-making:** How do teachers, leaders, and communities make sense of reform?

As more and more schools, districts, states, and nations attempted to make changes, it became increasingly evident that knowing more about how teachers and others enact and experience change was central to any reform's success. Sense-making can vary by age (Evans, 1996; Hargreaves, 2005), career stage (Evans, 2000; Hargreaves, 2005), experience with change (Kelchtermans, 2009), and generation (Stone-Johnson, 2016), among other reasons. Acknowledging how teachers orient to change is increasingly viewed as a key to understanding the potential for success of educational reforms.

**Scale:** How do reforms move from one context to another and from pockets of success to widespread success? More specifically, how do reforms that have been successful in one context get taken up in new contexts? Questions about how changes start small and become bigger and more widespread dominated, and continue to dominate, much of the study of educational reform (Harris & Jones, 2018; Le, 2018; Malone, 2018; Stein, Hubbard, & Mehan, 2004). More recent research has explored the complexity of scale and whether it is advisable or even possible (Elmore, 2016).

**Structure:** How are schools structured, primarily through leadership and policy decisions, to help or hinder change efforts? Within the notion of structure are concepts such as professional learning communities (Hargreaves, 2003), distributed leadership (Harris, 2007; Harris & Spillane, 2008; Spillane, Halverson, & Diamond, 2004), and collaborative professionalism (Hargreaves & O'Connor, 2017, 2018), all of which focus on how schools are situated (or not) to foster successful educational reforms. Questions regarding structure focus less on reforms themselves and more on the decisions school leaders make to shepherd the changes through.

These three concepts ultimately address the most challenging aspect of reform, sustainability. What is the potential for reform to endure, and for how long? While the concept of sustainability is situated within the field of presence, it is important to note that it may be the area with the least amount of knowledge. In spite of waves of reform, it remains unclear whether reforms last – or why. Scholarship within the field

of reform continues to discuss the grammar of schooling (Tyack & Tobin, 1994), the recalcitrant nature of schools to revert back to their original structures in spite of reform efforts (Mehta & Datnow, 2020). Much is known about the factors that hinder sustainability, but less is known about how to remedy these factors.

Across the field of presence, more questions than answers define the understanding of the challenge of global reform. Why is it so difficult for change to take root? And how can teachers, leaders, and school systems persevere in the face of such a challenge? To understand this vexing question, many scholars have turned to other fields.

### **The Field of Concomitance**

In 2011, noted educational change researchers Andy Hargreaves and Alma Harris sought to explore how organizations in the fields of sports, business, and education achieved success against the odds. In this influential study, the research team explored businesses and sports teams to understand the factors that drove success. In brief, the team found that organizations that perform beyond expectations: strive to reach a clear and compelling destination in relation to an unwanted or underestimated departure point; establish solid underpinnings and creative pathways as well as clear indicators of progress for reaching the desired destination; cultivate and co-ordinate everyone's capabilities to embark on and complete the challenging journey together; and develop the drive that maintains momentum and provides the steering and direction that ensures the effort does not miss the mark (Hargreaves & Harris, 2011, p. 4). The authors note in their study that "systematic cross-checking" (p. 35) of educational practice with practice in other fields is rare; indeed, this study is one of the few attempts to do so.

### **Discontinuities and Ruptures**

Perhaps the greatest rupture in the study of global educational reform is a fundamental belief about whether or not it is truly possible. Deep divides in scholarship addressing this question persist in spite of decades of reform efforts. In an editorial in the *Journal of Educational Change*, authors Shirley and Noble (2016, p. 142) write: "In spite of everything that has been said and written, scholars and practitioners persist in believing that a single intervention—be it through innovative technology, curricular change, or just the right pedagogy—will lead all educators to a never entirely defined promised land." Yet at the same time, deep skepticism remains about sustainability and spread. Harris and Jones (2018) warn of the dangers of borrowing reforms from other contexts, most especially nations' lack of readiness and different approaches to governance that can hinder implementation. Likewise, Le (2018) warns that even the best-intended reforms can ultimately reify rather than challenge existing norms.

In addition to the challenge of scale, three additional discontinuities shape the field of global educational reform. Shirley (2020) calls these discontinuities vectors. The first vector is educators' professionalism. Within this vector, scholarship explores where professionalism resides (and does not reside) and how it has grown or diminished over time, particularly in relation to large-scale national policy efforts. The second vector is scale. As described earlier, questions of scale relate to the identification of successful reform or change efforts and how such reforms or changes travel

across contexts. Scale also relates to impact; how does a successful reform grow in its reach from one classroom to many? Finally, the third vector is justice. Questions of justice in the field of educational reform respond to how educators and educational institutions both empower students most in need of quality education and eliminate or mitigate the barriers that may keep quality education from occurring.

While these vectors describe the discontinuities within the field, it is also essential to delineate the areas where scholarship in the field remains in need of development. For the field of educational reform and change, these areas primarily center on the locus of the research, both where it is generated and the areas it describes. As Garcia-Huidobro and colleagues write (Garcia-Huidobro, Nannemann, Bacon, & Thompson, 2017), the Anglo- and US-centric nature of educational change research limits the capacity to truly understand change writ large. At the same time, the research is generated primarily from scholars from the United States, United Kingdom, and Europe, again limiting a deep understanding of reform (Fleisch, 2020).

### **Critical Assumptions or Presupposition**

Two essential critical assumptions of global educational change are that change takes time and that schools are fairly immutable organizations. First, the idea that change takes time is perhaps one of the most fundamental understandings of reform as well as a primary source of tension between policy and practice. Policy is undergirded by urgency, whereas practice is undergirded by deep contextual understandings of the nuances of reform. The assumption that change takes time is a key understanding in Fullan's (2007) *The New Meaning of Educational Change* and underscores one of the inherent tensions in reform work: while the need for reform typically emerges from crises or emergencies within educational sectors, the process of reform is nuanced and slow. Thus, reform is frequently seen to fail, yet rarely is the fact that not enough time was allowed seen as a potential factor.

A second critical assumption is frequently referred to as the grammar of school. Originally described by Tyack and Tobin (1994), the grammar of schooling includes those aspects of schooling which have become institutionalized and are particularly challenging to disrupt. A challenge of education reform is that in spite of myriad efforts, schools nearly always revert back to the grammar of schooling. More recent writing (Mehta & Datnow, 2020) moves the needle by suggesting that a challenge of reform research is that it tends to focus on averages rather than outliers; in their article, Mehta and Datnow suggest that understanding reform may need to shift more toward looking at exceptions rather than rules.

---

## **Introduction**

As described earlier, three vectors describe the research about the global challenge of educational reform. These vectors address fundamental questions within the field: Who is doing the work and how are they supported? How can reform that is successful in one realm be both sustained within that context and travel to other contexts? Who benefits? These sticky questions are not rhetorical, and yet they also

do not have an answer. In spite of decades of practice and research, much of the field of educational reform remains in flux.

Others have traced the arc of educational reform scholarship over time (Garcia-Huidobro et al., 2017), elucidating the waves of educational change through research and practice in the field. This chapter builds upon such scholarship, describing the global challenge of educational reform, briefly tracing the history of reform over the last 20 decades in order to frame the understanding of educational reform, and then outlining the obstacles that have been met along the way. These waves of reform and across the waves the vectors of change play a strong role in making sense of the past and highlighting the global challenge of educational reform work. The chapter then describes the challenges of the present moment, including but not limited to the impact of the Covid-19 pandemic on reform efforts. Finally, the chapter presents a vision of the future of educational reform.

---

## The Origins and Outlines of Educational Reform

In this chapter, it will not be possible to describe the entire history of educational reform. Rather, the chapter will describe the outlines of educational reform, providing a shape and structure, albeit shifting, of the influences impacting the durability of educational reform in a global context. Instead of focusing on events from a historical perspective, the chapter includes several key concepts in the field as well as the scholars and research that have shaped the development of educational reform as a field of study. It is important to note additional limitations of this work. First and foremost, as described earlier, for most of the last century and even into the current one, the *understanding* of educational reform has derived nearly exclusively from Western contexts. More specifically, as referenced in the waves of reform listed above, the understanding has come from the United States and the United Kingdom. This is not to say that only those contexts have experienced educational reform; rather, it is to highlight the concern that those areas remain the most dominant contexts for study and exploration of educational reform. Second, what is described in this chapter comes from scholarship in academic journals; there is a wide array of writing in other venues including practitioner journals, but for the purposes of this chapter, the focus is only on books and articles from more academic venues.

## The Global Challenge of Educational Reform

As outlined earlier in this chapter, the history of educational reform is a small chapter in the general study of education more broadly. The *Journal of Educational Change*, the academic venue dedicated to the study of reform and change, is only now entering its third decade. Across this span of time, however, a great deal has been learned about educational reform. This section includes a deeper description of the three key understandings of global educational reform described earlier in the Field of Presence.

## Sense-Making

In spite of policy efforts that seem to imply a linear relationship between reform and change or improvement, educational reform is not simply a technical matter. Rather, reform is highly relational, shaped, and influenced by the myriad interactions and relationships as well as personal factors that exist within school buildings and those who work in them. Reform cannot occur, and most certainly cannot succeed, without people, and people, it can be simply said, are complex.

Research underscores the relationship between biography and teaching experience (Kelchtermans, 2009); a key feature of reform is how teachers experience it and make sense of it (Coburn, 2001). Reform is deeply intertwined with who teachers are as unique people. That is to say, reform efforts may have differential impact based on teachers' prior experiences with change (Bailey, 2000; Huberman, 1989, Kaniuka, 2012; Sannino, 2010), which affects their readiness or willingness to engage in new reform efforts. Additionally, reform is influenced by teachers' beliefs about change (Kelchtermans, 2009), as well as teachers' unique attributes such as their biography (Kelchtermans, 2009), generational identity (Stone-Johnson, 2016, 2017), age (Evans, 1996; Hargreaves, 2005), and career stage (Evans, 2000; Hargreaves, 2005). Similarly, reform itself is not neutral; when enacted in schools, its meaning shifts, requiring individual and collective sense-making which result in varied responses and effects (März & Kelchtermans, 2013).

Why, then, is sense-making a challenge for global educational reform? Primarily, research on sense-making highlights the tension between the necessity for reform and its subsequent implementation and the lived experiences of those asked to enact the reforms.

Even as research that supports the idea that people must believe in particular reforms for them to succeed, reforms are pushed at skyrocketing rates. The lack of attention to teachers' experiences is a primary driver of reform failure. Not only do reforms without teacher buy-in fail, there are long-lasting effects on teachers' careers. For example, in Huberman's (1989) classic study of the teacher life cycle, experienced teachers who engage in reforms but do not meet with success depart from their career more bitter than those who are more successful. The effects can be equally devastating for new teachers as well, including departure from teaching jobs as well as from the profession as a whole (Achinstein & Ogawa, 2006).

## Scale

The enticing lure of educational reform is that change is possible. Schools and systems worldwide engage in reform efforts to improve outcomes for students. It is logical, then, that when success happens in one realm, others will want to attain the same success in their own realm and will attempt to borrow reforms to enact in their own contexts. In a highly influential paper, Elmore (1996, p.4) raised the question of how reforms can move from "pockets of excellence" to more classrooms:

The problem of scale is not a problem of the general resistance or failure of schools to change. Most schools are, in fact, constantly changing—adopting new curricula, tests, and grouping practices, changing schedules, creating new mechanisms for participation in

decisionmaking, adding or subtracting teaching and administrative roles, and myriad other modifications. Within this vortex of change, however, basic conceptions of knowledge, of the teacher's and the student's role in constructing knowledge, and the role of classroom- and school-level structures in enabling student learning remain relatively static.

The last two decades of research in educational reform, however, have brought to light the issues that arise when a reform that is successful in one context is either taken up or forced in a new context (see, e.g., Stein et al., 2004). Most recently, the importance of context has taken center stage. In a special issue of the journal *Educational Research for Policy and Practice* about context and scale, guest co-editor Helen Janc Malone (2018, p. 192) draws attention to the importance of attention to local context, arguing that “shared practitioner values, beliefs, goals, processes, and opportunity to authentically collaborate facilitate the likelihood of an intervention implementation in a way that both honors the strategy and the context in which it is situated.” When reforms honor context, they can flourish. For example, Niesz and Ryan (2018) describe how Activity-Based Learning drew upon teacher ownership at every stage to scale from a local effort to a statewide strategy. Similarly, Osmond-Johnson and Campbell (2018) describe how the province of Ontario scaled up reform efforts through partnerships, attention to teachers' professional needs, and a networked approach to support, drawing on individual and regional strengths to spread change. In contrast, when reforms are implemented without attention to context, they may be more likely to fail. Le (2018) describes how Vietnam's attempt to adopt the child-centric and teacher-focused reform *Escuela Nueva* suffered when local norms of valuing textbooks hampered the spread of the reform's innovations.

After years of study regarding scaling up educational change, Elmore (2016, p. 531) recently revisited his earlier writing, pointing to the importance of context in the role of scaling up educational reform: “[I]f we have learned anything from 25 to 30 years of attempts to ‘reform’ education it is that every effort at reform is heavily influenced by the contexts, micro and macro, in which it exists. In the face of this understanding, the idea of ‘scale’ seems either very superficial or downright wrong.” Thus, an essential learning from the field is that reforms cannot simply be transported from one context to another without knowledge and understanding of the factors that hinder or support its success. As Stone-Johnson (2018) writes, five contextual features influence the potential for reforms to spread. First, a system's size affects its ability to scale reform. Smaller systems are more likely to support fidelity to reforms, whereas larger systems depend upon implementation in multiple local levels which can dilute the capacity for fidelity. Second, a context's locus of control matters. Centrally controlled systems can stymie reform efforts, whereas systems with more organic and participatory decision-making can be more supportive. Third, a system's norms matter. Systems with high levels of managerial norms encourage compliance rather than the necessary forms of sense-making described earlier; in contrast, systems with lower managerial norms allow for more grass-roots decision-making. Fourth, the socio-cultural context of a system matters. Contexts with deep rule-abiding norms foster fear over engagement, whereas cultures that support risk-taking offer teachers more agency. Finally, a context's socioeconomic development

matters. In contexts where teachers hold multiple jobs as a means of economic support, teachers have less stability in their roles; in contrast, more developed contexts provide a sense of stability that fosters sustained engagement.

### Structure

Much of the conversation in this chapter thus far has related to the *nature* of the changes themselves as well as the people who implement them and the national and international contexts where they are implemented. Less attention has been paid to the schools themselves: how schools and spaces within them are or are not set up to facilitate reform and its spread, how days and working spaces are or are not arranged to provide time for both young people and adults to learn together, and how school leadership does or does not talk about or support teachers in the process of change. Yet these structural concerns may be equally important to the success of reform. As with sense-making and scale, understanding how schools themselves facilitate reform warrants exploration.

One of the most studied structural changes influencing global educational reform is the introduction of professional learning communities. Professional learning communities bring professionals and evidence together in order to generate improvements in practice and student learning (DuFour et al., 2004; Hargreaves & Fullan, 2012; Stoll, Bolam, McMahon, Wallace, & Thomas, 2006). Professional learning communities are intended to promote collaborative work and discussion and to focus tightly on improving student learning. As such, they attempt to address the challenge of heroic leadership described in the introductory portion of this chapter. School leaders cannot reform alone; the work requires a team effort. At their heart, professional learning communities are intended to bring teachers together to focus on change efforts. In reality, as McLaughlin and Talbert (2001) note, not every professional learning community is actually concerned with improvement. Professional learning communities are most successful when they have shared values and vision; employ collective responsibility; include reflective professional inquiry; rely on collaboration; and promote group as well as individual learning; include mutual trust, respect, and support among members; are inclusive in membership beyond just the members; and look beyond the school for inspiration (Stoll et al., 2006).

The danger of professional learning communities comes when they are viewed solely as structural rather than social changes. As Hargreaves (2003, p. 185) writes, “Professional learning communities do not flourish in overly standardized systems which restrict teachers’ discretion for decision-making and self-initiated change.” With pressure to focus on data and student achievement, professional learning communities can quickly devolve into what Hargreaves (2003) describes as performance training. Under such conditions, professional learning communities lose or at least minimize the benefits outlined above and devolve into performance training sects which can lack teacher reflection or judgment. In a pressurized context of raising student achievement in the United States and United Kingdom, professional learning communities ultimately became equated with quick fixes rather than long term ways of thinking and learning in school (Hargreaves & O’Connor, 2017).

To address this concern, more recent research suggests a shift away from a focus on professional learning communities and toward collaborative professionalism (Hargreaves & O'Connor, 2018). The difference is more than semantic; Hargreaves and O'Connor describe collaborative professionalism as a transformation rather than a reorganization of teaching and learning. Professional learning communities and their very structure are endangered by the potential for usurpation by larger policy needs, whereas collaborative professionalism, as more of an organizing principle, may be less fragile.

While teachers are at the heart of collaborative professionalism, strong school leadership creates, supports, and nourishes it. One of the most enduring concepts over the last two decades in research in educational administration and educational reform is distributed leadership. Harris and Spillane (2008) define distributed leadership as the perspective that within a school there are multiple leaders and that the activities of leadership are spread both within and across organizations (Harris, 2007; Spillane et al., 2004). Distributed leadership is not the same as delegating leadership; it is a reframing of the work of leadership to move beyond the challenge of instructional leadership as dependent on one leader to the belief that leadership resides throughout a school. At its heart is the elevation of teachers and others in the building to a semblance of teacher leadership. While the definition of teacher leadership, as with many concepts, is varied, Wenner and Campbell (2017, p. 140) define teacher leaders as “teachers who maintain K-12 classroom-based teaching responsibilities, while also taking on leadership responsibilities outside of the classroom.” A full description of teacher leadership is beyond the scope of this chapter, but it is necessary to demark the importance of leadership and the shift from heroic to shared as a factor in educational reform. Leaders cannot do the work of reform without others, and yet forcing reform on others is not a viable or desirable solution. Leadership that is inclusive and woven throughout a building is more likely to result in change that lasts.

---

## Conclusions and Reflections

This chapter traces the arc of the challenge of global educational reform. In doing so, it identifies three interrelated concepts: sense-making, scale, and structure. Sense-making refers to how teachers and others who are expected to implement reforms orient to them. Evidence indicates that reforms are not neutral but rather shaped at the ground level by a variety of factors including but not limited to teachers' prior experiences with change, their age, their career stage, and their generation. Scale refers to the process of taking a reform that has been successful in one context and attempting to implement it in another. While the possibility of scale remains debatable, most recent research indicates that understanding the contextual features of new reform locations is essential to any potential success. Finally, structure refers to how schools and systems are arranged to facilitate or hinder reforms efforts. School leadership plays a prime role in this effort through organizing schools and classrooms to be sites of collaboration, professionalism, and shared decision-making.

Had this chapter been written a year ago, a discussion of shifts or anticipated ruptures or controversies would likely have included a plea for schools and systems to prioritize each of these three factors. Attention to teachers' experiences with reform would center on the high number of new teachers in the field and the rising rates of teacher turnover even as the last generation of teachers retires. The potential for institutional memory fades in the face of such high turnover. A focus on how less experienced teachers orient to change would be needed in order to address this challenge. A controversial stance would be to investigate how alternative school arrangements such as charter schools in the United States have addressed this challenge, as such schools are associated with high levels of teacher turnover (Stuit & Smith, 2012).

Attention to scale would likely have included a plea to focus more on the contextual challenges of reform implementation. Pressure to improve with the publication of international indices such as PISA and TALIS can drive systems to adapt quick and a-contextual changes but, as the research argues, doing so would likely not result in any sustainable improvements. Identifying factors associated with systemic readiness for reform would be an essential next step in understanding if and how reforms can travel.

Attention to structure would likely have included the suggestion for schools to become sites of genuine collaboration and professionalism. Understanding the importance of valuing joint work and finding ways to make work meaningful would ultimately benefit teachers' experiences with reform as well as systemic capacity to support it over time.

At the writing of this chapter, however, a new variable has added a layer of complication. Beginning in early 2020, the Covid-19 pandemic upended schools, shuttering nearly every school building around the world for at least a period of time. Many, especially in the United States, remain closed or open only in a hybrid fashion with some learners in the building and some learning from home. Even as Covid-19 has laid bare some of the deepest challenges of schooling, most especially educating the most vulnerable students, the pandemic does offer a chance for many of the challenges outlined in this chapter, particularly the grammar of schooling, to finally be overcome. At the school level, Powers and colleagues (Powers, Brown, & Wyatt, 2020) describe a unique school that relies on project-based learning, teacher looping, and support for social emotional learning, among other aspects, to support students through transitions in and out of school. At the teacher level, Hargreaves and Fullan (2020, p. 335) indicate that the pandemic sparked creativity and collaboration in response to the crisis facing schools, decoupling educators from "bureaucratic micromanagement." At the system level, Sahlberg (2020) offers two ideas. First, addressing inequality means more than technology support; governments must focus on equity to move forward. Second, ideas should come from those who work in the schools. Sahlberg (2020, p. 364) suggests that leaders should "loosen the grip on control and increase freedom."

Given the longitudinal nature of this chapter, it may not be wise to focus on the impact of Covid-19 on the prospects for global educational reform; its full impact has yet to be determined. Regardless, the earth-shattering nature of the pandemic on schools may, for those with an optimistic outlook, provide the fuel necessary to overcome the challenges described in the earlier portions of this chapter.

## Abstract

While essentially a borrowed concept in the field of educational leadership studies, this chapter makes a case for paradox as both theoretically and practically useful as an intervention in the constitutive politics of school leadership. Drawing from the historical emergence of epistemological paradox, the pragmatics of organizational studies and some of the threads of post-structuralism, paradox is conferred with additional theoretical content directed to its use in critical-oriented inquiry. A paradox lens is subsequently formulated to reveal the conflicting forces

shaping school leaders and their work. A number of paradox examples, taken as central in the working lives of leaders, are provided to illustrate claims to an enlarged functionality, to illuminate ways of seeing school leadership differently, and to test whether paradox might be fitted to the critical engagement of school leaders in matters of power, authority, and freedom. The aim of the chapter is not to make a complete case for the application of paradox, but rather to ask and try to answer the question “does the use of paradox translate into *crucial functions* and *practical gains* in understanding that otherwise would not have been available?”

**The Field of Memory**

Currently favored depictions of school leaders give prominence to singular and idealized versions over those which foreground paradoxical qualities. In neoliberal times, the rich history of paradox in Ancient and Renaissance literature is subjugated to popular models of leadership that emphasize an agile and single-minded compliance directed to optimizing participation in the schooling marketplace. However, by dint of the continued presence of conflict and ambiguity in the lives and work of contemporary leaders, it remains possible to detect important paradoxical qualities and, more ambitiously, to bring the historical prominence and current-day relevance of paradox to the development of new theoretical possibilities for thinking and seeing school leadership differently.

**The Field of Presence**

In thinking about leaders and their work, the objectivity of the sciences and positivist assumptions about a capacity to discover an absolute and generalizable truth have marginalized other claims to the truth made in an outside space of multiple, and even contradictory, readings. Instrumental and scientific models of leadership dominate a field that constructs schools as corporate businesses and asks school leaders to respond by making themselves entrepreneurial and responsible agents of neoliberal transformation. The necessity of these populist models is sheeted home by causal links constructed between effective leadership and measured improvement in student outcomes and by devising generic lists of desired traits, attributes, and behaviors against which leaders can be chosen, managed, and valued.

**The Field of Concomitance**

Thinking and seeing with paradox draw heavily from outside the field of critical leadership studies. While Ancient and Renaissance uses of paradox provide useful historical into their longevity and durability, the most influential contemporary insights come largely from the field organizational studies. Ideas about the tensions

that arise out of competing interests and ideas, the simultaneity and interdependence of the sides in paradoxical conflict, the joining and separating of paradox from a number of its familial concepts, and the importance of managing persistent and systemic contradictions in the workplace all draw heavily from the theoretical insights and empirical work of organizational studies scholars.

### **Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field**

Interrupting a tendency to benign and generic readings of leadership and expectations of uniformity and compliance in those designated as leaders requires consideration of the political possibilities that paradox might add to understandings of school leaders and their work. Post-structural thought about the constitutive possibilities in discourse, the primacy and ubiquitous presence of contradiction, and the way a doxa/paradox dialectic brings contingency to cemented-in orthodoxies about leadership, all connects paradox with politically oriented functions. These threads of post-structuralism reveal how paradox, when taken as formed in an unstable network of dominant and subjugated discourses, might suggest new subjectivities, less restrained freedoms, and practices of critique and resistance.

### **Critical Assumptions or Presupposition**

Claims made for expanded theoretical and practical uses of paradox rest on the important assumption that paradox forms and operates in discourse, rather than as a reflection of it. Further advancing this perspective, depictions of paradox as a constitutive presence, rather than just a symptom of tension and conflict, rely on a Foucauldian interpretive that takes the operations of discourse as *forming* reality, thus opening productive possibilities for thinking about what discourse is doing in situations where paradoxes form. Importantly, this interpretation broadens the epistemological space of paradox by rendering it as neither neutral nor apolitical. Another presupposition forms around satisfying paradox's demand for an audience to its workings. Taking school leaders as a willing audience to paradox makes broad assumptions about their willingness to interpret the conflicts in which they enmeshed as paradoxical, to hold open the sides of these conflicts to deep and extended scrutiny, and to resist the temptation to hasty, oversimplified, or one-sided resolution.

---

## **Introduction**

In the West, paradox has its origin in the Greek *para* (beyond) and *doxon* (opinion) signifying opposite meaning. In ancient Greek literature, it appeared to denote situations or propositions that opposed or even reversed the common meaning or expectation, conferring on paradox the "ability to challenge common opinions, to rankle to unsettle" (Platt, 2016, p. 4). These qualities are amply displayed in *Zeno's paradoxes* (written by Greek philosopher Zeno of Elea, 490–430 BC), including the

famous Arrow and Achilles and Tortoise paradoxes. The 10 known paradoxes attributed to Zeno are formulated against scientific assumptions of the day about divisibility of time and space. While this creates the enduring paradoxical quality of the seemingly impossible existence of contrary sides, it also shifts the emphasis in these paradoxes from tight rhetorical construction to thinking about and constructing new oppositions to the status quo.

Somewhat akin to the enduring interest of western philosophers and scholars in Zeno's paradoxes, this chapter is directed away from resolving persistent ambiguities in the lives and work of school leaders by trading off contrasting options or employing strategies for resolving conflict. Rather, it is concerned with using paradox to think about, talk about, and see things differently – to hold open and scrutinize its “complex pluralistic tensions” (Ivory & Brooks, 2018, p. 349) and to find generative possibilities in the coexistence of its contradictory elements.

Applied to the forces shaping leaders and their work, such analysis has paradox exceed its depiction as a symptomatic presence in the workplace. Instead of functioning only as a representation of conflict, ambiguity, and tension, paradox is taken to be formed in the constitutive practices of discourses and, following Foucault's theoretical insights, to open productive possibilities to think about what discourse does (or is doing) in situations where paradoxes form. Such a “constitutive approach” opens a wider epistemological space and reveals paradoxical tension as neither neutral nor apolitical.

The suggestion in the title of this chapter that paradox might intervene in the shaping of school leaders and their work assumes a level of functionality and efficacy for paradox that is not immediately obvious in its everyday, common language use. Against a tendency to refer to the sides of any argument as “paradoxical” and to easily resort to the clichéd claim that “it's a paradox,” this chapter works to establish a broader interpretation and more practical application. Underpinning these aspirations, a two-part process is used in this chapter to, firstly, establish additional *theoretical content* for paradox as a tool of thought and, secondly, to shift this theoretical content into practice by using a *paradox lens* to explore the constitutive politics of school leadership.

In building theoretical content, Colie's (1966) notion of “epistemological paradox” is used to hinge a case for thinking with paradox that draws from its historical prominence and durability. Further support is derived from the use of paradox in contemporary research, especially in the field of organizational studies, and from its productive links with the work of post-structuralist philosophers including Michel Foucault and Roland Barthes. Theoretical possibilities for thinking with paradox are subsequently translated to practice by using a paradox lens to look differently at school leadership. This lens is deployed to various purposes directly related to the practices of leaders, including challenging the certainty of currently available leader subject positions, causing mistrust in the entreaties of the neoliberal policy field in which school leadership currently resides and finding in paradox ways of thinking, speaking, and acting that render the status quo more contingent and fragile. Several examples of paradoxes are used to illuminate practice and suggest a broader functionality for paradox in the field of critical leadership studies.

## Critical Deployment of a Paradox Interpretive Lens

The conjoining of the theoretical content of paradox to a paradox interpretive lens is to analyze school leadership practices by foregrounding complexity, plurality, and contradiction. To support such analysis, various conflicts and oppositional forces, taken as prominent in the lives and work of school leaders, are formulated in terms of their paradoxical qualities. These examples of paradox are used to illustrate the utility of a paradox lens. The aim is not to traverse the broad terrain of school leadership or to claim that a paradox lens provides a complete response to the question of constitutive influences. Rather, it is to show how paradox might be deployed as a critical tool for gaining insights that would otherwise be inaccessible. Deacon (2000) neatly captures the place of this work:

This is not to suggest that one ought to focus exclusively on discontinuity, to celebrate contingency, or to extol difference; rather it is a question of problematizing the superficiality of what appears to be profound, of warily exposing the transitory patterns that configure capricious chaos. (p. 142)

While conceding the illuminative limitations of a small selection, the critical deployment of a paradox lens in the examples which follow is directed to a range of “actionable and useful” leadership practices (Lavine, 2014, p. 191), including:

- *Joining macro-policy discourses of neoliberalism to the micro-practices of school leaders* – showing how the power effects of various discourses on the subjectivity of leaders directly influence both the conflicts, contradictions, and ambiguities that confront them and the choices they have for managing them.
- *Highlighting how the componentry of each paradox supports revival and maintenance of conflicting truths* – keeping or bringing into play the conflicting sides of paradox to suggest possibilities in subjugated and alternate practices and to highlight the presence of struggle over leader subjectivity.
- *Suggesting political possibilities for paradox that challenge the power relations that support the current doxa* – testing whether theoretical possibilities for paradox might have practical application in mitigating the risks and consequences of working beyond accepted and orthodox responses and in deploying critique to more palpable practices of transgression and resistance.

The confident assertion of these purposes, which prima facie may appear to counter the frequent calls made in the chapter for leaders to remain undecided in the face of conflicting alternatives, is to propose that a bigger space in which leaders might do critical work emerges when the tendency to rational reconciliation of the competing sides of paradox is halted. Marcus and Fischer (1999) provide support for this stance in claiming:

The only way to an accurate view and confident knowledge of the world is through a sophisticated epistemology that takes full account of intractable contradiction, paradox, irony, and uncertainty in the explanation of human activities. (pp. 14–15)

## Epistemological Paradox

Rosalie Colie, in her seminal text *Paradoxia Epidemica: The Renaissance Tradition of Paradox* (1966), draws upon the “many collections of paradoxes, ancient and modern” to chart the rediscovery and rise to prominence of paradox in Renaissance times “amongst the learned who made them up and the educated who were amused by them” (p. 4). Through an extended engagement with the literature, Colie suggests that paradox reached its intellectual peak in the Renaissance (see also Luhmann, 1995; Platt, 2016) as it gained a broader audience for its word games and tricks of logic, as well as exceeding its entertainment value in creating unorthodox oppositions and multiple perspectives. Drawing from this latter function, Colie (1966) describes paradox as “a formulation of any sort running counter to received opinion” (p. 9) and attaches to certain paradoxes an “epistemological” quality.

Colie’s “epistemological paradox” provides historical insights into thinking with paradox and opens possibilities for finding theoretical content beyond the logics and poetics of its Renaissance deployment. Colie (1966) says that “the epistemological paradox calls into question the process of human thought, as well as the categories thought out (by human thought) to express human thought” (p. 7). Following Colie, epistemological paradox opens possibilities for other ways of thinking and talking by “stimulating further questions, speculation, qualification, even contradiction on the part of that wondering audience” (p. 22). Colie’s claims for epistemological paradox offer an important first step in mitigating a tendency to regard paradox as “logically unserious” in the construction of theory (Luhmann, 1995, p. 30) and in ushering in new knowledge-forming possibilities that counter the scientific and rational explanations that saturate the current field of educational leadership studies. Epistemological paradox also orients paradox towards more critical purposes. As Colie notes, such paradoxes “play with rational discourse” and challenge “at the edge of progressive thinking,” that which has become fixed “into adamant hardness” (p. 7).

### **Finding Other Ways of Thinking and Talking: *The Paradox of Team Belonging***

The shifting of paradox “from a label to a lens” (Lüscher & Lewis, 2008, p. 222) carries the promise of epistemological paradox to prompt new thinking and to call into question that which has become a matter-of-fact and obvious. *The paradox of team belonging* is used here to illustrate these qualities.

Team membership and collaborative work have become cornerstones in multiple depictions of school leaders and leadership in the literature (e.g., Kouzes & Posner, 2007; Senge, 2006; Spillane, 2012). Taken collectively, these accounts suggest that large amounts of leaders’ time, both within and beyond their schools, are (or should be) devoted to working together in teams. These readings provide various expressions of leaders’ commitment to collaboration and teamwork, for example, in

outwardly generous efforts to distribute leadership responsibility, fostering broader participation by establishing professional learning communities, championing an open-door policy, and engaging in various professional and social interactions with colleagues. The preference for being “one of the team” is also found in a dislike among leaders of a vocabulary that signifies their power and control and a preference for descriptors such as “influential” and “collegiate” (see Dolan, 2020).

While seemingly benign and productive in its various iterations, the team belonging that leaders appear to covet, when viewed paradoxically, redirects “thoughtful attention to the faulty or limited structures of thought” (Colie, 1966, p. 7) that allow an uncritical embrace of collaboration and teamwork. Lewis (2000) provides a useful template for a paradoxical reading in what she terms “paradoxes of belonging”:

Paradoxical tensions arise because actors strive for both self-expression and collective affiliation. Seeking to comprehend their roles in a group, organisation and/or community, members attempt to artificially distinguish themselves (e.g., differentiating personal competencies, occupational practices, or ethnic values). (p. 769)

*The paradox of team belonging* applies the tension that Lewis depicts between “collective affiliation” and “self-expression” to school leaders and their work. A wider epistemological space for thinking about leaders’ fondness for various affiliations is proposed by paying closer attention to the paradoxical qualities in two aspects of leadership practice.

Firstly, *the paradox of team belonging* highlights a personal conflict of identity. Leaders in schools might appear greatly enamored with being “one of the team,” but, paradoxically, they also enjoy depictions of themselves that draw on metaphors of ship captains and company chief executives, and that point to their positional power and strong and decisive individual actions. To understand the workings of this paradox requires thoughtful attention be paid to the reasons for leaders’ involvement in a multiplicity of group settings such as committees, working parties, consultation groups, professional networks, and learning teams.

Against an idealized depiction of wholehearted and generous involvement, a paradoxical understanding rests on more diverse set of leaders’ experiences and more searching consideration of their motives for collaboration. Reading from Lewis’ (2000) observation of “the tenuous and often seemingly absurd nature of membership” (p. 769), a certain ambivalence can be taken to surface when leaders feel compelled to displays of willing participation in groups and at meetings where they feel disconnected and irrelevant. Bringing this ambivalence to the sides of Lewis’ (2000) identity/belonging tension, it becomes possible to interpret an enthusiasm among school leaders for their collaborative commitments in terms of the opportunities they can derive to both express their individual worth and find a purpose that is personally useful. Such an interpretation speaks to the identity tension founded on the leader’s desire to distinguish and assert themselves individually while simultaneously displaying loyalty and allegiance to the group.

A second expression of this paradox takes the clamor of the individual desire for distinction and a strident preference for teamwork as competing interests in the work

leaders do in “people management . . . to meet structural and follower demands” (Zhang, Waldman, Han, & Li, 2015, p. 538). A significant component of people management involves leaders in establishing, managing, and sustaining a wide range of groups within their schools. Group membership, whether derived from mandatory or voluntary participation, is lauded not only as a vehicle for accomplishing change and improvement but also as creating a sense of loyalty and belonging. Accordingly, leaders are regularly engaged in public affirmations of the work of groups (and private affirmations of individuals within these groups), in linking various teams to identified school priorities, and in using group structures to build consensus and resolve conflict.

New ambiguities and conflicts materialize in the complexity of these team-affirming practices, as smooth and positive depictions of team belonging emerge in practice as not only uneven and messy, but potentially problematic and exclusive. The unambiguous regard leaders show for the power and importance of teams when joined with their desire to “seek both homogeneity and distinction” (Smith & Lewis, 2011, p. 383) surfaces questions about whether leaders’ outwardly altruistic reasons for garnering the collaborative participation of others may disguise motives of self-interest and personal advantage. Here, *the paradox of team belonging* works epistemologically “to stimulate further thought in the reader, even further speculation” (Colie, 1966, p. 21) by raising issues, for example, about the uneven contribution of individuals to teams, the symbolic and perfunctory qualities of membership, and the inherent jealousies, competitions, and squabbles that confound perceptions of smooth order. A paradox lens also interrupts the logic on which teams are founded and publicly championed, thus revealing the role that membership plays in excluding those not deemed suitable and enhancing the status and personal ambition of those who “make the cut.”

Against the opportunism and deception that may be read into a tendency among leaders to direct team involvement to enhancing their personal standing and power, a paradox lens may also be turned to more productive ends in identifying a need to find different ways of working together. Here, *the paradox of team belonging* points to the potentiality of a new “democratic horizon” (De Lissovoy, 2015, p. 24) at the intersection of various leader identities. It opens the possibility of a multiplicity of authorities and collaborations and for engagement in different processes of democratic leadership practice and self-formation.

---

## Meaning and Distinction

Shifting away from concerns with orthodox/unorthodox positions and the reversing of common meaning, contemporary research into workplace paradox – principally conducted by organizational studies scholars – appears more interested in the “tug-of-war experience” of contradiction (Schad, Lewis, Raisch, & Smith, 2016, p. 10). In examining the tensions that arise out of competing interests and ideas, definitional emphasis shifts to what Smith and Lewis (2011) describe as “contradictory yet interrelated elements that exist simultaneously and persist over time” (p. 382).

Carefully establishing the meaning of paradox – and positioning it alongside other familial terms – is first directed to a more complete explication of its theoretical content and practical application in school leadership by making a case for resisting the reductive qualities and simplified shaping of dilemmic conflicts and embracing the possibilities in what is termed “true paradox” or antinomy.

### Resisting Closure: Paradox, Dilemma, and Antinomy

A componentry of contradictory yet interrelated elements brings into sharp relief the differences between paradox and the “cleft stick” qualities of *dilemma*. Paradox works against a tendency to see tension and conflict forming in the “either/or” choices of separate and opposing poles and resists the temptation a dilemmic construction provides for “weighing the costs and benefits of each choice and deciding which one is most advantageous” (Stoltzfus, Stohl, & Seibold, 2011, p. 351). Rather, a paradoxical reading supports a “both/and” approach (Smith, Lewis, & Tushman, 2016) that adds new theoretical content by using the simultaneity and interdependency of conflicting sides to hold open and keep in play opposing elements and their interactions. Translating this theory into practice means inviting school leaders to resist closure and embrace the complexity of a paradoxical interpretation rather than trying to configure their conflicts as dilemmas and seek quick resolution using more reductive and expedient possibilities. These contrasting practices yield important insights into the challenges of thinking with paradox while also working to shift a “both/and” approach away from allegations of weakness, ambivalence, and fence-sitting. They suggest that, in seeking a more “rigorous, skeptical intelligence” (Stevens, 1996, p. 210) in paradox, leaders must also manage attendant risks and discomforts in a struggle between prized leadership qualities of “parsimony and internal consistency” (Lavine, 2014, p. 191) and a need hold to less decisive and more expansive ways of managing conflict and tension.

Adding persistent and entrenched qualities to its meaning moves paradox away from an entertaining play of logic and rhetoric towards more serious contemplation of its entwined sides. Rappaport evokes the *antinomy* in claiming that researcher must distinguish between the “false” paradox that may resolve, disappear, or crumble under scrutiny and the “true” paradox constituted as antinomy by the validity of the claims held in its opposing arguments and its resistance to easy resolution. Enhanced theoretical possibilities emerge as the consideration of paradox as antinomy strengthens calls to question accepted ways of reasoning that are directed to single solutions.

For school leaders, identifying and working with true paradoxes include a call to abandon the search “for one monolithic way of doing things” (Rappaport, 2002, p. 137) or, put differently, to concede the impossibility of deciding in favor of one side of deep-seated and irreconcilable opposites. The risks and difficulties of such a concession are clear in Quine’s (1976) famous essay *The ways of paradox*, when he notes that antinomies “bring on the crises in thought” by establishing that “some tacit and trusted pattern of reasoning must be made explicit and henceforth be avoided or

revised” (p. 5). The qualities of the true paradox and the seductions, simplifications, and drawbacks of dilemmic construction of tensions are now illustrated through *the paradox of stability and transformation*.

### **Dealing with Antinomy: *The Paradox of Stability and Transformation***

In models of transformational leadership and associated literature, Ball (2012) notes that designated school leaders, especially principals, are cast as the “one figure . . . invariably crucial either in initiating or supporting change in the school” (p. 78). As already noted, school leaders are deeply interested in building collegiality and loyalty among members of the school community. *The paradox of stability and change* works from the inherent tension between the change agenda that those in designated leadership positions seek to enact and a workforce that, by virtue of long-established loyalty and organizational identification, is resistant to the change and more wedded to the stability and comfort of existing arrangements.

The construction of this conflict as paradoxical draws heavily from the now famous research of March (1991) into the tension in organizations between what he terms “exploitation” and “exploration.” Succinctly put, March claims that *exploitation* – the short-term operational work of organizations expressed in “the refinement and extension of existing competencies, technologies and paradigms” – is at odds with *exploration*, the longer-term, innovative work associated with “experimentation with new alternatives” (p. 85). March contends that both exploitation and exploration are necessary for success but that there is a tension brought on by the incompatibility between the reliable gains and efficiencies sought in exploitation and qualities of exploration, such as variation, risk taking, trial and error, flexibility, and discovery.

This tension is often masked by an orientation to the more comfortable and familiar preferences of the parties involved. Non-leadership staff direct their work to an understanding of what designated leaders want, thus creating an iterative and self-reinforcing effect as the leaders in turn provide affirmations of that work. Some obvious benefits flow from these arrangements. Staff are motivated to accomplish tasks and contribute to broader organizational objectives, levels of comfort and work satisfaction are enhanced, and a deeper loyalty to leaders and a stronger identity with the school are built. For leaders, these arrangements support their use of team metaphors about staff cohesion and loyalty and the uniqueness of the group while providing a context for showings of praise and regard that help legitimize claims about individual competence and school achievement.

Interpreted into the work of school leaders, this preference for the comfortable and familiar translates to a way of mobilizing the existing staff to effect short-term change and improvement or, in the vernacular of organizational research, exploiting “the information currently available to improve present return” (March, 1991, p. 72). Leaders create the parameters within which the rest of the staff execute agreed and known tasks. The mutually beneficial outcomes of those tasks become part of a cumulative loop of feedback and accomplishment. In effect, even if leaders recognize a conflict between exploitation and exploration, it is likely constructed as a

dilemma that is most comfortably resolved by staying with the familiarity of existing arrangements.

However, a number of limitations are revealed when the stability inherent in exploiting the known is considered against the need for change or, in March's (1991) words, "the exploration of new possibilities" (p. 71). While exploitation may yield short-term success, limitations of current knowledge and expertise narrow the possibilities for new ideas and innovation. Levels of comfort gained through mutuality and familiarity may morph into complacency and to what Watson (2013) describes as "stagnation and lack of adaptability to new situations" (p. 259). March's work emphasizes the interplay of exploitation and exploration and the need to maintain an appropriate balance between the two.

A preference for courting and championing of current staff as the key to the success of the school may, paradoxically, work to limit success by stultifying new possibilities and privileging comfort and mutual admiration over risk and dissonance in working relationships. An obvious reversal of this paradox can also be discerned in a preference for change over stability. As a "true paradox" or antinomy, *the paradox of stability and transformation* also suggests that the innovative and risky work of exploration must also be subject to closer scrutiny. For example, innovations such as major shifts in pedagogical practice, experimentation with new technology, and rearranging the school's leadership structure, while designed to gain advantage, may, in reality, be shown to be frustrating, time-consuming, and subject to failure.

*The paradox of stability and transformation* is instructive on several levels. For example, it notes the existence of a tangible space for the local shaping of change and innovation, separate from the pronouncements of outside policy. Interpreted through micro-politics of schools, it surfaces the power relations circulating through the practices of designated leaders associated with building loyalty and affiliation that are, more generally, rendered as benign and apolitical. In recognition of its antinomous qualities, *the paradox of stability and transformation* warns of the consequences for schools of leaders favoring one side of a persistent tension over the other while also suggesting advantages in holding open competing sides so that their separate merits and interrelations can be used to local advantage.

## The Dialectic

Continuing to draw on familial concepts, the *dialectic* can be interpreted as belonging in the paradox fold when it is not taken as a battle of antagonistic opposites and the interplay of its contradictory forces is not directed to having one subdue the other. Rather, the dialectic is aligned more closely with paradox when emphasis is shifted to matters of contingency and plurality, so that the interactions, convergences, and various alignments in its sides become the basis for discussion and analysis. Colie (1966) supports and extends this interpretation when she claims "(t)he paradox is always somehow involved in dialectic:

challenging some orthodoxy, the paradox is an oblique criticism of absolute judgement or absolute convention” (p. 10).

In this reading, the dialectic is shifted away from the Socratic processes for detecting truth and error through argumentative dialogue and Hegelian prescriptions for synthesizing a fixed meaning in the interplay of the thesis and its antithesis. Instead, close contemplation of relational qualities involves dialectics in “the synergies and possibilities beyond dichotomous tensions” (Lavine, 2014, p. 193) and, towards revealing the workings of power, emphasizes the incorporation of “multiple and competing viewpoints” (Putnam, Fairhurst, & Banghart, 2016, p. 119). This contribution to the theoretical content of paradox can be productively captured by using the idea of “thirdness” – the generation of “concepts and patterns of activity that go beyond and transcend the available opposing forces or options” (Engeström & Sannino, 2011, p. 371). “Going beyond” adds to the canon of paradox thought, possibilities from outside of the imagined boundaries of opposing sides that might first appear peripheral, irrelevant, or fanciful.

For school leaders, the idea of thirdness invites more creative possibilities in the contemplation of commonly depicted dialectic relationships such as subjectivity/freedom, control/resistance, individual/team, stability/change, and leader/follower (see Collinson, 2005). Dialectical studies, when focused on simultaneity, further caution leaders against the premature choice of one option over another in decision-making by suggesting the need to be sensitive to broader possibilities. It brings *heteroglossia* – the hearing of many voices and the consideration of multiple perspectives – to the language of paradox and, following Collinson (2014), “can surface important questions about organisational power relations, conflicts, tensions, paradoxes, and contradictions that are typically under-explored or marginalized within mainstream leadership studies” (p. 38).

## **Revealing Multiple and Competing Viewpoints: Leader/Follower Paradoxes**

*Leader/follower paradoxes* are revealed by problematizing a simplistic interpretation of school leadership as a top-down practice of control and coercion carried out by formally designated leaders, with followers rendered as docile and powerless. This dichotomous thinking perpetuates the idea of clear separation between leaders and followers and, in the asymmetry of its construction, fails to notice the active and influential role that followers play in constituting leaders and their work. In support of an interpretation of the multi-directional workings of power, Collinson (2005) emphasizes the importance of “followers’ practices” claiming that “they are frequently proactive, knowledgeable and oppositional” (p. 1419).

Implicit in thinking of followers as “knowledgeable agents” (Collinson, 2005, p. 1422) is the idea that power is not just the province of designated leaders. However, abundant images of heroic and visionary individuals feed favored constructions of leader identities and what Roberts (2009) describes as a “fictional

belief in the self as an autonomous entity” (p. 967). This leader-centric focus not only brings the leader/follower bifurcation into sharper relief but also overlooks the power and importance of followership. Leaders who assume identities that are individualistic, autonomous, and heroic are, paradoxically, dependent on the perceptions, “projections and fantasies” (Sinclair, 2011, p. 510) of followers to endow such an identity upon them.

In describing “the political and discursive processes by which manager and leader identities are manufactured, controlled and occasionally resisted,” Sinclair (2011) notes that leaders maneuver the well-known “characters and metaphors” of leadership “to provide consistency to their conflicting leadership experiences” (p. 508). This work is not just about a personal attachment to a preferred identity. It is also performative work, where public displays of qualities such as empowerment, collaboration, approachability, and mutual respect can be interpreted in terms of the recognition and admiration they induce in followers and the contribution they make in presenting the leader to followers as “watertight attractive” (Sinclair, 2011, p. 508). More productively, leaders’ overt displays of their attractiveness can be understood as a form of pastoral power (Foucault, 1982) directed not just to courting followers but also to mobilizing them. This interpretation is captured by Ball and Carter (2002) when they describe how teachers are “subject to the charismatic gaze” of leaders who “project a charismatic identity in order that they get results . . . in terms of staff commitment, motivation and empowerment” (p. 564).

The importance of the dialectical qualities of this *leader/follower paradox* affecting identity lies in its explanatory and interpretive functions related to power. It reveals something of the circularity of local power relations and a “micro-political conundrum” (Ball, 2012, p. 82) which has the leader caught in the tension between their own attachment to versions of themselves and their vulnerability to the opinions of others (see Collinson, 2006, p. 182). In this dynamic, a further paradoxical quality emerges when leaders, in their attempts to fashion their true and stable leadership selves – and thus render themselves “authentic” leaders – must take account of the power of followers to endorse, modify, and reject their performed identity. Paradoxically, this identity work is more likely to reinforce the very ambiguity and insecurity they are trying to overcome.

Interpreting the leader/follower dialectic through a paradox lens reveals the importance of taking account of the micro-political environment within which leader subjectivities are formed. Notions of a docile and impotent followership are refuted as a paradoxical interpretation reveals the constitutive importance of follower opinions and perceptions. Rejecting a bifurcated relationship and looking beyond the apparent deceptions of simplified portrayals of leader/follower relations allow in the creative possibilities of “thirdness,” for example, in critiquing of current hierarchical arrangements and scrutinizing claims of more democratic ways of leading schools.

An example of applying the leader/follower dialectic more creatively can be drawn by critiquing the way models of leadership that elevate and exalt designated leaders are often treated as the binary opposite of those that advocate shared and

distributed leadership. Dualistic positioning of these models overlooks important questions about the relationship between them. A dialectical approach, directed to new (“third”) possibilities, draws additional insights from this relationship, for example, regarding the distribution of power in models where leadership is shared, about a leader’s need for “follower” endorsement even in the most hierarchical arrangements, and in the merit of leaders trying to hold open conflicting positions in decisions about the allocation and distribution of leadership responsibilities.

---

## Post-Structural Threads and Rhetorical Resources

Platt (2016) supports his assertion that “paradox looks different after post-structuralism” (p. 15) with discussion of how the historical weakness of paradox in political work is addressed in the works of philosophers often connected with *post-structuralism*, such as Michel Foucault, Jacques Derrida, Roland Barthes, Pierre Bourdieu, and Jacques Lacan. This final move in expanding the theoretical content of paradox does not attempt to capture a particular meaning for post-structuralism from a somewhat strewn and discordant academic history (e.g., Bansel, 2015; Niesche & Gowlett, 2015; Howarth, 2013). Rather, it aims to highlight some of the “threads” (Woermann, 2016, p. 6) that run through the canon of philosophical work associated with a post-structural system of thought. These threads include, most pertinently, “the significance of the non-closure of meaning” and “the contingent nature of knowledge and identity” (Woermann, 2016, p. 6) and a fascination for “doubleness, undecidability and radical ambiguity” (Platt, 2016, p. 6).

This selective use of post-structuralist “threads” is to join paradox with more generative thinking about matters of freedom, conflict, politics, and power. Formulated as a gradual opening of possibilities, a three-part expansion of the theoretical content of paradox is proposed drawing from the work of Foucault and Barthes.

## Paradox and Discourse

Under the influence of post-structural thought, and, more particularly, the insights into discourse provided by Michel Foucault, a new configuration of the relations of paradox and discourse emerges. Early references in this chapter to paradoxes being formed in the constitutive practices of discourse may have appeared to take paradox as part of the discourses that signify and vivify current reality. Foucault (1972) reverses the notion that discourses work to *reflect* what is real and instead asserts that their operations (or their discursive practices) *form* reality, so that the world and its subjects can only be “known” through an understanding of these operations. This aspect of Foucault’s thinking about discourse suggests for paradox a different consideration of its origins, emergences, and qualities. The constitution of paradox is now set in an array of competing discourses, marked by variations across space and time, differential interminglings, and the asymmetrical levels of prominence and influence of its sides. The apparent symmetry and pragmatism of two-sided conflict,

which is assumed in more logical renditions, is replaced with a “tangled plurality” of practices (Foucault, 1972, p. 53).

In using Foucault’s discourse to expand the theoretical content of paradox, conflicting possibilities arise. On the one hand, this joining of paradox and discourse appears as a chance to add more productive and influential qualities. Foucault (1977) alludes to such qualities in one of the few direct references in his work to paradox:

What if thought freed itself from common sense and decided to function only in its extreme singularity? What if it adopted the disreputable bias of the paradox, instead of complacently accepting its citizenship in the doxa? What if it conceived of difference differently, instead of searching out the common elements underlying difference? (p. 182)

Against a complacent “citizenship” in the fixed and reputable surrounds of existing arrangements, Foucault’s thoughts on paradox align with post-structural interests in contingency, ambiguity, and undecidability. Working from the premise that paradox forms in many competing discourses, his advocacy for paradoxical thinking and suspicion of the “doxa” may also be taken to suggest for paradox new possibilities in critique, problematization, and political opposition.

Against this productive reading, Foucault’s insights also reveal a tendency for paradox to be obscured by the dominance of certain discourses. In the context of school leadership, the current constitutive work of neoliberal policy discourses (see Dolan, 2020) serves as a useful example. The apparent authority and validity of discourses of choice, excellence, entrepreneurship, and managerialism, in neoliberal times, hide the presence of conflicting or ambiguous ideas that “manifest in the half silent murmur of another discourse” (Foucault, 1972, p. 31). The presence of paradox is obscured by a status quo that works to appear natural and untroubled by its oppositions. For school leaders, as policy subjects, dominant discourses shape their available subjectivities and, in their formulation as seductive and natural, provide taken-for-granted truths to which leaders are compelled to attach their identity and authority. *The paradox of politicized subjectivity* works to reveal the power effects and constitutive presence of dominant discourses and to extract a more ambiguous form of leader authority from neoliberal promises of autonomy and agency.

### **Detecting a More Ambiguous Authority: *The Paradox of Politicized Subjectivity***

*The paradox of politicized subjectivity* provides a broad schema for the relations of power in which school leaders are enmeshed. This paradox relies on Butler’s (1997) interpretation of Foucault’s work on the productive function of power and its implication in the process of subject formation. School leaders may understand and feel the oppressive effects of power exercised from above and outside – a type of power that “subordinates, sets underneath and relegates to a lower order”

(Butler, 1997, p. 2). However, the very power that pushes down on leaders and asks for them to submit to external demands is the power, paradoxically, on which they depend for their authority and identity and which they “harbor and preserve” (Butler, 1997, p. 2). Butler describes “a fundamental dependency on a discourse we never chose but that, paradoxically, initiates and sustains our agency” (p. 2).

In this paradoxical arrangement, the school leader appears to be afforded some power to act. However, it is not expressed as unencumbered choice, but rather set against the rules and structures that work to constrain and contain it or, as Benwell and Stokoe (2006) say of Butler’s account, “the subject is never fully determined by power, but neither is it fully determining” (p. 32). Such an understanding guards against idealized positivist accounts and, instead, takes leaders and their work as discursively constructed within the inherent tensions and ambiguities of “politicized subjectivity” (Benwell & Stokoe, 2006, p. 32).

The school leader, as politicized subject, while not fully enclosed but already constructed by power (Foucault, 1982, p. 781), is susceptible to interpellation when answering the call of the authoritative outside voice to comply and submit. However, politicized subjectivity, when understood in its paradox, involves more than a “hailing” (Althusser, 1971) of the leader as obedient subject. Rather, the discursive and non-discursive forces acting on leaders require and form particular technical “mentalities” that are not usually open to question by those who use them but are ubiquitous and persuasive in governing their conduct. In neoliberal times these mentalities of rule – what Foucault terms “neoliberal governmentality” (see ► Chap. 27, “The Worldwide Specter of Neoliberalism and the “Neoliberalization” of Educational Leaders”) – penetrate deeply into the lives of leaders to create an expectation that they not only submit to being governed, but also submit to lending a hand to the mode of governing to which they are subjected. Their “agency” under these conditions is cast in an interdependent relationship with their subjectivity. It is found in the efforts of school leaders to seek in themselves qualities such as agility, flexibility, and enterprise and in the way they take responsibility for their own choices, expertise, and susceptibilities and watch, measure, and audit the value they return to their schools. In short, their agency is derived from their efforts to govern themselves.

Championing of school leaders as agential and transformational – for example, in the centrality of their positioning in the school effectiveness movement – tends to obscure the power relations that underpin their compliance and submission and which entreat their self-governance. The practical application of the *paradox of politicized subjectivity*, therefore, necessitates critical work that surfaces and examines how power operates to produce leader subjectivities, and a constrained form of agency, and the extent to which it forecloses other opportunities for freedom and autonomy. This paradox describes, in its simultaneity and the inter-relatedness of its parts, a fundamental shift from sociology’s traditional structure versus agency debate and, more particularly, a permanent separation from the idea that agency is a free-floating quality that individuals apprehend and use (see also Clarke et al., 2015, p. 57).

## The Primacy of Contradiction

The second part of this imbrication of post-structural thought and paradox continues to draw from the work of Foucault. In the *Contradictions* chapter of *The Archaeology of Knowledge*, Foucault (1972) provides an antidote to dominant regimes with an account that more resolutely follows post-structural threads about the non-closure of meaning and the contingency of knowledge. He describes how an analysis of discursive practices brings into play “a fundamental contradiction . . . a model for all other oppositions” replete with “incompatible postulates [and] intersections of irreconcilable influences” (p. 168). Foucault’s (1972) thoughts draw closer to paradox when he says that archaeological analysis “erects the primacy of a contradiction that has its model in the simultaneous affirmation and negation of a single proposition” (p. 155). “The great game of contradiction,” Foucault says, is “present under innumerable guises” (p. 153).

From this reference to innumerability, more nuanced and fluid influences on paradox emerge, along with the possibility that paradox, when considered as constituted in discourse, is imbued with a different language and new theoretical content. Treated to this point as largely apolitical and detached, the oppositional forces in paradox, when read alongside of Foucault’s account of contradiction, can be viewed as invested with the power of competing discourses. Applied to school leadership, these oppositions usher in new theoretical and explanatory possibilities for bringing paradox to the constitutive forces operating on leaders and their work. For example, they suggest paradox could be used to challenge the rationality of absolute judgments and commonsense solutions carried by the dominant discourses affecting school leadership, and they highlight the contingency and uncertainty brought on by competing discourses, thus rendering the power relations in which leaders are enmeshed as more dynamic and unstable.

Using Foucault’s thoughts on contradiction more forensically, thinking with paradox may uncover the political interests that advocate fixed interpretations of leaders and their work, in turn revealing the production of subjectivities as a “complex accomplishment” under the influence of multiple, competing discourses (Walkerline & Bansel, 2010, p. 11).

## Seeing Contradiction and Complexity: *The Paradox of Choice and Equity*

Bringing a paradox lens to notions of choice and equity reveals their oppositions and imbrications. School choice is enshrined by broad public/private options and reinforced by more intricate choices among schools based, for example, on history, location, facilities, and perceived status. Choice is favored in biased funding arrangements and given a kind of political “bullet-proofing” through its promises of improved student and school performance. Notions of equity and social justice, in focusing concern on the vulnerabilities, needs, and aspirations of individual students,

seem to bring affirmative and separate logics to the purposes of schooling. However, in neoliberal times, these logics are more likely bound up in the hopeful rhetoric of continuous improvement and high achievement and in related measures of excellence on which successful school choice outcomes rely.

In taking a school's equity and social justice outcomes as occurring within the strictures of dominant neoliberal discourses, paradoxical qualities begin to emerge from both local priorities and broader social concerns. Inside the school, leaders and teachers are urged to improve achievement outcomes for all students, but paradoxically their concern to redress disadvantage and attend to the needs of individuals must be subordinated to the more pressing demands of summative and mandated measures of excellence and associated school-of-choice status. More broadly, choice and equity are cast in an antinomial relationship where the merits of choice, and any improvements that flow to students through competition between schools, are not available to those who need them most. Choice can only be exercised by that group with the required income, mobility, and location. As a result, the entwinement of choice with equity – including equity of access, participation, and opportunity – is one which actually (and paradoxically) produces very significant *inequities*, with the disadvantage of students already at risk compounded by their very limited schooling options.

The discourse of choice implicates school leaders directly in the work of “competing to be chosen” (Angus, 2015, p. 396) and in the promulgation of marketing campaigns that must exemplify a school's best qualities and differentiate it from competitors in order to appear as more attractive to those who are choosing. In shaping the identity of school leaders, the choice discourse exemplifies the aforementioned qualities of “politicized subjectivity” as leaders look to derive greater worth and authority by submitting to the entreaties and demands of a favored discursive order founded on the logics of the market. Showings of willing participation by school leaders help disguise the power of this discourse – a quality noted by Binkley (2009) when he describes “the practical, ethical work individuals perform on themselves in their effort to become more agentive, decisionistic, voluntaristic and vital market agents” (p. 62).

While revealing qualities of dominance and subjugation, and suggesting inherent problems in bringing equity under the school choice banner, *the paradox of choice and equity* can also be used to prompt new deliberations on the complexities inherent in (re)instating socially just and equitable classroom and leadership practices in the face of homogeneous systemic and societal requirements for growth and achievement. In terms of shaping leader subjectivity, these paradoxes raise the possibility of multiple affiliations and an associated plurality of subject positions. They highlight how the discursive construction of school choice exposes the apparent fixity of its meaning to more critical and dispersed interpretations. Berkhout (2007) describes how this discursive construction “opens up a critical creative space for school leaders to engage with competing discourses and narratives, in the interest of social justice and transformation, and to engage with what is vying for privilege” (p. 411).

Aligning *the paradox of choice and equity* with Berkhout's "creative space" suggests, for school leaders, differently oriented work on the self as they seek to alleviate, mollify, vary, and resist the effects of the market-oriented choice discourse. More expansively, it opens new constitutive possibilities that reside in the contingency and variability of the process of their neoliberalization (see ► [Chap. 27, "The Worldwide Specter of Neoliberalism and the "Neoliberalization" of Educational Leaders"](#)). This is not to imagine the unencumbered "social justice leader" (DeMatthews, Mungal, & Carrola, 2015) fighting for equity beyond the reach of dominant discourses. Rather, it is to (i) position leaders as subjects who can access and invigilate versions of themselves that rearticulate, interrupt, and resist vivid and pressing neoliberal representations and (ii) privilege that aspect of leader's practice that DeMatthews et al. (2015) describe as an "ongoing struggle" focused "on the day-to-day realities of creating more socially just schools in inequitable societies" (pp. 18–19).

## Responding to the Doxa

While Foucault's archaeological insights suggest a potential for paradox to do political work, the theoretical insights of Roland Barthes are now used – as a third incursion into post-structural thought – to formulate a more explicit oppositional freedom from the doxa's oppression. Barthes describes a two-tense dialectic as "the tense of *doxa*, opinion, and the tense of *paradoxa*, dispute" (Barthes, 1975, p. 18, italics in original). Elsewhere, he characterizes this dialectic as "the stereotype and the novation, fatigue and freshness" (Barthes, 1972, p. 68). However, he is also mindful of the limitations of paradox in influencing this dialectic when it is reactively formulated as just a contrary opinion to the doxa. While the interrelatedness of its parts has, to this point, been recognized as a theoretical strength in paradox, Barthes (1972) suggests that, in a doxa/paradox dialectic, paradox is at risk of turning bad and becoming "a new concretion . . . a new doxa" (p. 71). To counter this tendency, he proposes that paradox must be rendered as dynamic and uses the metaphor of the spiral to suggest the discovery of a third term "which is not a synthesis but a *translation*" – an imagined and fictional alternative "at another turn of the spiral" (Barthes, 1972, p. 69, emphasis in original).

Barthes' theoretically rich doxa/paradox dialectic refutes notions of leaders and their work as constituted in a cemented-in orthodoxy. Instead, it suggests new ways of being and working might emerge from a competitive, messy, and unstable network of dominant and subjugated forces. While Barthes studiously avoids engagement with any pragmatic application of his thinking, the doxa can be considered to exert particular versions of its politics, albeit in subtle and diffuse ways. For example, it may insist on the commonsense logic of its controlling discourse and may evoke in school leaders what Pierrot (2002), drawing on Barthes (1972), identifies as a struggle against an active force from which they cannot be free (p. 431). Space for paradox to work politically thus appears diminished by a doxa

that lays claim, along with the sciences, to “an arrogance and discourse of truth” (Pierrot, 2002, p. 431).

Barthes’ helps enlarge and color this political space by underlining the need, already established in Foucault’s work, to be skeptical of the current orthodoxy, to be mindful of the political power bound up in it, and to acquire productive ways of disputing and resisting it. He suggests that more dynamic and ephemeral iterations are needed to work within and against dominant interests – versions of paradox that do not merely give simplified expression to opposing sides, but that show a nuanced understanding of the active and shifting qualities of the stereotype and find, within and beyond the doxa’s political discourse, a “sumptuous and fresh wisdom” (Barthes, 1972, p. 123).

### **Complicating a Cemented-In Orthodoxy: *The Paradox of Policy Implementation***

Policy discourses so often depicted as hegemonic and homogenous, “given the strength of the coercive extralocal forces mobilized and channelled by neoliberalism” (Peck & Tickell, 2002, p. 396), may actually materialize in schools as variegated and uneven and, therefore, susceptible to local influence and interpretation (see Springer, 2012). Part of the cemented-in orthodoxy of policy implementation in schools is the casting of school leaders, in particular principals, as willing and apolitical subjects, keen to act as conduits for centrally mandated directives and to keep the intentions of policy-makers intact. Rizvi and Lingard (2009) superimpose a more complex dynamic when linking the aspirations of policy-makers with school implementation of policy:

Policy desires or imagines change – it offers an imagined future state of affairs, but in articulating desired change always offers an account somewhat more simplified than the actual realities of practice. (p. 5)

While the compliance of school leaders is typically assumed, and conveyed as natural and unproblematic, a paradox lens reveals that the doxa’s claim to a certain truth about smooth and faithful policy implementation is interrupted when local practices are brought to bear. Paradoxically, the casting of school leaders as compliant policy subjects may actually work against desired consistency and homogeneity when precise expectations about implementation come into tension with in-school processes variously described as *translation*, *enactment*, and *settlement*. Leaders are at once cognizant of both their systemic responsibility to implement centralized policy and the need to respond to local pressures to adapt, diminish, and even ignore outside directives in order to better meet the needs of their school. This puts leaders at the center of competing political interests where they can fashion opportunities for reinterpreting, challenging, and changing policy while necessarily espousing compliance (Berkhout, 2007, p. 408).

Introducing the contingency of “central input and local inflections” (Clarke et al., 2015, p. 15) interrupts notions of a linear flow of policy knowledge and assumptions of a smooth and untroubled implementation of ruler ambitions and intentions in schools. This paradox also encapsulates, in practice, Butler’s (1997) interplay of subjectivity and agency as depicted in *the paradox of politicized subjectivity*. The policy discourses of neoliberalism cast leaders in a particular and preferred mold while at the same time promulgating a range of subjectivities governed by seemingly unavoidable forms of disciplinary power and “technologies of control” (Anderson & Grinberg, 1998, p. 329). In practice, however, the policy work of school leaders is imbued with degrees of resistance, ambivalence, and conformity as processes of translation, enactment, and settlement are variously enacted and expectations of obedience are interrupted by more dispersed constitutive possibilities.

It is in this dispersion of possibilities that *the paradox of policy implementation* draws closer to Barthes’ (1972) metaphor of the spiral and to imagining alternatives outside of a doxa/paradox dialectic. Available subjectivities now include those that dwell on more fertile possibilities in a space of “creative enactment” (Webb, 2014, p. 366) between the macro concerns of policy (and policy-makers) and micro-practices of leaders in schools. Clarke et al. (2015) fill some of this creative space in claiming contestable and oppositional possibilities in the “translation” of policy at the local level:

rather than translation being deterministic and unidirectional, translation should also be understood as contested, and, as such, translation inevitably includes the possibility of retranslation, of redefining and resisting, of ‘talking back’ to dominant understandings, or taking back the possibility of self-naming. (p. 40)

The assumption of a space of dissent easily accessed by school leaders doing their policy work on behalf of their local community belies the complexity and professional risks involved in such work. A more pragmatic reading is of the ambiguity and tension intrinsic to the positioning of leaders as they make their “with and against” responses to neoliberal-inflected technologies and policies. These responses provide a key to understanding *the paradox of policy implementation* as imbued with power relations and as providing an illumination, in practice, of a struggle over the subjectivity of leaders.

---

## Conclusion and Reflections

F. Scott Fitzgerald (2009) wrote:

The test of a first-rate intelligence is the ability to hold two opposing ideas in mind at the same time and still retain the ability to function. . . . It is through the exploration of these opposing ideas, or uncertainty if you will, that we come to better outcomes. (p. 69)

While this chapter has been oriented to establishing useful thinking and seeing possibilities for paradox and applying these to the constitution of school leaders and

their work, its underpinning tenets run close to the thoughts of Fitzgerald. Principles of undecidability, resistance to closure, and productive use of the simultaneity and interrelatedness of oppositions provide essential support to claims that paradox adds productive theoretical and practical possibilities to critically oriented analysis of school leadership.

The conclusion to this chapter is directed to more evaluative and reflexive ends in testing Fitzgerald's (2009) claim that, via uncertainty, "we come to better outcomes" (p. 69). While the eclectic and partial qualities of the chapter are acknowledged, for example, in the opportunistic use of historic and contemporary insights and the selective use of paradox examples, it remains reasonable to ask and try to answer the question "does the use of paradox translate into *crucial functions* and *practical gains* in understanding that otherwise would not have been available?". In keeping with a paradoxical rendition, the response to this question is framed equivocally, with each of the following claims made for the value and relevance of paradox accompanied by references to its limits, delimits, and limitations.

*Paradox attends to the significant conflict, tension, and ambiguity that characterize the working lives of school leaders.* Bringing paradox to critically oriented research works against simplified and essentialist accounts of leadership that characterize positivist studies to restore complexity and reveal more nuanced and theoretically rigorous renditions. The limitations on this claim arise from the inability of paradox to provide an adequate representation of actual complexity and a related tendency to normativity in the framing of conflict. As Woermann (2016) notes, "the only complete description of a complex system is the system itself" (p. 11).

*The constitutive qualities of paradox impose a requirement for critical scholars, and for leaders themselves, to understand the implications held in the different ways conflict, tension, and ambiguity are conceived, apprehended, and managed.* The examples of paradox used in this chapter portray school leaders are deeply invested in the "task of deciding between competing and conflicting demands in the context of uncertainty" (Watson, 2013, p. 256). Dameron and Torset (2014), in a reference to "building subjectivities through tensions" (p. 294), suggest that such an investment might also shape leaders and their work. These constitutive possibilities, often referred to in this chapter and held in competing and conflicting demands of paradox, become both "crucial" and "practical" when they prompt questions for further inquiry – questions about the varying levels of prominence given to conflict by individual leaders, the different ways they make sense of it (and give sense to it), and the responses they choose in apprehending and managing it. Bringing paradox to critical inquiry also asks after the macro- and micro-sources of conflict and the ways in which multiple pressures are exerted on leaders' choices. However, this work is delimited somewhat by the representation of complexity that the componentry of paradox encourages, with a tendency towards enclosed (and often two-sided) depictions of conflict, tension, and ambiguity possibly working against more imaginative and resourceful solutions.

*Paradox creates opportunities for new learning.* Schad et al. (2016) allude to these learning opportunities when they observe that "paradoxes stare us in the face – taunting our established certainties, while tempting our untapped creativity" (p. 6).

Dolan (2020) proposes a “pedagogy of paradox” and outlines a “schema . . . to offer possibilities for learning with paradox, and to argue the efficacy and functionality of the different categories of learning proposed” (p. 200). A range of learning opportunities are proposed for leaders that connect the generative possibilities in paradox with, for example, improved capacity to represent and make sense of contradiction and ambiguity, revealing a wider range of decision-making choices in the face of intractable conflict, and possibilities for critical engagement held in understanding the “politics of subjectivity” and the “intrusion of power relations” and in bringing the theoretical content of paradox to processes of critique and agonistic resistance. While such learning opportunities appear to exhibit crucial and practical qualities, each is also conditional on filling the prerequisite need for a “wonderer” – an audience to paradox who admire and wonder about it and who are willing to share in and prolong its actions (Colie, 1966, p. 519).

*Paradox can work politically to direct attention away from the status quo and towards new possibilities.* In “exploring the critical consequences that complexity holds” (Woermann, 2016, p. 3), the relevance of thinking and seeing with paradox shifts to the possibilities in using the language of paradox to narrate the politics of opposition to the status quo. A paradox language directs leaders away from reductive and simplified problem-solving logic and supports strategically challenging the current orthodoxy, troubling one-sided interpretations, seeking creative alternatives, and keeping options open by delaying the rush to resolution.

An extended possibility related to this political work is to suggest for paradox a capacity to help better see what Giroux (2008), citing the philosopher Ernst Bloch, describes as “the possibilities of the *not yet*” (p. 139). This concept of the “not yet” connects with trying to visualize, from a paradox platform, the more distant and diffuse possibilities of new and productive gaps for the agonistic expression of resistance and freedom. Such visualizations rely on a more imaginative reading of the “epistemic friction” (Medina, 2011) between the fixed assertions of neoliberal policy discourses and the plurality of local knowledges and oppositions – readings which not only represent this pluralism in paradox, but use “the gaps, discontinuities, tensions and clashes among perspectives and discursive practices” (Medina, 2011, p. 24) that paradox reveals to envisage new ways in which school leaders might fashion their political participation.

The limits of this political function lie, most obviously, in its translation into practice. In neoliberal times, leaders are caught in a lopsided contest, with the authorized and seductive shaping work of neoliberal policy discourses dwarfing sporadic and dispersed practices of agonism, transgression, and resistance. Even when conceived as a struggle, its inherently paradoxical qualities are obscured and diminished by the efficacious work that dominant discourses do to hide their hegemonic aspirations and present themselves as self-evident and natural.

the authors argue: (1) neoliberal reforms intended to enhance organizational responsiveness generate conditions of precarity conducive to mobbing; (2) mobbing dynamics may serve managerial ends of organizational control; (3) overlapping and intersecting with microaggressive practices, mobbing may contribute to minoritization and marginalization; and (4) managerial efforts to curb minoritization and marginalization may be more symbolic than substantive and may contribute to rather than counter mobbing conditions.

**Keywords**

Workplace aggression · Workplace mobbing · Workplace bullying · Harassment · Hostile workplace · Micropolitics · Marginalization · Minoritization · Microaggression · Managerial discourse · Managerialism · Neoliberalism · Neoliberal reform · Precarity

**The Field of Memory**

Workplace aggression and tolerance of it is reflected a variety of once prevalent conceptions. These include: (1) normative expectations for leadership, organizational behavior, and belonging shaped by patriarchy, white supremacy, heteronormativity, ableism, etc.; (2) trait-based, “great-man” theories of heroic leadership which sanctioned aggressive behavior toward subordinates and peers and encouraged “trial by fire” approaches to member induction; and (3) theories of leadership and organization that pathologized organizational conflict and valorized organizational conformity around monolithic visions associated with “corporate culture” (Bates, 1987) and “management of culture” approaches (Cooke, 2003).

**The Field of Presence**

Growing concern about workplace aggression such as mobbing correspond to theories of leadership and organization that feature – rhetorically if not always in practice – more socially, culturally, and politically informed conceptions of belonging. These yield more inclusive approaches to organization which promote and value diversity in membership and leadership. These also reflect more complex theories of leadership which expand conceptions of who may lead as well as the more collective, collaborative, and distributed forms leadership takes. Further, contemporary theories of leadership increasingly reflect more nuanced ideas – or ideals – of reciprocity between organizations and members and leadership responsibilities for the social and emotional health of workers and the workplace.

**The Field of Concomitance**

Leadership improvements in identifying and addressing workplace aggression capitalize on more sophisticated theories of organizational behavior, dynamics, and health. Seeking to head off or mitigate damaging effects of workplace aggression, leadership utilizes insights into the erosion of productivity, morale, retention, etc. from scholarship on human resources/relations, organizational psychology, and

counseling psychology. This is complemented by work of legal scholars and employee advocates outlining the risks, responsibilities, and liabilities based on existing and evolving obligations of employers and organizations. Increasingly, critical leadership scholars benefit from an array of incisive critiques of transnational neoliberal reform policies and managerial practices offered by critically oriented scholars in politics, sociology, anthropology, and public affairs.

### **Ruptures and Discontinuities**

While neoliberal reforms took root in the 1970s, a series of events and movements following the 2008 financial crisis may be exacerbating organizational dynamics contributing to precarity, workplace aggression and awareness of connections to neoliberalism. The Occupy movement protested social and economic inequality and erosion of substantive democracy through a privileging of corporate interests over those of workers. Recognized as a stalking horse to undermine LGBTQ+ rights, efforts by social conservatives to impose so-called religious freedom protections drew intense backlash from the left and, to some degree, from moderates and the business community. The Black Lives Matter movement drew public attention and galvanized opposition to ongoing police violence experienced by communities of color generally and the Black community in particular. Finally, and most recently, the politicized response to the global covid-19 pandemic revealed disparate health and economic impacts, yawning gaps in social safety nets, and deep distrust in social and political institutions. Separately and in concert, these have called attention to the role and influence of multinational corporations in shaping and intensifying uneven conditions of precarity and accompanying social and individual anxieties. As discussed below, these contribute to the enabling conditions for and the theorization of workplace aggression such as mobbing.

### **Critical Assumptions**

In theorizing the micropolitics of mobbing and its relationship to managerial discourse, the authors presume that organizational activity and leadership are inherently political. Members and groups pursue personal and professional interests in and through organizational activity. This extends to those in positions of authority – leaders and managers – who may capitalize on worker anxiety and organizational conflict in pursuit of personal as well as organizational goals. The authors also presume that the within-organization or “micro”-politics are influenced by, but do not completely mirror, the broader macro-level politics of the community and society.

---

## **Introduction**

Nearly 20 years ago, both authors had the distinct pleasure of enrolling in Gideon Sjoberg’s graduate class in critical social theory. An urban sociologist recognized for his work on preindustrial cities and sociological methods, Professor Sjoberg spent his entire 60-year career at the University of Texas at Austin. The authors were struck

by his presentation of Foucault's inversion of Mill's principle of utility. Reading passages from *The Passion of Michel Foucault*, the octogenarian revealed how Foucault turned Mill's utilitarian vision of morality on its head by surfacing, as only Foucault could, the subjective character of the common sense of the utility of pain and pleasure.

The authors came to know Dr. Sjoberg a little better prior to completing their studies. He was by his own account something of an odd duck, choosing not to work or socialize much with his departmental colleagues. A night owl, he refused to arrive on campus before noon and worked into the early morning hours. At the time, the authors viewed these as endearing quirks of an academic nonconformist. The authors did not know – nor could they have fully appreciated at that point – that midway into his career Gideon Sjoberg had been the target of a professionally damaging and personally painful academic mobbing of the sort they explore below. This occurred years before the term as it is now applied was coined, but his account of ostracization and degradation offered in *Notes on the life of a tortured optimist* (Sjoberg, 1989) is a textbook case. In this chapter, the authors invoke his example and memory as they seek to make sense of the micropolitics and administrative utility of mobbing.

---

## An Overview of Mobbing

A form of workplace aggression, mobbing refers to targeting collective hostility at a colleague with the objective of removal from the organization. The phenomenon is not new, but has only recently garnered professional and academic attention in the USA. This chapter offers an overview of the emergence and evolution of the concept and connect current reports with neoliberal reforms. Recognizing a need to theorize mobbing, a micropolitical perspective is presented that draws on Stephen J. Ball's work on micropolitics and managerialism. Considering mobbing in educational settings undergoing reform, this perspective suggests: (1) neoliberal reforms intended to enhance organizational responsiveness generate conditions of precarity conducive to mobbing; (2) mobbing dynamics may serve managerial ends of organizational control; (3) overlapping and intersecting with microaggressive practices, mobbing may contribute to minoritization and marginalization; and (4) managerial efforts to curb minoritization and marginalization may be more symbolic than substantive and may contribute to rather than counter mobbing conditions.

Maureen Duffy and Len Sperry (2007) define workplace mobbing as “the non-sexual harassment of a coworker by a group of other workers or other members of an organization designed to secure the removal from the organization of the one who is targeted” (p. 398). Borrowing from Garfinkel, Duffy and Sperry (2012) characterize mobbing as a “degradation ceremony” through which members persecute, humiliate, and degrade the target or targets. The description as “degradation ceremony” is reaffirmed by Cornoiu and Gyorgy (2013) who suggest the purpose of mobbing is “professional, psychological and social destruction of the victim” (p. 711) occurring through “a series of persecutions, attacks and humiliations that occur slowly, subtly and persist for a long time” (p. 712).

In contrast to workplace bullying, which has received increased reporting and study, “the problem of workplace mobbing is less well understood, at least in English speaking countries” (Shallcross, Ramsay, & Barker, 2008). Nielsen and Einarsen (2018) suggest that most research on mobbing focuses on the targets and victims and note that the limited knowledge around mobbing and workplace bullying is partly explained by methodological limitations dominated by cross-sectional designs. Issues of definition and reporting frustrate measurement of workplace bullying and mobbing (Keashly, 2018). Surveys in the UK suggest that from 12–50% of the UK workforce experiences bullying (Khoo, 2010, p. 61). Looking across efforts to assess prevalence, Keashly estimates that 7–8% of US workers report being mobbed within the prior 6–12 months and 25% over the course of their career. Moreover, she finds that one-third to one-half of workers encounter aggressive behavior each year which may develop into bullying or mobbing. These figures are concerning in terms of damage to organizational productivity and professional standing, but more so given documented links between mobbing, depression, and suicidal ideation (Nielsen, Nielsen, Notelaers, & Einarsen, 2015).

In the opening chapter of the expansive two-volume *Workplace Bullying and Mobbing in the United States*, Yamada, Duffy, and Berry (2018) recount the emergence of organizational bullying and mobbing as topics of professional and academic interest. They note that workplace mobbing is related to a variety of phenomena including workplace bullying, workplace aggression, abusive supervision, harassment and hostile work environment, and workplace incivility. While related and overlapping to a degree, each of these reflects distinctive uses and meanings. Yamada and his colleagues credit journalist Andrea Adams, scholar-activists Gary and Ruth Namie, and European researchers and theorists Stale Einarsen, Helge Hoel, Dieter Zapf, and Cary Cooper with bringing *workplace bullying* into public and scholarly consciousness in the 1980s and 1990s. The related phenomenon of *workplace mobbing* derived from foundational work by Swedish psychologist Hans Leymann in the 1980s, further developed by Canadian sociologist Kenneth Westhues in the 1990s. Mobbing was introduced into the US discussions of employee relations by Noa Zanolli Davenport, Ruth Distler Schwartz, and Gail Pursell Elliott in the late 1990s. The first major US work on mobbing did not appear until the 2012 publication by Duffy and Sperry of *Mobbing: Causes, Consequences, and Solutions*.

The term mobbing emerged in the literature in relationship to, and is often used interchangeably with, workplace bullying (Sperry, 2009). However, Duffy and Sperry (2012) distinguish mobbing from bullying in its organizational dimensions and situatedness:

Unlike bullying, mobbing is a systemic phenomenon that involves the interplay of organizational, group, and individual dynamics and behavior. Mobbing always includes organizational dynamics and involvement, whereas bullying does not (p. 4).

This organizational involvement is consequential, increasing the severity of mobbing relative to bullying as a function of the extent of collusion and the degree of abusiveness (Sperry, 2009). Bringing focus to the interplay of individual, group,

and organizational behaviors and dynamics, this distinction points to the political – or micropolitical – dimensions of the phenomenon.

Sloan et al. (2010) find that workers in the field of education, along with those in social and health services, are nearly three times more likely to be mobbed than the average worker. Drawing from Crawford (2001) and Davenport, Schwartz, and Elliot (2002), Erdemir, Demir, Yıldırım Öcal, and Kondakçı (2020) describe educational organizations as “mobbing-prone” contexts. For example, Khoo (2010) finds that college and university campuses are common grounds for “nonviolent, polite, sophisticated kind of academic mobbing culture” (p. 61). This seems further borne out in reports of mobbing in schools (Olweus, 1978; Pikas, 1975) and colleges and universities (Erdemir et al., 2020; Frazier, 2011; Hernández-Saca, Martin, & Meacham, 2020; Keim & McDermott, 2010; Khoo, 2010; Minibas-Poussard, 2018; Oravec, 2012; Prevost & Hunt, 2018; Wylie, 2019). Citing neoliberal reforms as a proximate cause, Erdemir et al. argue, “New work patterns and values that came with globalization have inevitably brought strained relationships and abusive work behaviors into the academic context and caused what is referred to as mobbing” (Erdemir et al., 2020, p. 127). These are important insights. However, where Erdemir et al. focus on leadership mitigating mobbing, the focus below is to problematize the ways management may leverage mobbing in those educational reforms.

---

## Toward a Micropolitical Theory of Mobbing

Workplace aggression is not new, nor presumably is workplace mobbing (Erdemir et al., 2020). Reflecting on Leymann’s coining of the term, Westhues (2012) observed,

Leymann’s gift to us all was to put a name on this extraordinary process, exhilarating to the perpetrators and terrifying to the target, momentous in the lives of all involved. Having the word *mobbing* in our lexicon lets us recognize and understand bizarre events in our working lives that would otherwise be incomprehensible. (p. viii)

Recognizing the damage and destruction to individuals and organizations, Yamada et al. (2018) caution against devoting undue energy to debating terminology. However, while invaluable, the coining of the term and subsequent evolution of the concept to focus on treating and heading off the trauma have contributed to an undertheorization of the phenomenon (Branch, Ramsay, & Barker, 2013; Nielsen & Einarsen, 2018). Nielsen and Einarsen (2018) argue that

because the scientific study of workplace bullying seems to have arisen from a need to address an important social problem rather than as the result of purely academic and theoretical interest, theories guiding workplace bullying research are therefore relatively few and far between. (p. 77)

In an effort to theorize mobbing, This chapter presents a micropolitical perspective to illuminate the dynamics of mobbing. This approach is informed by the apparent emergence of mobbing as a phenomenon of interest in the wake of a global shift toward

neoliberal management (Erdemir et al., 2020; Vandekerckhove & Commers, 2003). Though the latter is not confined to the USA, the organizational conditions required of mobbing may be common and common sensical in the distinctive American context which valorizes rugged individualism and downplays corporate and employer responsibility (Duffy & Yamada, 2018). In seeking to elucidate the micropolitics of mobbing in the context of those reforms, this chapter draws heavily on the work of UK educational sociologist Stephen J. Ball to situate mobbing within a managerial discourse. This begins with a brief overview of his exploration of micropolitics, managerialism, and neoliberal reforms.

### **Borrowing from Stephen J. Ball: Insights into Micropolitics, Managerialism, and Markets**

Given the organizational emphasis of mobbing, it is instructive to trace a particular line of Ball's work, beginning with his early interest in educational micropolitics, through his Foucauldian analysis of managerialism, to his more recent critiques of neoliberal reforms in education. This approach reveals Ball's project as a consistent, coherent, and incisive analysis of the instrumental and political use of "managerial technologies" to shape educational policy and practice. His exploration, which tracks the prevalence of neoliberal reform logics and associated practices, helps locate mobbing as a specific outgrowth of that evolving form of governmentality.

*Micropolitics:* Ball published *The micro-politics of the school: Towards a theory of school organization* in 1989. Reflective of a growing interest in intraorganizational politics,<sup>1</sup> the book uses UK case studies to call out shortcomings of "system-oriented" theories of organization. Referring to the top-down perspectives and managerial bias of these approaches he asserts,

In this way theories of organization actually become ideologies, legitimations for certain forms of organization...[which] actually close down the possibility of considering alternative forms of organization. (p. 21)

Challenging managerial orthodoxy which treated conflict as counterproductive and pathological, Ball viewed schools as "arenas of struggle" (p. 34) featuring actual and potential conflict over legitimate differences in member interests. He suggested,

once the loose-coupled or anarchic character of schools and their ideological diversity are recognized then the ever-present potential for conflict must also be accepted...These conflicts often call up elements of personal belief and commitment that go beyond technical opinion and beyond individual or group interest, although in many cases philosophies and self-interest develop together in close and interdependent relation. (pp. 31–32).

---

<sup>1</sup>The 1980s and 1990s saw a growing interest in the intraorganizational politics of schools that has come to be known as "micropolitics" (Bacharach & Mundell, 1993; Blase, 1995; Hoyle, 1982; Iannacone, 1991; Lindle, 1994; Malen, 1994; Marshall & Scribner, 1991).

Eschewing management-inflected prescriptions in favor of a rich description, Ball called for pragmatic and critical study of “micropolitical” activity as an expression of member efforts to pursue vested, ideological, and self-interests through control of organizational resources, policies, and agenda. Occupying “an uneasy middle ground between...hierarchical...and member-controlled organizations” schools feature “diverse and contradictory strategies of control” (pp. 24–25).

This attention to intra-organizational conflict and struggle for control offers a window into the personal and interpersonal dynamics of mobbing. Particularly instructive are Ball’s observations regarding the backstage realities and emotional dimensions of organizational life featuring gossip, rumor, and humor as means of social control. As argued below, it is the administrative displacement of conflict to these backstage spaces that “inadvertently reinforce[s] bullying and mobbing behavior” particularly in “[o]rganizational cultures that support a veneer of civility” (Sloan et al., 2010, pp. 91–92).

*Management as moral technology:* The following year, Ball edited the volume *Foucault and Education: Disciplines and Knowledge* (1990), an early effort to employ Foucauldian analysis to evolving discourses and disciplinary disputes in the field of education. In this text, he theorized administrative bias in schools as a form of what Foucault termed “governmentality.” His chapter “Management as moral technology: A Luddite analysis” examined the role of management in the ongoing reconstruction of teachers’ work. Noting the growing influence of market logics on schooling, he observed “[t]eachers are increasingly subject to systems of administrative rationality that exclude them from an effective say in the kind of substantive decision-making that could equally well be determined collectively” (p. 153). Where his earlier book recognized schools as arenas of struggle over the means, ends, and conditions of work, this chapter emphasized the ways management depoliticized its colonization of that lifeworld:

Management is, *par excellence*, what Foucault calls a ‘moral technology’ or a technology of power...an all-embracing conception of organizational control. It subsists both as a body of theory to be learned and internalized by managers, and as a set of practices to be implemented, encompassing managers and managed. (p. 154)

Noting the instrumental reason inherent in this form of governmentality, Ball suggested, “[m]anagement is a theoretical and practical technology of rationality geared to efficiency, practicality and control. It is a means to an end and its participants are also means” (p. 157). But, “[m]anagement is also an imperialistic discourse. Management theory views the social world as locked into irrational chaos, as needing to be brought into its redeeming order” (p. 157). As such, “Opposition to control, to change, to methods of efficiency, are thus treated as the worker’s problem, typically as a ‘symptom’ of personal dissatisfaction or unfulfilled needs” (p. 158). In this discourse and as discussed below, mobbing functions within a discursive practice of control produced by and directed toward the pathologizing and disciplining of dissent and difference.

*Markets, managerialism, and performativity:* In the 2000s and 2010s, Ball turned attention to the corrosive impact of neoliberal logics animating the managerial

technologies noted in his earlier “Luddite analysis.” He directed attention to the impact and influence of neoliberal reforms that combine technologies of *market*, *managerialism*, and *performance*. Recognizing the role of policy borrowing in the proliferation of neoliberal technologies, Ball (2016) noted that such reforms are neither instituted through sweeping legislation nor do they sweep out existing commitments.

Rather, reform is made up of small, incremental moves and tactics, a ratchet of initiatives and programmes that introduce new possibilities and innovations into policy and practice which, once established, make further moves thinkable and doable, and ultimately make them obvious and indeed necessary. (p. 1048)

Ball’s focus on the personal and interpersonal nature of the incremental moves and tactics of these reforms are of particular importance in understanding the transformational power of these educational management technologies, and the political utility of mobbing,

the crucial aspect of these technologies and the reform process generally is that these are not simply changes in the way we do things or get things done. . . . They do not just change what we do; they also change who we are, how we think about what we do, how we relate to one another, how we decide what is important and what is acceptable, what is tolerable. As I have said already – these changes are both out there, in the system, the institution; and ‘in here’, in our heads and in our souls. (2016, p. 1050)

Discussing impacts of neoliberal reforms, Ball finds schools, colleges, and universities function in a devolved environment incorporating interrelated policy technologies of market, managerialism, and performativity. The latter “is a technology, a culture and a mode of regulation that employs judgements, comparisons and displays as means of incentive, control, attrition and change based on rewards and sanctions (both material and symbolic)” (2003, p. 216).

As the authors have written elsewhere (Maxcy, 2009, 2011; Maxcy, Sungtong, & Nguyen, 2010), the trends Ball and others note express the reform principles and practices encapsulated in the discourse of New Public Management (NPM). Hood (1991), who coined the term, noted argued NPM as a managerial discourse promoted organizational values of efficiency and effectiveness at the expense of values such as resilience and fairness.<sup>2</sup> This shift in and of itself – by generating individual and group anxiety – produces ideal organizational conditions within the ranks for mobbing. However, Ball’s insights into “performativity” as a related reform technology suggests mobbing may be a particular and predictable discursive production in and for neoliberal

<sup>2</sup>“According to Hood NPM does not see the performance of the public sector as something hopeless, but rather as something to be improved, which could be done if it would act similarly as the market sector does, . . . if internally it would become merit-based and careers would be organized on a professional instead of formal-legal basis, if management-objectives would become dominant over legal arrangements, if mobility would increase and flexible work contracts would replace seniority principles, if the bureaucratic ethos would disappear and the emphasis would be on the quality of service delivery and e-government. . . .” (deVries & Nemeč, 2013).

reform environments. To elucidate the micropolitics of mobbing, this chapter examines administrative technologies that emerge around the threats to resilience and fairness.

---

## The Micropolitics of Workplace Mobbing: An Exploration

### Generating and Harnessing Precarity: Using Mobbing as Technology of Social Control

Neoliberal reform logics were premised on the benefits of markets to discipline bloated and unresponsive public sector organizations (Hood & Peters, 2004). Early adoption of these logics in education reform occurred through the introduction of market-like forces through systems of performance accountability in the 1990s and early 2000s (Maxcy, 2009, 2011). Over the past 20 years, reforms have increasingly invoked true market pressures. To reduce reliance on public dollars, funding policies for schools, colleges, and universities have been reworked to foster competition for student headcounts and thereby emphasize and reshape the management of client relations. In higher education, this occurs as state legislatures reduce direct appropriations and also shift financial burden to tuition-paying students with the transition from grants to loans. In PK-12 education this occurs as states expand school choice options and increase the availability of public vouchers for private and parochial schools. Invocation of market forces also included the contracting out of services in both arenas (Ball, 2016).

In these marketized environments, organizational choices about recruiting and retaining students or about contracting services become existential questions: *Who are we? Who do we serve? How should we invest our resources? How will we make ends meet?* Neilson (2015) attributed subjective shifts of this sort – shifts from ontological security to existential anxiety – to “circumstantial precarity” derived from trends toward neoliberal organization.

Existential anxiety, understood as mental unease induced by the self-reflexive perception of life’s precarious character, is intensified by the reality of deepening social and material precarity. In contrast, everyday trust in the continuity of life or ontological security is encouraged by circumstantial security (p. 185).

While the anxiety is generalized, Neilson recognizes that responses are varied, complex, and conditioned by a variety of factors.

The questions derived from existential anxiety are also political questions concerning the vested, ideological, and self-interests of the members: *Who wins and who loses when janitorial or food services or curriculum development or professional development are contracted out? What are the implications of our choices for recruiting and retaining teachers, or scholars, or students? Or as Chana Joffe Walt asks in her New York Times podcast, how should we (re)organize a Brooklyn middle school (again and again) to appeal to “Nice White Parents”?*

Devolved to the organization, the choices reflect real and material consequences for individual members. These decisions influence the nature and conditions of work, opportunities for advancement, compensation, as well as determining who is and who is not a member. According to Ball (2003), neoliberal shifts in management mobilize the *terrors of performativity* “as teachers, as ethical subjects, find their values challenged or displaced.” He argues,

the policy technologies of education reform are not simply vehicles for the technical and structural change of organizations but are also mechanisms for reforming teachers (scholars and researchers) and for changing what it means to be a teacher, [to] produce new kinds of teacher subjects. . . . This is the struggle over the teacher’s soul. (p. 217)

By design, markets focus conditions of circumstantial precarity for the organization and the members; poor choices imperil the organization. Using Ball’s terminology, management utilizes a “technology of precarity” generating anxiety to treat the “bureau-pathology” (Kaboolian, 1998) of organizational unresponsiveness.

Recognizing politics as an inherent part of organizational activity, the dynamics intensify as stakes increase, as does the potential for interpersonal conflict to mount, morph, and metastasize. At a minimum, such conditions move the organization toward the more abusive end of the workplace continuum where mobbing becomes more likely (Erdemir et al., 2020; Fernando, 2018; Sperry, 2009).

While organizational politics may be inevitable, the practice of mobbing is not. Thus, it is worth considering whether mobbing is a by-product or a central feature of *a technology of precarity*. Ball’s conception of “management as moral technology” suggests behavior of that sort may be predictable under conditions of precarity. This management “presents itself as an objective, technically neutral mechanism, dedicated only to greater efficiency” (Ball, 1990, p. 157). But, as an “imperialistic discourse” (p. 157) this sort of “cold management” (Bottery, 2003) operates at a distance to establish order as individuals and groups vie for control over policy and resources. In this workplace,

Dissensus or conflict are not necessarily totally ignored. . . but are regarded, within the logic of the paradigm, as aberrant and pathological. In this way oppositional activity within the organization is defined, in terms of the perspectives of the dominant groups, as inherently irrational. . . . The resister is cast as social deviant, and is normalized through coercive or therapeutic procedures. (Ball, 1990, p. 158)

From this perspective, mobbing functions as part and parcel of the disciplinary technology: *a discursive practice condoned if not (indirectly) directed by management to enforce compliance whether through acquiescence or expulsion*. Viewed from outside the organization and with appreciation for the value and dignity of each individual member, mobbing practices such as isolation, humiliation, character assassination, and degradation appear destructive and abhorrent. Within the organization, such “normalizing” actions may be cast by the dominant group – and affirmed by management – as necessary, appropriate, and even ennobling given the potentially destabilizing effect of internal strife which may compromise the

organization's viability and thus the members' and clients' security. If, from a micropolitical perspective, schools are arenas of struggle,

The ground of such struggles is often highly personal. Expressed in the lexicons of belief and commitment, service and even love, and of mental health and emotional well-being. The struggles are often internalized and set the care of the self against duty to others. (Ball, 2016, pp. 216–217)

Through tacit approval or abdication, the “technically neutral” moral technology of management transmutes via mobbing “the terrors of performativity” (Ball, 2003) into group discipline. In this way, the impersonal forces of the market, transmitted through the technology of precarity, are embodied in the personal and interpersonal efforts to reform practices and people by targeting, leaning on, and/or pushing out “dissenters” and “deviants.”

It must be emphasized that deviance and dissent are read against dominant group preferences and expectations. The mobbing literature reports victims are often members acting with integrity and in accord with organizational policies, espoused values, legal requirements, and professional norms and principles (Khou, 2010; Namie & Namie, 2018; Sloan et al., 2010; Tigrel & Kokalan, 2009). In such cases, a mobbing presents a tactic in organizational realpolitik that recasts legitimate dissent and challenges to authority and/or orthodoxy as oppositional, uncollegial, and self-serving. “Deviant” members may then be targeted despite acting on principle, making reasonable demands based on the law, formal policy, and/or espoused organizational values, and even when sincerely pursuing the collective interest. While charges of deviance spread through whisper campaigns may not withstand scrutiny, the effectiveness of gossip and rumor as tactics of social control does not depend on veracity of the claims (Ball, 1989). Moreover, advances in communication and social media technologies offer cyber dimensions to workplace bullying and mobbing with enhanced reach, speed, and destructive power (Hladíková, 2020).

### **Fostering and Leveraging Unfairness: Mobbing, Microaggression, and Deniability**

Neoliberal reform discourses value productivity over resilience and fairness (Hood, 1991). The latter has direct and indirect implications for the production and utility of mobbing. The market, management, and performativity generate precarity and with it distrust of the organization and among members. Indirectly, distrust may be a predictable manifestation of the more generalized organizational anxiety resulting from a devaluation of resilience relative to productivity. Responding rationally to the reform logics, members may rightly recognize a weakened organizational commitment to them which contributes to a sense of vulnerability vis-à-vis management. The more Hobbesian organizational conditions that result favor more aggressive and ruthless micropolitical behaviors among members and managers.

In parallel to and compounding the disciplinary dynamics discussed above, members' angst about their relative position and prospects in the organization may corrode interpersonal trust by recasting colleagues as competitors. Unease may fester and grow in contexts where open expression of discontent is disallowed and subject to group discipline as noted earlier. In this way, mounting distrust serves as a counterpart to anxiety in producing a "culture of unhappiness" (Bottery, 2003) and with it those workplace conditions conducive to mobbing (Sperry, 2009). In these contexts, mobbing may reflect responses of pressuring those actively or potentially breaking with the dominant group.

However, the dynamics of distrust derived from job insecurity or concern about professional status and standing may lead to preemptive targeting of rivals and scapegoats. Both are evident in accounts of mobbing (Friedenberg, 2008; Sloan et al., 2010; Westhues, 2004). For instance, the literature finds that mobbing of highly productive members is not uncommon (Khou, 2010). While destructive to the individual and counterproductive to the organization, undercutting a rising star is an unsurprising micropolitical tactic to protect the status of those being outshone and outgrown (Ball, 1989). This play may be rationalized on the grounds that it protects avenues for advancement for "more deserving" members, that is, those from the fold. Relatedly, the mobbing literature reports incidents in which members are singled out for blame for group failures and dysfunctions (Sloan et al., 2010). The resultant mobbing seizes upon and exploits a perceived failure or weakness as grounds for punishment, ridicule, and potential expulsion (Duffy & Sperry, 2012). Regardless of the grounds for the projection, mobbing in the form of scapegoating increases the potency of a well-worn micropolitical tactic of displacing blame.

While predictable, mobbing rivals and scapegoats does not reflect fair play. However, fairness is downplayed relative to productivity in neoliberal reforms, (Hood, 1991). As a result, workplace conditions conducive to mobbing mount at the same time that organizations disinvest in safeguards. As the chapter takes up next, mobbing generated and managed under these conditions take on familiar shapes and targets.

### **Precarity and Microaggressions: Mobbing, Minoritization, and Marginalization**

Noting shifting work patterns and values, Erdemir et al. (2020) suggest reforms associated with globalization result in strained relationships, abusive behaviors, and mobbing in the academy. As past is prologue, it would be surprising if dominant groups did not target more isolated and vulnerable members as markets, management, and performativity combine to intensify organizational anxiety and distrust. In fact, Sloan et al. (2010) report that members of historically marginalized groups, older and younger workers, along with women, are at greater risk for mobbing. Connecting mobbing, marginalization, and microaggressions they suggest the psychological and emotional terrorism characteristic of mobbing are anchored in hate.

Hate speech is one mechanism that can be used to create and maintain the unequal power relationships of bullying and mobbing, particularly when the target is a member of a traditionally marginalized group. Hate speech is designed to harm and silence while creating a context for expanding microaggressions that support the waging of violence that appears normal. (p. 88)

This connection to work by Derald Sue and colleagues (2007) on racial microaggressions is instructive. Elaborating the term coined by Pierce, Sue et al. define racial microaggressions as “brief, everyday exchanges that send denigrating messages to people of color because they belong to a racial minority group” (p. 273). Quoting Sue et al. at length,

Microaggressions are often unconsciously delivered in the form of subtle snubs or dismissive looks, gestures, and tones. These exchanges are so pervasive and automatic in daily conversations and interactions that they are often dismissed and glossed over as being innocent and innocuous. Yet, as indicated previously, microaggressions are detrimental to persons of color because they impair performance in a multitude of settings by sapping the psychic and spiritual energy of recipients and by creating inequities. . . . (p. 273)

In form and effect, the microaggressions discussed by Sue et al. mirror practices associated with mobbing (Sloan et al., 2010) and represent powerful tools to maintain the social order. Said differently, microaggressive techniques deployed through mobbing produce marginalization and minoritization as instruments of social control.

To be clear, the immediate focus is on the intraorganizational processes of marginalization and minoritization rather than broader societal forms of oppression. However, micropolitics do not simply mirror the politics of their environment, nor can they be wholly extricated from those macropolitics (Bacharach & Mundell, 1993; Ball, 1989), particularly as these relate to racial politics in education (Larson, 1997; Lopez, 2003). Neoliberal reform dynamics intensify precarity in ways that activate micropolitical efforts to secure positions and prospects as already discussed. Within this vein, microaggressions reflect techniques of control adapted to and from ever-evolving forms and expression of oppression, including racism as well as sexism (Basford, Offermann, & Behrend, 2014), heteronormativity (Sterzing, Gartner, Woodford, & Fisher, 2017), and ableism (Keller & Galgay, 2010).

With regard to racial microaggressions, Sue et al. distinguish the modern symbolic racism of political conservatives from an aversive racism of White liberals. Beyond or in service to belief in white supremacy, the former centers ideologies of individualism and meritocracy which mesh easily with neoliberal reform rhetoric. Whether expressed through *microassaults*, *microinsults*, or *microinvalidations* (Sue et al., 2007), microaggressions animated by individualist and meritocratic narratives valorize the existing order, repudiate would-be complainants as malcontents, and stigmatize those outsiders who enter and/or rise in the ranks as benefiting from unearned advantages.

Sue et al. (2007) contrast these with progressive-appearing “aversive” forms of racism which are perhaps more prevalent among the White liberals who populate

large segments of schools and colleges. These forms combine espoused commitments to egalitarianism with implicit biases based on race, gender, national origin, disability, etc. Despite an uneasy fit of egalitarian ideals with neoliberal logics, these too may fuel mobbing associated with racial microaggressions. That is, while liberal White members may decry competition promoted by neoliberal reforms as inappropriate and unfair, they cannot countenance that they have participated in and benefited from the maintenance of the status quo. Notwithstanding their egalitarian rhetoric, they minoritize and marginalize through microinsults voiced, for instance, as sincere but backhanded compliments, or microinvalidations offered in sympathetic and empty deflections blaming “the Man” or “the system.” Perhaps more insidiously, they respond with outrage if their egalitarian overtures are called out and more so if their motives and positions – ideological or organizational – are challenged. Deflections of this sort facilitate mobbing by maintaining “a toxic work environment that supports a culture of secrecy, rumor, and innuendo and the presence of a veneer that brushes over organizational violence” (Sloan et al., 2010, pp. 91–92). In this way – though on different grounds than their avowedly conservative colleagues – they too police the margins and discipline minority malcontents.

It is worth noting that others – or Others – are also susceptible to holding and acting upon implicit bias, deficit orientations, and stereotype. To be certain, US history and organizational demographics favor White males in this regard (and others) and increasingly White females in educational settings. As the covid-19 pandemic made clear, circumstances of precarity and associated anxiety may be experienced broadly, but the consequences are visited disproportionately on vulnerable members and historically marginalized communities. Similarly, mobbing inflicted upon minoritized and marginalized groups as a consequence of precarity is an entirely predictable by-product of managerialism. Less obvious are the ways precarity may contribute to within-group discipline among both dominant and minoritized/marginalized groups. Likewise, anxiety and vulnerability may increase the potential for mobbing across minoritized and marginalized groups. In these ways, precarity feeds a politics of resentment among members and groups which erodes empathy and undermines efforts to mobilize to improve conditions.

### **Threats to Fairness: Elaborating the Moral Technology**

As suggested above, mobbing is a predictable by-product of neoliberal reforms which create conditions and feelings of precarity among members and groups. The authors have also suggested here and elsewhere (Maxcy, 2009, 2011; Maxcy et al., 2010) that these reforms are channeled through new managerial discourses that value productivity over values of resilience and fairness. Addressing the latter, attention turns here to the ways management as a moral technology addresses – or evades – the concerns of fairness that emerge with precarity and mobbing. From a micro-political view of intergroup conflict, Ball’s language is instructive,

Management theory views the social world as locked into irrational chaos, as needing to be brought into its redeeming order. . . .The language of management deploys rationality and efficiency to promote control; it is a regime of ‘jurisdiction’ and ‘veridiction.’ (p. 156)

Ironically, while neoliberal management in the first instance combines with markets and performativity to intensify precarity, it is positioned in the next as arbiter of the resulting discord playing out among members and groups. While volumes have been written on managing organizational conflict (see Blank, 2020; Rahim, 1986; Roche, Teague, & Colvin, 2016), the chapter will highlight three discursive practices indicative of managerial efforts to moderate, mediate, and mitigate conflict. The first is the promotion of “learning communities” to moderate conflict. The next is use of conflict mediation processes to “work through” member differences. The third is the institution of formal roles and structures to adjudicate and discipline member behavior, particularly as these involve issues of diversity, equity, and inclusion discussed above.

*Moderation.* Interest in professional learning communities in educational organizations grew in the 1990s (Stoll, Bolam, McMahon, Wallace, & Thomas, 2006). As discussed by Bottery (2003), the appealing nomenclature belies a managerial inflection of the concept. The appeal capitalizes on the “political utility” of devolved decision-making to manage conflict, enhance efficiency, enhance responsiveness, and/or offer compensatory legitimation displacing blame from management to the rank and file (Malen, 1994; Weiler, 1990). In the 2000s, attention turned to so-called “distributed leadership” approaches (see Gronn, 2002; Spillane, Halverson, & Diamond, 2004), many of which featured similar instrumental logics veiled in depoliticized and/or democratic terminology (Hatcher, 2005; Maxcy & Nguyen, 2006). As Scribner, Sawyer, Watson, and Myers (2007) find regarding the distribution of leadership on teacher teams, managerial responsibility is reduced to striking a proper balance between enabling and disabling levels of autonomy, where team autonomy is defined in terms of organizational outcomes. Similarly, the authors found that managerial tolerance for distributed leadership expressed by teacher teams serving Vietnamese and Latinx communities depended on perceived congruence with administrative prerogatives (Maxcy & Nguyen, 2006; Nguyen & Maxcy, 2015; 2020).

In conditions of precarity, this “cool management” (Bottery, 2003) approach simultaneously erodes organizational trust and the already fragile professional standing of educators. While PLCs and distributed leadership may emerge from common purpose and reflect norms of collegiality, the terms and conditions of membership merit scrutiny. Group and community discipline may be enforced by the specter if not the practice of mobbing.

*Mediation.* If promising gains in productivity, professional community and distributed leadership also hold potential for conflict among members and across teams – particularly in conditions of precarity. When this occurs, management as a moral technology channels conflict toward particular resolutions. “As a counsel of perfection and as an epitome of efficient form, management stands in tension with its imperfect servants. . . .prone to irrationality, atavistic practices, and surfeits of

emotion” (Ball, 1990, p. 158). Commonly Presented as “above the fray” and “seeing the big picture,” management simultaneously signals its neutrality as a virtue and pathologizes conflict as it “looks out for the greater good.” As it pertains to mobbing, this discursive practice effectively incentivizes acquiescence among the parties and stigmatizes any who persist as self-serving. To press in calls for fair treatment, for instance, is to place one’s personal (or group’s) interests above those of the organization as a whole. But this also reveals the constricted terms of mediation. Management is not disinterested, but establishes and reinforces particular terms of resolution by portraying ongoing conflict as a threat to efficient operation and ultimately to organizational viability. As discussed above, conditions of precarity enable and ennoble management’s invocation of mobbing as a form of coercion by proxy to bring recalcitrant members into line.

*Mitigation.* A disclaimer is appropriate prior to examining structures and processes to advance organizational fairness and justice. The interest here is not to question the value of diversity, equity, or inclusion to the organization or to its members; very much the contrary. Likewise, there is no implied judgment about the sincerity or integrity of professionals championing those values and/or charged with administrative responsibility for those. Rather, the objective is to trouble the common sense of that which is taken as normal, natural, innocent, or inherently good and right. In particular, the effort is to surface and consider implications of contradictory managerial logics contained (or retained) in the elaboration of the moral technology through what they term specific fairness technologies and more collectively as a fairness infrastructure. The specific assertion is that while this elaboration is a logical managerial extension with significant “political utility” (Weiler, 1990), its value in mitigating mobbing is limited.

There are instances in which conflict over fair treatment produces new managerial roles and procedures. Management may face demands to address persistent conflict premised on grounds not easily dismissed. For instance, management is legally bound to intervene when members of protected classes face harassment and hostile working conditions. Inaction is not simply a moral failure, but may be a violation of federal law which poses real and material risks for the manager and the organization. Thus, the drift toward a more abusive or hostile workplace conducive to mobbing – conditions intensified through neoliberal reforms – presents a managerial dilemma. As discussed above, management may be inclined in the name of efficiency to allow or even encourage those who benefit from the dominant order to discipline discontented members. However, failure to respond in an appropriate and timely manner to coercion that violates a member’s rights as defined in law and policy invites investigation, legal action, and sanctions. Given alignment of reform logics and ideological commitments noted above, mobbing of those in protected classes poses a predictable and potentially costly outcome.

Consistent with the managerial logic, the dilemma may be addressed administratively through elaboration of the moral technology. To lessen the risk that operational managers ignore or mishandle particular types of conflict, organizations create dedicated roles and procedures to manage such conflicts. These are often made the

concern of offices for human resources and personnel management (Daniel, 2018) and may become the purview of separate offices dedicated to promoting equal opportunity and advancing organizational diversity, equity, and inclusion. In either case, personnel with commitment and professional expertise are charged with developing and implementing programming to promote those values, to ensure legal and policy compliance, and to limit the organization's liability. Ideally, this occurs through proactive measures such as fostering and securing collective commitment, institution of clear procedures, and appropriate training. However, recognizing the potential for violations – particularly given the conditions generated through neoliberal reforms – necessarily includes processes to investigate, adjudicate, sanction, and remediate through technical assistance.

As outlined above, management as moral technology trades on its apparent objectivity and technical neutrality as an arbiter of conflict. In that regard, investments in the *fairness infrastructure*—which refers here to the array of administrative offices, policies, and procedures for addressing workplace mistreatment and inequity—hold political utility via compensatory legitimation (Malen, 1994; Weiler, 1990) even the range of responses (or especially) when these are more symbolic than substantive. Nonetheless, that legitimacy is more tenuous and fragile in the elaboration of more discrete, specific policies, procedures, and practices—termed here *fairness technologies*—which will be perceived and valued differently according to the ideological commitments of members and groups. For political conservatives, the institution of these fairness technologies confirms the inability of “protected” members to compete without coddling. For those progressives prone to aversive racism, these pique paranoia that their privileges will be called out and their egalitarian bona fides called into question. For allies, these will be championed as necessary but insufficient protections for vulnerable colleagues. Most ironically, those vulnerable colleagues face a Catch-22: the potential to invoke the wrath of those served by the dominant order dissuades any open appeal for intervention except as a last resort, when in the case of a mobbing much if not all has already been lost.

Given its dependence on perceived legitimacy, this ambivalence and dissensus undermines the fairness infrastructure if not rendering it impotent. In the first instance, policing fair treatment will be read as counter to the interest of the more numerous and powerful members of dominant groups and thereby exacerbating conditions of precarity. As aggressors become more aware, vigilant, and anxious, their microaggressions are less likely to dissipate than to become more subtle, coded, shaded, and pointed. At the same time, the grounding of microaggressions in stereotype and pervasive deficit orientations (Sue et al., 2007) will contribute to the resonance of gossip, rumor, and humor deployed at the expense of those deemed to be outsiders. As a result, the risk to benefit ratio limits the appeal of any particular fairness technology for those minoritized and marginalized members for whom the infrastructure promises protection.

Ironically, overtures to fair process intended to curb ambivalence and legitimate the approach may further erode effectiveness. As noted, engaging fairness technologies presents risks for minoritized and marginalized members that may exacerbate victim angst and trauma. For instance, formalization of a complaint of bullying, harassment, or mobbing forces the victim to reveal and recount painful experiences,

which may be traumatic in and of itself. However, complainants must also contend with the prospect that claims will be doubted and dismissed, or worse, that they will be deemed culpable upon review and relitigation of every behavior. Further, victims face threshold expectations that complaints merit organizational attention and intervention, demanding significant investment in documentation while enduring ongoing hostility.

A sense of foreboding on the part of victims is not misplaced given conflicting responsibilities of HR offices to members and the organization (Daniel, 2018). The mobbing literature and resolution statistics suggest administrators take on the prejudices of the perpetrators and may perceive victims as paranoid and refer them for counseling (Leymann, 1990). These dynamics undercut both the effectiveness of, and confidence in, legal protections for victims and allies intended to prevent retaliation for reporting harassment. This may also raise doubts regarding the objective of the counseling referral, deterring victims from seeking support.

A hallmark of fair play, investigation by an objective and disinterested party is neither neutral nor innocent in cases of mobbing, particularly when the effort to know is shaped by epistemological racism (Scheurich & Young, 1997). In calling for investigation, the victim invites scrutiny of the administrative gaze and instrumental eye. In the name of documenting the violations, this objectifying practice invades and exposes the victim's private world, making public the "hidden transcripts" and "arts of resistance" (Scott, 1990) that the "prudent sub-altern" enacts to survive, thrive, and subvert domination (Nguyen & Lee, 2013; Nguyen & Maxcy, 2020). Paradoxically, breaking silence and stripping back the veneer of collegiality to document patterns of harassment and hostility commonly invite characterizations of hypersensitivity, uncollegiality, and paranoia – and invite mobbing (Sloan et al., 2010). Such efforts, which effectively eliminate any doubt about the identity of the complainant, may even be recast as aggression toward the colleagues who targeted them.

Given the nature and use of microaggressions to minoritize and marginalize, perceptions that complaints will be misread and mishandled are not misplaced. Victims who have been singled out, demeaned, gossiped about, and gaslighted have ample grounds for distrust. A common feature of mobbing is denial and deniability by those in positions of responsibility.

In a mobbing that, by definition, takes place within the shelter of an organization, the organization provides maximum deniability for wrongdoings visited on employees, students, or other organizational members. The claims of "I didn't know what was going on," "I was in the dark and didn't have all the facts at my disposal," and "I didn't do anything" are commonly heard responses by organizational representatives in positions of responsibility. Organizational deniability combined with moral righteousness of perpetrators in a mobbing makes for a very dangerous cocktail. (Duffy & Sperry, 2012, p. xii)

As discussed by Daniel (2018), the potential of human resource offices to intervene is compromised by multiple and conflicting responsibilities and risks facing HR professionals. As a result, members face a very real dilemma in reporting bullying and mobbing to human resources given the role of the latter in protecting managerial and organizational interests. She notes, "There is all too often some truth

to that perception,” that HR sided “with management in some of the worst workplace bullying situations brought to their attention” (p. 237).

If claims of sexual assault or harassment are commonly dismissed and discounted as “he said/she said” incidents, the “I said/they said” character of mobbing claims face even steeper odds. As the authors have written elsewhere, marginalized and minoritized groups face real risks when acts of “creative non-compliance” to evade social control are revealed (Maxcy & Nguyen, 2006), even or especially when these reveal lapses in understanding of the “powers that be” (Nguyễn & Maxcy, 2020). For these reasons, the micropolitical dynamics of mobbing do not engender confidence in the prospects of an investigation or the possibilities of favorable outcomes for the mobbed, minoritized, and/or marginalized.

In these ways, the tools intended to protect may further isolate, alienate, and expose victims and ironically or by design this contributes to organizational deniability. As discussed below, this is a function of instrumental logics featured in managerialism specifically, and neoliberal reform more generally. The conclusion draws on Chantal Mouffe’s insights in an effort to suggest how this apparent inevitability might be otherwise.

---

## Conclusions and Reflections

### Mobbing in Reforming Educational Settings: More than Coincidence

Neoliberal reforms reshape delivery of public sector services with markets, management, and performativity. The resulting precarity creates space for and makes use of the practice and specter of mobbing to transmit market pressures into personal and interpersonal interactions. Arguably – or perhaps more visibly to us as academics and educational researchers – the impacts seem particularly pronounced in schools, colleges, and universities where egalitarian traditions and sensibilities are revered if not practiced. Schools, colleges, and universities are targets of those reforms and, historically, have also been notoriously difficult, if not impervious, to reform. The relevant literature suggests that these spaces are common and inviting spaces for mobbing.

While neoliberal reforms are a global phenomenon, there are particular aspects of the American context which may predispose US organizations to mobbing (Duffy & Yamada, 2018). These include ideologies valorizing individualism and markets and undercutting collectivist action on labor. The USA also has a long and troubled history with racism and white supremacy along with traditions of patriarchy, xenophobia and nativism, religious intolerance, ableism, and heteronormativity. These have been effectively leveraged over the past 30 years to shape legal and policy frameworks which indemnify corporations, disinvest in public infrastructure, and erode social safety nets. The result is an intensification and normalization of conditions of precarity that make mobbing more predictable and administratively useful.

While terminology varies there have been some inroads into legislating anti-bullying and anti-mobbing policies in Europe, Canada, Australia, and Japan (Cobb, 2018).

However, this work is in its infancy in the USA (Cobb, 2018; Yamada, 2018) with proposals focused on protections from unhealthy workplaces garnering some limited traction at the local and state levels. It is troubling but not surprising that the few state and count codes offering protection from abusive workplaces focus on the personal culpability of perpetrators, obligations of victims and bystanders, and in some instances using those to effectively create employer safeguards (Yamada, 2018). Protections require alignment of personal and organizational responsibility and liability. This occurs, for instance, when universities address Title IX responsibilities by requiring employees as responsible parties to immediately report sexual misconduct. This interrupts the active suspension of conscience by bystanders and activates organizational responsibility (de Mink as cited in Sloan et al., 2010). Such approaches are promising, but not panaceas. As discussed, the approach faces additional challenges with regard to mobbing. Bystanders – and even HR professionals (Daniel, 2018) – may fear becoming a target, may lack confidence to report given challenges specifying the behaviors, may feel some culpability based on active or passive participation, and/or may infer tacit managerial approval of the mobbing. This contributes to the dynamic of deniability in mobbing-prone organizations (Duffy & Sperry, 2012).

### **Mobbing, Minoritization, and Marginalization: Radical Possibilities inferred from Mouffe**

While precarity may be a generalized phenomenon, it is important to recognize that it is experienced differently across and within organizations. This chapter has borrowed and built upon Ball's metaphor of "moral technology" to highlight how the administrative narrative "virtu-izes" amorality and fetishizes the impersonal and objective administrative gaze. This story not only permits but valorizes the application of dehumanizing instrumental reason which recasts members as objects to be managed, subjugates the individual to the corporate, and treats difference as aberrant and a problem to be solved. In the account offered here, the administrative gaze associated with neoliberal reform isolates and individualizes, induces, and leverages precarity, and normalizes mobbing, minoritization, and marginalization as inevitable, unpleasant, but ultimately manageable dynamics.

Ball's terminology is clearly ironic. Administration qua technology is neither moral nor immoral. Administrators like all members may act morally (and immorally), but administration operated as technology is amoral. It functions without conscience; whatever conscience or morality possesses an organization derives from the consciousness of its members and expresses the working out of their collective values. To quibble with Mitt Romney, corporations are not people, but they are peopled. Of concern are the ways that these logics engender a self-discipline among members which depends on the active suspension of conscience, whether to participate in the mobbing or to withhold aid to the victim. It is in those ways that members convey market forces into the personal and interpersonal, that thereby become instruments of the reforms.

But organizations even amid conditions of precarity can be spaces of hope. Viewed through the moral technology, incidents of mobbing in these hopeful spaces are dispiriting aberrations amenable to managerial correction through improved control produced through the fairness infrastructure discussed above. A more humane view might recognize victims as “canaries in the coalmine” calling out a precarious climate that has become toxic to some and dangerous for all. Accounts of mobbing reflect breathtaking acts of dehumanization, cruelty, and trauma: organized and intentional efforts to isolate, demean, and degrade a colleague often to the point of depression, despair, departure, and suicidal ideation. And these closely resemble the marginalizing and minoritizing microaggressions routinely deployed to keep colleagues of color, women, LGBTQ+ colleagues, and others “in their place.” And all reflect instrumental reductions of others – and Others – to objects to be managed rather than colleagues worthy of respect and dignity.

Spaces of hope envision and seek out conditions for individual and collective flourishing (Harvey, 2000). Such provisional spaces are avowedly political and cognizant of the productive and destructive circulation of power. Eschewing preoccupation with managing difference as a problem, difference is recognized if not celebrated for what problems it may solve and/or resolve into. If the vision is utopian, the pursuit occurs in and through the personal, interpersonal, and quotidian. As such, it is the human and humane counterpart to “Management [as] an all-embracing conception of organizational control” (Ball, 1990, p. 156) – what Habermas (1987) terms the emancipatory intent.

In contesting the inevitability of a drift into a Hobbesian world, Mouffe’s agonistic vision is very instructive (Mouffe, 2000). Calling for a return to the political, Mouffe rejects a Rawlsian consensual approach to democracy grounded in his vision of justice and fairness which offers no place for the adversary and opposition. Likewise, she takes issue with Habermas’ incorporation of systems theoretic reformulation of critical theory. However well intended, she demonstrates that his effort to account for and manage power differentials forms at its logical conclusion a totalizing and stultifying system. In contrast, Mouffe’s proposal recognizes the potential of and for radical democracy realized through politics. She does not hold fairplay and justice as preconditions of collective action. Rather, her agonistic vision recognizes the inevitability – and the right – of others to differ and emphasizes the syncretic possibilities difference may yield through political action. This view rescues and reanimates opponents; they are not objects to be managed, dominated, or annihilated, but worthy adversaries with whom to engage, argue, and struggle – and also to afford respect and dignity.

Mouffe (2000) is not naïve to the ways structural power dynamics shaped by historical conditions advantage some at the expense of others. These form the bases for individual and group differences in interest, material, ideology, etc. Neither is she naïve regarding the administrative efforts to neutralize these, a conclusion borne out historically and also notably with the purported “end of history” (Fukuyama, 2006). Thus, her call for a return to the political centers self-determination in a non-teleological working out of the terms and conditions of individual and community flourishing.

In this vision, administration has a role to play in the collective determination of the terms of and approaches to flourishing. But it is not and cannot be portrayed as above and outside the political. As such, administrative acts must be subject to scrutiny and critique with regard to whose interests are served and what values are advanced through the technology. How are the administrative levers involved in determining “who gets what, when, and how?” (Lasswell, 1936) as well as the ways these depoliticize to occlude who is not getting what and why not? (López, 2003).

## The Political Utility of Mobbing

The earlier ornithological references to odd ducks, night owls, and coalmining canaries were neither accidental nor innocent. The term “mobbing” as applied to organizational behavior was drawn initially from the work of ornithologist and ethologist Konrad Lorenz. Lorenz used the term to describe the surprising behavior of herbivorous geese to collectively attack and drive off predators. It is not improper to recognize or theorize analogs between human behaviors in an organization and those of a gaggle of geese – or a murder of crows or an ambush of tigers. But to project a moral equivalence – or lack thereof – merits careful scrutiny, particularly as that may be taken up in the “human sciences.” Invoking parallels to animal behavior carries an implied judgement of such actions as bestial, barbaric, uncivilized, or even pathological.

A mobbing undoubtedly, and by design, is characterized by incivility; it may derive from psycho- or sociopathologies. However, to view it solely as aberrant, pathological, and unproductive is to deny or obscure its political dimensions and political utility. Mobbing is political, even or especially when management simultaneously activates, depoliticizes, and denies it. In drawing attention to interests, conflict, and power, a micropolitical view helps foreground and make sense of the backstage interplay of individual, group, and organizational dynamics. To be clear, the intent here is not to legitimize mobbing. Rather, the centering of the political is intended to shed light on the instrumental use of the practice – implemented as a moral technology – as a form of social control to shape and manage the reform of educational work and workers. Tracing the circulation of power, this perspective also makes visible the political utility of overtures to fairness which offer management compensatory legitimation and contribute to organizational deniability.

## Abstract

“Neoliberalism” has become society’s dominant organizing framework influencing all aspects of life, including education – its purposes, underpinning values, policies, discourses, practices, and leadership. This chapter explains the origins and major tenets of neoliberalism and the attendant intersecting influences of globalization and free market economics. It documents how neoliberalism emerged as a prevailing force, why and how education policy has become caught up in neoliberal pursuits, and responds to foundational questions such as: “what are education’s purposes?” “whose interests do they serve?” and “what are the effects on practice?” The chapter then focuses more specifically on neoliberalism’s effects on leadership practice and canvasses both intended and predictable outcomes, as well as unexpected consequences.

**Keywords**

Neoliberalism · Education leadership · Education policy · Globalization · Free market economics · Policy discourses · Policy effects

**The field of memory**

Keynesian economics; the interventionist state; centralized bureaucratic power and authority; social welfare policies; state-provided and controlled service provision; policy commitments to social justice, inclusion, diversity and equity; education conceived primarily as a “common good.”

**The field of presence**

The logic of *free*, unfettered market liberalism within competitive globalization; neoliberalism as the attendant policy partner for the global free market; governments’ non-interference with market forces; small government; social justice as anathema to free market operation; revised education policies, purposes, values, and practices.

**The field of concomitance**

The valorization of market economic discourses as the basis for social theory; public sector reform, new public administration and corporate management; external audit and compliance accountabilities (imported from classical economics, the business/corporate/private sector).

**Discontinuities and ruptures**

The neoliberal hegemony disruption of long-accepted assumptions about education’s underlying values; education leadership positioned as the means for neoliberal agenda enactment; mandated accountabilities ensuring control and impact amidst institutional autonomy; inherent incompatibilities and disruption in education practice and leadership.

**Critical assumptions**

Neoliberal reform agendas frustrate traditional education aims and purposes; the adoption of neoliberal education policy similarities across international borders; education leaders’ work situated at the cross-hairs of macro and meso neoliberal policy aims/agendas and micro realities as they mediate policy, accountability mandates, and responsibilities for institutional outcomes, with considerations concerning the educational interests of students.

---

**Introduction**

Since the 1980s, neoliberalism has been a major theme in scholarly texts on education, particularly in relation to policy and leadership. Definitions and information about neoliberalism’s origins, however, usually receives scant if any attention. This chapter

goes back to basics, focusing on the powerful triumvirate of globalization, the free market and neoliberalism, and unpacking the new wave of subsequent politics, economics, and social discourses that have been embraced across developed democracies as the organizing framework for society, including education and other social services. It discusses neoliberalism's history and origins, including the role of the state as a prime mover behind impacts on education policy, practices, and leadership.

Globalizing policy discourses have created similarities in education policy "reforms" around the westernized world – sometimes referred to as the global education reform movement (GERM) (see Murgatroyd & Sahlberg, 2016) – with "policy" being processes and outcomes (Ball, 1994) embodying political influences from formulation through to practice. Policy discourses morph as they circulate over time, with remnants of traditional conventions and discourses and further contextual variations (historical, geographical, political, economic, cultural, and technological) influencing local policy enactment. As a bottom line, policies attempt to legitimate certain values and behaviors, which behooves educators to ask – what and whose values and towards what ends?

Throughout the developed world, governments of varying political hues have instigated similar albeit nuanced structural reforms in response to intensified global economic competition, which have constantly fortified a globalized laissez-faire economic and neoliberal policy hegemony (see Starr, 2019). Policies, practices, and leadership discourses and behaviors have adapted and adjusted to align with market imperatives, including in education. In so doing, education's role in national economic growth, productivity, and competitiveness has assumed primacy over its individual, civic, or social benefits.

First, the history and indissoluble links between globalization, the free market, and neoliberalism are interrogated below (see also Starr, 2019). Each component of this intricate and inextricably linked triumvirate is discussed in turn, demonstrating how they work in unison. The chapter then turns to neoliberalism's effects on education policy and leadership practice.

---

## Globalization

Globalization is the defining feature of our time, yet it is not new. Definitions are contested, but globalization's main features concern greater world interdependence and the breakdown of regional, national, and cultural boundaries and moves away from national "protected" economies towards "free" world trade and markets (see Al-Rhodhan & Stoudmann, 2006). Recent forms of globalization have stimulated an exponential rise in global flows of capital, people, goods, services, information, and culture, with English as the international lingua franca, aided by interconnected globalized infrastructure: ubiquitous technologies, transport, banking systems with rapid diffusion of knowledge, information and ideas as time and space across the planet are compressed.

Globalization is a fluid, unfinished project that morphs and adapts to world events, recalibrations of power and shifting circumstances, making complexity, change, and uncertainty the new normal. Globalization encapsulates multifarious processes; it is both cause and effect, and ubiquitous. Globalization unsettles

modernist and western-centric assumptions that underpinned life for most of the last century, as rapid change defies prevailing customs, antagonizes established thinking, traditions and assumptions, and fundamentally alters the way we live, work, produce, consume, and behave.

Globalization shapes the behaviors of nation states, governments, corporations, institutions, communities, families, and individuals with regular “re-forms” serving changing political and economic imperatives.

Globalization’s complex forces and processes incorporate so many dimensions to be neatly summed up in the term “globalization” – but its combined effects profoundly influence power relations between and within countries and amongst peoples. Effects are positive and negative, there are winners and losers, but no one is unaffected (Chomsky, 1999; Hertz, 2001). Without us even being aware of it, globalization profoundly influences everything and everyone – the onset of Covid-19 demonstrating how no human being on earth can escape globalization’s labyrinthine tendons.

Recent backlashes against globalization demonstrate rising dissatisfaction among some groups, such as the rise of religious and cultural fundamentalisms, anti-establishment movements, the rise of geo-politicism and populist forms of nationalism, demonstrations against governments and transnational corporations, conflicts and terrorism, concerns about rising poverty and wealth concentrations, environmental degradation, and species extinction – while coming to global consensus on urgent issues affecting the entire planet escapes consensus.

In education, globalization has created more mobile student and educator populations; greater cultural, linguistic, religious, and age diversity; policy fluidity as pursuits in one region are adopted in others, with governments everywhere becoming more interventionist, expecting increased productivity, and greater return on investment (see Litz, 2011).

Globalization changes the nature and focus of education policy discourses in teaching, learning, leadership, education business, governance, and institutional relationships with the state (see Ball, 1994). Education policy discourses have increasingly subsumed economic imperatives to achieve national objectives, focusing on enhancing national competitiveness and productivity in a global marketplace by increasing knowledge yield and ensuring a well-educated, effective, productive workforce and citizenry.

Globalization is aided by a free economic market – one freed from restrictions, regulation, and red tape – a topic to which we now turn.

---

## Free Market Economics

Current global economic structures are based on ideas emanating from liberal theorists from the seventeenth to the twentieth centuries, like John Locke, Thomas Hobbes, Adam Smith, Alfred Marshall, Ludwig von Mises, Milton Friedman, and Friedrich Hayek, whose ideas have been revised to produce the free market economy we experience today.

At the basis of economic theories are assumptions about human nature and emotions. Adam Smith's works (1759, 1776) provide clear examples, suggesting that economic activity is underpinned by two essential human motivations: "self-interest" – individuals' basic motivations to pursue their own needs and desires, and "fellow-feeling" – regard and care for other individuals, including community connections and the social "good."

Free market economic theory contends that individuals pursuing their self-interests spur production, consumption, and competition for goods and services (Smith, 1776). The market as a place of exchange assumes that individuals will rationally weigh up all options in making transactions that meet their needs and interests. This is the notion of "Rational Economic Man" (REM) indicating the market's contingency on individual rational agency in buying and selling, consuming, and producing (see Marginson, 1997). Individuals seeking to meet their personal needs and wants heighten demand for quality and encourage innovation and invention among suppliers/producers. The market rewards successful entrepreneurs if innovation satisfies consumer needs and demand and, therefore, incentivizes entrepreneurialism. This in turn encourages "progress" through continual improvements and, as other market players emulate good ideas, through competition via cheaper consumer prices.

Competition is a natural outcome of trade as the market enables individuals to choose the best quality for the best price, whether this be the choice of workers, internet providers, or schools. Similarly with employment – individuals "sell" their labor capabilities in the market of exchange. The best employees raise overall quality because their work will be sought after and raises consumer expectations about the quality of goods or services provided (see Butler, 1983).

On a larger scale, in the free market, organizations, communities, and nations pursue their self-interests in the same way.

These ideas lead to the main tenet of the free market: that the economic social order or any facet of social life is not the result of extensive human design or intervention but is the result of unplanned market machinations between individuals. The social order is thus unplanned and unpredictable, but produces its own natural liberty resulting in better outcomes including raising everybody's living standards – an idea often referred to as the market's "trickle-down" effect. Without obstruction to the natural market order, everyone benefits although some will gain more than others. Hutton (1995, p. 169) explains:

The stated objective has been to improve efficiency, raise economic growth and so advance the welfare of all. Those at the top of the pile may do especially well, but the argument is that their enhanced efforts will improve the lot of those at the bottom of the income scale – who will do better under this system than any other.

This thinking underpins the free market mantra: "a rising tide lifts all boats."

Free market proponents believe that interference or interventions by the state (the national political community or government and its agencies) disrupt the market's naturally occurring spontaneous order because they interrupt the prices and trends that serve as indicators of demands for, and availability (supply) of, goods and

services. Being opposed to an interventionist state, free market proponents encourage private ownership of property and the means of production as issues of sovereign freedom and individual enterprise. Human nature is the integral component – the free will of individuals creates free market operations for the common good, whereas incursions disincentivize individual effort, competition, inventiveness, entrepreneurialism, and efficiency (Friedman, 1962; Hayek, 1976).

Over the past few decades, the economic views of Nobel prize-winning Friedrich Hayek have been privileged by most post-industrial capitalist economies. Hayek viewed the market in terms of a game – a game of life requiring skill and luck for wealth creation. He named this the game of “catallaxy,” derived from the Greek *katalatto* – the process of exchange or “the order brought about by the mutual adjustment of many individual economies in a market” (Hayek, 1976, pp. 108–109). Butler explains:

...the market system is... a ‘game’ of exchange... What goals will be achieved first, and to what degree each player will benefit... is... unknown at the beginning... it is only a measure of doubt about the outcome which makes the activity interesting and worthwhile, stimulating people to take risks and make efforts which, in the market system, benefit others as well... the most we can do is set the rules fairly so that there is an equal chance for everyone to benefit... (1983, p. 45)

## The Role of the State

In post-industrial countries, the state has bedrock needs deriving essentially from the needs of capital – it supports capital accumulation and economic growth requiring the promotion of production and consumption. Key strategic alliances, trade agreements, and foreign policy projects are thus formed to secure state advantages. As a bottom line, the state wants to ramp up production and consumption, increase exports, reduce imports, and expand GDP (gross domestic product) to foster economic “growth.”

From a free market perspective, the role of government concerns the protection of individual freedoms through law and order and national defense, with taxation being low with a limited “safety net” social welfare spending targeted to those unable to provide for themselves (Friedman, 1962; Hayek, 1976).

A “free” market calls for a “rolled-back” state (a lean and efficient public sector with many previous functions and services outsourced to the private sector) – also referred to as “small government” – that enables and supports both free market operations and the sovereignty of individuals. Further, “small” government or the “minimal” state negates government interference and disruption to the natural “spontaneous market order” (see Hutton, 1995). The state itself becomes “anti-state.”

In free market thinking, national governments best serve the market by reducing “red tape” (regulation) and anti-competitive policies and behaviors enabling trade and workforce flexibility to meet dynamic market needs (Friedman, 1962; Hayek, 1976). (For example, businesses may transfer capital, resources, and infrastructure

anywhere in the world to ensure lower wages, production costs, and taxes. Some create “efficiencies” by eliminating traditional workers and workplaces altogether through virtual business.)

The state interferes, however, when reduced levels of taxation from business and industry “efficiencies” (cost savings) affect government budgets and the subsequent quantum available for spending on public services and infrastructure – including essential services like education. Hence, governments play the efficiency game themselves – instigating structural reforms such as reducing its public sector workforce (bureaucracy), reducing funding to public institutions, services and social benefits, emphasizing efficiency, productivity, requiring service “users” to contribute to costs (user-pays principles), selling public assets, outsourcing public work, or developing public-private partnerships to build and manage public infrastructure.

Given the size of public expenditure, education is often the focus of the state’s “efficiencies,” with governments seeking cost savings, greater returns on investment (ROI), and better value for money (VFM) (Starr, 2012). The state is pressured to get out of the market’s way, but the state also deems education to be compulsory to secure the benefits of an educated population. Hence, to ensure quality, it guarantees, funds, monitors, and regulates education and its operations. States produce policy to meet national aims but amidst competing interests. Many free market proponents would prefer the state to disentangle from expensive education provisioning by leaving this to the private sector or requiring individuals to meet costs themselves.

To function optimally, the global free market requires the state to develop and pursue a sympathetic and enabling policy philosophy and stance – including education. This requirement is discussed in the following section.

---

## Neoliberalism

Neoliberalism is the foot servant of global free market capitalism providing the ideological policy climate for promoting market practices aiding consumption, production, improvement, innovation, and investment (Starr, 2019). Meaning “new liberalism,” there is no one neat and true meaning that can be ascribed to the word “neoliberalism.” It is an assemblage of complex and interlinked political, economic, and social philosophies underpinned epistemically by the fundamental belief in the free market as the most efficient and effective means of organizing all aspects of life (Birch, Tyfield, & Chiappetta, 2018).

Hayek’s views underpin what we refer to as neoliberalism which encapsulates a strident resurgence of classical laissez-faire economic policy, a doctrine of sovereign individualism, market competition, human choice, and human capital theories, a circumvention of state interventionism, and emphasizing investment, development, and entrepreneurialism. Neoliberalism infiltrates economic coordination, social distribution, and personal motivation, with governments’ role being to protect individual freedoms while bolstering individual responsibility, obligation, and accountability.

Neoliberalism is described as “elusive,” “fluid,” “impossible to define,” while its definitions in social sciences are criticized for being evaded, scant, inconsistent,

misguided, lacking precision, or morally-laden (see Boas & Gans-Morse, 2009; Mudge, 2008; Stiglitz, 2012). Venugopal argues:

There is no contemporary body of knowledge that calls itself neoliberalism, no self-described neoliberal theorists that elaborate it, nor policy-makers or practitioners that implement it. There are no primers or advanced textbooks on the subject matter, no pedagogues, courses, or students of neoliberalism, no policies or election manifestoes that promise to implement it (although there are many that promise to dismantle it). (Venugopal, 2015, p. 5)

Those described as “neoliberals” rarely use the term to describe themselves or their policies – it is a term that “dares not speak its own name” (Venugopal, 2015, p. 5). As such:

... neoliberalism is defined, conceptualized, and deployed exclusively by those who stand in evident opposition to it, such that the act of using the word has the two-fold effect of identifying oneself as non-neoliberal, and of passing negative moral judgment over it. Consequently, neoliberalism often features, even in sober academic tracts, in the rhetorical toolkit of caricature and dismissal, rather than of analysis and deliberation. (Venugopal, 2015, p. 5)

Despite definitional difficulties, essentially “neoliberalism” is “a broad indicator of the historical turn in macro-political economy” (Venugopal, 2015, p. 15).

## Origins

Neoliberalism emanates from different schools of thought from different points in history in various parts of the world. There is little agreement about exact origins or the timing of its re-emergence in recent times.

Birch (2017) cites origins in an article by Armstrong (1884) describing neoliberalism as a new form of liberalism endorsing economic interventions by the state – the opposite conception to its current iteration, and Gide in 1898 supporting free competition as the best means of producing maximum pleasure and indulgence for the greatest number of people – a view similar to the meaning ascribed to neoliberalism today.

Waddock (2016) believes neoliberalism emerged as a major influence in western democracies at the 1947 economists’ meeting in Mont Pelerin, Switzerland. Attendees, including Friedrich Hayek, Ludwig von Mises, Milton Friedman, Karl Popper, and George Stigler, expressed concerns about government interference in individual freedoms and free enterprise. Participants’ described neoliberalism as we mostly understand it now, resolving to promote ideals of individual freedom, private rights, and a free market in their home countries.

Boas and Gans-Morse (2009) suggest “neoliberalism” emanated from the German Freiberg School, which also referred to neoliberalism as “ordoliberalism” (from the Latin “*ordo*” meaning “order”), and entered scholarly usage in twentieth century Europe between the two world wars. The Freiberg neoliberals believed

classical liberalism was outdated and wanted government intervention to be tempered with legislation, regulation, re-distributory, or “ordered” policies to counter the free market’s worst effects. Endorsing social justice and opposing market fundamentalism, the Freiberg School rejected unfettered free market proponents (e.g., Mises, Friedman, and Hayek) as “paleo-liberals.” The Freiberg form of neoliberalism corresponded more closely to what we now refer to as “liberal progressivism” (defense of social justice, equality, and inclusion with support for liberty and justice) and stood against what we now refer to as neoliberalism.

“Neoliberalism” as used by Latin American scholars during Pinochet’s 1970s/80s coup in Chile underwent a 180° transformation again, with usage connoting fundamentalist market liberalism (see Connell, 2013).

Neoliberalism’s influence became global when Friedman’s (1962) work (from *Mont Pelerin*) received endorsement by USA President Ronald Reagan in the 1980s. Reagan supported small government, lower tax rates, rolled back regulation, and free trade, arguing: “In this present [economic] crisis, government is not the solution to our problem, government is the problem,” and “Government’s first duty is to protect the people, not run their lives.” He had support and agreement from the then UK Prime Minister Margaret Thatcher who believed that a misguided sense of welfare entitlement was thriving in the UK. Referring to Hayek’s ideas, Thatcher believed people should take responsibility for their lives without government dependence or interference. The most famous quote (underlined below) expressing her neoliberal policy stance came from a 1987 interview with *Women’s Own* magazine:

... we’ve been through a period where too many people have been given to understand that if they have a problem, it’s the government’s job to cope with it. ‘I have a problem; I’ll get a grant.’ ‘I’m homeless, the government must house me.’ They’re casting their problem on society. And, you know, there is no such thing as society. There are individual men and women, and there are families. And no government can do anything except through people, and people must look to themselves first... People have got the entitlements too much in mind, without the obligations. There’s no such thing as entitlement, unless someone has first met an obligation.

Neoliberals equate social welfare with a mollycoddling “nanny state” that creates problems by raising expectations about rights and social entitlements, and having to contend with ever-increasing labor costs and taxation hikes to fund expanding redistributive welfare policies which disincentivize individual efforts, innovation, development, and the creation of profits (surplus value). In other words, market-driven economies promote improvement, whereas state-driven economies or “social economies” are considered “fatally lacking in dynamism” (Phelps, 2013, p. 127).

Since Reagan and Thatcher’s time, neoliberalism proliferated. Keynesian economic policies instituted after WWII espousing government intervention in fiscal and monetary stimulus to avoid recession when market demand weakened were criticized for restricting capital, corporate economic outcomes and the entrepreneurial spirit, while inflexible trade unionism and the welfare state were enemies of capitalism and growth. Neoliberal policies would enable the state’s capital

accumulation and growth processes to move from “cumbersome,” regulated mass consumption and provisioning towards flexible, deregulated, and differentiated forms of production, consumption, and investment that benefited everyone. Neoliberalism valorized supply-side economics (production – the interests of producers/suppliers/corporations) over the demand-side (consumption – the interests of consumers or the general public).

Rapid economic restructuring and social reforms freed capital from parochial policy strictures and hastened government disengagement – dismantling tariffs, protections, subsidies, wage, and price controls, reducing entitlements and welfare dependency as anathema to economic growth, and advancing sovereign freedoms for individuals and private institutions. Pragmatic neoliberalism involved a rebalancing act between capital and labor in favor of the former (Gamble, 2001; Hayek, 1976). Neoliberalism’s inbuilt remedies of individualism and individualized risk (being personally liable for lifelong needs – education, health, employment, retirement income, for example) enabled responsibility to be shifted from the state to individuals, changing the social contract.

Neoliberalism has been accepted and expanded by governments of all political persuasions, emphasizing the role and influence of neoliberal “nemes” developed at Mont Pelerin. Nemes are the discourses, ideas, phrases, symbols, and images that replicate and resonate from person to person so as to become established as universal beliefs and understandings about how the world works, hegemonically pervading thoughts, everyday narratives, actions, and plans (see Waddock, 2016).

Neoliberalism’s nemes embody its foundational axioms and values relating to individualism, including institutional autonomy and privatization; choice; competition; improvement, innovation, and entrepreneurialism; efficiency; productivity; performativity; and accountability. These fundamental beliefs are inextricably linked, mutually reinforcing, and form the powerful stable of forces that are “neoliberalism.” In collusion with these dominant discourses are those associated with new public administration systems based on corporate managerialism.

The effect is a striking change in the role of governments and their relationships with citizens, official public policy discourses and provisioning, and, in education, a major change in intersubjective relationships between education institutions and their “clients.”

So far this chapter has described neoliberalism in broad terms. The discussion will turn now to what it means for education, and for education policy and leadership in particular. To be expedient, the discussion uses school education as an example, although similar activities have occurred at other levels of education.

---

## Neoliberalism in Education

The neoliberal belief is that the market is the most propitious way to deliver education, encouraging individualism – including “individuation” with curricula and pedagogy tailored to individuals’ learning needs and interests; institutional autonomy or devolved authority to enable nuanced responses to local requirements;

competition among individuals and schools, especially for rankings, enrolments, and funding; consumer choice – greater selection for parents and students about education offerings and schools; and empowered governing bodies with increased authority and decision-making at the local level (see Marginson, 1997). Meanwhile, centralized policy discourses ensure compliance and accountability, emphasizing quality assurance, continuous improvement, higher performativity, and “outputs” gauged through performance indicators, standards, capability statements, and benchmarks – transforming individual subjectivities, particularly those of education leaders – the policy enactors.

Justification for education reform along neoliberal lines usually comes in the form of criticisms about low return on investment (ROI), poor value for money (VFM), and a long list of “failures”:

- Ideological bias and provider capture
- A lack of rigor and accountability
- Resistance to change
- A lack of incentive for improvement
- Rising costs
- Under-achievement and falling standards
- Unresponsiveness to public expectations and market impetus
- Students being ill-prepared for workforce participation
- A lack of parental involvement
- Obstructive teacher unions

Early on, structural reforms in education generally took two distinct forms (see Ball, 1994; Starr, 1999, 2019). First, were those that swept across entire public services: corporatization, privatization, outsourcing to the private sector, re-engineering (replacing people with technology), organizational “downsizing” (workforce reductions), casualization (replacing permanent employees with non-tenured, contract-based workers) (see Marginson, 1993). This also involved asset sales, school closures, public works suspensions, cessations of education support services, and budgetary cutbacks.

The second type of reforms delivered varying levels of autonomy to service sites, through policy banners such as “local school management,” “devolved authority,” “independent public schools,” or “default autonomy” (see Caldwell, 2008; Smyth, 1993). As education bureaucracies “downsized” to meet “small government” imperatives, previously centralized work was diverted to the institutional level. Devolved authority is also consistent with the notion of sovereign individualism applied to individual autonomous institutions.

Some of the effects on school leadership have been predictable while others have been remarkable. It could be expected, for example, that marketized education policy would create more competition between individuals and schools, especially for enrollments. And it is not surprising that in competition, schools identify their target market, publicize their brand, and market their strengths to their niche. Equally, it is understandable that “consumers” of education (parents

and students) will make choices (as far as they can) about education and the school they wish to attend. (Some may even make the choice to reject traditional offerings and choose home schooling.) Further, it is understandable that education authorities may determine that the best way to maintain a level of control over state-funded schools – particularly autonomous schools – is via a range of mandatory accountability and compliance requirements. And to ensure policy measures are enacted, they may use various accomplishment targets, keeping education leaders on their toes to ensure successful progress and raise productivity – ways that embed a strong sense of obligation and risk aversion such that “performativity” becomes an observable leadership phenomenon (Ball, 2016). Authorities also want improved outcomes, greater efficiencies (cost savings), and value for money (VFM).

Other consequences reported by school leaders, however, may not have been so readily expected or considered. Among many other concerns, four commonly cited themes emerge from longitudinal studies across developed jurisdictions over the past three decades (Starr, 2019). It is to these unexpected consequences of neoliberalism that the discussion now turns.

---

## Who Is Leading Education?

The overriding perception among education leaders is that education policy has been appropriated by the political class who decide its strategy and direction, aims and purposes, cast verdicts on outcomes and make critical determinations about resourcing allocations. Little acknowledgment is paid to academic research, with advice and advocacy deriving from political advisors, consultants, think tanks, pollsters, and auditors, such that Wright (2001) argues:

Leadership as the moral and value underpinning for the direction of education institutions is being removed from those who work there. It is now very substantially located at the political level where it is not available for contestation, modification or adjustment to local variations. (Wright, 2001, p. 280)

Politicians and policymakers thereby become the real leaders of education – individuals who are not educators, who do not work in the education sector, and who do not work with students. Politicians and policymakers, however, are perceived by school leaders as too insulated, out of touch with everyday education realities and insights, resulting in mandated policies that fail to acknowledge growing complexity, diversity, or the actual workings of education institutions.

The very strong view among education leaders across national borders is that there is too little debate, discussion, or consultation with the profession in major education policy decisions.

School leaders are charged with “implementing” policy decisions but are not involved in developing policy, casting them systemically as perfunctory middle managers (Starr, 1999).

Leaders see insufficient attention paid to students' circumstance and school context such that one-size-fits all policy mandates fail to suit everyone. They cite their growing mediating role, having to "reinterpret," "translate," or "adjust" policy intentions – through pragmatic contextual understandings – in order to achieve policy compliance in schools (Starr, 1999). This is the "political game" (Ryan, 2010, p. 360) as leaders decide whether to promote, contest, or ignore policy (Wang, 2018), although resistance or refusal is risky for leaders who are mostly employed on fixed-term bases. Those pulling the policy levers, however, are perceived to escape and exempt themselves from public responsibility and scrutiny.

School leaders are also concerned about policy evidence. Despite insisting on myriad forms of data from schools and the neoliberal push for "evidence-based decision-making," governments often fail to adequately justify or explain the rationale behind market-oriented mechanisms in education or provide evidence to validate the policy decisions they make. Similarly, long-term desired endpoints are rarely revealed. Too often policy decisions are believed to emerge from populist and politicized obsessions, justifications are often weak or based on insufficient or non-existent data (such as point-in-time standardized test results which can also delimit learning) (Taubman, 2009).

So the question "where is education heading?" underpins the second major policy concern and consequence.

---

## Misguided Education Policy

Neoliberalism has dismantled education's long-established, trusted understandings and traditions. This 180° turnaround stands diametrically opposed to policy settings of the not too distant past, with previous policy inherently determining that freedom is best sought through democracy, collective participation, and the common good, and the current position resolving that freedom is best pursued through the market, sovereignty, and choice (a private, individualized settlement).

Free market neoliberalism is justified and advocated as the best available means of achieving greater education improvement, affordability, and responsiveness to "stakeholders" – governments, communities, and individual "consumers."

The assumption is that education leaders will react and respond to market pressures to improve education and behave in much the same way as private organizations. Education leaders have thus adapted to both policy and practice becoming progressively more entrenched in neoliberalism, as education is positioned as a key plank in re-shaping society along market lines and viewed as a public good only as a consequence of enhancing individuals' rights, choices, and chances.

Neoliberal policy is, therefore, criticized by education leaders who believe it is based on flawed aims and incorrect assumptions, while producing "wicked" consequences – "re-formed" education is now failing many citizens. Primary among concerns is education's growing inequities which have come into starker relief – the third major consequence and concern for those leading schools.

## The Disappearance of Equity

During the 1980s and 1990s, social justice, equal opportunity, equity, inclusion, and diversity policies were widely promulgated by education systems across liberal democracies. Although never unproblematic, there was endorsement for the underlying understanding that education should and could make a difference in the lives of all students.

This stance progressively changed from the 1990s, however, as current forms of neoliberal globalization increasingly took root with broad-sweeping de-regulation and states “rolling back” their remit, their funding and public commitments, and instigating market-influenced policies and reforms. Consequently, terms like “social justice” are rarely used in current government policy documents, while the equity-oriented policies that do exist are limited to addressing special learning needs, for example, and usually funded on a short-term basis (see Zelizer, 2015).

The abasement of equity as an education policy priority is hardly surprising, since notions of social justice and equity are anathema to free market neoliberalism (see Hayek, 1944, 1976, 1979a, b). Visions of social equity are incompatible with competitive individualism, hence, free market neoliberalism is averse to re-distributive economic policies as forms of “social engineering” that interrupt the market view that “society” is the product of unplanned spontaneous order (so no individual or group can be blamed for the range of variable social outcomes).

Hayek (1979a, b) condemned social justice legislation as contravening the social goods derived from economic freedom and its intersecting forces of “self-interest” and “fellow-feeling.” The term “social justice” he argued, misconstrues the words “justice” and “injustice,” because they can only be applied to human action and conduct, and not to collective, unbiased market activity – a free market encapsulates its own self-evolving form of “justice” but remains “neutral.” Nobody behaves in an “unjust” way, because in the market order “the overall outcome is completely unpredictable” (Butler, 1983, p. 88). In a free market, relations between individuals and society are not ends-related but means-related. “Justice” changes from being a moral issue to the outcome of the unfettered “free” market. As Friedman (1962, p. 195) argues, “One cannot be both egalitarian and a liberal.” Hence, in neoliberalism, social justice is:

... an intellectually unrespectable idea... I have come to feel strongly that the greatest service I can still render to my fellow men (*sic*) would be that I could make the speakers and writers among them thoroughly ashamed ever again to employ the term “social justice”. (Hayek, 1976, p. 97)

Education policy discourses changed from referring to social justice and equal opportunities to those based on “equity” which the OECD defines as “providing all students, regardless of their socio-economic status, with opportunities to benefit from education” (2014, p. 193). This “does not imply that everyone will have the same outcomes from their education” (Hayek, 1976, p. 97). “Equity” is about “access to quality educational resources and opportunities to learn” (p. 97) – a stance

based on the notion of “justice as fairness” (Rawls, 1972; see Starr, 2015) which is neither re-distributive in intent nor disruptive to established social arrangements and power relations.

This shift from the earlier social democratic policy agenda to laissez-faire market liberalism has shored up a different set of policy terms associated with the OECD’s equity conceptions: “evaluation,” “school improvement,” “quality assurance,” “accountability,” “compliance” which do not alleviate outcomes discrepancies between student groups.

Trickle-down economic theory suggests that social benefits are distributed in ways that enhance the lives of everyone, albeit to differing degrees, and achieved in different ways (as indicated by the OECD’s definition cited above). As such, education’s traditional mission, and still pervasive expectation, demands accessibility and equity for all. However, market extemporization invisibly manipulates education policies overtly to sort, compare, and determine “quality,” including who is successful and who is unsuccessful. Hence, rather than playing its part in nation building, neoliberal education becomes instrumental in aiding and abetting greater social, economic, and political divisions along with the negative consequences so entailed (Chomsky, 1999; Stiglitz, 2015).

Many former theorists like Smith (1776), Mill (1863), and Keynes (1919) foresaw the negative consequence of an unfettered free market’s potential to exacerbate inequities – in society and education – but their warnings have been overlooked in neo-classical economic revivalism. Education leaders lament this drastic turnaround but are witnessing a further negative outcome of neoliberal policy regimes.

---

## A Changed Social Psyche

Education leaders are concerned about increasing social fragmentation, aided by social media and disquiet about anti-education, anti-intellectual, anti-authority, and anti-democratic sentiments infiltrating local, national, and global discourses (Starr, 2019; see also Bazalgette, 2017; Enfield, 2017). “Bad faith” is rooted in distrust, anger, disenfranchisement, and resentment against the political class and governments, intellectuals, traditional authority figures, educators and academics, scientists, journalists, elites, and professionals of any kind (Hawkings, 2018), who are criticized for their betrayal and being out-of-touch with “main street” interests and everyday realities. Media polls and politicians have underestimated the anger, fear, doubt, bigotry, and cynicism of large sectors of the community who claim victim status – feeling left out of conventional politics and left behind by decisions wielded in the name of neoliberal globalization.

Education leaders worry that the effects of bad faith, hate speech, and pervasive anti-intellectual, anti-educational forces are destabilizing students’ learning and visions of a fair and civil, democratic society. The social biases, injustices, and discriminations of the past are being renewed, revised, and reinvigorated – a phenomenon perceived as dangerous, divisive, and a wake-up call for education

leaders and authorities. Previously hard-won rights and accepted assumptions are more fragile and transient than many expected.

Xenophobia and nationalism rooted in racism and mono-culturalism; patriarchal, chauvinist, and/or fundamentalist views rooted in sexism, misogyny, and multi-gender bigotry; and a pervasive rudeness and “close-to-the-surface” anger and intolerance that attacks, vilifies and maligns, refuses to listen to alternative viewpoints, and poisons public debate.

Verifiable facts, history, or reality are denied, “fake news,” “alternative facts,” misinformation, and conspiracy theories abound, while usual rules of evidence and balanced media reporting are discarded while broadcasting becomes “narrowcasting.” New cultures of prejudice, intolerance, and fanaticism are viewed as threats to civility, common respect, politeness, kindness, empathy, tolerance of diversity, and democracy (see Hertz, 2001). Proctor and Schiebinger (2008) argue we are living in the “age of agnotology” or culturally constructed ignorance and suggest that if educators don’t understand the forces of ignorance, they will have little chance of surmounting this powerful “anti”-force.

Education is a quest for knowledge and skills to build capability and wisdom. It endorses students being exposed to diverse views and perspectives stemming from factual information. It encourages students to think – critically and deeply – for themselves, to find and interrogate the “facts” and examine all sides of an argument to arrive at a considered opinion. Education encourages celebration of difference and the ability to compromise. Politicization, prejudice, and attempts to skew facts, hide information, or to silence and shut down debate, undermine learning and the education endeavor, and erode democracy.

---

## Conclusions and Reflections

Among education leaders are pervasive concerns about neoliberalism:

- Market values infiltrating education policy and practice
- Governmental retreats from public education and its provisioning
- Shifts in responsibility, problem solving, and risk management from government/systemic instrumentalities to individual leaders, autonomous schools, and their governing bodies
- Discourses and expectations at odds with teaching, learning, and scholarship
- Education policy pursuits inspired by populist discourses and political aims
- Acceptance of inequitable education outcomes

It would be easy to pass this whole story off as the triumph of the political right over the left, but it is not. Governments of various colors across developed nations have pursued increasingly market-oriented neoliberal policies and practices in social policy, including education. School leaders believe that governments must bear responsibility for the problems neoliberalism has created, having abandoned their twentieth century remit and responsibilities for public education (Starr, 2019).

None of neoliberalism's effects augur well for education which is considered too important to be held hostage to the game of catallaxy (see also Waddock, 2016). According to education leaders, education policy is heading in the wrong direction, producing the opposite results to those it seeks – higher standards, “quality.” Education policy is moving away from equity and social justice ambitions which are anathema to neoliberalism. Consequently, human dignity and collective freedoms can't get traction under the vicissitudes of competitive individualism. Democracy itself is undermined by bad faith narratives and pervasive anti-education/anti-professional/anti-traditional authority narratives. And divided populations and their equally polarized governments exacerbate such phenomena in the contest for power, voice, legitimacy, and ideological discursive dominance. Such trends strike at what it means to be “educated.”

Education's real leaders are politicians, policymakers, and the consultants who advise them. School leaders criticize policymakers who don't consult or who arrogantly denounce practitioners' wisdom. Subsequently, education leaders “intercept” and “reconstruct” policy to make it usable and acceptable, yet it is difficult to alter the course of fundamental policy purposes.

However, theory is one thing and practice is another. During the 2007–2008 global financial crisis and amidst a global pandemic from 2020, governments have had to intervene in major ways, demonstrating that the market cannot be trusted to solve all problems, including those created through unwise or unethical market behaviors, poor regulation, or inadequate social support structures.

Covid-19 has compounded social dislocation, slippages in market theory, increasing difficulties in politics, and governing, deepening, and fractious discontents and global problems. Only time will tell if this be enough for widespread, turnaround social change, including education.

### Abstract

Literature presents evidence of the exponential rise of distributed leadership both as a focus of research and as leadership development in education in the twenty-first century (Hairon S, Goh JWP, *Educ Manage Adm Leadersh* 43:693–718, 2015; Hall D, *Educ Rev* 65:467–487, 2013), in addition to the growing criticism of the theory’s dominance and its “acquired taken-for-granted status” (Lumby J, *Manage Educ* 30:161–167, 2016, p. 161). It remains a resilient leadership concept in the guise of professional capital, collaborative networks, and teacher-led reform (Hargreaves A, *J Prof Cap Community* 1, 2016; Hargreaves A, Ainscow M, *Phi Delta Kappan* 97:42–48, 2015; Harris A, *J Manage Dev* 30:20–32, 2011a; Harris A, *Distributed leadership matters: perspectives, practicalities, and potential*. Corwin Press, Thousand Oaks, CA, 2013b). Empirical research exploring distribution dilemmas queries the coexistence of distributed leadership and hierarchical leadership, the relationship between the leader and the distributees, as well as the leadership distribution process (Mifsud D, *Educ Manage Adm Leadersh*

D. Mifsud (✉)

Euro-Mediterranean Centre for Educational Research, University of Malta, Msida, Malta

45:978–1001, 2017a). This chapter revisits the literature narrative around the concept of distributed leadership and problematizes this particular school leadership discourse drawing on the work of Michel Foucault, more specifically his notion of governmentality, with a focus on the analytics of government. Distributed leadership, perceived as one of the various educational leadership discourses, emerges as a regime of government, an assembling process, and a mode of subjectification. School leadership is presented as being about distributed leadership to foster empowerment and autonomy, where the governmentality at play thus uses distributed leadership as a means of attaining the desired leadership goals (Gillies D, Educational leadership and Michel Foucault. Routledge, London, 2013). Analyzing distributed leadership discourse through a Foucauldian governmentality perspective positions leadership as a locus of political struggle, thereby enabling school leaders to be open to nontraditional ways of seeing the world. The critique presented in this chapter may thus be significant for educational practice, policy, and theory in terms of the generation of problematization.

---

**Keywords**

Distributed leadership · Educational leadership discourses · Foucault · Governmentality · Problematics of government

**The field of memory**

Leadership has been romanticized as the only determining factor of the success or otherwise of an educational organization, thus constructed as an exceptional practice. The emergence of the distributed leadership concept was initiated by the recognition of the limitations of the charismatic hero.

**The field of presence**

Distributed leadership gained visibility as a focus of research and as leadership development in education in the twenty-first century. At the level of policy rhetoric, it can also be regarded as a response to policy shifts to claim power sharing and autonomy while easing in the government's agenda of centralization and managerialism.

**The field of concomitance**

Distributed leadership is a concept in the guise of professional capital, collaborative networks, and teacher-led reform. It spilled over from management literature and contemporary public service reforms that require a network regime of governance and the concept of liquid modernity in a contemporary culture. Distributed leadership is one of the discourses of educational leadership.

**Discontinuities and ruptures which form the different viewpoints of this area or field**

Distributed leadership has been problematized as the prescriptive, normative paradigm and also for being positioned as the antithesis of top-down, hierarchical leadership and the antidote to heroic leadership.

### Critical assumptions or presuppositions

There is growing criticism of the theory's dominance and its acquired taken-for-granted status. Distribution also calls autocracy, democracy, and direction into play, in addition to the dysfunctional dynamics of control-collaboration tensions.

---

## Introduction

Alvesson and Spicer (2011) state that, "The leader has become one of the dominant heroes of our time . . . Whatever the problem, leadership has become the solution" (p. 1). We inhabit a "leadership-obsessed culture" where leadership is often considered as the only determining factor of the success or otherwise of an educational organization, resulting in a society pushing us to deny "ambiguities, incoherencies, and shifts in our great leaders" (ibid, p. 3). The existing frameworks of leadership construct it as something existing as an "exceptional practice," resulting in a normalizing of leadership into models dominated by stories of heroic endeavors (Niesche, 2011, p. 2). However, "leadership is seldom a matter of a great leader with a clear understanding who directs, supports, and controls followers," instead it is best understood as "full of ambiguities, paradoxes, confusions, inconsistencies" (Alvesson & Spicer, 2011, p.48). It is apparent that sharing leadership with agencies outside their walls is still not a widespread practice among many school leaders, thus the advocacy of "genuinely shared or distributed leadership" (Black, 2008) to overcome sectoral isolation. The emergence of distributed leadership as a concept seems to have been motivated by the recognition of the limitations of the "charismatic hero" (Fullan, 2005), as well as the need to ease the burden of principals and senior leaders who have become overloaded (Hartley, 2010).

Literature presents evidence of the exponential rise of distributed leadership both as a focus of research and as leadership development in education in the twenty-first century (Hairon & Goh, 2015; Hall, 2013), in addition to the growing criticism of the theory's dominance and its "acquired taken-for-granted status" (Lumby, 2016, p. 161). Harris and DeFlaminis (2016) thus argue that "No other leadership concept, it seems, has caused so much controversy, angst and debate as distributed leadership" (p. 141). It remains a resilient leadership concept in the guise of professional capital, collaborative networks, and teacher-led reform (Hargreaves, 2016; Hargreaves & Ainscow, 2015; Harris, 2011a; Harris, 2013b). The dearth of research surrounding the meanings and implications of distributed leadership (Storey, 2004), as well as the under-theorization of identity and power issues within distributed leadership (Crawford, 2012) led to empirical research in which the author explored distribution dilemmas within policy-mandated multisite school collaboratives [in Malta] (Mifsud, 2017a, 2017b, 2017c). Findings gave rise to such questions: "Can distributed leadership and hierarchical leadership co-exist? Is there a single distributor who distributes leadership? Do the distributees ever question the role of their leader as leadership distributor, how s/he distributes, and the intentions behind the distribution? Distribution: Autocracy: Democracy: Direction" (Mifsud, 2017a, p. 996). The author thus revisits the literature narrative around the concept of distributed leadership and problematizes this

particular school leadership discourse drawing on the work of Michel Foucault, more specifically his notion of governmentality.

It is to be trusted that the application of Foucauldian analysis to educational leadership discourse as presented in the literature “will unmask the politics that underlie some of the *apparent neutrality* of educational reform” (Ball, 2010, p. 7, added emphasis). In the words of Foucault (2002e), “the real political task in a society such as ours is to criticize the working of institutions which appear to be both neutral and independent” (p. 171). Foucault’s notion of governmentality allows the author to unravel the educational leadership discourse as presented in the literature, in order to identify the rationality within and the justification it gives itself for the promotion of distributed leadership. The governmentality of leadership focuses on the shaping of others’ conduct. School leadership is presented as being about distributed leadership to foster empowerment and autonomy, where the governmentality at play thus uses distributed leadership as a means of attaining the desired leadership goals (Gillies, 2013). The critique presented in this chapter may thus be significant for educational practice, policy, and theory in terms of the generation of problematization. As attested by Niesche and Gowlett (2015), “Analyzing leadership discourses through post-structuralist ideas positions leadership as a site of political struggle and subsequently opens up traditional ways of seeing the world thereby enabling more avenues for doing leadership research” (p. 383).

The following section outlines Foucault’s (2002a) notion of governmentality, focusing on its application as an analytic concept in education studies. It then moves to an analysis of distributed leadership as a regime of government, an assembling process, and a mode of subjectification. The concluding section aims to demonstrate the usefulness of Foucault’s work in educational leadership, more specifically the discourses of distributed leadership, while advocating a post-structuralist politics for educational leadership.

---

## Foucault, Governmentality, and the Analytics of Government

I don’t feel that it is necessary to know exactly what I am. The main interest in life and work is to become someone else you were not in the beginning. If you knew when you began a book what you would say at the end, do you think you would have the courage to write it? The game is worthwhile in so far as we don’t know where it will end (Foucault, 1988, p. 9).

This is how Foucault characteristically replied to a question about his intellectual identity. Ball (2010) states how “Foucault’s playfulness and elusiveness seem to have stimulated fascination and exasperation in equal measure” (p. 1). Notwithstanding this fact, his work has impacted on a wide range of disciplines, among which are the social sciences, despite the fact that in a lifetime of academia, Foucault paid very little attention to education (and even less to the study of educational leadership) as an area of study. Foucault further elaborated on his role as

to show people that they are much freer than they feel, that people accept as truth, as evidence, some themes which have been built up at a certain moment during history, and that this so-called evidence can be criticized and destroyed. To change something in the minds of people – that's the role of an intellectual (1988, p. 10).

Gillies (2013) demonstrates the value of Foucault's trident of skepticism, critique, and problematization to operate within educational discourse, "Given the scale of the educational leadership literature and the relatively small amount of questioning voices raised against it, it seems eminently timely to bring Foucault into the lists" (p. 23). Skepticism doubts and challenges educational leadership, while critique involves questioning, probing, and analyzing, in an attempt to demonstrate "that things are not as obvious as people believe, making it so that what is taken for granted is no longer taken for granted" (Foucault, 2002c, p. 456). Gillies (2013) suggests the adoption of critique as "a professional responsibility" (p. 18), in order to articulate and employ doubt to chosen values, beliefs, and assumptions in both policy and practice. Problematization constitutes the "development of a given into a question, this transformation of a group of obstacles and difficulties into problems to which the diverse solutions will attempt to produce a response" (Foucault, 2000a, p. 118). Conscious of the fact that Foucault was keen to avoid being seen as offering a "general system, an overarching theoretical framework or worldview" (Foucault, 2001, p. 240), I take a "piecemeal approach to his work" (Allen, 2012), by viewing it as a "tool-box" (Megill, 1987). Foucault (2002b) warns, "What I've written is never prescriptive either for me or for others – at most it's instrumental and tentative" (p. 240). Gillies (2013) therefore concludes that Foucault's (2001) support for his "gadgets" to be utilized as "thinking tools" (p. 65), combined with the current powerful status of leadership discourse within education, "make a Foucauldian analysis eminently suitable and potentially illuminative" (p. 18), the purpose of which is "to question, probe, and identify weaknesses, contradictions, assumptions, and problems" (p. 19).

Foucault's notion of governmentality has garnered proliferating attractiveness as an analytic concept (in particular Foucault, 2007, 2008), thus becoming one of his most well-known and widespread concepts. The term is developed from a combination of the words "government" and "mentality"/"rationality" in order to understand this particular domain of analysis – how government is justified and rationalized. Dean (2010) explicates this further,

Government concerns not only practices of government but also practices of the self. To analyse government is to analyse those practices that try to shape, sculpt, mobilize and work through the choices, desires, aspirations, needs, wants and lifestyles of individuals and groups (p. 12).

In his analysis of the concept of *gouvernementalite*, consisting of methods of shaping others' behavior, Foucault (2002a) stresses that institutions are fragile and have a great potential for change. Thereby, he implies that power is subject to negotiation, each individual having his/her place in the hierarchy, no matter its degree of flexibility. Foucault thereby hints at the potential for change within the retention of a pyramidal structure. Foucault understood the term "government" as

“the conduct of conduct” (2002e, p. 341), in both a wide and narrow sense, encompassing forms of activity to affect the conduct of others, as well as the relation between self and self. Governmentality encompasses both political rationality (dealing with mentalities, conceptions, and discourse) and technologies of government (dealing with the ways in which government is exercised) (Olssen, 2003, p. 197). Foucault (2002a) reveals a preoccupation with the “art of government” (p. 201), when he enquires “How to govern oneself, how to be governed, how to govern others, by whom the people will accept being governed, how to become the best possible governor” (p. 202).

Gillies (2013) suggests substituting “govern” with “lead” in order to identify the relevance of the preoccupations of government for the world of education – the government of leadership is focused on the shaping of others’ conduct. According to Foucault, modern governmental rationality is simultaneously individualizing and totalizing, in its attempt to explore what it is for an individual, and for a number of individuals to be governed. In his essay “Governmentality” (2002a, p. 205), Foucault alludes to the “multifarious” practices of government “concern[ing] many kinds of people,” further describing how the art of government involves establishing a continuity, in both an upwards and a downwards direction, learning to govern both oneself and others. Gordon (1991) draws attention to the fact that this idea of government rationality may need “to be credible to the governed as well as to the governing” (p. 48). In a political context where there is a double movement of state centralization and dispersion, Foucault (2002a, p. 202) identifies a “problematic of government” that emerges through “how to be ruled, how strictly, by whom, to what end, by what methods, and so on.” Gordon (2002) further suggests that the “problematic of government” provides Foucault with a more practical way to address the power–freedom association, as power only functions in the presence of freedom. Thereby, certain discourses (that is, rationalities of government) are “transactional realities,” tools for negotiation, which may eventually lead to dissenting “counterconducts.” Gillies (2013) explores the utilization of a Foucauldian governmentality perspective in relation to the discourse of educational leadership – it allows one to examine the rationality of its exercise; the justification of its own activity; as well as the way it comprehends its own function (p. 66). When an analysis of governmentality is applied, “it increases our awareness of the role of construction and the constructed in governmental landscapes and institutions, and of the way in which habit leads us to accept these constructions as facts of nature or universal categories” (Gordon, 2002, p. xxiv). According to Gordon (2002), this governmentality generates critique, “a certain decided (*decisoire*) will not to be governed” (p. xxxix).

Analytically, the author will focus on the following definition of government, as explored in the work of Grimaldi (2020):

[government is] any more or less calculated and rational activity, undertaken by a multiplicity of authorities and agencies, employing a variety of techniques and forms of knowledge, that seek to shape conduct by working through the desires, aspirations, interests and beliefs of various actors for definite but shifting ends and with a diverse set of relatively unpredictable consequences, effects and outcomes. (Dean, 2010, p. 18)

The author will now proceed to outline the conceptual implications extricated by Grimaldi (2020, p. 15) that will steer the forthcoming analysis of distributed leadership as one of the school leadership discourses. Government is presented under three distinct guises: as an activity; as an assembling process; and a director of human conduct. The activity, or “regime of government,” is the set of organized practices through which we are governed and govern ourselves and others, involving the production of knowledge and truth, the exercise of power through ordering and calculation, together with the establishment of norms and ends. These “regimes” are regarded as “assembling processes that involve the mobilization of multiple and heterogeneous elements” (ibid, p. 15). Another interpretation is as “an intentional and yet non-subjective attempt to direct human conduct” (ibid, p. 15), thus linked to ethical effects. Such a notion of government as the field for investigation draws our attention to the associations between issues of government, authority and politics, and those of identity and self.

But how can distributed leadership, as presented in the literature narrative, be critiqued using governmentality as a field for investigation? Following Grimaldi (2020, pp. 16–18) and Dean (2010, pp. 40–41), it is possible to interrogate these regimes of government via four modalities of an “analytics of government” (Dean, 2010). There is a focus on:

- a) *forms of rationality*, which are characteristic ways of reasoning and querying that give rise to specific glossaries and practices for truth production
- b) *fields of visibility*, that is, modes of envisaging and comprehending that are inherent to a regime of government and are crucial to its undertaking
- c) *forms of ruling*, which are the “modus operandi” that delineates and regulates the opportunity of performing, reasoning, and existing
- d) *identity formation*, that is, practices that form the individual and collective identities within a regime of government

The table below presents the four modalities that can be addressed as potential foci for the analytics of regimes of government (Table 1).

## **Governmentality and Educational Leadership Discourses: Distributed Leadership as a Regime of Government, an Assembling Process, and a Mode of Subjectification**

### **Exploring the Mechanisms of Neoliberal Governance in Educational Leadership**

The politics of the later part of the twentieth century have been denoted by the emergence of neoliberalism (Doherty, 2007), which has thus become the dominant political and ideological paradigm of our time (Pinto, 2015). An outline of the constituents of neoliberal governmentality is provided by Peters (2001b, pp. 143–144), of which the author will only mention those relevant to the issue

**Table 1** Four modalities to interrogate regimes of government (Adapted from Grimaldi, 2020, p. 18)

	Focus	Meaning
<b>The analytics of government</b> <i>A materialist analysis of practices of government as assembling processes that involve multiple and heterogeneous elements that vary from routines, technologies, ways of doing things, and agencies to theories, programs, knowledge, and expertise</i>	Forms of rationality	The distinctive ways of thinking and questioning that mobilize specific vocabularies and procedures for the production of truth in a regime of government
	Fields of visibility	Ways of seeing and perceiving that are characteristic of a regime of government and are necessary to its operation
	Techne	Peculiar modes of acting, intervening, and directing that combine distinct practical rationalities, expertise, and know-how and rely on definite techniques and technologies in a regime of government
	Identity formation	Characteristic ways of forming subjects, selves, persons, actors, or agents within a regime of government

under exploration. Government is perceived as the community of free, autonomous, self-regulated individuals with an emphasis on their “responsibilization” as moral agents. It also incorporates quasi-autonomous individuals and entities through the promotion of self-management, as well as “degovernmentalization” of the state. “Government at a distance” is developed through new forms of social accounting, simultaneously with increasing decentralization, “devolution,” and delegation of power, authority, and responsibility from the center to the local institution.

Consequently, Joseph (2007) describes neoliberalism as a “political discourse concerned with the governing of individuals from a distance” (p. 7), further stating that it “gives the pretence of freedom while acting in a coercive way” (p. 8). This hegemonic neoliberalism has been portrayed as “the closest thing to a global meta-narrative” (Peters, 2001a, p. viii). Bailey (2013) defines neoliberalism as both a political rationality and a discourse – it incites people to govern themselves while aligning their conducts with the exigencies of the state, while constructing a particular conception of the human subject and his relationship to him-/herself, the state, and society. Neoliberalism can thus be regarded as a set of accountability practices, “paradoxically re-assert[ing] the State’s role centraliz[ing] and decentraliz[ing] the State” (Webb, 2011, p. 736), with the intention of developing “governmentality constellations” (ibid, p.735). This neoliberal discourse, as such portrayed, can thus be regarded as a “practice of government” (Dean, 2010, p. 12) which is shrouded, and eventually internalized as a “practice of the self” (ibid). This governing at a distance is thus justified, albeit unknowingly via the convincing facade of autonomy, where

accountability practices sculpt the choices of these “self-managed” individuals, in our case, educational leaders.

The concomitant move towards “network governance” in education, evident in the proliferation of networks, collaboratives, and partnership working, is perceived as “one regulatory element of the policy dispositive” (Bailey, 2013, p. 817). This propensity for affiliation and distribution is being complemented by “an ideological fantasy of ‘empowerment’, which conceals the subordination of actors to these neoliberal logics by constituting [them] as powerful actors who have been freed from constraints forced upon them by central government” (Wright, 2012, p. 279). Mifsud (2016) offers a reading of Maltese school reform, more specifically the policy-mandated setting up of school networks, which reveals the coercive nature of the policy discourse under the guise of the empowerment agenda, where government still steers at a distance. The educational leaders experience disjunctures in the contradictions that unfold around issues of autonomy, accountability, performativity, and deregulation. (For more details on the presence of neoliberal discourse in the policy to practice trajectory of school networks in Malta, see Mifsud (2016).) Networking can thus be interpreted as one of the technologies of government (Olssen, 2003) through which government is exercised in a concerting subtle manner via education reform, in order to propagate the neoliberal agenda in a more widespread manner throughout the state, at both a micro and macro level.

Essentially, the concept of distributed leadership that is prolific in management literature has now gained momentum in the educational leadership discourse (Harris & Spillane, 2008). The prominence of distributed leadership results from contemporary public service reforms that require a “network” regime of governance, embedded in a societal culture that purports a flexible “liquid modern” view of space and time, together with a new work order coherent with the knowledge economy (Hartley, 2007, 2009). The attraction of distributed leadership in education lies in its capacity to bring about school improvement (Harris, 2012; Spillane & Healey, 2010), due to the enhanced line roles, project roles, and networking roles emerging within the changing policy environment (Simkins, 2005). Consequently, distributed leadership has gained popularity as a good practice (Hopkins, 2001). The justification for the proliferation of distributed leadership in educational leadership theory and practice can be regarded as an excellent example of the unfolding of the definition of government provided by Guillaume de La Perriere, that Michel Foucault elaborates upon in his essay entitled “Governmentality” – “government is the right disposition of things, arranged so as to lead to a convenient end” (2002a, p. 208). The “things” to be governed in a distributed leadership scenario are the schools realigned via networking in order to foster school improvement and effectiveness.

Jopling and Spender (2006) argue that there is “no simple, single solution to leading networks” (p. 5), with Hadfield (2007) describing how “the very nature of a network makes it difficult to define who its leaders are” (p. 260). Katz et al. (2009, p. 5) claim that in these new collaborative partnerships of school networking, leadership is “defined by activity other than formal position,” encompassing the

practices and activities of the various leaders across different strata both within the network and across schools. Jopling and Crandall (2006) assert that networks of schools do require some form of leadership despite their shift towards more plural, distributed, and adaptive forms. They go on to explain that network leadership is qualitatively distinct from traditional notions of hierarchical school leadership as it is facilitative rather than directive; it is about leadership emerging from interactions and relationships between people, rather than charismatic individuals – it seems to work best when it is distributed, being more responsive to context. Hadfield (2007) states that “the increasing popularity of network-based approaches is generating new and emergent leadership challenges, which in their turn are likely to create new leadership approaches” (p. 259).

Harris (2005) describes the state of networking: “we are witnessing a proliferation of collaborative possibilities schools are frenetically pursuing the goal of networks and networking” (p. 5). Consequently, Harris foresees the generation of leadership challenges in terms of the necessity of more innovative and dynamic approaches resulting in lateral and vertical forms of leadership practice. Distributed leadership is thus regarded as a complementary mode of thought about leadership practice that meets the shifting demands of multisite collaboration, due to the conception of this leadership theory being based on the metaphor of the network with its ideas of interaction, undefined boundaries, wide distributions, and power flows. The fit of distributed leadership to networks as described in the educational leadership literature can be explained as a government rationality (as both a conception and a discourse) that needs “to be credible to the governed as well as to the governing” (Gordon, 1991, p. 48). Educational leadership is regarded as “an effect of discourses of schooling” (Lingard, Hayes, Mills, & Christie, 2003, p. 143), with Niesche (2011) framing educational leadership as a discourse, or rather a set of discourses. In this chapter, the author thus approaches distributed leadership as one of the “regimes of truth” (Foucault, 2002f, p. 132) of educational leadership, within a Foucauldian analysis framework.

## **Distributed Leadership as a Technique and Rationality of Government**

Lumby (2013) argues that the conception of distributed leadership has dominated educational leadership theory and practice, thus becoming “the theory of choice for many” (p. 581), undergoing a transformation “from a tool to facilitate the comprehension of leadership ecology to a widely stipulated praxis” (ibid, p. 581). She expands on this by adding that distributed leadership theory has moved on into practice. Bush (2013) further states that this leadership model has been given “normative preference,” with Gronn (2010) noting the “accelerating amount of scholarly and practitioner attention” (p. 70) given to this model in an undivided manner. Lumby (2016) questions why “such an unsatisfactory concept” [distributed leadership] continues to be utilized “so enthusiastically” given the fact “that there is no adequate definition of distributed leadership to identify it as a distinctive way of

leading, and therefore no credible way of promoting it as action or of assessing its impact" (p. 161). Lumby further questions whether distributed leadership is "a fashion, a fad or a rational choice" (ibid, p. 162) due to her conviction of this concept as theoretically weak, with its diffusion dependent on external pressure from national or international organizations. Is it being promoted "as a purported innovation leading to greater effectiveness"? (ibid, p. 162). How can the literature narrative present distributed leadership as "the theory of choice" while paradoxically asserting its inclusion as a feature in various policy frameworks? Education practitioners and policy scholars do attempt to raise questions and difficulties inherent in their praxis for a reconsideration of improvement and change. Accordingly, Foucault (1981) defines an education system as "a ritualization of speech, a qualification and a fixing of the roles for speaking subjects. Any system of education is a political way of maintaining or modifying the appropriation of discourses, along with the knowledges and powers which they carry" (p. 64). To what extent is the concept of distributed leadership fixing roles for the "autonomous" and "self-managed" education leaders?

Distributed leadership already features in policy frameworks in several countries and is being actively advocated. One such case is the Maltese state education system, where, similarly to England, distributed leadership underpins the new models of schooling as researched by Chapman et al. (2010). Similarly, literature by both Harris and Jones (2010), and Harris (2011b) describes how in the Welsh case, distributed leadership is a vital part of system-wide reform, manifesting itself through a national infrastructure of professional learning communities within, between, and across schools.

Definitions of distributed leadership abound in literature. Harris (2005) describes it as "collective leadership responsibility rather than top-down authority" (p. 1), subscribing to Spillane's (2005) "leader plus" perspective, moving us from a "person solo" to a "person plus" perspective, suggesting multiple leaders at multiple levels. This is premised on a collective approach to capacity building in schools (Harris & Lambert, 2003) through a recognition that leadership practice is constructed through shared action and interaction. In his emphasis on "leaders, followers, and their situation," Spillane (2005) implies an interdependent influence between followers and leaders, who emerge as leadership coproducers. Harris (2005) points out the contradiction in this model – having the idea of followership within distributed leadership. However, as Spillane (2005) rationalizes, the follower dimension incorporates followers as influencers in the determination and shaping of leadership practice. Within such a leader/follower scenario, distributed leadership can be interpreted as a form of government that unfolds as "the conduct of conduct" (Foucault, 2002e, p. 341), which encompasses forms of activity affecting the conduct of others [leaders mobilizing followers], in addition to the relation between self and self [followers as influencers and genuine leadership coproducers]. Bennett, Wise, Woods, and Harvey (2003) identify three characteristics of distributed leadership: as an emergent property of a network of interacting individuals; operating within undefined boundaries that can only vary along a continuum between wide and restricted; and with widely distributed expertise and leadership opportunities. Zepke

(2007) builds on Gronn's (2002) definition of distributed leadership as "structurally conjoint agency" (p. 543), describing it as a "community for action" (p. 305) where power flows from leader to leader as new leadership roles emerge and are nurtured.

Harris and DeFlaminis (2016) explore the misconceptions and misunderstandings surrounding the practical application of distributed leadership, problematizing it as the "prescriptive, normative paradigm," thus challenging the inherent goodness and automatic association with positive outcomes. They call into question the motivation of the leadership distributors; its "palatable" presentation as an attractive mechanism for the "top-down" delivery of policies; the "everyone is a leader" notion; and the absence of a distributed leadership blueprint or model. Consequently, "distributed leadership is not a panacea; it depends on how it is shared, received and enacted" (ibid, p. 143). In fact, according to Foucault, modern governmental rationality is simultaneously individualizing and totalizing – in the case of distributed leadership one has to consider the significance of governance for an individual and for a number of individuals.

Mayrowetz (2008, p. 425) argues that the term "distributed leadership" has been widely applied to notions of school leadership and adapted in education discourses – leading to the coexistence, persistence, and prevalence of diverse conceptualizations and interpretations of the term – thus encouraging researchers to "talk past each other." These diverse conceptualizations of the distributed leadership term can thus be interpreted as a "plurality of forms of government" (Foucault, 2002a, pp. 205–206), concerning many kinds of people. These "multifarious" practices of government attempt to establish a continuity in both an upwards and a downwards direction, leading to govern oneself (the leadership distributors) and others (the leadership distributees). Harris (2013a) distinguishes one common misuse of the term in literature which renders it more difficult to demarcate its "precise" meaning – using it as an umbrella term to encompass any mode of shared, collaborative, or extended leadership practice. Confusion is further engendered by its positioning as the antithesis of top-down, hierarchical leadership – a position critiqued by Harris (2013a), for whom distributed leadership is a form of co-leadership involving "both formal and informal leaders, it is not an *either/or*" (p. 548, emphasis added). It is this "loose" application of the term which may lead to some confusion – in the words of Hartley (2010), "If distributed leadership is indeed a loose cannon, open to doctrinal disputes, then it is perhaps of little surprise that its operationalization within empirical research is less than consistent" (p. 281).

Lumby (2016) questions the notion of distributed leadership as an antidote to heroic leadership due to its connotations of empowerment, collaboration, and the inclusion of multiple leaders. She therefore concludes that it is a "sharing of" rather than an "antidote to" heroic leadership, besides its offer of an illusion of greater empowerment, as well as its propagation as a means of moral leadership. It also seemingly enjoys a "taken-for-granted" status and is automatically linked to effectiveness in empirical research reports. Notwithstanding, Foucault (2002c) suggests "the possibility of establishing a relation between governor and governed that is not a relation of obedience . . . [that] doesn't imply either a subjection or a blanket acceptance" (pp. 455–456). Lumby (2016) goes as far as to equate distributed

leadership with “a *theoretical virus* whose continuous hybridization of theory appears to make it immune to the attacks of rational argument about its lack of clarity” (p. 165, emphasis added), moreover regarding it as a displacement activity blinding us to the transmission of inequality. Hairon and Goh (2015) unpack the construct of distributed leadership and its dimensionality, outlining three major issues involved in the explication of this paradigm that are namely (1) conceptual and operational, (2) quantifiable, and (3) contextual. The elusiveness of distributed leadership as a substantive conceptual construct weakens the methodological explanatory force of its effects as a school improvement tool, besides the lack of empirical methodological rigor in distributed leadership research. Distributed leadership measures are also absent due to the lack of rigor in the operational analysis of distributed leadership. Moreover, Hairon and Goh (2015) are skeptical about the transferability of distributed leadership to non-Western contexts.

Various reasons have been given as to the motivation for distribution. Those which feature the most prominently are what Fullan (2005) proposes as the recognition of the limitations of the “charismatic hero,” which, according to Bush (2012, p. 649), have been “supplemented but not supplanted” by concepts of shared leadership, mirroring the trend towards self-management, together with the pragmatic popularity of distributed leadership to ease the burden of principals and senior leaders who have become overloaded, as evidenced by Hartley (2010). Bush (2013), however, argues that distributed leadership oversteps this instrumental motive to an acknowledgment of the conjoint expertise of organization members. Hartley (2007) explores the emergence of distributed leadership in education through political and cultural considerations – besides providing a response to recent policy shifts foci on the merging or networking of work-based activities, distributed leadership resonates with Bauman’s (2000) concept of “liquid modernity” in a contemporary culture that favors the trend “from organized social structure to network culture” (Page, 2006, unpaginated). Dispersion of leadership within and across organizations resonates with the flexible “liquid modern” view of time and space. Moreover, Hartley (2010) claims that it fits in well with the contemporary trend of organizational learning within a so-called knowledge economy.

Harris (2013a) offers a note of warning, however:

Distributed leadership does not guarantee better performance; it is not a panacea for success, it does not possess any innate good or bad qualities, it is not friend or foe. Much depends on *how* leadership is distributed and the *intentions* behind it (p. 552, emphasis added).

Is Harris (2013a) hereby utilizing a governmentality lens to demonstrate her skepticism of distributed leadership by problematizing both the “technologies of government” (Olssen, 2003, p. 197) [the *how* of leadership distribution] and its “political rationality” (ibid) [the *why* of leadership distribution] Jopling and Crandall (2006) suggest that distributed leadership is viewed as an important practice in school networks as it offers a new way of talking about leadership in which all the voices of relatively “unrecognized leaders” are legitimized, and the language of leadership is extended. Relatively new, emergent leadership roles are given the space

to expand across the network. Distributed leadership aids leaders in challenging expectations, adding new perspectives, and making lateral and latent leadership practice more visible, as Bennett et al. (2003) say, it is “an important analytical tool for thinking about leadership and re-orientating thinking about its nature” (p. 7). Can the distributed leadership discourse itself encourage education leaders to practice critique? “A critique does not consist in saying that things aren’t good the way they are. It consists in seeing on what type of assumptions, of familiar notions, of established, unexamined ways of thinking the accepted practices are based” (Foucault, 2002c, p. 456). According to Foucault (ibid), “A reform is never anything but the outcome of a process in which there is conflict, confrontation, struggle, resistance” (p. 457).

---

### The “Problematics of Government” in Distributed Leadership Discourse

Lakomski (2008) however describes distributed leadership research as “causally idle” (p. 278), with the field having weak theoretical foundations. On a similar note, Timperley (2005) argues:

Yet, leadership has always been distributed within organizations; it is a little surprising that we have taken so long to recognize it and develop the associated conceptual frameworks. Grounding further research in empirical studies that chart the territory, as well as its inadequacies, is essential if distributed leadership does not just become another faulty conceptualization of leadership to be overtaken by the next set of ideas (p. 418).

Here we are presented with a typical example of what Foucault (2002a) identifies as a “problematic of government” that emerges through preoccupations about “how to be ruled, how strictly, by whom, to what end, by what methods, and so on” (p. 202). Distributed leadership is thus regarded as a neoliberal “regime of truth” (Foucault, 2002d) that explores how the subjects are produced “as an effect” through and within discourse and within specific discursive formations, that is, how the education leaders are positioned by the leadership policy discourse, and how they subsequently position themselves according to their distributed leadership performance.

Hartley (2007) suggests that one of the main reasons behind the emergence of distributed leadership in schools, at least at the level of policy rhetoric, can be regarded as it being a response to policy shifts. The notion of distributed leadership might just be used as a mask by policy producers and government officials to ease in their agenda as a normalizing discourse in schools. Hartley (2010) further elaborates on this notion of distributed leadership by stating that it “is a means to an end whose purpose is organizational *development*. It is mainly about accomplishing the *organizational* goals which comprise the instrumental tasks and targets set by officialdom” (p. 281, original emphasis). Hall, Gunter, and Bragg (2011) recognize distributed leadership as the “officially sanctioned model of good practice” (p. 32) advocated by government departments, yet suggest that discussions around this

notion reflect normative narratives and are just part of policy rhetoric to claim that power and autonomy are being shared with schools, whereas reality points to centralization and managerialism. Hartley (2007) regards it as “yet another sign of an institutional isomorphism” (p. 211), whereby the public sector purports to legitimate its policies by appeals to the new organizational forms within the private sector (Alvesson & Thompson, 2005, p. 488).

Gunter and Forrester (2008) detect a control imperative in the relationship between policy and practice in the professional practice of “policy entrepreneurs” (a term coined by Kingdon (2003)), thus concluding that the primacy of the single person (that is, the “solo” leader) remains, with distribution coming downward and used as a form of sophisticated delegation. Youngs (2009) states that education reforms by neoliberal policy agendas have privileged the economic purpose of education, leading to the opposition between self-management and mandated external accountability. He points to the lack of critique surrounding the policy environment and queries the extent to which distributed leadership practices will be shaped or hindered by “official and delegated leadership practices informed by neo-liberal ideals” as opposed to the “more educative and democratic ideals” (p. 382) informing the professionals’ performative environment. The reasons behind the emergence of distributed leadership in schools point to invisible strategies of “normalization” (Foucault, 2002e), with the educational leaders being under a “misconception” of a state of total freedom.

Lumby (2013) laments the fact that distributed leadership literature fails to problematize power and its relationship to distributed leadership, except for a few sporadic attempts, as revealed in studies carried out by Flessa (2009), Hartley (2010), Hatcher (2005), and Storey (2004). Hartley (2007) notes the under-theorization of the relationship between power and distribution. However, organizations are replete with structures of power, unlike the “mirage,” the “apolitical workplace,” that according to Lumby (2013, p. 582), distributed leadership has been used to create.

Ignoring politics can be interpreted as a political act as much as overt engagement. In its avoidance of issues of power, distributed leadership is a profoundly political phenomenon, replete with the uses and abuses of power (ibid, p. 592).

Within this unproblematized theoretical framework of distributed leadership, evidence of a hierarchical framework of control lurks – residual control which is presented as a necessity for successful distribution. Autonomy is restricted, nesting within the imperative of the official agenda, due to the potential threat to the coherence of school improvement initiatives that may come about as a result of differing agendas between the leadership distributors and those among whom it is distributed – the latter is an issue that was explored by both Harris (2008) and Timperley (2005). In his exploration of the inequality in the leadership hierarchy between the “distributors” and the “distributees,” Youngs (2009) concludes that leadership is a vehicle of power. Youngs (2009) further questions the locus of power in educational contexts and whose interests are being safeguarded. He problematizes the assumption that “official” distributed leadership is presented as “a moral and

educational act” of distribution, thus implying that those at the receiving end “do not have it in the same measure in the first place” (p. 387). He shows his concern that “distributed leadership may become a term that is synonymous with and restricted to formal leaders distributing more leadership to others” (p. 387).

This produces a directed form of distributed leadership, which ends up emphasizing rather than lessening the distinct leadership hierarchies. This notion leads to the “dysfunctional dynamics of control-collaboration tensions” as defined by Sundaramurthy and Lewis (2003, p. 399). While control curtails human limitations through discipline, collaboration leads to the empowerment of individuals. Yet, if one approach gains more prominence, the danger of groupthink or distrust comes forward. This is a paradox which Watson (2013) locates in the strong advocacy of distributed approaches to leadership in the UK for the head teachers. The twin justifications provided by appeal to organizational effectiveness and democracy highlight the inherent contradictions within distributed leadership practices. These power issues point to distributed leadership discourse as “a space of differentiated subject-positions and subject functions” (Foucault, 1991, p. 58). Therefore, the subjects (educational leaders) are not shaped solely by social structures (neoliberal school environments), but actively take up their own discourses through which they are shaped and by which they shape themselves.

Some critics of the distributed leadership notion inquire whether such a concept offers a genuine alternative to other forms of leadership, or whether it just serves as “the emperor’s new clothes” (Bolden, 2011, p. 254) or as a pragmatic response to society’s demand for equity and purpose. Lumby (2013) accuses distributed leadership of offering “yet another nuanced rebranding, anchoring the nebulous concept of leadership to a seemingly fresh and inclusive activity” (p. 589). She argues that in this way distributed leadership subjects educators to the ever-increasing limitations posed by centralized curriculum control, surveillance, and marketization. This comes about as distributed leadership appears to loosen the bonds in encouraging staff to embrace it as a “technology of the self” (Foucault, 2000b, p. 177), thus leading to the successful enactment of policy discourse. Hartley (2010) suggests that it is “little more than an emancipatory rhetoric” (p. 279), building on the accusation of Hargreaves and Fink (2008) of distributed leadership being a “more subtle and clever way to deliver standardized packages of government reforms and performance targets” (pp. 238–239). On a similar note, Spillane, Healey, and Parise (2011) argue that distributed leadership has “effortlessly entered the conversation about school leadership and management often with simplistic and unwarranted mantras such as *everyone is a leader* or *the more leaders the better*” (p. 159). Discourses construct subject positions, as is the case with distributed leadership which brings about its own specific discursive formations.

According to Woods (2004, p. 22), as with other discourses of legitimation, such as “empowerment” and “ownership,” the notion of distributed leadership appears to incorporate democratic procedures. Woods addresses the danger of the notions of democratic leadership becoming colonized by distributed leadership discourses, stating that the two notions cannot be regarded as synonymous. Distributed leadership incorporates a degree of control and autonomy, within which there is the scope

for dispersed initiative and the boundaries of participation. Despite being distributed, leadership does not imply the lack of a pyramid as it varies along the continuum between control and the autonomy participants are allowed to exercise. This positioning of distributed leadership across the control/autonomy continuum determines whether autonomy and empowerment are extended or if constraint and control are exercised in novel ways. Democratic leadership runs the risk of being regarded as another way of denoting distributed leadership; however, the concept of democratic leadership simultaneously draws open and goes beyond that of distributed leadership. Whereas distributed leadership may obscure the deeper questions inherent in democratic leadership through its widening of leadership boundaries, democratic leadership attempts to make visible these deeper questions. Woods (2004) thus argues that distributed leadership promises a “hollow” democracy, further entailing a “democratic deficit,” which, according to Woods and Gronn (2009, p. 430), leads to its critical interrogation. Is it the leadership of one or the leadership of many?

Hartley (2007) argues that distributed leaders do not arrive at their position as the result of an election, but an appointment, with a “presumed harmony and consensus” about the whole affair. Hatcher (2005) and Storey (2004) think that “distribution” tends to underestimate the micropolitical aspects of leadership practice, while completely ignoring the “distribution” of wealth beyond the school and its causal relationship to attainment. However, leadership cannot survive without difference – this seems to be echoed by Harter, Ziolkowski, and Wyatt (2006) who argue that leadership dynamics are “unequal” in one way or another – power differentials exist despite the notion of distributed leadership. This notion emphasizes the inequality present within the discursive field of distributed leadership. Woods et al. (2004) propagate the existence of distributed leadership and strong senior leadership which allows for strong partnerships with the simultaneous power disparities between the partners. Watson (2013) draws on McMurry’s (1958, p. 82) notion of “benevolent autocracy” to show its particular relevance to school leadership, thus implying that distributed leadership practices are “only” possible “where an autocratic leader at the top ruthlessly ensures that participatory ideals are adhered to by those lower down the hierarchy” (p. 259).

Stohl and Cheney (2001, pp. 387–389) have revealed that even in situations where leadership is a matter of collective consideration, people’s attachment to the concept of “strong leaders” is sometimes still very heavily felt. Lingard et al. (2003) stress the necessity for leadership in schools, arguing that “schooling discourses locate authority in principals and defend their positional power because schools, as we know them, require leadership in order to function *as* schools” (p. 144, original emphasis). How can a school move forward without a leader at the “top” to steer its direction? Distributed leadership does not equate to no leadership, and does not mean that everyone has an equal say in every matter. It is this common conception (or misconception, rather) that creates a tension between the notions of distribution, democracy, and the concept of the network. These tensions reflect a battle among the discourses of heroic leadership, distributed leadership, and isolationism, via the distinct discourses of critical leadership, as interpreted via Foucault’s (1975) view of the world as discourse. Gunter, Hall, and Bragg (2013) regard the single leader as

central to distribution, in line with the reasoning of Harris (2007), “The paradox is that without stable, consistent leadership in schools distributed leadership will be incredibly vulnerable and ultimately fragile” (p. 322). Harris (2005) argues that distribution of leadership does not lead to the redundancy of the Head who has the critical role of providing empowerment to the would-be leaders through asymmetrically distributing the tasks.

Can distributed leadership and hierarchical leadership coexist? Leadership can be stretched over leaders in a school, but is not necessarily democratic – Spillane (2005) argues how a distributed leadership perspective may also give rise to autocracy. Is there a single distributor who “distributes” leadership? One must question *what* is being distributed, *how*, and *to whom*, as well as the way in which this distribution occurs.

---

### **Challenges to the Implementation of Distributed Leadership: A Focus on the Multifarious Practices of Government**

Education practitioners and policymakers have been lured by the attractive notion of leadership distribution for various reasons. Mayrowetz (2008) explores the value of distributed leadership in a pragmatic sense, pointing out four benefits that can be generated through its practice. It may be regarded as a theoretical lens for exploring the leadership dynamics; as a means for furthering democracy (despite distributed leadership and democracy being very distinct, as outlined by Woods, 2004); as a way of improving organizational efficiency and effectiveness; and finally, as leading towards human capacity-building.

Notwithstanding the “perceived” advantages of distributed forms of leadership, Harris (2004) states that inevitable and inherent difficulties are associated with its implementation in schools – namely structural, cultural, and micro-political barriers in operation. This section thus outlines the challenges that are presented by the tensions revolving around the hierarchical structure, power, and autonomy; the notion of distribution and boundary spanning; and the level of control and autonomy. The “perceived” benefits of distributed leadership are internalized via Foucault’s (2002e) notion of subjectification through which the educational leaders, as subjects, are constituted through “practices of subjection” and multiple “practices of the self” (p. 331), mirrored in the changes that occur in their leadership conduct due to these novel distribution practices and discourses. They are thus woven into and out of discourse, the discourse of distributed leadership.

Schools as traditional hierarchies, with the demarcations of position and pay scale, may prove to be a barrier to a more fluid and distributed approach to leadership. Moore and Kelly (2009) claim that the nature of schools as traditionally hierarchical structures with the head teacher as the leader tends to conflict with the leadership style promoted in networks (p. 397). Hopkins and Jackson (2002) suggest that the “more hierarchical the management structure, the more the liberation of leadership capacity is likely to be stifled” (p. 11). Harris (2004) also states how distributed leadership may pose an inherent threat to the status quo, placing the head in a position of vulnerability due to a relinquishing of power to others, leading to a

lack of direct control over certain activities. Issues regarding loss of leadership power and autonomy may arise as school leaders struggle with the notion of delegating responsibility and accountability to network members. Earl and Katz (2005) explain how, "Establishing patterns of distributed leadership is a subtle dance of power and authority. Sharing leadership within schools and across the network can cause confusion, resentment and protection of position and power" (p. 71).

Harris (2004) shows concern that significant impediments to distributed leadership are presented by "top-down" approaches to leadership and the internal school structures. Another challenge is posed by "how to distribute" and "who distributes," ensuring that distributed leadership "is not simply misguided delegation" (ibid, p. 20), involving interdependency rather than dependency, with "the leadership function *stretched over* the interaction of *multiple leaders*" (Spillane, Halverson, & Diamond, 2001, p. 24, emphasis added). Timperley (2005) writes about the potential problem of incoherence within an organization due to the different agendas circulating among those to whom leadership is distributed and the "official" leaders, especially where no boundary spanning is involved. Boundary-spanning leadership as defined by Miller (2007) has an important role to play in leadership distribution as it involves bridge-building with numerous points of contact, establishing collaborative environments, as well as carrying out information brokerage.

Jarvis (2012) describes how schools as organizations are "the loci for various forms of power and compliance relationships" (p. 489) due to their high level of complexity. Distributed leadership, according to Woods et al. (2004), may be both constraining and enabling, depending on the degree of control and autonomy in the organization, which turns out to be a major variable in this leadership practice. This concern raises the issue of the extent and limits of individual autonomy. Furthermore, they draw attention to the fact that where distributed leadership veers towards the autonomy pole of the control/autonomy continuum, one should not assume that nonnegotiable, "top-down" goals, values, and aims are always unsuitable, despite presenting a strong, directive steer. Smith and Lewis (2011, p. 384) identify an organizational paradox emanating from the tension around "empowerment and direction," where leaders are expected to enact their roles while following others' decisions in a "supposedly" distributed leadership setting. Consequently, Watson (2013) draws our attention to the paradox in relation to autonomy and collectivity, which produces tensions between belonging and performing, thus giving rise to the dichotomy between "collective" and "individual" identities. A plausible connection between the two sets of tensions identified above seems to exist in equating "empowerment" with autonomy, thus leading to individual identity, and "direction" which leads to the nurturing of "collective" identities due to enacting that which is "given." This is engendered by the push for distributed leadership within a scenario of networks, cooperation, and flatter hierarchies. Gronn (2009) states that little attention has been paid as to how it may be ideologically driven and political in nature.

Moreover, according to Sugrue (2009), distributed leadership can promote an excessive reliance on group-based leadership and understate the importance of the individual leader in organizational effectiveness. Gronn (2009) argues that "solo leaders continue to figure prominently in accounts that purport to be distributed and

that distributed leadership apologists have not adequately clarified the role and contribution of individuals as continuing sources of organizational influence within a distributed framework” (p. 383). In his view, distributed leadership fails to give an explanation of the different forms of leadership at work at any one time, from concentrated solo leaders to more dispersed forms of networks within the same organization.

Mifsud’s (2017c) study that addresses gaps in educational leadership literature in the areas of collegiality, relations of power, and leadership distribution practices (the latter being the main focus of this chapter) simultaneously undermines leadership theories through findings that contradict conventional, reputable concepts. Mifsud (2017c) addresses the “conceptual confusion and empirical reticence” indicated by Harris (2007, p. 315) and other researchers (Heck & Hallinger, 2005; Storey, 2004) in the field of distributed leadership. The Maltese college (school network) undermines the very idea of “distribution,” due to its leadership practices revealing themselves as “direction,” “delegation,” “centralization,” “control,” “constraint,” and accountability. Furthermore, the theme of infantilization emerges very powerfully in the portrayed relationship between the College Principal and the Heads of School. A “concurrent double positioning and performance” is constructed “through the positioning of the Heads by the Principal and through the Heads’ acceptance and performance of this positioning” (Mifsud, 2017c, p. 209), thus showing the Heads subjecting themselves to this adult–child relationship.

---

## Conclusion and Reflections

Foucault’s concept of governmentality offers a divergent framework for an exploration of distributed leadership as presented in the literature narrative as an aspect of changing rationalities of government.

In the table below, the author portrays the regimes of government present in the distributed leadership literature narrative, according to the four modalities identified by Grimaldi (2020) (Table 2):

Niesche (2011, p. 139) commends researchers to cast a wider net “in terms of approaching, researching, theorizing, and analysing educational leadership.” Gunter (2010) argues that while theory does not immediately solve the dilemmas of what decisions can be made and implemented in a school leader’s work practices, it does allow possibilities for the generation of novel perspectives on this phenomenon we call leadership. This chapter may demonstrate the importance of the relationship between theory and practice which is sorely lacking in leadership studies.

The author also aims to highlight the usefulness of Foucault’s work in educational leadership, more specifically the discourses of distributed leadership. His themes are still relevant today, in fact, May (2005) argues that if we need to question the relevance of Foucault’s work for today, then we must become *more* Foucauldian rather than less. It is possible that a move towards distributed leadership will simply involve more complex “masks” being utilized. Foucault’s work helps me examine how leadership discourses operate to produce particular leader subjectivities and

**Table 2** Regimes of government practices within the distributed leadership literature narrative

Focus of the analytics of government	Presence of the regimes of government in distributed leadership
<i>Forms of rationality</i>	Distributed leadership as a feature in policy frameworks The motivation of the leadership distributors
<i>Fields of visibility</i>	The presentation of distributed leadership as an attractive mechanism for the “top-down” delivery of policies The diverse conceptualizations of the distributed leadership term
<i>Techne</i>	“Network governance,” that is, education reform via networking for school effectiveness and improvement Inequality in the distributor/distributee leadership hierarchy The notion of “benevolent autocracy”
<i>Identity formation</i>	The interdependent influence between followers and leaders as leadership coproducers The “everyone is a leader” notion The presentation of distributed leadership as an antidote to heroic leadership with promises of empowerment and collaboration The “distributed versus democratic” leadership distinction/divide The “autonomy–collectivity” paradox

how these, in turn, offer resistance to produce particular discursive positions – they are both *subjects to* and the *subjects of* particular leadership discourses.

This piece of writing can also serve as an inspiration for practicing leaders in present-day educational institutions in order for them to reflect on the multiple influences on their leadership experience and identity, on how they are “subjected” by both local and global forces, and how they in turn subjectify others, all the while moving down the leadership hierarchy. They can come to an understanding of the forces by which they are “subjectified” from above, in turn leading them to “subjectify” those beneath them, who in turn offer “resistance” in response to this subjectification. These forms of “subjectification” and “resistance” which are internalized by the various leaders as a “normalization,” “a regime of truth,” thus becoming a “technology of the self,” may therefore be viewed with skepticism and critiqued, rather than being accepted in an essentialist unproblematic way. The leaders’ subjectivities are a constantly shifting and flexible phenomenon rather than fixed as is constructed through policy documents – they are created through a range of particular discourses, power relations, and interactions. Educational leaders can take up Foucault’s (2000a) notion of critique as a “permanent” ethos in which they explore the nature of their existence but at the same time query the limits imposed upon them, while probing opportunities for increasing freedom (p. 118).

Niesche and Gowlett (2015) advocate a post-structuralist politics for educational leadership as it allows for a better understanding of leaders and their shifting subjectivities, where leadership practice is regarded “as a phenomenon that is contested and fluid, open to change, moving between different positionings, and disrupting the search for that essential human feature” (p. 382). Analyzing distributed leadership discourse through a Foucauldian governmentality perspective positions leadership as a locus of political struggle, thereby enabling school leaders to be open to

nontraditional ways of seeing the world. Moreover, this allows for “a rejection of imposed categories and identifies spaces of freedom for leaders’ actions rather than a closing down and erasing of difference lead[ing] to a productive (re)thinking of leadership practice as it occurs” (ibid, p. 383).

### Abstract

Few issues before the courts have proven over time to be as compelling, divisive, or enduring as the principles of separation and how they have been outlined within the United States Constitution. Arguments have been steadily addressed and dispatched according to the various modes of constitutional interpretation from which legal scholars operate. While consideration of originalism or textualism and other popular methods of interpretation make their way into any legal discussion, the catalyst for addressing this chapter differed. Instead, this chapter examines the topic through a historical perspective that focuses on power and purpose as it traces the inherent motives behind visible shifts in Constitutional interpretations and leanings. Specifically, this chapter first engages in an examination of the ideals and arguments that were registered as the country was

coming into being. It next moves from history and philosophy to foundational case arguments and rulings that followed. This evolves into the balancing act between science and the beliefs that underscored an evident emergence of political leanings making their continued presence felt. Finally, the chapter examines implications for educational leadership, including expected conflict, just ahead of providing an accounting of anticipated future imports for this topic regarding the next generation or two.

**The field of memory**

Clearly, the work of Thomas Jefferson and others was profoundly thoughtful and influential in creating the underlying ideals that became the United States. Also, just as clearly, there are and have always been motivations linked to the separation of church and state that should be studied from the perspective of constitutional rights, along with a historical accounting of social and political influence. Ultimately these interactions need to be traced through the years of conflict and discord and weighed against the impacts each has had on educational leadership. The relationship between religion and governance has a complicated history in the United States. Tales of the “Founding Fathers” highlight the principles and contributions of the dominant white male culture and their religious beliefs. Conveniently, the ensuing narrative often leaves out their hegemonic relationships with indigenous peoples and the oppressions that took place during the nation-building period. At times this innate contradiction is just accepted as the way things were – a sign of the times. Still, trouble emerges when that insouciant mentality reappears and fails to embrace the responsibilities that accompany the rights and ideals initially set out by the founding founders – while also creating a pathway for dismissive attitudes towards any number of sources of discord that may be inconvenient to contend with.

**The field of presence**

Educational leaders have an essential role to play in the protection of constitutional rights and need to have an understanding of the gradual erosion of those rights within the current cultural context. Although tremendous wisdom has been assigned to the Constitution and its underlying tenets, increasing complexity and cultural conflict (English, 2012; Hughes, 2019) continue to expose tears in the fabric of American society and civility. While there are those who inexorably assume the underlying philosophy that has girded American democracy for so long will continue to persevere, partisanship has replaced historical approaches to governing. The court system seems increasingly politicized or encased in procedural and precedential gridlock. Sound bites are created for maximum reaction, and conflicting points of

view are rationalized to the point that all sides in disputes represent themselves as marginalized victims. The idea of “taking sides” and the accusation of “but it’s not fair” are pervasive criticisms of both institutions and the people that lead them and schools are not exempt. Educational leaders must understand and take action to demonstrate that they know and believe in the careful balance between rights and responsibilities and how to protect and teach both of those critical aspects of democratic governance.

### **The field of concomitance**

Though the United States Constitution has influenced governments, customs, and norms for hundreds of years, numerous outside sources have impacted this topic in return. One of these influential sources is science. As Americans have increasingly come to express their faith in science, including archeology, chemistry, and medicine, there are members of faith-based and other communities who have taken issue with that point of view. Famously argued during the Scopes Monkey Trial, the reality of science versus religion powerfully revealed itself during the COVID-19 pandemic where science was sometimes ignored. Instead, remedies of faith were supported by the federal administration, who pushed the idea that the crisis would come to a miraculous end. On another front, the influences of traditional media and communications, including televangelism and more, as well as social media, has had a highly significant impact on the direction of this topic. Pieced together, these impacts have helped shape the trajectory of efforts to eliminate the wall of separation outright. They have also combined to sustain a long-term attack on public education, which is the single most remarkable institution in support of equity and democracy. Religion has been used as a justification for the privatization or chartering of public schools, however, it often takes the side of business, profit, and capitalism ahead of efforts to support equity through shared education.

### **Discontinuities and ruptures**

As referenced concerning the relationship between business and prominent religion, there is a glaring reality that is mostly overlooked and is perhaps even taboo to register in a severe look at this topic. Central religion has been fully mobilized within its alignment with a major political party, yet churches continue to enjoy tax-exempt status. Without going so far as to criticize the piety of churches and religion on any large scale, beyond tax status, some would suggest that capitalism is the largest denomination in the country, with Christianity absorbing and fully embracing that pairing. There are high stakes returns for both major political parties and elements of significant religion which stand to benefit immensely because they have adopted a doctrine of capitalism ahead of all else – and delivered a flock of the faithful to the hands of their allied party – regardless of issue or how troubling the character and competence of political leadership.

### **Critical assumptions or presuppositions**

Important assumptions guide the ideas expressed in this chapter and how they impact school leadership. Regardless of the day, the age or location, or the size of an

educational organization, leaders have regularly needed to balance the right of individuals with the community or “common” good. As matters become more complex (Hughes, 2019; Miller, 2018) conflict also increases in complexity and it is vital to have a better understanding of how issues reached their place of prominence in our social and legal settings. That understanding necessitates familiarity with the underlying philosophy driving as much as it requires a knowledge of the case history. This is because the political tides the nation goes through constantly reshape the boundaries surrounding the broad concepts as well as the comparably more minor details. Though the political and legal claims being made are intense, ultimately, the discussion always comes back to the philosophy associated with the concept. For this reason, this chapter explores the underlying philosophy first.

---

## Introduction

This chapter examines the historical progression of church and state issues from the period within which the United States was organized, through to the present day. It traces critical issues through vantage points that emerged at critical junctures in American history to help shape the present-day realities concerning the separation between church and state.

More specifically, this chapter traces historical and philosophical underpinnings at the earliest stages of government development first. It then examines legal case-work surrounding the topic before jumping into the union of politics and separation ideology that showed more prominently throughout the twentieth Century. Finally, the chapter entertains implications for educational leadership ahead of offering commentary on the possible next incarnations of this topic in the foreseeable future.

---

## Ye Old Deluder Satan

Long before the First Amendment of the United States constitution, with its political and linguistic construct of separation between church and state, the two were inexorably entwined. The unwinding yet continual interplay of these ideas may be influential in the controversies and legal battles that still rage today.

In 1647, the state of Massachusetts passed the Old Deluder Satan Act, which became the basis for public schools in the United States. The Puritans, religious immigrants themselves, felt that children should learn to read to prevent “ye old deluder, Satan” in his goal “to keep men from the knowledge of ye Scriptures” (Stillwaggon, 2012, p. 352). Although having a legal requirement for access to scripture may seem pious, there was also an attitude of intolerance prevalent in this belief system, as Hirschman (2004) describes the Puritans in Massachusetts as “hanging two Quakers who refused to quit their province” (p. 1213).

The Act required towns of 50 or more to “hire and maintain” a teacher for reading and writing, and cities with a population greater than 100 were required to use taxes to support a grammar school (Carleton, n.d., p. 1). In demanding that taxes be used to

pay for a typical school, this piece of legislation created the foundation of the property tax reliant school funding model still followed in most states today. In addition to mandating a specific funding scheme, Carleton (n.d.) writes that the Act:

Established several principles upon which public primary and secondary education continues to rest today: that basic knowledge is a public or community responsibility, that the state can require communities to raise and expend local funds for schools, that day-to-day responsibility for the operation of schools rests at the local level, and that schools are to be organized in levels separating elementary from secondary education (p. 1).

Public schools in the United States were configured because of religious convictions about the importance of reading and understanding scripture. Educational leaders may wish to consider how the Puritanical reasons for the importance of education may continue to inform both legal requirements and cultural expectations for schools, and if there are underlying currents or religious assumptions about behavior and belief systems that linger in institutions of public education. Nelson (2010) quotes Noddings as observing the particular “Deweyan ideal of a religious attitude—one inspired not by doctrine or dogma but by an energetic and faithful dedication to the worthy tasks at hand. Surely, this attitude can be legitimized in public schools.” Nelson goes on to describe this idea as “classically American,” with a priority on “doing and validating thought through action” (p. 335). The role that religion has in educational systems, intentionally or subliminally, warrants a more in-depth examination that follows historical background, involvement of the judicial system, cultural and political influences, and possible future impacts.

---

## A Historical Wall of Separation

The Supreme Court adjudicates Constitutional law and their rulings on schools and religion have, in general, been based on each justice’s application of the First Amendment’s Establishment and Free Exercise Clauses, which read “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof.”

Notably, the two clauses do not include the phrase “separation of church and state”, nor is that phrase anywhere in the constitution. Despite this, it is referenced and even quoted so frequently in the context of religion in the public schools that a more in-depth discussion may be helpful.

The Danbury Letter (Little, 1976) was written by the newly elected President Thomas Jefferson to the Danbury Baptist Association of Connecticut and communicated that Jefferson was supportive of the rights of individuals to practice religion freely. Jefferson wrote:

Believing with you that religion is a matter which lies solely between a man and his God, that he owes account to none other for his faith or worship, that the legislative powers of government reach actions only, and not opinions, I contemplate with sovereign reverence

that act of the whole American people which declared that their legislature should ‘make no law respecting an establishment of religion, or prohibiting the free exercise thereof,’ *thus building a wall of separation between Church and State*. Adhering to this expression of the supreme will of the nation in behalf of the rights of conscience, I shall see with sincere satisfaction the progress of those sentiments which tend to restore to handle all his natural rights, convinced he has no natural right in opposition to his social duties. (p. 59).

Kevin Welner succinctly wrote about Jefferson’s concerns with the entanglement of religion and politics, and that his “embrace of a wall of separation was to avoid government involvement that could corrupt-free religious practice, while also protecting the government against church influence” (Welner, 2018, p. 2).

As an example of various vectors of power and the careful balancing of them by leaders, however, Jefferson’s words should also be understood within the political context of the time in which he wrote them. Jefferson penned the letter in response to the Danbury Connecticut Baptist Association’s letter to him detailing their complaints about the influence that the more powerful Congregational church had on community, governmental and tax decisions. Perhaps more crucially, the message was written during a time of intense political debate and Jefferson’s concerns about a trend towards Federalism and away from the republic form of governing envisioned by Jefferson and his peers (Hutson & Jefferson, 1999, p. 777). Additionally, during the presidential campaign of 1800, The Federalist Party had labeled Jefferson an atheist (Hutson & Jefferson, 1999, p. 782), a serious charge that he needed to renounce by making some sort of public statement about the role of religion, and perhaps his own beliefs about the matter. The Danbury Letter provided him that opportunity. While Jefferson did believe what he so eloquently wrote, it also provided him with a much-needed platform from which to broadcast his ideas.

The idea of the separation between church and state has loomed large in the American consciousness, and cases involving how schools allow or don’t allow religious practices have been continually litigated. The Supreme Court has heard trials that range from how, when, and by whom prayer at school may be conducted (examples: *Engel v. Vitale* (1962), *School District of Abington Township v. Schempp* (1963), *Santa Fe Independent School District v. Doe* (2000)), student release time for religious instruction (example: *McCollum v. Board of Education*, 1948), reading the Bible in school (example: *Murray v. Curlett* (1962) and the pledge of allegiance (example: *Elk Grove Unified School District v. Newdow*, 2004)), in addition to other areas of litigation.

Lupa, Masci, and Tuttle (2019), in their report for the Pew Research Center, captured the cultural conflict that stems from those judicial decisions with this observation:

Some Americans are troubled by what they see as an effort on the part of federal courts and civil liberties advocates to exclude God and religious sentiment from public schools. Such an effort, these Americans believe, infringes on the First Amendment right to free exercise of religion.

Many civil libertarians and others, meanwhile, voice concern that conservative Christians and others are trying to impose their values on students. Federal courts, they point out,

consistently have interpreted the First Amendment's prohibition on the establishment of religion to forbid state sponsorship of prayer and most other religious activities in public schools (2019, p. 1).

An educational leader must understand the history along with intertwining of culture, political influence, and religion as well as how those relationships impact educational institutions and their communities. An excellent place to start that history is with the concepts of right and wrong and with the judicial system, and no court serves as a better example of that for this area of interest than the Supreme Court of the United States.

## Legal Discussions on Matters of Church and State

A deconstructive definition of logocentrism, a concept, and term credited to Derrida, often includes the words truth, law, logic, and reason (Mills, Durepos, & Wiebe, 2010) and identifies the binary aspects of human thought; man/woman, good/bad, inside/outside. In considering transgressions of church and state, an issue squarely rooted in the interpretation of human-created written law, a debate might be had on how to view the purported binary right and wrong of law and what is perceived as a search for "truth" in a situation, with the complex intersection of differing beliefs. Knowledge of the law may also serve as an external manifestation of power in rulemaking, judiciary resolutions, and decisions made by school administrators. Those same school leaders are tasked with using their skills and experience in school procedures and expectations to balance the rights and responsibilities of a school community.

James (2018) explained that for Foucault, the relationship between "truth," power, and competing claims was not negative, but rather that in considering the opposing sides of an argument, one might discover more insight than in simply looking for the "right" or "true" answers. For educational leaders, the search for the "right" answer is a familiar one that often arises around matters of freedom of speech and religious expression versus what is appropriate or permissible in a school setting. Educational leaders must explore their ideas about a "right" answer to the role that religion might play in the public-school system, and also consider if that "right" answer has changed over the years as the court system has evolved to reflect changes in national mores and administrations.

The relationship between church and state provides a compelling example of the complexities in finding a "right" answer, as in many cases involving the issue, each side will have a different perspective on what that answer should be. When transgressions of church and state end up in court, the arguments are wholly based in political and legal forms of power, and the resolution of disagreements uses written phrases and interpretation to build, enforce or bend a wall between an individual's beliefs and the community's public practice. It would be instructive to follow two cases related to church and state, examine the opposing sides, or "competing claims," and consider how the Court interpreted Constitutional law to make their decisions.

*Everson v Board of Education* (330 U.S. 1 1947) was decided by the Supreme Court in 1947 and continues to be influential on how the courts adjudicate church and state issues.

New Jersey had a state statute that allowed parents to be reimbursed for transportation costs if they chose to send their children to private schools, including church supported, religious private schools. The statute was challenged by *Everson*, a local taxpayer, who felt that using taxes to pay for religious school transport provided indirect aid to religion and therefore was a violation of the First Amendment's establishment clause. Ward (2009) detailed two essential points that were outlined by the Court as they debated and decided this case:

- The First Amendment could be applied to state constitutions, based on the 14th Amendment that requires due process. Before the *Everson* case, the Bill of Rights was considered only in cases involving the federal government.
- Justice Black, speaking for the majority, quoted Jefferson's Danbury letter, where the phrase "building a wall of separation between church and state" first appears. Black then added that the "Court believes that the wall must remain high and impregnable."

Somewhat surprisingly, given his statements on the importance of a wall, Black then argued that using public funds to cover religious school transportation did not violate the establishment clause, as the funds were also used for transportation to nonreligious private schools, that the state must be neutral towards religion, and that "no person can be punished for entertaining or professing religious beliefs or disbeliefs, for church attendance or non-attendance" (Kauper, 1973, p. 313). Therefore, as long as taxpayer funds could be used for transportation to nonreligious private schools, the Court had to support the use for religious schools as well (Ward, 2009). In as much as the payments were made directly to parents and not to the religious school, the Court majority did not find that the program provided direct state aid to religion.

The justices who wrote the dissenting argument felt that parochial school was an integral part of the Catholic Church and "to render tax aid to its Church school is indistinguishable . . . from rendering the same aid to the Church itself." Their comments shed some light on the areas of disagreement in the judiciary on how to define and apply the "establishment" of religion in the context of government support or neutrality (Ward, 2009).

Chemerinsky and McDonald (2018, p. 1030) described what they consider to be one of the most important and precedent-setting impacts of the *Everson* case:

There is no doubt that when the Court inserted itself into church-state issues in *Everson* after they had been worked out at the colony and state levels for over 300 years, it departed from this historical understanding of free exercise rights.

In 2020, the Supreme Court decided a case that was based on a state statute similar to the one challenged in *Everson*. Despite the gap spanning 73 years and completely different justices, the decision echoed the majority from the earlier case.

On June 30, 2020, the Supreme Court ruled on *Espinoza v. Montana Department of Revenue*, No. 18-1195. (Espinoza, U.S 591, 2020). A Montana state statute allowed for tax credits to be applied to scholarships for children who attended private schools. Still, the Montana Department of Revenue excluded religious schools specifically from that tax option based on the state constitution that barred aid to sectarian schools. Three mothers whose children attended a religious school in Kalispell, Montana, sued the state, challenging the exclusion of religious schools from the scholarship program as discriminatory. The initial decision was for the parents, but on appeal, the Department of Revenue argued that the scholarship program would be unconstitutional if it funded private religious schools. The Montana Supreme Court agreed and reversed the lower court's decision.

The Supreme Court thus considered the question, "Does a state law that allowed for funding for religious schools violate the Religion Clauses or the Equal Protection Clause of the federal Constitution? (Oyez, 2020).

The Montana Supreme court had invalidated the entire program over conflicting statutory regulations. Still, the U.S. Supreme Court, in a 5-4 vote, overturned that lower court's ruling, finding for the parents with a statement that the statute "cuts off funding only to religious schools while allowing funding for other non-public schools, putting the school to a choice between being religious or receiving government benefits" (Van Oort & Nelson, 2020). The Court wrote that the Free Exercise Clause "protects religious observers against unequal treatment and against laws that impose special disabilities based on religious status and that the state statute banning aid to religious schools violated that clause" (Oyez, 2020).

These two cases show some continuity in how the Supreme Court has interpreted the First Amendment in finding a "right" legal answer for the specific issue of using public funds for religious school supports. Their rulings in these similar situations have favored and redefined the idea that the Court, and the state, must remain neutral in deciding matters of financial supports for public and private schools, be they secular or sectarian. These cases indicate that the Court may be interpreting neutral as the same treatment for all sides, not as keeping religion out of the public sphere.

---

## The Marriage of Religion and Politics

It would be tempting to start a timeline of the deliberate yet still complicated relationship between religion and politics with the theatrical Scopes Trial of 1925 that pitted creationism against evolution as part of the school curriculum, or with the 1954 addition of the words "under God" to the pledge of allegiance as a reaction, some argue, to McCarthyism and communism, which was perceived as "godless." Those moments in history, and many more, might be used to illustrate the attempted encroachment of religion into the public sphere. For this chapter and the slow lowering of Jefferson's wall, the candidacy and presidency of Ronald Reagan provide a perfect place to begin.

Craig Smith (2017) made this bold statement:

Over the last fifty years, however, conservatives have migrated into the Republican Party, and liberals have migrated into the Democratic Party, creating the strongest ideological division in the parties since the days of the Federalists and the Anti-Federalists. One of the reasons for this shift was Ronald Reagan's ability to build a broad coalition around conservatism (p. 33).

During the presidential election of 1980, both the incumbent Jimmy Carter and challenger Ronald Reagan utilized religion to appeal to potential voters. Hogue (2009, p. 2) described that both candidates "practiced the politics of religion, appealing to their strong religious values and Christin piety" as reasons why voters should want them as the next President. Reagan won that election, of course, and historians to this day puzzle about how "a divorced Hollywood star become the symbol of conservative Christianity's revitalization, as he trounced born-again Sunday school teacher Jimmy Carter" (Sutton, 2015, p. 205).

Of importance to this discussion was the emergence of a political alliance known as the Religious Right. Many of the social changes that occurred in the 1970's; the increase in women working out of the home, youth rebellion, Vietnam war protests, the Supreme Court's decision on *Roe v. Wade* that legalized abortion and the emergence of the gay rights movement all worked together to create an environment where more traditional, Christian families felt that their way of life was under attack (Sutton, 2015). Many of these issues also troubled political conservatives, albeit for different reasons. Enter Jerry Falwell.

Falwell was an influential preacher who lead a vast, evangelical church in Lynchburg, Virginia, and at the urging of conservative political operators, became a founder of the Moral Majority, the title of the Religious Right as a social and political entity, in June of 1979. The Moral Majority identified themselves as "pro-life, pro-family, pro-moral, pro-Israel, and pro-strong national defense causes" (Sutton, 2015, p. 208). Briefly put, the Moral Majority found itself in closer alignment to Reagan than they did to Carter, and lodged their growing political power behind his success.

One of the Regan administration's lesser-known forays into the business of religion and educational institutions happened over the tax-exempt status of Bob Jones University, (BJU), "a fundamentalist university in South Carolina that had denied admission to African Americans until 1971 and in 1975 still prohibited interracial dating" (Sutton, 2015, p. 213). The IRS, as a body of the U.S government, had determined that, based on the Civil Rights Act of 1964, institutions that practiced segregation were not eligible for tax exemption. BJU and one other college sued the United States to regain their tax-exempt status. In 1982, The United States Treasury, backed by the White House, announced that the IRS did not have the authority to make that kind of decision and that the colleges in question would have their status restored. The Reagan administration may have underestimated the public's reaction to this turn of events, as the President received enormous criticism for his support of BJU. As Aaron Haberman (2005) wrote, this situation.

...forced the Reagan administration first to initiate Congressional action to revoke the newly restored tax exemptions and then to ask the Supreme Court to settle the matter once and for all. In May 1983, the Supreme Court ruled eight to one in favor of the IRS's authority to deny the tax exemptions (p. 234).

In that specific case, and despite pressure from the President, the Supreme Court upheld the Civil Rights Act and did not allow an institution, religious or not, to flagrantly ignore federal law and still reap the benefits of federal tax exemption. However, Reagan's appointments to the Supreme Court during his years in office reshaped how the Court rules on religion and education cases to this day. This reshaping of "the bench" mellowed in subsequent years as several justices became more neutral if not even liberal in their later years. However, in 2016, the need to solidify a conservative majority within the court system became a preeminent need and rally cry for the "right-leaning" and often "Christian" oriented voters across America. With efforts still underway to further strengthen the conservative majority in the courts, this orientation has established a stronghold that will influence the nation in general and educational leaders in particular for at least the next generation.

---

## Implications for Educational Leadership

For educational leaders, awareness of their critical role in safeguarding the constitutional rights of the school community, including those that pertain to religious expression, may sometimes get lost in more immediate concerns about academic progress or school site safety. Or, perhaps more worryingly, because the subject matter under consideration is not within the mainstream beliefs and preferences of the school community. But protecting the idea of a democracy and the rights and responsibilities that come along with that form of government should be of utmost priority for school leaders. Balancing the common good; what actions or reactions will benefit the community as a whole, with the civil liberties of an individual, is a recurring theme in the work of administrators who are tasked with protecting the safety of the institution in which they serve, acknowledging and responding to local values, and supporting tenets of the governance of the United States.

To facilitate finding that balance, educational leaders might consider the separation of church and state in public schools within the broader context of the rights granted and protected by the Constitution and reflect on the often-difficult choices between honoring an individual's free speech and expression and concerns about maintaining an orderly school setting.

Administrators are not without resources as they navigate these nuanced decisions. *Tinker v. Des Moines* (1969), arguably the most well-known student free speech case ever decided by the Supreme Court, provides both the legal backbone and the language needed to prevent, stop or discipline students for speech or other forms of expression, including religious, that might be deemed a threat to a safe and secure environment.

As described by Chemerinsky (2000), in addition to delivering the famous statement “It can hardly be argued that either students or teachers shed their constitutional rights to freedom of speech or expression at the schoolhouse gate” (p. 530), Justice Fortas, speaking for the court majority, also gave administrators the power to decide if an expression of speech could be banned by a school as he stated:

In order for the state in the person of school officials to justify prohibition of a particular expression of opinion, it must be able to show that its action [is] . . . something more than a mere desire to avoid the discomfort and unpleasantness that always accompany an unpopular viewpoint. Certainly where there is no finding and no showing that engaging in of the forbidden conduct would “materially and substantially interfere with the requirements of appropriate discipline in the operation of the school,” the prohibition cannot be sustained. (Chemerinsky, 2000, p. 532)

For school leaders, however, great care should be taken to not overstate what material or substantial disruption might be in an effort to dissuade unpleasant or inconvenient speech. Clay Calvert offered an example of a student wearing a black armband to mourn the students killed in the Columbine shooting of 1999. The school’s response was to issue “a three-day suspension coupled with an order gagging her from speaking with members of the news media” (Calvert, 2000, p. 739). Calvert then raised the claim that in a post Columbine world, “administrators fraught with fears of similar violence at their own institutions, routinely sacrifice students’ rights to free expression” (p. 740).

Erwin Chemerinsky (2000) agreed, contending that since the Warren Court decided *Tinker*, and found for the free speech and expression rights of students, there have been no other cases that the Court has ruled on in favor of protecting the First Amendment rights of students in schools (p. 528).

For educational leaders then, part of their work might include guarding against and protecting from the coercive pressure that may be exerted on non-conforming students. Some legal scholars have voiced deep concern over trends in judicial decision-making and what they see as a slow curve away from students as citizens in their own right and towards the power of the institution of school and the educational leaders within that system, to act with impunity and sanctioned immunity towards the constitutional rights of their constituents. Supporting the idea of schools as having powerful coercive pressure, Calvert (2000) noted that.

The troubling lessons taught today’s youth are that free speech means very little when fear takes over and that conformity to the norm-not daring to speak out, not voicing one’s own opinion on issues, not engaging in creative writing or artwork-is the only way to avoid controversy, both inside and outside of school (p. 740).

Perhaps one could argue that students practicing a non-mainstream religion might also be included in Calvert’s list of behaviors for students to avoid if they wish to sidestep cultural controversy.

Björk, Browne-Ferrigno, & Potterton, (2019, p. 14) quoted Björk and Keedy (2001) in stating that “Superintendents clearly carry great power when considering

equity and justice in schools. Hence, to assure all children receive appropriate support for learning at their highest ability, district leaders must sometimes make decisions that may not align with majority perspectives.”

They expand upon the idea that organizational justice includes creating and enforcing “meaningful rules for distributive and procedural justice” (p. 14). While that quote may be most naturally directed at resource management and equity, the idea of procedural justice as part of a leader’s role in protecting constitutional rights is also relevant. Using an ethical framework such as organizational justice, along with a strong understanding of students’ constitutional rights, will help educational leaders with their difficult work in balancing what is good for the whole community and still protecting all students against the coercive nature of peer pressure and social norms.

### **Future Conflict Involving Religion and Public School**

Justin Driver (2018) described the Supreme Court’s recognition of the importance of maintaining a religiously neutral environment around issues of church and state in schools and highlighted the inherent power that resides in the institution of schools and its representatives. He wrote:

(The Court had) . . . an awareness both that the public school setting potentially imposes acute coercive pressure on students’ religious beliefs and that this religiously diverse nation must take special steps to forestall any notion that only receiving an education subjects students to proselytization (p. 362).

Driver also comments that “right-leaning” citizens continue to accuse the Court of bias against Christianity with undue restrictions on prayer at school events, while “left-leaning” citizens have “condemned the Court’s decision legitimizing vouchers” for religious schools (p. 364). He suggests that these opposing criticisms may indicate that the Court is broadly successful in achieving the neutrality that he believes is asked for in the Constitution.

Not everyone is as convinced about the Court’s neutrality in matters of religion. Welner (2018) said:

Today’s Supreme Court does not share Jefferson’s vision. In fact, the court has been sawing away at the high fence for decades. In cases posing challenges to state funding of religious institutions, the court has steadily permitted greater and greater financial entanglements (p. 4).

Chemerinsky and McDonald are even more direct in their warning about the increasing conservatism of the Court. They describe:

. . . a trend of decisions by the conservative wing of the Rehnquist and Roberts Courts to lower the church-state wall in a misguided way, one that will only be accelerated by the recent appointments of Justices Neil Gorsuch and Brett Kavanaugh to the Court-giving the conservatives a solid five-vote majority for years to come (p. 1015).

Kenneth Townsend (2016) wrote about the Court's current "shift away from viewing the Establishment Clause as a basis for creating secular public space and, instead, as simply a mandate for evenhanded treatment between religion and non-religion" (p. 370). He points to the difficulty that both the Court and greater society have had in defining neutrality in the context of public schools and in struggling with the essential question that asks if neutrality means secularism or if it means evenhandedness (p. 371). Townsend then elaborated on the work of Paul Kahn in explaining potential impacts when society begins to see public secularism as "one sort of viewpoint among others, rather than as perspectives that transcended difference and protected the public sphere from being overrun by any particular faith" (p. 372). He cautioned that:

As views expressed in the public sphere become increasingly understood as only expressions of private interest, the liberal public sphere itself will have more difficulty being understood as something that has independent, intrinsic worth (p. 373).

With the Court's recent emphasis on treating religious and non-religious organizations in the same manner and not maintaining the separation supported by previous Courts, new challenges have emerged for public schools. Perhaps the most impactful of those challenge will be how and when public funds will be used to support students' attendance at religious schools. It may be that the wall of separation will not be pushed over in a dramatic upheaval, but rather quietly dismantled, brick by brick, though changes in the foundational funding of schools. Cheuk and Quinn (2018) wrote:

Three spheres of influence — the courts, the executive branch, and public opinion — are now operating in concert to normalize such uses of public financing, and as a result, we are beginning to see a significant erosion of the wall separating church and state (p. 1).

Although *Espinoza v Montana*, (591, U.S. 2020) may be the most recent, the 2002 Supreme Court case of *Zelman v Simmons-Harris* (536 U.S. 639, 2002) provides some insight into the thinking that the court has used as they gradually change the definition of separation. The arguments of the case mirror those used in other cases and serve as an excellent example of the Court's majority position.

In 1995, the city of Cleveland established a voucher program for low income families as a way to provide parents some choice in improving their children's educational outcomes. In 1999, although a relatively small number of students, less than 1%, were participating, the American Civil Liberties Union (ACLU) sued the district on the claim that the program was violating the Establishment Clause by allowing the vouchers to be used for attendance at religious schools. The Supreme Court was asked to decide if "Ohio's school voucher program violates the Establishment Clause?" (Oyez, n.d).

In a 5–4 vote, the Court determined that the use of vouchers for religious schools did not violate the Establishment clause. Chief Justice Rehnquist, speaking for the majority, declared that:

Government aid reaches religious institutions only by way of the deliberate choices of numerous individual recipients, and the incidental advancement of a religious mission, or any perceived endorsement, is reasonably attributable to the individual aid recipients not the government. ... The program is therefore a program of true private choice. (Oyez, n.d)

## Conclusions and Reflections

The use of the words “private choice” brings up a whole host of other concerns for many educational and legal commentators. Townsend (2016) termed this the “communitarian threat in which the interests of parents or other intimate communities constrain the goals of public education.” That definition sounds a lot like prioritizing the rights of the individual over the community good, a common thread of discussion in this chapter.

Chemerinsky and McDonald (2018) used the Zelman case (p. 1041) as a framework for discussing the Court’s decision in *Trinity Lutheran Church of Columbia Inc. v. Comer* (2017) as they point out that the former case allowed that it was *permissible* to use public funds for religious school choice and that in *Trinity*, the Court has taken the additional step to “suggest that the government *must* allow those funds to be used for religious schools if they are also used for sectarian ones.” They then described the “disturbing trend” in the Court’s “unholy alliance” (p. 1053) between church and state.

As a summary comment, Chemerinsky and McDonald (2018) expressed their belief that the Court rulings that have blurred the lines between church and state now allow that the “government will have more constitutional latitude to support or promote religion should democratic majorities in various geopolitical communities choose to do so” (p. 1056). On its face, allowing the government to be a part of religion expression based on the preferences of the majority in any given geopolitical area may not create much local controversy. The Pew Research Center’s Religion and Public Life Project (2015), found that 70.6% of respondents identified as Christian and 6% as non-Christian faiths. However, those percentages may not be accurate for any given school or specific community, and educational leaders must be aware of the impact of allowing the majority religion to have a voice at any schools, but in particular, schools with religious diversity.

That said, the Constitution does not make distinction between geopolitical regions. In contrast, there is regionalism in court findings through the federal district courts, ultimately the appeal process reintegrates issues back into a more collective “national” scheme when matters are directed toward the Supreme Court of The United States. One may argue that prevailing local conditions should dictate convention in this matter. In the southwest, where there is a very strong Latter Day Saints contingent, it is often argued that this is already the case. To offer, however, that a practice of regional accommodation toward religious preference is a practical and effective end solution for conflict stemming from this topic, is likely misguided.

The immediate future appears to be shaping up as one where political and religious affiliations continue along the same lines that have been drawn for the past 40 plus years. Still, in America 2020, the multiple layers of wide-spread conflict currently in play would seem to foreshadow multiple seismic shifts in educational practice and subsequently educational policy. Christian leaders have been unified to this point, but recently faced splintering within their ranks. Similar to the reality of seeing numerous factions of conservative bodies challenging the current administration and incarnation of the Republican Party, multiple religious leaders have found fault with the alliances which have been built. Some have voiced distain for these

relationships and questioned the underlying morality and civility of condoning and supporting a government that practices anything but Christian beliefs on a daily basis.

The easy call would be to suggest that the future of this topic depends on the outcome of the 2020 Presidential Election. And to some extent there is no way of avoiding that reality. Still, there are some givens to consider regardless of the outcomes in the executive and legislative branches of government.

- The discord surrounding this topic will continue to escalate in part because that which was already “becoming” personal at times has blatantly been made to be personal as much as possible to further create division and separation between groups. It is working.
- The court system that oversees related issues at various levels continues to become increasingly partisan. This means it is not enough for school leaders to know their case histories. The outcomes are recorded will very likely be reversed at some level and at some point in time depending on the specifics.
- As important as it is to understand law, from a legal history standpoint, understanding of conflict resolution will also stand out as social media and growing discord bring related issues into schools more immediately and more directly.
- This issue will be pulled into other significant issues such as equity and social justice because of the growth in cultural conflict where advocates for equity are no longer limited only to barriers and resistance, but face deliberate efforts to repeal past progress (Hughes, 2019) and this is often mobilized along the lines of religious and political conservatism.

In as much as this broader topic has been with us for centuries and is steeped in traditions that are so well known, they can also almost be rendered invisible; it is an area that will continue to demand attention from educational leaders. The underlying philosophy, history, and political affiliations are important matters for administrators to attend to. This chapter has been developed to make introduction to these three elements, and contribute to the broader understanding of leaders from all vantage points.

## Abstract

This chapter provides an overview of the many forms of postcolonial critiques as they apply to educational administration and leadership, in part as a critique of neoliberalism and globalization, but also from the perspective of preserving and maintaining the integrity of identity, culture, knowledge traditions, and social institutions of non-Western states and indigenous communities that have been colonized during various periods in history and in the contemporary world. Using Foucault's concept of governmentality and enunciative dimensions of the archaeology of knowledge, the chapter explores memory, presence, and concomitance, as well as disruptions and ruptures that have produced the postcolonial critiques. This involves an examination of conceptions of education, its administration and leadership roles, curriculum and pedagogy, and the contextual factors of education as a social institution in society that differ significantly from Western countries. Emphasis is placed on the requirements of decolonizing educational organizations and the field of educational administration in order to restore

teaching and research appropriate to the diversity of cultures and communities through a reconstruction that recognizes the human right, under UN resolutions to one's culture and belief systems, of an inclusivity of others' constitutional and legal systems, governance and administration practices, cultural structures and norms, and the way that social institutions are structured.

Postcolonialism · Decolonization · Subalternity · Epistemicide · Cultural security · Neocolonization · Globalization · Neoliberalism · Indigenous studies · Governmentality · Archaeology of knowledge

**The Field of Memory**

The field of memory in the postcolonial critiques of educational administration and leadership encompass both historical periods of imperialism, mostly in the eighteenth and nineteenth centuries of many non-Western regions, territories and states, and the current globalization period since the 1980s during which primarily Anglo-American neoliberalism has been exported through curriculum, expatriate faculty and staff, and promoted through international organizations and agencies. There are a number of postcolonial critiques that have analyzed what forms and levels of colonization have been exercised and their impact, as well as promoted ways of decolonizing education in order for countries and cultures to recover their sovereignty and support and protection for their political systems, cultures, religions, language, and identities. These include the colonization of mind and identity, of knowledge and research, of roles and practices in organizations, and the policy regimes that exist as well as extending education back to its many roles and responsibilities in a society apart from its contribution to economic development. This applies to all levels of education from curriculum and pedagogy to role modeling, administering and fulfilling leadership roles in schools, universities, government departments and agencies, and research institutes and funding foundations.

**The Field of Presence**

The primary concepts, ideas, theories, and models are constructed out of the recognition and acceptance of principles of diversity globally as well as new UN resolutions and conventions that extend human rights to include the rights to one's religion and culture (United Nations, n.d.). This diversification is also referred to as the internationalization of and comparative approaches in many disciplines and fields in the last two decades to include many non-Western contexts and indigenous peoples. It has also produced more diverse and contextually appropriate and accurate research methods since the late 1990s expressed in some research ethics procedures where one has to take into account the laws, cultures, and social norms of the communities and countries in which one conducts research such as that appropriate in non-Western and indigenous contexts. The range of postcolonialisms includes the colonization of mind, the subaltern

identity, epistemicide, critiques of neocolonization (often through globalization), multiple modernities theory, cultural security, and decolonization among others.

### **The Field of Concomitance**

There are a number of disciplines and fields that have provided the foundational theories, models, and critiques for constructing a postcolonial and diverse educational administration and leadership, as they have for all other conceptual and theoretical foundations in the field. This includes both primary disciplines like history, philosophy (e.g., ethics and mind), sociology, political science, psychology, religious studies, anthropology and cultural studies, as well as applied fields like public administration and management studies. All of these have expanded in their scope for international and comparative studies as well as various forms of post-colonial critiques.

### **Discontinuities and Ruptures**

Some of the most important areas of educational administration and leadership have been affected by the increasing internationalization and cross-cultural critique that includes those produced by postcolonialism in contextual, identity, values, policy, organizational studies, and leadership. Contextual factors include the political, economic, cultural, and societal differences across countries and communities, in part due to historical forces that have shaped them and the current conditions including for many countries high levels of violence classified by the UN as “conflict zones.” Culture, religion, and social norms as well as intellectual and knowledge traditions also affect principles and values of conception and practice, including ethics and social justice. Additionally, the configuration of social institutions including the structures and practices of families and tribes also influence educational structures, and practices need to be taken into account in policy development, education, and research methods.

### **Critical Assumptions**

There are a number of assumptions one makes when engaging critically with colonization and constructively in decolonizing education to rebuild it. First, many negative stereotypes and false assumptions about knowledge, intelligence, skills, and how divergently societies function. In part this means rejecting convergence theory, neoliberal globalization precepts, conscious and unconscious assumptions about the superiority and universalizability of Western, mostly Anglo-American knowledge and practices, appropriate professional identities, roles and practices, and where leadership is located in the community. An additional assumption comes from Bourdieu on the nature of symbolic violence that applies to many countries where their indigenous or traditional bodies of knowledge, values, identities and roles, and forms of policy have had Western neoliberal influence and been damaged or destroyed. Accompanying this diversification and cultural sensitivity is also a movement in management studies that is applicable to many other fields to recognize that many cultures and belief systems also have a humanistic tradition, which allows for comparison and a common humanity on the

underlying and foundational value levels, although taking different forms of expression across cultures and countries.

---

## Introduction

This chapter provides an overview of postcolonial perspectives that have formed since the mid-twentieth century that can be read as an archaeology of the field in Foucaultian terms, focused on the role of governmentalities of education and its administration and leadership that form the colonizing periods, from the early modern ones of the nineteenth and twentieth centuries (although earlier periods of colonization existed) as well as the current globalization recolonization or neocolonization in curriculum and pedagogy in the field, and the postcolonial governmentalities that many scholars and some national policies have been putting into place as alternatives. Relevant here is the notion of “global monopolism” to describe the impact of globalization on many countries, described by Banerjee (2008) to produce a “necrocapitalism” that leads to social or culture death in the non-Western world where cultural and intellectual colonies composed of exported education and pedagogy threatens others’ cultures and commodifies the cultural sector through neoliberal practices and secularity (Dresch & Piscatori, 2013). Three of the main objections to globalization are that it reproduces foreign socio-cultural and educational structures, governance, responsibilities, roles, practices, etc.; it homogenizes societal structures and practices compromising sovereignty, personal and national identity, culture, and religion and other social institutions; and the emphasis on the individuals places their interests over that of community and society.

For Foucault, governmentality is a complex concept that denotes discourses and practices of knowledge and the power this produces form “regimes of truth” that become dominant (Lemke, 2016; Rose, O’Malley, & Valverde, 2009). Tikly (2003) was one of the early authors in educational administration who applied Foucault’s conception of governmentality to a postcolonial examination of education, as a way of thinking consisting of philosophies, disciplines, values, ideas, concepts, language, and forms of knowledge as sources of power that govern roles, identities, social relations, thinking, and actions in a given context. These form the technologies of governmentality – the policies, guidelines, procedures, programs, instruments, assessments and evaluations, professional norms and ethics, both as documents and social norms that govern thought, decisions, actions, and social relations that normalize and marginalize or assign deviance in any of these spheres (Inda, 2005). Colonization, as Inda (2005) argues, can also be read this way, including neoliberal regimes that operate from an economic perspective producing “homo oeconomicus” focused on individual self-interest, and using rational choice and market principles exclusively (Hamann, 2009), and the current neoliberal globalized colonization of education internationally grounded in the foreign systems originating in Western states that reshape other peoples’ worlds. For higher education this produces three main effects: translating all research, curriculum and

pedagogy, and their participants into commodified product form; reshaping academic activities into market-based competitive systems; and collapsing the difference between government and individuals and groups, effectively removing academic freedom (Davies & Bansel, 2010).

There are a number of developments across disciplines and fields that provide part of the foundation for postcolonial critiques and solutions. Internationalization and diversification through cross-cultural studies and an accompanying cultural competence literature (Deardorff, 2009), critiques in the international schools sector (Bates, 2011), problems in conflict zones (Paczyńska & Hirsch, 2019), policy transfer studies identifying modification and adaptations issues (Rapple, 2012), and the development of modernized school and higher education systems in many countries (Hickey & Hossain, 2019). Colonization problems exist also for many foreign students at Western universities where curriculum may be parochial or inadequately internationalized, reflecting the internationalization of fields that have been underway (González y González & Lincoln, 2006). The conception of “internationalizing” has transformed the field from almost exclusively Western (primarily Anglo-American) countries toward redefinitions that are more inclusive of non-Western countries, but while identified many years ago (e.g., Hughes, 1975) have only in the last two decades developed into a significant representative body of literature (e.g., Jarvis & Mok, 2019). There are also Western scholars pursuing a more diverse educational administration such as Dimmock and Walker (2005) and more diversified book series with publishers like Symposium, Routledge, and Springer.

The chapter will first provide an overview of the colonizing forms and influences from early historical periods including the nineteenth and twentieth centuries in many world regions, as well as the current globalization period, which, in governmentality terms, is exerting pressure on many countries to conform to particular Western theories, models, and standards. This involves examining the various ruptures and discontinuities in local and regional bodies of knowledge that colonizations have brought through oral and written practices in academia and through sociocultural forces that directly and indirectly affect knowledge conceptions and the construction of administration and leadership roles in education. These include through the archaeology of knowledge the “enunciative” operating through memory, presence, and concomitance as well as forms of governmentality (Foucault, 1972, 1979), that is, the various subjectivities from which approaches, techniques, and practices are derived, which these traditions exhibit. These dimensions of the enunciative are used to explore the historical phases culminating in the postcolonial.

The second section identifies a number of the postcolonial critiques and theories that have arisen in many parts of the world of particular interest to educational administration and leadership, reflecting local conditions and which are focused in different levels and dimensions of experience and knowledge that shape education. Many of them are not applicable to only one level or one dimension of professional experience and life, but they do tend to fall into major categories such as the colonization of mind (e.g., Thiong'o, 1987), and the subaltern identity (e.g., Spivak, 1988) as well as the destruction and reconstruction of knowledge through epistemicide (Hall & Tandon, 2017).

The final section examines the resistance to globalization that exports Western knowledge, curriculum and pedagogy, and the rise of internationalization and culturally inclusive/diverse literature read through changes in governmentality at all levels, from mind, through social relations to organizational and social institutional levels locally and internationally, through the three dimensions of Foucault's enunciative and its role in the reconstructions of governmentalities such as decolonization strategies. This is evident in the changes in educational administration and leadership curriculum, pedagogy and practices advised by postcolonial critiques, as well as in supervision of foreign students who particularly require broader perspectives in the field and who may be involved in indigenization or nationalization of education to restore and protect culture, religion, language, and their social institutions often in accordance with social justice and the human rights to culture and religion such as the International Covenant on Economic, Social and Cultural Rights and Resolution adopted by the Human Rights Council in September 2016 on cultural rights and the protection of cultural heritage that calls upon all States to respect, promote, and protect the right of everyone to take part in cultural life, including the ability to access and enjoy cultural heritage (see United Nations, [n.d.](#); Hafstein, 2014). The educational sector is critical for societies in maintaining identity, constitutions, laws, policy systems, and values, their economic systems, and social structures like family and tribe that vary considerably internationally.

The overall aim here is toward a decolonization of educational administration and leadership curriculum and research by examining the implications of the post-colonialisms established in a number of fields and advocating a recognition of diversity and an inclusiveness of many knowledge and educational traditions appropriate to countries and cultures. Various critical conceptual lenses are used to identify internationalizing principles in reconstructing the field on foundations that reflect a diversity of indigenous and non-Western societal institutions, values and identity construction, and knowledge traditions. This also requires a much greater and deeper use of contextualization such as historical forces, constitutional and legal systems, governance and administration practices, cultural structures and norms, and the way that social institutions are structured differently.

---

## The Effects of Colonizations

There have been a number of colonizations throughout history, and also transmissions of knowledge that served as intellectual colonizations that have not necessarily been destructive such as the often overlooked or excluded period from the medieval to the enlightenment when scholarship from the Islamic world was transferred into Europe providing foundations, knowledge and research practices in all disciplines and applied fields now comprising a very large body of literature in English (e.g., Morgan, 2007; Saliba, 2007). Intellectual development in Europe also specifically referred to many of these scholars, sometimes using Latinized versions of their names like Averroes for Ibn Rushd and Avicenna for Ibn Sina. It was not only their findings in research that traveled to Europe, but also their research methods that

developed to very high intellectual levels such as the scientific research methods and apparatus (Mutahhari, 2002), and also the interpretive tradition and some forms of critical theory that then provided a foundation for European scholars. It is often forgotten that Europe's use of classical Greek scholars were first adopted in the Islamic world and built upon to a very large extent before transferring to Europe (Saliba, 2007) This was also a period when many intellectual traditions from India and China also were integrated into scholarship, initially in the Islamic world and then transferred to Europe. Of issue here for this chapter are Western colonizations of education, not including many that occurred in other regions like Asia where other states like China colonized regions around them (e.g., Herman, 2007).

A number of colonizations were carried out in early modern periods like Guaman Poma de Ayala in the sixteenth century (Mignolo & Walsh, 2018), and continuing through to the nineteenth and twentieth centuries in many world regions, consisting of not only control over political and economic systems, but also the cultural sector affecting schools and higher education. However, this is not only a phenomenon in the historical past, but has continued through contemporary history with the last four decades of globalization (see Nagy-Zekmi & Zabus, 2010). These caused ruptures and discontinuities in local and regional bodies of knowledge, including for many of them strong oral as well as written traditions through academic and sociocultural forces that directly and indirectly affected knowledge and the construction of administration and leadership roles in education. In many cases this included (and still includes in the current globalization period) covert, or "hidden" ideas, values, concepts, and theories similar to those described by Bourdieu and Passeron (1977) in their "hidden curriculum" construct. In these cases, authentic "knowledge" and "education" were assumed to originate only in colonizer countries, often in a use of concepts and knowledge content reflective of colonizer countries that the colonized may not understand (Bourdieu, Passeron, & de Saint Martin, 1994). In these cases the use of terminology of educational administration and leadership from a foreign culture does not relate well to other contexts since jurisdictional and cultural content differs. Through the archaeology of knowledge, colonizing knowledge and education can be analyzed through the "enunciative" operating through the three dimensions of memory, presence, and concomitance, as well as the forms of governmentality (Foucault, 1972, 1979). That is, the various subjectivities from which approaches, techniques, and practices are derived are shifted from a national and indigenous base to that of the colonizer. These processes and dynamics effectively negate or rendered valueless indigenous knowledges, values, identities, and roles.

For Mignolo (2000), gaining control over knowledge and education is a critical part of the colonizing process, making colonies dependent not only on colonizers markets, but also the knowledge and values they hold, but it also is used to socialize and acculturate the colonized into a position of dependence by asserting that colonizer knowledge is universal and that "there can be no others" (p. 59), thereby transforming knowledge from a cultural construction into a geopolitical space of power. It was this process, beginning in the fifteenth century and continuing into the nineteenth and twentieth centuries that promulgated a false history of the origins of

knowledge and research linked to capitalistic ventures of many Western countries. The capture of a country's educational system and knowledge are the power instrument used to erode the sources of a community's own power by devaluing their own educational and knowledge traditions, religion, language, and cultural traditions upon which their society is built.

Colonization also occurs on a psychological level affecting many dimensions of one's life, analyzed by Oliver (2004) from an existential and psychoanalytic perspective to reshape self, identity, and social interaction through psychic processes like alienation, shame, sublimation, sense of agency, and idealization to reorient the individual toward an acceptance, submission to, and subjugation of colonizing structures and separating them from their own national and cultural values and norms.

---

## An Overview of Postcolonial Critiques

This section explores a number of postcolonialisms as they relate to their critiques of the colonizing process that serves colonizing actors and forces, and what implications these have for educational administration and leadership. There are many types of postcolonialisms designed to address different levels of experience and knowledge, such as the individual, social interaction, the group and organizations, communities, and social institutions. This organization of the critiques is used to cluster them into discreet categories, although it is important to recognize that aspects of them overlap into other categories.

There are many instructive guidelines provided by postcolonial forms of critique that relate to educational administration and leadership, approached here as "diagnoses" of the problem. This includes psychological, social, cultural, and political approaches that have developed over many decades, with early writers like Freire (1954) who examined the colonizing effects of working in a foreign language, and Fanon (1965) who examined foreign education as indoctrination against which the colonized should refuse recognition to the colonial "masters." Bourdieu and Passeron's (1977) critical theory exposes unconscious socialization through the hidden curriculum critique one can apply to many expatriate faculty's curriculum and pedagogy. Another foundational author is Edward Said (1978) whose "Orientalism" thesis examined how constructions of superiority and denigrations of others are formed by colonizing powers and their political, economic, and educational representatives in other countries. Termed "pedagogy of the other" by Burney (2012), Said's work laid the foundation for a praxis of research and pedagogy that addresses subjectification of many cultures to colonial power expressed through many different forms, creating "subalterns" who attach themselves to the goals and intent of the colonizer.

These authors raised many issues involved in principles of curricular development and content that derive not just from other knowledge traditions and critiques, which are not necessarily destructive, but when imposed to replace others' concepts and knowledge are determining in a hegemonic way what is regarded as legitimate,

valuable, and useful. This necessitates historical and sociocultural understanding of knowledges and how they operate within various institutional and cultural contexts in countries, and within multiculturalism, (Kymlicka, 2001) by legitimizing other cultures including minority groups in Western countries.

One way to organize the implications of critiques for a postcolonial reconstruction of educational administration and leadership is through levels of relevance from the individual, through social interaction groups, organizations, sectors and social institutions, national and cross-national levels that require education grounded in the world in which one lives, as well as the larger international world. Part of this context also are the historical forces that have influenced societies and cultures, and various historical periods or phases they have gone through including international trade and influences in knowledge as well as colonizing activities either as the colonizer or the colonized. It is important to remember that many countries colonized in recent and modern history had been colonizers themselves, sometimes the center of great empires each spawning periods of educational development and scholarship (e.g., see Burbank & Cooper, 2010).

It is through these levels that one can construct curricular and pedagogical content and principles of practice. The individual level consists primarily of the unconscious mind, personality, senses of self, character, and identity and values one internalizes as well as the various roles one constructs in social interaction that require embeddedness in one's own culture while learning about a broader world. This requires a curriculum from which students develop the rules and modes of ethics and behavior in their own societies and for instructors and supervisors to remove the power relations that often exist in cross-cultural teaching, an argument made by Waziyatawin and Yellow Bird (2012). The sector and social institution level consists of structures that comprise a society such as family and tribe, health, social services, education, and governmental that takes on a number of forms depending on the type of society involved. This requires that professionals define their roles, responsibilities, and obligations within these, applying to many development contexts (McEwan, 2019). Professional education, like educational administration, also requires that the graduates operate within the constitutional, legal, and governmental systems of their own country and its participation in international organizations like the UN and regional bodies, necessitating that a large proportion of the curriculum reflect the local context while also covering international scholarship.

Perhaps most strongly, it is the many postcolonially oriented literatures that have the potential to transform the field from a Western hegemonic one into that of international scope and an inclusion of knowledges in other societies in a socially just way. Another side to the postcolonial is inclusivity of minorities Western countries in schools and higher education (Khalifa, 2018; Minthorn & Chávez, 2015).

## **Mind and Identity Formation**

On a fundamental level, there are postcolonial critiques that examine how mind and identity are affected by colonized education. One of the most important critiques

come from Thiong'o (1987) who regards the decolonization of mind from the literature and media sources (e.g., literature, film) that can be in part corrected by placing more emphasis on and incorporating indigenous sources at the center of a curriculum to correct for their marginalization or elimination by academics and journalists who are part of the "neocolonial establishment." Colonizing material is viewed as a "cultural bomb" that annihilates peoples' belief in their names, languages, values, capacities, and selves. For Dabashi (2015), colonization mind also takes the form of Western negative stereotypes of others as incapable of intellectual thought. Fanon (1965) also analyzes the socially conditioned inferiority complex inflicted onto colonized people through the imposition of an alien culture into the unconscious as an ego ideal and dissociation of people from their culture of origin.

Another point to note is that colonizing knowledge in other countries is often done unconsciously, referred to by Bourdieu and Passeron (1977) as "hidden curriculum" that not only embeds preferred values but also can produce negative stereotypes and generalizations. Nandy (1983) advocates a psychological resistance necessary to liberation from colonization and colonizing, given the levels on which it operates: the first a physical conquest; and the second, relevant to globalized education, are the occupation of mind, senses of self, and culture. This is evident in the Western constructions of Occidental and Oriental, civilized and primitive, scientific and superstitious, and developed and developing (Prakash, 1995). The colonization of mind and body "releases forces within colonized societies to alter their cultural priorities once and for all. In the process, it helps to generalize the concept of the modern West from a geographical and temporal entity to a psychological category. The West is now everywhere, within the West and outside, in structures and in minds" (Nandy, 1983, p. xi).

## Knowledge Traditions/Curricular Content

There are a number of postcolonial scholars who have focused on knowledge, its construction, selection, marginalization, and even elimination. Some focus on the destruction of others' knowledge tradition, like Hall and Tandon (2017) and Gandhi (1998) who regard it as epistemicide, and Bourdieu and Wacquant's (1992) on intellectualism as symbolic power and violence. This kind of power emanates from cultural and intellectual capital, but used repressively through the reproduction of colonizing self-perpetuating hierarchies of domination, the shaping of politics and power structures through colonizing forces shaping the fields of activity and habitus.

Others have characterized it similarly as epistemic injustice (e.g., Fricker, 2007; Kidd, Medina, & Pohlhaus, 2017), cognitive injustice (e.g., de Sousa Santos, 2007), or cultural genocide (e.g., Bachman, 2019). In all cases, the marginalization of knowledge systems produces "a destruction of the sociocultural fabric" termed "cultural genocide" (Novic, 2016, p. 9), the very fabric that educational systems are supposed to protect as reservoirs of national cultures, but instead become the instruments of cultural imperialism (Naidoo, 2007). For Mignolo (2011), colonization is not only political and economic, but subjective and knowledge-based

requiring imagining others' worlds and countering this form of cultural imperialism, enforced through systems of foreign accreditation (Altbach, 2015).

It is also important to recognize that the research methods through which knowledge is constructed itself has to be modified to cultural appropriateness so that violations do not occur, more accurate data is collected, and social justice is achieved in research, issues raised, and methodological innovations presented by a number of authors over the last two decades (e.g., Chilisa, 2011; Smith, 1999; Xilem, Lee-Morgan, & De Santolo, 2019).

## **Social Interaction and Roles**

On a social interactional and role level, colonized education affects the construction of relationships people have as they form social groupings (e.g., seen in Western models of leadership that are taught), and the culture and social institutions formed through them. Several postcolonial authors have critiqued cultural imperialism on this level (e.g., Mignolo, 2011; Naidoo, 2007; Satterthwaite & Atkinson, 2005) as reproductions of foreign sociocultural and educational structures, governance systems, and one's responsibilities, roles, practices within them. Education is one means through which colonizers' discourse socially constructs the signifiers of a foreign society in another culture that silences other perspectives and experiences, enculturating colonial peoples into a social/professional language and value system that is foreign thereby separating them from their own culture, values, religion, and social norms. This sociocultural reproduction creates what Guha (1982) and Spivak (1988) call the hierarchically subservient "subaltern" personae and roles, or subaltern identity, through marginalization. All of this contributes to a colonizing of educational administration and leadership.

## **Organizational and Social Institution Levels**

On a larger scale, the formation of organizations and larger social institutions like the economy has been critiqued by postcolonial authors like Banerjee (2008) as "necrocapitalism," by Satterthwaite and Atkinson (2005), Mignolo (2011) and Naidoo (2007) "cultural imperialism," by Battiste (2014) from an indigenous perspective as a colonization of policy and practice, an as recolonization or neocolonization by Memmi (2003), Nkrumah (2009), and Quist (2001) to emphasize that the current globalization is a form of colonization, and the more recent cultural security critique bring other levels of postcolonialisms. The "postcolonial" literatures also include recolonization or neocolonization and cultural genocide (from a legal perspective) as approaches that can redress negative impacts. A recent approach, drawing from European constructivist security studies is the cultural security problem that colonizing education has produced, threatening traditional or conventional cultures on an existential level through a foreign culture replacing identity, values, roles, and practices (e.g., Samier, 2015).

## Decolonization

Decolonization authors have examined the implications of the postcolonialisms established in a number of fields advocating a decolonization of disciplines and professional practices, extending back historically in the early modern period to Guaman Poma de Ayala in the sixteenth century (Mignolo & Walsh, 2018). Here, their suggestions for decolonizing curriculum and research is examined through a critical conceptual lens identifying internationalizing principles in reconstructing the field on foundations that reflect a diversity of indigenous and non-Western societal institutions, values and identity construction, and knowledge traditions. This also requires a much greater and deeper use of contextualization such as historical forces, constitutional and legal systems, governance and administration practices, cultural structures and norms, and the way that social institutions are structured differently, such as Côté and Levine (2002) have argued, creating a multi-dimensional and level model inclusive of cultures that allows for one to establish the relationships from the individual, to the group, organizational, and societal levels that transfers well from one society to another that can be used to reconstruct educational systems and their administration. Indigenous and First Nations authors have also contributed to a culturally more just educational studies aiming at deconstructing colonizing education and reconstructing a culturally more just and sustainable education (Battiste, 2014; Frawley, Larkin, & Smith, 2017). Another decolonizing response has come from Eisenstadt (2000) in sociology whose work on “multiple modernities” as a recognition that countries can take their own paths in modernizing instead of replicating the process and structures used in Western countries has been adopted in a number of fields, but yet has to have much impact in education.

Decolonization has generally been seen as a knowledge issue, defined as “epistemic disobedience” by Mignolo (2011, pp. 122–123) or “epistemic reconstruction” (Quijano, 2007, p. 176), although Mignolo also suggests that “trans-modernity” may be more appropriate since it would incorporate other knowledge traditions rather than replacing Western modernity, although the implications for identity, social institutions, and culture are profound. In this sense, decolonization rejects the universality and domination of Western thought and calls for the creation of new curriculum that is derived from different traditions, histories, and cultures to correct a Western perspective resulting in a distortion of reality (Quijano, 2007). Decolonization aims to resist the increasing influence of globalization that attempts to develop a homogeneous culture through the distribution of Western secular values, knowledge, lifestyle, and products with no consideration to indigenous cultures, values, and life practices, what Cesari (2004, p. 80) calls “the MacDonalidization of the world.” The globalization of higher education has resulted in the uncritical borrowing of Western models and curricula that gives primacy to Western knowledge and experiences with little or no consideration of student traditional values, knowledge, history, academic competency, and styles of learning.

## Conclusion and Reflections

The indigenization movement in social sciences, Boroujerdi (2004) argues, was established by the 1970s, that non-Western countries need to be wary of Western-dominated theories, models, and research methodologies that have “colonized” other countries, where instead concepts and theories should reflect “indigenous intellectual traditions, historical experiences, and cultural practices” (pp. 30–31). This critique has also formed in foundational disciplines to educational administration, for example, in psychology (Bhatia, 2018; Gelberg, Poteet, Moore, & Coyhis, 2018), sociology (Rodriguez, Boatcă, & Costa, 2016), political science (Jones, 2006), and anthropology (Harrison, 1997) where problems of colonization through education, often historically alongside political and economic subjugation, form. They analyze a number of topics: the legacy of earlier colonizations; organizations that do not reflect local cultures; populations and social institutions; colonizing curricula and pedagogy (Ndlovu-Gatsheni, 2018); and remotely through accreditation and ranking systems that reflect Western values and standards (Altbach, 2015). Another form is the establishment of branch campuses, exporting curriculum and teachers (Spring, 2015). In other words, curriculum and pedagogy can be instruments of foreign policy in power-political, economic, and social terms, and as such foreign curricula can be viewed as existential and security threats to national cultures, social institutional structures, legal traditions, language, and religion (Samier, 2015; Thiong’o, 1987).

The arguments are multiple for reshaping the educational administration and leadership field, and thereby curriculum:

1. Moral, social, and cognitive justice arguments (de Sousa Santos, 2018) based on human rights principles, such as the epistemological injustice literature.
2. Valuing other knowledge traditions and using them in curriculum and research practices particularly in cultures where they would be appropriate.
3. Recognizing that despite differences that need to be used in education, there is a common humanity that is captured in various humanisms internationally with complexities and identity rights as they apply to administration and leadership.
4. Practice a respect for others’ cultures and heritage and fairness locally and internationally to students and colleagues through curriculum, pedagogy, and research activities.
5. Acknowledge that part of the sovereignty of nations is control over and ability to protect their cultures, values, and traditions.
6. Remove the primacy of the Western definition of curriculum as formal, objective, and separate from people, context, and pedagogy (a feature of bureaucratized modern societies) with definitions that are contextualized and include the informal and nonformal that characterize many societies that can be equally represented, supported, and protected.
7. Internationalize curriculum in Western universities not only for the many foreign students who study there and return to their countries, but also to educate Western students into a much broader and more inclusive world.

8. Consider securitizing cultures, societies, and knowledge traditions in the educational administration and leadership fields that allows for it to be recognized as under existential threat and requiring responses from government, universities, and faculty themselves.

Early postcolonial theorists like Edward Said (1978) explicitly drew on Foucault (1972, 1979) in focusing on the colonizing control over representational discourse in the reshaping and reconstruction of knowledge, roles, identities, and societal systems, although not without several criticisms (Nichols, 2010). These are complemented by new approaches in many disciplines that have internationalized knowledge, such as Eisenstadt's (2017) proposal of multiple modernities theory in sociology to release academic knowledge from mostly Anglo-American conceptions of modernization that is now influencing other fields like economics and political science. All of these are read through the lens of Foucault's governmentalities, each of the postcolonial approaches and alternatives demonstrating different levels of governmentality critique.

## Abstract

Permanent secretaries, despite being the most senior, and most powerful of Whitehall mandarins, are under-researched and their role under-theorized. From a historically oriented, interview-based perspective, this chapter explores the extent to which, and how, the eight permanent secretaries who served at the Department for Education (DfE) from 1976 to 2011 sought to influence education policy for England. Drawing on an analytical model designed to interpret their praxis, it locates them on a spectrum of related yet distinct genres of “centrism” and an associated continuum of contingent descriptive styles. Sixteen centrist

metapolitical practices are identified exemplifying a potential a posteriori relationship between the main constructs of the model. In what follows, having rehearsed the model in outline, the chapter reports on these policy practices in a series of illustrative vignettes. It concludes with some general thoughts on the implications of this analysis for the nature and character of the role of the mandarin in policy-making in education, and beyond, in England and perhaps elsewhere, and offers some suggestions for the direction of future research.

**The Field of Memory**

Evers (► [Chap. 82, “The Search for Science and Scientific Standing”](#)) outlines a framework derived from Foucault (1972) to critique the history of thought associated with attempts to build a science of administration. An alternative Foucauldian framework based on the notion of modes of discourse (description, narration, exposition, and argumentation) would have been attractive. However, in setting what follows the chapter will begin, like Evers, with a note on fields of memory, presence, concomitance, discontinuities and ruptures, and critical assumptions. On fields of memory, for much of the postwar era ideas in educational administration, and to an extent in public administration, were dominated by positivistic and quantitative assumptions. On substantive issues, the agency of senior civil servants was largely assumed to be unproblematic and little studied. Mandarins, despite many attempts to reform the service, notably in the United Kingdom, it seemed, simply did what their job descriptions and terms of reference said they did.

**The Field of Presence**

The field of educational administration from the 1970s to 1990s was enlivened by fierce disputes (special editions of *Educational Management and Administration* “Philosophy and the Study of Educational Administration,” July 1993 and *Educational Administration Quarterly* “Postpositivist conceptions of science in educational administration,” August 1996) as the prevailing logical empiricist paradigm based on the “theory movement” came under attack from critics arguing the merits of a subjectivist philosophical standpoint and of qualitative research (Greenfield & Ribbins, 1993). Curiously, an associated field, “leadership studies escaped many of the more injurious lacerations and mortal wounds suffered by its disciplinary neighbours. The reasons for this successful immunity are not entirely clear. . .but whilst many fields of knowledge began tearing themselves apart in the 1980s, leadership underwent a massive resurgence following a period of stagnation in the 1970s” (Gronn & Ribbins, 1996, 453). As part of this development, some field members began to take an interest in “intermediaries” in government. On this, for

Abbott, Genschel, Snidal, and Zhang (2021), the prevailing wisdom was that intermediaries were disposed to use their autonomy *opportunistically* in the pursuit of self-interest. This echoes the research and thinking of influential theorists, who in the 1970s and 1980s were proposing, for example, “public choice” and “bureau shaping” models.

### **The Field of Concomitance**

As Evers (► Chap. 82, “The Search for Science and Scientific Standing”) notes, external influences on all three fields (educational administration, policy administration, leadership) come from a variety of sources including philosophy and the philosophy of science along with ideas from Weberian social science. In addition, the influence of post-modernist thinking, notably of Foucault and Bourdieu, is playing a part in reshaping educational and public administration as fields of study and practice.

### **Discontinuities and Ruptures**

Discontinuities and ruptures in fields relevant to the chapter have taken various forms philosophically, methodologically, and substantively. On the first two it would seem all three fields have settled for a period relatively untroubled by major paradigm disputes in which a mix, if not necessarily mixed-methods, of research can take place. Substantively, ruptures in the form of competing theories and models seeking to describe and explain the motives and praxis of intermediaries, notably civil servants, remain to be resolved.

### **Critical Assumptions**

A critical assumption of this chapter is that the mandarin class, in whatever context, is far too important to be left largely unexamined. That in the conduct of such research, the study of their motivation, orientation, and praxis would be enhanced by a historical approach; one which asks them, inter alia, about what they do, why, with whom, and with what result. But although such research is necessary, for a fuller account of the work of the civil service to aspire to be sufficient it would also have to study officials at more junior levels and in doing so, demanding as this would be, to consider not just what is said but also what is done.

---

## **Introduction**

Remarkably little is known about the mandarin class, notably permanent secretaries or their equivalent, in England or, for that matter, anywhere else. This notwithstanding, the range of powers they exercise and the extent of their bureaucratic span while extensive, can vary very considerably. Thus, for example, in 2021, the Department of Works and Pensions employs some 85,000 civil servants and the DfE only just over 8000. As for the nature of the responsibility exercised by permanent secretaries, this, according to David Normington reflecting on his experience of having led both the DfE and the Home Office, could vary very considerably from department to

department. In part this was due to significant difference in size – during his time there were some 70,000 directly employed staff in the Home Office but not many more than 3000 at the DfE. Important as this was, of equal significance, for him, were variations in the roles of the two Departments and what this meant for a permanent secretary. Having described the overall components (policy advice to ministers, leadership of the organization, working with external bodies) of the role, he argues “you do these jobs in completely different proportions according to where you go. In Education it felt as though the whole job was to try and shape the education system and to lead it to some extent. . . In the Home Office. . . you do some of this but. . . it is a constant struggle to see and set the longer-term direction. What is actually on your plate is usually a problem or a crisis. . . So the jobs feel completely different. I think most of my former colleagues would also say that. . . Although the components can be the same. . . they can be experienced in very different ways.”

This notwithstanding, unlike politicians, permanent secretaries rarely write of themselves and not much is written of them by others. What follows builds on work by Sherratt (2004) developed by Ribbins and Sherratt (2012, 2013a, 2013b, 2014, 2015, 2016, 2021) outlining an analytical model for interpreting the policy praxis of the Whitehall mandarin. As such, the chapter sets out for the first time an indicative summary of the range of the empirical evidence drawn from a longitudinal study of the eight permanent secretaries who served at the Department for Education (DfE) from 1976 to 2011 from which the model was drawn. The DfE (2021) is a ministerial department responsible for children’s services and education including early years, schools, and also higher and further education policy, apprenticeships, and wider skills in England. Over its long history the department has had many different remits and many names but for purposes of this chapter its current title will normally be applied. In what follows, the chapter explores aspects of the extent to which and how the eight have sought to play a role in policy-making, and in doing so locates them and their praxis across a spectrum of six related yet distinct genres of “centrism” and an associated continuum of five contingent descriptive styles. From this, 16 centrist metapolitical policy practices are identified and illustrated in case studies that exemplify a potential a posteriori relationship between the main constructs of the model. Having rehearsed the model and said something of the scope and method of the research from which it was derived, the chapter focuses on these practices and does so in a series of illustrative vignettes. Justified as a standalone study seeking to interrogate and understand specific questions within a particular national context, it can nevertheless claim to have potentially a wider international, sociopolitical, and methodological relevance.

---

## Research and the Model

The research that underpins the chapter is informed in part by a historical approach. In a special edition of the journal *Educational Administration and History* (Ribbins, 2006), a case for a greater role for history in educational administration, broadly conceived, is made. This needed to be done, because as several contributors to the

special edition argue, as a field of study, it has tended to be ahistorical, even anti-historical, in nature. As Samier (2006) notes “History plays a small part. . . It is rarely taught in courses (including research courses) or included in programmes, apart from simplistic, and arbitrary treatment primarily for illustrative purposes” (125). But it is one thing to claim a greater role for history, another to suggest what this might mean in practice; an issue, one way or another, addressed by all contributors to the special edition. Of these, the paper by English (2006) identifying 12 forms of life-writing is, as noted elsewhere (Ribbins & Sherratt, 2016), most relevant to the research reported below. This had its origins in a portrait-based study of the seven Secretaries of State for Education who served during the Thatcher (May 1979–November 1990) and Major (November 1990–May 1997) years (Ribbins & Sherratt, 1997). To date, relatively little work of this kind has been published although Abbott (2015) has reported on a similar interview-based study of ten Education Secretaries from Shirley Williams to Michael Gove. This offers an illuminating report of their role in education policy and how this was shaped by their interaction with other key policy actors. However, while acknowledging “senior civil servants are highly influential in policy development” (335), no significant reference is made to the activity of any particular permanent secretary.

Following up the study of the seven Education Secretaries of the Thatcher/Major era, a wider view of policy-making and policy-makers was sought (Sherratt, 2004). This involved interviews with relevant others including, providentially, two permanent secretaries. On finding how little the work of senior officials had been researched, the project refocused on them leading to interviews with James Hamilton, David Hancock, John Caines, Geoffrey Holland, Timothy Lankester, Michael Bichard, David Normington, and David Bell. The first interview took place in 1997 (with Holland) and the last in 2012 (with Normington). Using an approach set out in Ribbins and Sherratt (2016), all were spoken to face-to-face (65–80 min) and, after a gap of at least several months and sometimes longer, by telephone (35–50 min). In addition, 40 interviews with 28 relevant others have been recorded including 14 Secretaries of State, 2 Chancellors, 5 Home Secretaries, 5 junior Ministers, 2 Chief Inspectors, 5 special advisers, and 3 permanent secretaries from other departments.

In interpreting this data and generalizing from it, an analytical model is relevant to the project. Central to this are the concepts of “consensus” and “centrism.” In the postwar era, it is possible to discern three main phases in the evolving story of the policy praxis of Ministers and senior officials. Phase 1 (1950s–1970s) was characterized by a broad national consensus between Labour and Conservative governments on key social, economic, and education policy (“Butskillism”) that might be labelled *proto-centrism*. In Phase 2, this unusual accommodation (Kogan, 1971, 29–30) began to break down in the late 1970s and 1980s largely as a consequence of the growing influence of the political ideology of the mid and late Thatcher years (“Thatcherism”). With the advent of a Labour government in the landslide election of 1997, the Thatcherite consensus began to fray. Phase 3 reached its zenith in the Blair administrations (“Blairism”) and arguably has survived substantially intact

since then. This has been distinguished by a kind of consensus built around the apparent espousal of middle ground positions, a *via media*. For the metapolitical class – senior civil servants who although not politicians must work closely with politicians and political ideas (Ribbins & Sherratt, 2015, 11–14) – this constitutes a political milieu likely to provide policy continuity and equilibrium. However, while vestiges of the kind of *proto-centrism* characteristic of Phase 1 survive, it has been largely superseded by new, if not entirely unrelated, forms of centrism.

This “new centrism,” refracted through the prism of metapolitical practice of Whitehall bureaucratic convention, produces a spectrum of reactions notably from senior civil servants and to an extent also from their political masters. To date, five related yet distinct genres of centrism have been identified (Ribbins & Sherratt, 2015, 17–19) and characterized as follows. *Pragma-centrism* by an apparent reasonableness with currency beyond party politics and as such likely to produce policy continuity; *retro-centrism* by a desire for a stable policy *milieu* which promotes not only continuity of particular policies across successive administrations but also a longitudinal policy equilibrium in which direction is sustained despite Cabinet re-shuffles and general election outcomes; *ideo-centrism* by a civil service reaction to policies officials perceive to be starkly ideologically predicated or an expression by them of an alternative ideology, sometimes leading to conflict with Ministers; *meta-centrism* by a commitment to the *via media* which transcends ideology and consensual *proto-centrism* and in doing so provides a *milieu* within which Ministerial political will and civil service “impartiality” are most likely to coalesce; and, *exo-centrism* by a reaction to a perceived need in recent times, via the recruitment of “outsider” experts from the wider public sector or the private sector, to improve the ability of Whitehall to manage programs and deliver objectives defined by Ministers. *Proto-centrism* is not included in this set since it is viewed as antecedent to, rather than as a type of, “new centrism.” Having noted these centrist genres, five descriptive categories of practice (Ribbins & Sherratt, 2013a, 32–35, 2015, 19–24) will now be outlined and their link with centrism examined.

These categories were also mostly identified inductively from field work data. They vary on a continuum according to how far permanent secretaries lead or are led in the determination of policy. Each category constitutes a type of centrist metapolitical practice; these and the metapolitical identities involved are specified as follows. They are a *maker (iterative)* of policy when the policy is primarily their idea; a *resister (evasive)* when, justifiably or otherwise, they seek to circumvent/prevent a Ministerial policy intention and do so using counter-iterative arguments or delaying and blocking tactics; a *sharer (collaborative)* when there is concurrence on a policy idea in which they strive to cooperate with the Minister in producing and implementing the policy; a *shaper (reiterative)* when they seek to present policy options to their Minister in line with a previously articulated purpose; and a *taker (performative)* when, whether or not they approve personally of the stated policy, they seek to perform according to the classic convention of the mandarin in which an official strives as best they can to realize the Minister’s wishes. Theorizing on centrist genres, descriptive practices and the relationships between them can be summarized as in Fig. 1.

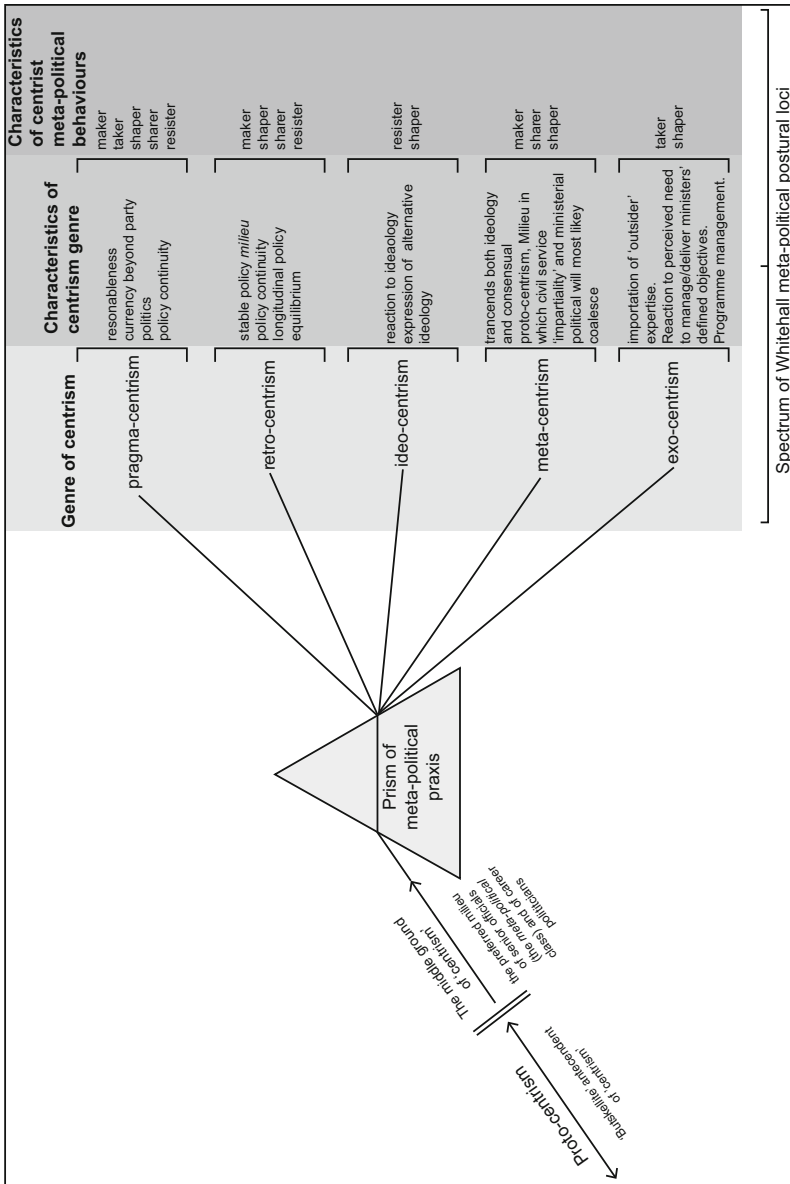

Fig. 1 Centrism genres and their associated observable metapolitical practice patterns

As the figure illustrates, to date, 16 practices have been identified with the number varying between genres suggesting some generate more types than do others. A possible explanation is in part deductive – for example, a permanent secretary recruited from outside (*exo-centrist*) for a particular expertise or a specific purpose is arguably *prima facie* more likely to be a *taker* or *shaper* than a *resister*. In what follows, vignettes reported in earlier publications (1, 6, 10, 12, 15) are noted briefly; the rest are more fully discussed.

---

## Illustrative Vignettes

### Pragma-Centrism

This is the only genre for which all five metapolitical practices could be identified. To illustrate these, selected examples from the praxis of Hamilton, Caines, and Lankester are set out. However, it should be noted that the *pragma-centrist* impulse was common to the habitual practice of all the permanent secretaries studied.

#### 1. Hamilton as *maker* of the “Yellow Book” and *shaper* of the Ruskin policy

Hamilton’s praxis in the creation of the Yellow Paper, the source of the Ruskin College Speech initiating the “Great Debate” of the Callaghan administration, is a classic case of mandarin *pragma-centrism*. For Hamilton, the Paper did “nothing but present some obvious truths about education.” Arguably, he was not only very much the *maker* of the Yellow Paper but also played a major role as a *shaper* of the Ruskin policy that followed which led to a significant reconfiguration of power relationships between central and local government in favour of the DfE (Ribbins & Sherratt, 2013a, 35–44, 2015, 24).

#### 2. Caines as *taker* of the Ofsted policy

Caines’ *modus operandi*, as much as any of the eight, was typified by *pragma-centrism* (Ribbins & Sherratt, 2013b, 113–120), a claim illustrated in cases of his praxis as a *taker* and *sharer*. On this, if for some Ministers the DfE was ruled by “big beasts” pursuing an idiosyncratic (*ideo-centrist*) agenda, Caines cannot be so labelled. Defining his approach, he said: “You will hear a Minister say ‘This lot is trying to tell me what to do.’ Actually, what we were trying to do was say ‘Look. Your predecessor but one-or-two wanted to do this for the following reasons. These were thought valid...’ gently reminding a Minister his own party had different views and in Education particularly time horizons are rather long.” *Pragma-centrist* insofar as its motivation is to ensure Ministers are equipped to make policy decisions, promotes policy continuity (obviating unravelling work by officials) within and across governments. As such, a *pragma-centrist* impulse permeated his style, avoiding any hint of a personal agenda; “You have to be seen to be your Secretary of State’s man.”

The reconstitution of HMI as OFSTED (Office for Standards in Education) as a result of the Education (Schools) Act of 1992 can be taken as a case in point. The background to the Act was a growing concern in Conservative political

circles and to some extent beyond, that as constituted at the time HMI lacked the capacity to undertake a full and regular program of inspections. This meant that schools and other educational institutions were experiencing long gaps since they had been visited by inspectors for this purpose. To enable such a program, the remedy proposed was to add sufficient numbers of mainly part-time inspectors to the core group of full-time HMIs. In addition, it was resolved that inspection reports should no longer be deemed departmental documents but would be made publicly available. Both proposals were at the time widely regarded as controversial. As an example of his reaction to the resolve of his Minister, Kenneth Clarke, Caines recalls “we advised him he would not get sufficient private sector inspectors, he would not be able to achieve the four-year cycle of inspections, he would be left with egg on his face. We said, ‘These are the risks down the road that we foresee. . .’ He said, ‘Fine, I see those risks. I’m prepared to take them.’ Then we made it happen. We had to disband HMI (the national education inspectorate). There were difficult personnel issues. . . We managed our way through. OFSTED is up and running.” Caines ensured that all issues were aired. Clarke “wasn’t going to be surprised by something that cropped up later as he tried to implement it.”

Not all were persuaded. Eric Bolton, HMI’s Senior Chief Inspector, characterizes Caines as having a classical career “in which the civil service view was you did the deciding about what went to the politicians.” In contrast, Bolton felt that whereas Caines’ predecessor, David Hancock, was “wholly cognisant of just how dependent the Department was on HMI. . . to be sure-footed in its policy advice. . . Caines didn’t really appreciate that. He seemed to find it irritating there was this body of people between him and. . . Ministers. . .” It could be this frustration originated from his *pragma-centric taker* stance. He did seek to acquaint his Minister with the risks of disbanding HMI but the final decision was Clarke’s who believed the Department could liaise effectively with OFSTED. Others, such as Lankester, doubted this: “I think it meant advice to Ministers was not as well based as it should have been.” Even so, if OFSTED was not of Caines’ making, it was a policy, once Clarke’s intention was clear, on which he saw his role performatively – he identified with it, took it up, followed it through.

### 3. Caines as *sharer* of the grant-maintained policy

When Caines arrived at the Department, the grant-maintained concept was “an ongoing piece of policy that was already established. . . Reports coming out of the system suggested that it was having beneficial effects.” Characteristically, he denies involvement in *shaping* the policy but accepts he was a *sharer* (collaborative). His positive assessment might have been one reason why more schools became GM in Clarke’s time than under any other Minister. Caines was matter-of-fact about the momentum of the policy: “If it becomes clear schools are doing better as a result of GM you will get others wanting to follow suite.” If Caines regarded as “irrelevant” any personal view which, as permanent secretary, he might have held on the policy, he nevertheless acknowledges his “general pre-disposition for delegating responsibility and decision-making down as far as you can.” If others at the DfE were unsupportive of the policy, this was not true

of him. However, he did accept that officials can be apprehensive if they foresee themselves directly responsible for what happens in schools. Certainly, he expressed concern on how his duties as Accounting Officer could be reconciled with this: “It becomes very difficult indeed because the permanent secretary could be hung, drawn and quartered before the Public Accounts Committee.”

However, despite potential pitfalls in the GM policy, Caines maintained that there were not many of a financial nature. Even so, as he observes, it was the duty of civil servants to point out that Ministers would themselves become answerable in Parliament on matters relating to individual schools. In pointing that out, he recognized that a Minister might conclude: “Ah, you’re opposed to my policy!” Alternatively, a Minister might say, “They drew my attention to some risks I had not thought of.” In summary, Caines made it clear that, in the context of GM policy, civil servants and Ministers were troubled by problems relating to the relationship between central and local government which, to his mind, had never been thought through: “It will always be an uneasy compromise.” Even so his personal engagement in seeking to resolve problems in rolling out the policy was considerable. In doing so, with regard to GM, he did not just take policy but shared notably in its development. Explaining this he concluded “it was a very important area of policy for Ministers, so I was involved with it.” On his (Caines) contribution to this, and generally, Clarke was full of praise: “he helped me to avoid a lot of trouble. . . as my permanent secretary, he accepted I was Secretary of State and that the Department should deliver what I wanted, and in his very quiet, avuncular way, I think he oiled the wheels and made sure that clashes did not arise between me and parts of the Department.”

#### 4. Lankester as *shaper* of a merger of departments

If Caines offers a paradigm example of *pragma-centrism*, among the eight permanent secretaries Lankester ran him, if for very different reasons, a close second. In discussing his policy praxis, Lankester’s conduct as a *shaper* and *resister* (Ribbins & Sherratt, 2016, 6–10) is examined focusing on what was involved in these practices and in what sense they were *pragma-centric*.

The possibility of a merger between the DfE and DoE (Department of Employment) into a Department for Education and Employment (DfEE) had been long mooted (Aldrich, Crook, & Watson, 2000) but the merger, when it happened, did so with little warning. In July 1995, “Bichard (the new permanent secretary at the DoE) and I were called in on a Wednesday morning and informed the announcement would take place that afternoon. . . Bichard and I were asked to implement the merger.” Lankester recalled that he had “promoted it” on visits to the Cabinet Secretary and also in “a note stating the advantages of a merger.” In doing so, he stressed the logical, economic, common sense, and pragmatic argument for this, and in the wake of its announcement played an active role in its implementation. He and Bichard were invited to work in tandem (as joint permanent secretaries) for a year with both soon concluding that such a “bicephalous” arrangement was not in the Department’s interest. Given his advocacy of the merger and productive collaboration with Bichard in making it happen, Lankester is justified in regarding himself as instrumental in bringing the

departments together: “I think I was a *shaper* (our emphasis) of the merger. I feel proud I played that part in it. Michael did very well too. He was extremely good, but we worked very closely together.” Bichard (Ribbins & Sherratt, 2021) largely agreed.

#### 5. Lankester as a *resister* of the Pergau aid policy

The Civil Service Code sets high expectations regarding the neutrality required of officials in performing their role. Even so, the *resister* (*evasive*) mode can be legitimate for entirely *pragma-centrist* reasons. Attempts to resist a Ministerial initiative based on relevant information and presented impartially without fear or favor can be justified and indeed can be the duty of civil servants (Ribbins & Sherratt, 2015, 33–34). Such was the case of Lankester and the Pergau Dam project which, following two parliamentary enquiries and a landmark High Court legal judgment, was declared unlawful. It was the most perplexing problem he encountered as permanent secretary at the Overseas Development Agency (ODA) and among the most controversial in the history of British aid. Unusually for an official involved in a divisive policy issue, Lankester (2012) has published an account of events. *The Economist* (2012) notes “in contravention of international agreements, and Britain’s stated policy, aid for the project was linked to unrelated orders Malaysia placed for British Defence equipment” (1). As Lankester recalled, “the decision to finance the project was taken in the face of strongly negative appraisal by (the) ODA.” This led him to “require a formal direction before authorising expenditure. Such a direction is rare. . . It placed on record that the decision had been taken against the advice of the civil service and that Ministers alone had taken responsibility for it” (2). Even so he regrets not pursuing his doubts about the project’s legality: “I was advised that it was lawful and I accepted this. I should not have.” Had he sought fuller legal advice, this might have halted the project. *The Economist* (2012) largely exonerates him noting “his dissent on the project may have cost him his career.” However, his promotion shortly after to the DfE in 1994 does not support this view but political memories can be long: and in the competition for the DfEE post in 1995, he did lose out to (Ribbins & Sherratt, 2021).

## Retro-Centrism

This genre also seemed to be all but ubiquitous in the praxis of every one of the eight senior officials. Although it implies caution in endeavoring to maintain, where possible, policy equilibrium, it also offers some scope for entrepreneurialism. The one metapolitical practice that could not be identified from our field research was that of “active” *taker* of policy as described above.

#### 6. Hancock as a *sharer* and *shaper* of policy on the National Curriculum

This can be illustrated drawing on the part Hancock played in the initiation of the National Curriculum in which he proved himself a master of policy continuity (Ribbins & Sherratt, 2012, 551–555, 2015, 24). With Kenneth Baker, his

Secretary of State, building on the work of his predecessor, Hamilton, he exercised a key *sharing* and *shaping* role, facing a great deal of opposition, in establishing a stable policy *milieu* and longitudinal policy equilibrium – thus England still has a national school curriculum.

7. Holland as a *maker* in managing a stand-off between teachers and Government on testing

With one exception, Holland did not see himself as exercising a major influence over DfE policy. “Determined, a priori, highly ideological,” for him, the drive came from “the No. 10 Policy Unit.” DfE officials could critique, analyze, or present options, but never in the “driving seat.” Given such impotence, he could only be a (performative) policy *taker*: “it is extremely demoralising for a Department to have some other outfit over which it has absolutely no control, with which it has very few links and cannot have a serious discussion, dictating from outside what shall happen. You are reduced to a ‘taker’ of the policy, to pushing it forward as best you can and trying to prevent the worst excesses.” Such feelings were intensified by working for a Secretary of State (John Patten) who: “from our point of view, had few thoughts of his own but having thoughts, ideas and indeed decisions shaped for him by others elsewhere.” This could be said to constitute a form of taking, but does not fulfil the requirement of *taking* as defined in our model since, for Holland, there was no obvious sense in which the wishes of the Minister were being carried out – in this case because he had few discernible personal policy purposes, acceding mainly to requirements originating elsewhere.

The exception to such a sense of powerlessness among senior officials had its origins in a stand-off between teachers and Government on pupil testing: Holland seized the initiative to *make* policy and reestablish a sense of *retro-centrist* equilibrium. He and three of his senior colleagues felt the alliance between teachers and parents could not be defeated: “We thought it right, and our professional duty. . .to compose a paper on options the Government might or might not adopt. All. . .involved, in one way or another, Government backing off. . .I signed it on behalf of the four of us, and put it to Patten.” Holland can be seen as presenting his Minister with a *retro-centrist* set of alternatives designed to avoid strike action and in doing so maintaining a semblance of policy equilibrium. Although he came to accept one of the options, Patten was “absolutely furious and said ‘I am the person who makes policy. It is for you to carry it out. I regard this as stepping over the mark.’” Holland saw this (iterative) solution differently: “I regard it as the professional duty of a civil servant. I don’t know any other Secretary of State I have worked for who would have said that about that piece of paper. . . As the stand-off escalated. . .my one individual contribution of a proactive kind was to go and persuade Ron Dearing. . .to take on the job of reviewing the situation for Ministers.”

The impasse over testing was problematic for the Government and for Holland and his senior colleagues. For the former because no solution had been advocated at Ministerial level and because of Patten’s reaction to his officials’ attempts at solution-seeking; for the latter because of how they perceived their

responsibilities. Holland sought a solution that involved the intervention of someone independent, whom Patten trusted: “We knew there was every chance of success if we presented Ron to Patten as somebody who could and would do it, but we weren’t certain we could get Ron in a frame of mind (to) acquiesce.” Holland therefore sounded Dearing out over lunch: “he said ‘yes.’ We said ‘Just stash it away, Ron. . . We’ll let you know.’” Holland put it to Patten, now “in a slightly more emollient frame of mind,” “that he, Patten, should persuade Dearing to do the job” pointing out: “it’s an outside chance. We did not let on we’d had lunch. . . that the outcome was likely to be a foregone conclusion. . . to put it crudely, we appealed to the Minister’s ego. Patten took great credit for it.”

8. Normington as a *shaper* of the Academies policy

The idea of the school academy had its origins during Blunkett’s time as Secretary of State but was not launched as a policy until after 2001 (Adonis, 2012). Academies are state schools which receive their funding from central government and not via a local authority. They are governed by a charitable body known as a trust. As such, they are said to have more freedom than schools run by local authorities. Currently, 2075 out of 3381 secondary schools and 2440 out of 16,766 primary schools in England are academies. On this Adonis (as Head of the No. 10 Policy Unit and then a DfE Minister from May 2005 to October 2008) claims the lead: “From the outset, inside and outside government, the policy was associated with me personally. This happened not only because it was ‘true’ but also because no one else much wanted to ‘own’ such a controversial and high-risk idea” (63). He is not complementary, with some exceptions, about the support he received from DfE civil servants: “inadequate leadership, drive and support for academies within the Whitehall machine was to dog the academies programme throughout its life” (72). He acknowledges the role of two Secretaries of State, Blunkett and Balls, but notes of the other junior ministers only that they were “all engaged to some extent.” Similarly, of senior officials, only “a few were. . . animated by academies” (73). One, not named as such, and indeed not referred to in the book, was Normington who was permanent secretary between May 2001 and December 2005. This suggests Adonis believed Normington was at best lukewarm on the policy and therefore he (Adonis) felt he had to make most of the running.

However, from the perspective of the model and from what he told us, Normington can be depicted as having displayed a degree of (reiterative) *retro-centrist* caution in respect of academies and in doing so to have been motivated by the desire to *shape* the policy in accordance with Ministerial intention. As such, for him, “The Department for Education I presided over had a series of Ministers who were cautious and to some degree sceptical about academies and therefore I too was cautious because my job was to ensure it was their policies that were implemented.” Furthermore, the backdrop to the policy was complicated by the fact that its origins were seen to be located in No 10 and with Adonis and thus “to an extent had to be sold to Secretaries of State in the education department.” In other words, if the policy was to appeal to the DfE, it had to be *shaped* to the departmental mindset and obviate tensions with No 10 “about how far and how fast the policy on academies should go.”

In retrospect, Normington concedes the policy “became a really important tool in changing the education system and Andrew had the vision to see that; the rest of us took a bit longer.” For him, a key issue was Adonis wanted to expand the program much faster and more widely than envisaged in the DfE: “If Andrew had had his way early on, as Michael Gove seems to be doing, he would have made all schools academies. Or at least...increased the numbers far more rapidly – good schools, bad schools.” But Normington believed Blunkett and most of his successors were keen on the policy insofar as it focused on transforming failing schools in deprived areas. This also appealed to DfE officials who were “strongly in favour of academies as a tool for school improvement and transformation in deprived areas.” From Normington’s perspective, academies were seen as expensive and *retro-centrist* caution was thus required. This meant *shaping* the policy so (a) expenditure was limited to investment in deprived and failing areas; (b) it did not inhibit the plans the DfE had for raising standards in other schools; and (c) it did not dilute the original intention behind the policy by creating many academies: this last “did mean we looked like a brake on Number 10’s ambitions.” In summary, he saw his job as supporting his Secretary of State and therefore “we were often in argument with Andrew about how fast we should go. . . I am rather keen on academies. . . but doubtful about a policy which seeks to make all schools academies because I thought it was, and should be, a tool for school improvement. . . Once you universalise that I am not sure it will be as powerful a tool for transformation as it was at the beginning.”

9. Hancock as *resister* of the CTC and GM policies

Hancock can be depicted as the “principal project manager” of the 1988 Education Reform Act (Ribbins & Sherratt, 2012). But if his zeal for aspects of the Act was plain, such as the National Curriculum, it was far less so for others, notably City Technology Colleges (CTCs) and Grant Maintained Schools (GMS). Kenneth Baker, his Secretary of State (Ribbins & Sherratt, 1997, 101–105), believed Margaret Thatcher was far too enthusiastic on GMS wanting every school to be required to “opt” for this. For Baker (1993): “CTCs were key in the process of reform because they were the first element to be announced, and incorporated many of the changes I wanted to introduce into the whole system – parental choice, per capita funding, local managerial control, independence from the LEA” (188). More recently he claims to have fathered the academies concept since CTCs “were (their) forerunners” (Baker, 2016, 16). Similarly, responding to an announcement, subsequently qualified, that all schools would be required by 2020 to become academies, he echoed his warning on the GMS policy of the risks of attempting to go too quickly. Regarding his CTC policy, he wanted to get this up and running to illustrate its practical benefits and only then initiate more radical reform (Ribbins & Sherratt, 1997, 103): “I chose CTCs because they crystallized nearly all the other issues. What was to be taught. . . who was to own them; how were they going to be funded.” For Hancock, this policy evolved because Baker was “fed up with hearing industrialists complaining about the schools’ system – it was a challenge to them to create their own schools and put up the money.” Given his Treasury background, Hancock was skeptical about the

financial calculations that had been made and soon came to feel his doubts were justified: “Unfortunately, although they (industrialists) did put in some money it was not nearly enough. . . It cost £10m to build a secondary school. He (Baker) never got more than a million from industry and the Department had to find the rest. This caused considerable distortion in the budget because large sums of money that might have improved schools nationwide went into a few CTCs.” Hancock also doubted their success: “The early reports by HMI on CTCs were not particularly favourable.”

Unsurprisingly, Hancock and his colleagues were unenthusiastic about developing the policy and not above dragging their feet on implementing it. This was how it was seen by some of Baker’s political colleagues. Referring to a number of meetings he had organized to formulate the CTC policy as a challenge to the monopoly of the LEAs, Baker (1993, 179) recalled his Special Adviser, Tony Kerpel, warning “that DES officials (presumably led by Hancock) were hijacking the CTC initiative and imposing their version, which simply represented a rehash of the very comprehensive schools we felt had failed.” If Hancock was skeptical about the merits of CTCs, he did not attempt to camouflage his disdain for the GM policy of opting out of local authority control: “It was part of the sort of general hatred of local authorities that was conspicuous at this phase of the Conservative Government.” He believed the New Labour Government was “right to channel all finance through local authorities again,” because under Baker’s successors, “the (Tory) government finished up. . . bribing schools to break free from local government. . . I don’t myself see the point of that.” Whereas Thatcher saw GM as the ideal for all schools, this was not a view shared by Hancock or, it seems, Baker. As Hancock put it: “the difference of view with the Prime Minister was that she wanted to make them more or less obligatory, whereas he (Baker) would only create a GM school if the parents voted for it. I think he recognised that there were some Local Authorities who did a good job.” This suggests that if Hancock was generally willing to assume the traditional Whitehall role of offering impartial advice and implementing his Minister’s wishes, on CTCs and GM schools there was not the meeting of minds that shaped, for example, his alliance with Baker on the National Curriculum, but rather an evasive *retro-centrist* resistance.

## Ideo-Centrism

Given the extent to which pragmatism and common sense are valued in British politics, it is not so surprising that we were able from field data to identify in this category only *shaping* or *resisting*. What seems likely is that further research will enable the detection of one or more of the other forms of metapolitical practice.

### 10. Lankester as a *resister* of further erosion of relationships between the DfE and LEAs

Lankester’s attempt to *resist* further erosion of the relationship between the DfE and local education authorities represents an exemplary case of mandarin *ideo-*

*centrism* (Ribbins & Sherratt, 2015, 24, also 2016). Implicit in opposing Government policy, the *metier* of the *ideo-centrist*, can be the desire to restore a status quo to its previous configuration. In such cases where dialogue between a Secretary of State and a permanent secretary had broken down (as occurred between John Patten and Lankester), then the official might be inclined to *circumvent* the wishes of his Minister and in doing so to seek circuitous ways of influence.

11. Hamilton as *shaper* of the context in which Keith Joseph gave up on voucherization

Hamilton is perhaps the most unusual mandarin studied (Ribbins & Sherratt, 2013a). He was a formidably gifted *shaper* (sometimes as a *resister*) of Ministerial will and in the above paper we discuss two such cases. One deals with his initiation of a policy that was to lead to a centralizing of curriculum control conflicting with the will of three of his four Secretaries of State. As such, he can be judged a *maker*, even “grandfather,” of the National Curriculum (41–44). The second considers his attitude (36–41) to “voucherisation”: a policy he did not favor despite knowing it was strongly advocated by Keith Joseph and his political advisers (Stuart Sexton and Oliver Letwin). According to Sexton “Letwin and I were invited by Joseph to formulate a voucher scheme. However, Keith said Mr. Hamilton and his colleagues were against a voucher scheme and he wanted us to discuss it with Mr. Ulrich first.” From this it is clear that Hamilton had reservations about the policy but decided not to seem to take the lead but rather to leave it to his formidable Deputy Secretary, Walter Ulrich, to “progress.” Sexton recalls many meetings at which he and Letwin endlessly debated vouchers with Ulrich which amounted to little more than a series of stalling tactics. For Hamilton: “I wandered through all the arguments. . .with the best people in the Department working on it.” For Sexton and Letwin these “‘best people’ were working against it.”

The final decision was delayed until Hamilton had retired, but he recalls: “A good deal of my last year and. . .the Department’s effort in 1982-1983 was spent on vouchers.” Political will was tempered in the context of Ministerial debate with officials, especially with Ulrich. For his part Hamilton, a pragmatist and a centrist, was openly *ideo-centrist*. As he saw it, “Keith was very clear on political grounds the Party wanted him to introduce vouchers, and certainly the Prime Minister did.” In contrast, discussion in the Department turned mainly on issues of practicability. Hamilton describes the vouchers debate as “Joseph and Ulrich head on” but insists officials were intellectually unconvinced, fearful the Secretary of State was “digging a hole for himself” and not “just being awkward.” On Ulrich’s stance, Hamilton was ambivalent: “In many ways he was not a good choice: he was very aggressive. On the other hand, he was a good choice because he was determined the Secretary of State should see the error of his ways.” For Sexton, Ulrich, supported by Hamilton, “put up a series of Aunt Sallies for us (with Letwin) to knock down. . .when we’d reckon we had solved his objection, he’d think of another. We played this game for several months until Keith got fed up.” In conclusion, it seems clear that Hamilton did share Ulrich’s hostility to the policy and revealed this in various ways – how else can

his comment about enabling Joseph to “see the error of his ways” be interpreted? Furthermore, if he had serious reservations about what Ulrich was doing, he could have replaced him but chose not to do so. As such, in *shaping* the ongoing debate between officials and Ministers by a judicious mixture of delay and counter-iterative argument, Hamilton effectively resisted (employing evasive tactics) the vouchers policy.

## Meta-Centrism

*Meta-centrism* characterizes the context in which the disposition of civil servants and political will of Ministers are most likely to correspond and policy *sharing* and agreement on remedies of a nonideological kind are manifest. As such, the three most likely metapolitical practices relevant to it are *making*, *shaping*, and *sharing*.

### 12. Bichard as *sharer* and *shaper* of the Learning and Skills Council Policy

This was evident in the praxis of Bichard who shared with David Blunkett, his Secretary of State, arguably the closest and most productive working relationship between mandarin and Minister in our study. Pre-occupied with “substance” not “politics,” both were impatient with notions of “left” and “right.” Such is the apolitical *via media* that led us to depict him, in collaboration with Blunkett, as a *meta-centrist co-maker, sharer* and *shaper* of key policies such as setting up the Learning and Skills Council (Ribbins & Sherratt, 2013b, 2015, 25).

### 13. Normington as a *sharer* in the academies’ context

An earlier vignette (8) explored Normington’s role as a *retro-centrist shaper* of the policy on academies. In what follows his praxis on this is examined, largely as he himself saw it, from a *meta-centrist* perspective as *sharer* in its development. Although he had reservations about universalizing the academies program, he did support devolving power from local authorities to schools: “If it was all about creating more autonomy for more and more schools, which I am strongly in favour of, the question is whether you needed to make them all academies.” Locating this view in historical context, he conceded that the initial drive for devolving autonomy stemmed from the Conservative GMS (Grant Maintained Schools) policy which released schools from the local authority system. But the incoming “Labour government...abolished grant-maintained schools which were the forerunner of independent schools in the state system...and brought them back into the local authority system and that was the prevailing political view that David Blunkett presided over.” This said, he then drew attention to the evolution, under Adonis, of the idea of the autonomous academy as central to New Labour’s school improvement program, a process that took 10 years and for which Adonis “was lauded in Labour and Conservative circles” – perhaps especially the latter insofar as one influential Conservative Secretary of State, Michael Gove, declared “We are on the same page as Andrew Adonis.”

From such a perspective, Normington saw grant-maintained schools, foundation schools, and academies as all “part of the same broad idea.” In a revealing display of his *meta-centrist* credentials, he recalled a conversation in which Adonis said: “‘It was a mistake, wasn’t it, for us to have abolished the grant-maintained schools?’ I said, ‘Yes it was.’ Since it was a Conservative idea and you wanted to get rid of that you should have evolved this, rather than try and put them back into the maintained sector. But that is politics in a way, isn’t it?” Such views demonstrate a position neither to the right nor the left but one which is nevertheless supportive of a policy whereby autonomy was devolved. This is indicative of a neutrality, or *meta-centrist* predisposition, that any government department would wish to discern in its meta-political officials in sharing and facilitating their policy ambitions. As Ruth Kelly, one of the nine Secretaries of State Normington worked with during 10 years as a permanent secretary, observed of him: “he had been around for such a long time, he had seen so many policies come and go, be developed, be delivered, that he knew what worked and what did not work.” In *sharing* departmental policy (collaborative) with Ministers at the DfE Normington acted independently of any right or left predisposition thus transcending, in the maelstrom of Blairite reform, any hint of a political orientation: “my job was to ensure that it was their policies that were implemented.”

#### 14. Caines as *shaper* of an interdepartmental context

A “big beast” in Caines’ Whitehall jungle of the time was the permanent secretary at the Department of Employment (DoE), Geoffrey Holland. Caines described the relations between the DfE and DoE as “disastrous.” It worried him that with overlapping responsibilities for 16–19 education policy they had very different purposes (caricatured as “education” or “training”). “They were not talking to each other. . . trying to bounce each other. . . fighting for turf.” He depicted the antipathy between officials as “disdain from DoE and distrust from DfE.” From this gloomy backdrop, he had hoped to aid collaboration and can be labelled as a reiterative *meta-centrist* who set out to *shape* a departmental disposition that enabled a coalescence of civil service preference and Ministerial political will. He tried to work closely with Holland: “Geoffrey and I regularly had lunch together. We had regular meetings of our top officials with an agenda that ‘we do not surprise each other’ . . . We got rid of one or two people who were not very helpful to the relationship. . . I was very keen that this relationship should work and that Geoffrey should succeed me” preferably in a DoEE. Caines: “liked (Holland’s) active style. . . a lot of drive, a lot of energy. I thought it would be better that the two ideas [education and training] should be pursued in an educational framework rather than against it.”

This sentiment is *meta-centrist*. It transcends ideology or consensus, suggesting the pursuit of a *shaping* influence in which conflicting policy conceptions decoupled by the existence of split departments, might be harmonized. He wished to achieve this “above board in co-operation rather than bouncing people behind the scenes – suddenly finding the Secretary of State for Employment had come out with some speech to do with educational matters.” However, he was adamant, he was managing “a relationship rather than promoting a

merger.” Even so, he was active behind the scenes. So, when Robin Butler (Head of the Civil Service) held meetings with senior officials on the machinery of government, the merger of the DfE and DoE was on the agenda: “I was involved in those, but don’t regard it (the merger) as my achievement. It just seemed a rather desirable way of breaking out of the dichotomy between vocational and academic, between competence and learning. . .” In summary, his *meta-centrist* impartiality in promoting Ministerial will prompted a desire to reshape a suboptimum state of affairs by providing “an environment within which policy initiatives can be taken forward, pursued and succeed. If you saw road blocks along the way your job was to get rid of them.”

## Exo-Centrism

This genre derives from a relatively recent reaction to a perceived need for civil servants to manage policy programs and deliver Ministerial objectives with greater commitment and effect. This has led to the recruitment of a growing number of “outsiders” who were thought to have the relevant skills, knowledge, and experience. Bichard was one, Bell another.

### 15. Bell as *taker* of the policy wishes of his Ministers

On the promotion of the academies policy, Adonis (2012) is critical of the level and quality of support from civil servants. He named Bell as among the few exceptions and seems to believe this was explainable, in part, by Bell’s “real” background in education which made him “deeply knowledgeable and supportive” in a way true of few civil servants. Unlike Bell: “They mostly possess superficial subject-specific knowledge and front-line experience. . .Barely any senior Education Department officials had taught in a school, let alone managed one. . .as likely as not they hadn’t visited a school since they attended one. Project management skills were in especially short supply. . .” (77). But if few would question his status as an “educationist,” Bell himself saw his role as mainly to do with department and project management, focusing on policy implementation rather than policy development which he saw as the domain of the Minister. Despite this, his appointment reflected a growing political demand for the kind of experience, expertise, and commitment he offered. Even so Bell, unlike Bichard, described his role in essentially performative terms; that is with *taking* and implementing the policy wishes of his Ministers (Ribbins & Sherratt, 2015, 25).

### 16. Bichard as a *shaper* of departmental culture

Bichard, like Bell, was an “outsider” (Ribbins & Sherratt, 2021). Both had excellent records of experience in management elsewhere and both served “apprenticeships” leading civil service agencies (Bell as Chief Inspector of Ofsted). Bichard was even more untypical as a mandarin than Bell, being evidently *exo-centrist* in background, capabilities, attitudes, and style: “I was a grammar school boy. . .My father was a docker, and thereafter a school caretaker.” His career

trajectory was also atypical, starting in: “a county borough, went on to a county, then into London, initially Lambeth, then Brent, as Chief Executive. . . Then I went to Gloucestershire. . . and then into the civil service via the Benefits Agency (as Chief Executive).” Nearing the end of his contract he “applied for the Employment job to see if I had a future in the civil service. No one really had encouraged me to.” Michael Portillo, the Secretary of State, insisted the post be advertised and Bichard believes this was significant as was the fact “they appointed someone who wasn’t traditional.” Despite his success, Bichard never took to Whitehall. Not setting out to be different, he realized, as did others, that he was; “I don’t think I ever felt I was going to be part of it. Some would say I deliberately kept myself apart. . . Whitehall traditionally has been something of a club. . . most people there were at university together. Some were at school together. . . I can’t say I didn’t feel a bit on the outside.” Refusing to be “captured by the culture of an organisation,” he set out to create a new culture for the DfEE, defining him as “a dynamic, driving leader.”

Blunkett, his Secretary of State, stressed that Bichard was the first non-professional career civil servant to be appointed permanent secretary: “It isn’t unusual now but it was then.” Reflecting on their close and productive relationship, Blunkett went out of his way to acknowledge Bichard’s commitment to shaping and delivering what he (Blunkett) wanted and to his ability to deliver because, as a manager, he understood the impact of policy. For Blunkett, like other external recruits, he brought to Whitehall the program management skills and leadership capabilities needed to inspire and drive people to deliver: “You need to be able to bring people in to do a particular job and reward them well.” Exemplifying how Bichard helped him succeed, Blunkett cited recruiting Michael Barber. Another “outsider” he had been a school teacher, worked in the Education Department of the National Union of Teachers, and served as Chair of Education of a London Borough before being recruited to be Chief Adviser to Blunkett. There was a “joint agreement before the election that [Bichard] and I, with Tony Blair’s support, were able to push through, against enormous resistance from Robin Butler (Cabinet Secretary), setting up the Standards and Effectiveness Unit. . . We put Barber in on day 2 of the government. . . This was ‘the biggest, most profound change’ in re-shaping departmental culture and creating momentum at the DfEE. Predicated on the concept of standards not structure,” the knock-on was “others saw the writing on the wall, and recognised this was a moment to take ‘gardening leave’” (a term widely used to describe a period when an employee on notice of termination of contract by the employer or of resignation by the employee, and are not permitted to come into their place of work during the period of notice). The Unit accelerated the rise of the “expert” in policy-making, pulling in “people active at the front line – head teachers, advisers within local authorities, academics. . . people who had recent experience and sufficient clout, standing and stature.” No wonder Blunkett accepted our description of Bichard as a “un-*mandarin* like *mandarin*”; “your phrase sums it up. That’s why, regrettably, he wasn’t given the nod he would become the next Secretary to the Cabinet.”

## Conclusions and Reflections

Given the significance attached to them, permanent secretaries have been under-researched and under-theorized. In recent years, a growing number of studies relating to the service in England have been published but the authors know of only three from one department over an extended time period. These are Neilson and Otte (2012) on the 12 at the Foreign Office between 1984 and 1946, and Abbot (2015) (1976–2014) and Ribbins and Sherratt (1976–2011) on the DfE. Against this backdrop, this chapter and earlier papers have sought to describe the policy practice of eight permanent secretaries. Drawing on interview-based field research this has led to the development of an analytical model that locates and interprets their praxis across a spectrum of genres of “centrism” and related descriptive practices. What then of the wider implications of such findings?

On this, among the criticisms most often made of the activities and influence of the mandarin class, historically in Britain and elsewhere, has been that they have too often acted as a drag on the identification and implementation of radical policies in accordance with the will of their political masters. Certainly, as has been argued elsewhere, they have in England been effective in resisting some of the more far-reaching attempts at civil service reform in general and the role of the mandarin class in particular (see Ribbins & Sherratt, 2014). It is challenging to see how a centrist disposition, in whatever form and whatever its merits, can be readily compatible with a committed and active pursuit of policies that represent major reversals of the status quo? But it is possible to overstate such a conclusion. Thus, among those Ribbins and Sherratt studied, there are examples in which permanent secretaries have been major agents of radical change. Two examples must suffice. In the first, the policies being pursued were very much aligned with the political will of the Secretary of State as with Bichard working closely with Blunkett on a raft of major and controversial policy initiatives (Ribbins & Sherratt, 2021). In the second, Hamilton actively and determinedly pursued a policy in favor of a national curriculum for schools despite “serving” Secretaries of State – two Labour and one Conservative – who were, as was arguably the general political will at the time, opposed to the idea (Ribbins & Sherratt, 2013a). A fourth, Mark Carlisle, was tentatively supportive but with a very light touch in mind – “headmasters should have a great deal of flexibility” – and felt that the National Curriculum (introduced in the wake of the 1988 Act) was “much too restrictive and prescriptive” (Ribbins & Sherratt, 1997, 76). Insofar as a significant gap exists between civil service disposition and ministerial political will, how might this be diminished?

The merits of various remedies have been advocated. These include making the service, and especially its senior members, more representative, and in doing so better reflect the characteristics and aspirations of the society it purports to serve. Thus, for example, in Susan Acland-Hood, the DfE has, since its origins in 1899, only just (2020) appointed its second woman permanent secretary. Currently 7 of 23 ministerial departments are headed by a woman and there has never been a woman Cabinet Secretary. Socioeconomically, like most of her predecessors in the DfE, and the Service as a whole, Acland-Hood was educated at an independent

school (59%) and Oxbridge (39%). High Court Judges only have higher percentages than permanent secretaries. Similarly, the case for recruiting at senior levels more outsiders with relevant experience of other public and private sector work has been advocated by some. A version of this approach is to encourage more senior civil servants to spend part of their careers in post outside the service. On this Normington (2013) has warned on behalf of the Civil Service Commission “We don’t believe the answer to all the Civil Service’s problems is to recruit at a senior level from outside” (2). Similarly, O’Donnell, a former Cabinet Secretary, recalls “I tried to bring in more people from outside and on the whole they did slightly worse than other civil servants” (Cameron, 2012, 25).

However, of the remedies canvassed, arguably the most influential might be described as the politicization of the civil service. In some countries, notably the United States, “vast swathes of the executive ranks are removed with each change of president. Incoming administrations can make around 4000 political appointments, including top positions in departments” (Nickson, 2020, 1). However, “whilst this gives an incoming president a huge degree of control over their administration, it also leads to a loss of institutional memory and expertise. Finding suitable candidates, and having them approved by congress takes time, and jobs often go unfilled for lengthy periods” (1). Insofar as this approach puts a high premium on the perceived merits of political commitment its guiding principles are very different from the notion of political impartiality long said to be a defining feature of the English civil service and other broadly similar systems. Any significant attempt to move from this in the direction of an “American” approach would entail a “seismic cultural and logistical change” (not to mention potentially highly significant cost-effectiveness issues). While there are those in England who would espouse this, or something like it (see Ribbins & Sherratt, 2014), this is not a view that would currently command much support within the dominant political classes. But, as Nickson (2020) points out, there has been a “gradual slide” towards such politicization in the practices of countries hitherto informed by UK-type assumptions. In Australia and Canada, there is “greater prime ministerial control over top civil service jobs and a greater tendency towards political appointments” (2).

In the case of the United Kingdom, in a rare but authoritative account of the politicization of the civil service, Richards (1997), having argued that the making of such senior appointments had been “largely shrouded in secrecy” (2), traces this development to the influence of the Conservative governments, especially under Thatcher, of the 1980s and 1990s. Although the idea that the appointment of permanent secretaries should be made directly by Secretaries of State has been resisted, their role now includes “agreeing the job description and person specification; agreeing the composition of the recruitment panel; meeting the shortlisted candidates; suggesting lines of questioning. . .” (Normington, 2013, 2). Currently the selection panel presents a short list of candidates “deemed appointable” to the Prime Minister who makes the formal appointment. This said, “the Constitutional Reform and Governance Act of 2010 requires all such appointments must be ‘on merit on the basis of fair and open competition’ meaning that appointments should not be political choices” (Haddon, 2020, 1). To determine authoritatively how far

this has, or has not, been honored would require a follow-up study of the kind that Richards (1997) reported in *Whitehall's Political Poodles?* The case of Secretaries of State is simpler – appointed by the prime minister they remain in post at the prime minister's discretion.

With respect to mandarins, there is, arguably, some evidence in recent times of the kind of political creep in England that Nickson (2020) reported from Canada and Australia. This can be exemplified by the real or perceived reasons for the departures of three permanent secretaries (Mark Sedwill from Cabinet Secretary and Head of the Civil Service, Philip Rutnam from the Home Office and Jonathan Slater from the DfE) at, it seems, the behest of the Prime Minister in the cases of Sedwill and Slater and the Home Secretary in the case of Rutnam. Apparently forced out, none were technically sacked although Rutnam claimed a constructive dismissal. There is also the case of the appointment of David Frost, a non-civil servant, who replaced Sedwill as National Security Adviser. This perhaps signals the shape of things to come in terms of civil servant independence and neutrality. Over time “political sackings can become accepted practice” (2). As a permanent secretary who actually was dismissed in Australia put it “the more often it happens the easier it becomes” (2).

Such developments would seem likely to have implications for the motivations of senior civil servants and this is a theme on which a number of more or less competing theories have been advanced. This chapter proposes that a “centrist disposition” is the norm among British mandarins. Other theories postulate “public choice” and “bureau shaping” models. Briefly, the former claims that rationally self-interested officials seek to increase the scope, power, and budget of their departments (Niskanen, 1971). The latter argues that welfare maximizing civil servants in policy ranks are concerned primarily with providing themselves with a congenial work environment and, as such, do not wish “to head up heavily staffed, large budget, but routine, conflictual and low status agencies” (Dunleavy, 1991, 202). More recently Abbott et al. (2021), exploring relations between governors and their intermediaries, identify four ideal type loyalties among the latter: *Opportunists* to self-interest, *Vassals* to a leader, *Zealots* to a policy or ideology, and *mandarins* to their institutions – with the British civil service taken to be the paradigm case. Applying these ideal types, perhaps in a modified form, might well be worth attempting as also would exploring what the implications might be for the motivations of mandarins of a shift from a British to an American system.

These and related issues surely warrant further empirical and theoretic examination. In this chapter, suggestions are offered as to how this might be done. Further data interrogation could lead to refinements of the genres of centrism and types of action discussed above. It might also enable identification of the missing meta-political practices for which no compelling evidence has to date been found. In addition, the scope of the research could be widened. Thus, although the model was derived from a study of permanent secretaries from one department, preliminary work in another, the Home Office, in the form of interviews with permanent secretaries and Home Secretaries, suggests it has a wider applicability. This could be so both in Whitehall and in other countries with services modelled on the British system and even in those that are not. But even if the model, and its “centrist”

findings, are found to have limited international applicability, the approach to field research advocated in the chapter might still be relevant. After all, if the role of senior civil servants in the development and implementation of policy, and in all else they are purported to do, is to be better understood then one way would be to ask them and relevant others about this? Of course, if such an approach constitutes a necessary condition for such an appreciation, it would not be sufficient. For this, other methods will surely be necessary.

This would include research exploring what permanent secretaries say in terms of what they actually do. To achieve this, a researcher would need to collect relevant documentary evidence on specific permanent secretaries in particular departments; observe them as they enact their praxis in relevant situations; discuss with them what they were trying to do and why; set this against the views, and actions, of significant others; and, in producing a final account, compare and contrast all the available evidence. On this Rhodes (2005) makes a persuasive case for ethnographically orientated inquiry. To illustrate its possibilities, he reports on a study of “three middle ranking service ministries” (5). Groundbreaking and illuminating as this is, it is relatively modest in scope. Even so the merits of his account make it regrettable that as of now there are no full-scale, in-depth, published ethnographies of any Whitehall department. Not least because such research would have the potential much to advance understanding of policy-making in particular and government in general. This notwithstanding it is hard to overestimate how difficult such a study would be in terms of securing access, maintaining ownership, and negotiating reporting. Furthermore, over the last couple of decades, the rules and regulations governing such research have become far more prescriptive, even restrictive. Given this, persuading contemporary university research ethics committees and research funding bodies to accept such research could well be challenging. In conclusion, while critical observations on the model and field work approach on which the findings reported above rest would be welcome, it is hoped the chapter will stimulate further historical and other forms of research into government departments of all kinds and into the policy praxis of senior and other civil servants in the United Kingdom and elsewhere.

## Abstract

Empirical research evidences that teen dating violence (TDV) disproportionately affects females, and in particular those within BIPOC (Black, Indigenous, People of Color) and LGBTQ+ demographic groups. Key to current and evolving leadership discourse concerning TDV is a clear understanding of how the sexual politics of education shape policies concerning TDV, as well as awareness of how the normative values attributed to schooling practices can influence public understanding of TDV and the extent to which adolescent relationships can be supported to develop prosocial behaviors that challenge rape culture. This chapter outlines the experience of TDV and the role that policy-makers and educational personnel play in the role of violence prevention. It explores current policies for dating violence across state and federal legislation, draws parallels between bullying and TDV, and discusses how bullying policy can inform more relevant policy on TDV. It also examines violence prevention and reporting barriers

identified through inconsistent state policies, inaccessible reporting resources, and lack of training for educators (i.e., leaders, teachers, counselors, and support staff). To address violence disclosure and prevention, recommendations are offered in the form of culturally responsive trauma-informed policies and practices (TIPP) and systemwide approaches such as bystander and comprehensive sexual education programming.

**The Field of Memory**

The idea that US public schools are safe spaces for students. The idea that sexual violence does not occur on school grounds or at school-related functions. The idea that sexual violence is a private concern and does not need to be addressed in the public sphere or by public policy. The idea that females and other historically underserved student groups who are sexually victimized are to blame for the event (s). The idea that once enacted, multilevel policies, practices, and programming can address and ameliorate entrenched sexual violence and the normative culture that has allowed it to exist.

The idea that discussing sexual behavior, sexuality, and sexual violence in school is inappropriate and/or not connected to classed, colonial, gendered, and raced dynamics of US history. The idea that abstinence-only sexual education programming has been effective at curbing rates of sexual activity, including sexual violence, among teens. The idea that abstinence-only messaging about teen sexuality does not contribute to normative school cultures wherein adolescent sexual violence is ignored, misunderstood, and thus unreported. The idea that this culture is not linked to broader societal normalization, which champions the position that (white, middle-class, and heterosexual) “boys will be boys” when suspected of sexual violence. The idea that beginning in adolescence and continuing to adulthood, these normalizing effects do not contribute to females being blamed and disciplined for sexual violence perpetrated against them.

The idea that normatively biased views about females and teen sexuality more broadly are not maintained through rape culture ideation and myths that include: if a teen female wore revealing clothing or behaved provocatively, then she “asked for it;” if a teen female is drunk at a party and is sexually assaulted, then she should have been more responsible; and if a teen female exercises her voice and agency, it is perceived as tension-inducing and abrasive, yet if a female victim does not fight back, it cannot be considered rape. The idea that longstanding Western-centric myths related to race and national origin do not drive how the public and its educators

(i.e., leaders, teachers, counselors, and support staff) normatively view BIPOC adolescent sexuality and related violence. The idea that heteronormative sexual violence only happens in a male and female binary and does not contribute to wider social instances of violence perpetrated against queer and gender non-conforming teens.

### **The Field of Presence**

In the 1970s, major international, national, and 50 state policy reform occurred to address sexual violence within multiple areas of public and private life, including education. Additionally, feminist critical and Women of Color feminist analyses of educational policies and processes identified how both reproduce inequality and violence against the female body, with the goal of transformative change in normative and political schooling structures. Still, where violence against women and girls is concerned, scholarship argued that the core causes of feminism, including violence prevention, are centered within policy in ways that actually regulate, silence, and undermine the intended aims of those policies and shore up structural factors driving violence. Furthermore, where policy and activism intersect, the unique contributions of feminism often are absorbed into other aspects of the general fight for basic human rights.

Though these analyses have differently influenced US K-12 and higher education policy, practice, and programming concerning gender violence, to a wide extent, contemporary researchers, practitioners, and policy-makers have an awareness of basic causes and effects of adolescent sexual violence, and that schools have a responsibility to prevent that violence. This understanding is derived in part from international, federal, and state policies and protocols. At the federal level, this includes legislation such as the Violence Against Women Act ((VAWA), 1994) and Title IX of the Educational Amendments of 1972, the latter of which specifically aims to prevent discrimination in education on the basis of gender, and outlines reporting procedures for educators to assist students who experience gender-based discrimination (including sexual violence). Across the 50 states, sexuality education legislation and programming vary significantly from minimal to extensive coverage, with a range of anti-bullying and anti-harassment laws in existence.

Due to these laws and the shifts in normative culture that led to their enactment, a stronger emphasis on consent for all parties in adolescent sexual activities now plays a role in K-12 sexuality education. In particular, the concept of “yes means yes” outweighs “no means no,” both legally and colloquially. Educational leaders have turned to trauma-informed policies and practices (TIPP) for teachers, counselors, and support staff, which highlight the causes and effects of trauma (including sexual), and in the best instances, cultural responsiveness and sensitivity toward BIPOC and gender diverse students as well. Bystander intervention strategies for violence prevention also have been embraced by K-12 school districts. In partnership with local community entities, including rape crisis centers that have worked on sexual violence prevention programming for over a half century, districts also aim to deliver evidence-based K-12 curriculum that is focused on healthy relationships, consent, peer influence, and social norms toward the end of sexual violence prevention.

### **The Field of Concomitance**

Political and social science research on sexual violence is vast. Critically minded researchers, practitioners, and policy-makers work to further infuse a culturally responsive trauma-informed approaches to responding to adolescent sexual violence, and in particular violence that occurs between teens. To address teen dating violence (TDV), it has been suggested that districts and schools adapt frameworks from cultural studies, community rape crisis centers, gender studies, school counseling and psychology, and social work best practices. Feminist analyses in particular, which aim to challenge and reconceptualize individual human interactions up to policy level decisions, could inform a K-12 gender violence prevention framework utilized in evidence-based training and curricula.

Yet, while federal and state policy on sexual violence increase in magnitude and narrow in focus, rates of sexual violence perpetrated against female youth have not declined. Despite copious empirical research and established best practices for directly naming those classed, gendered, and raced factors that contribute to US rape culture, K-12 climates remain normatively contested terrains in terms of implementing comprehensive and sex positive educator training and adolescent sexuality curricula. Where clear policy and actor will to address sexual violence does exist, educational leaders operating in these terrains are left to their own devices to identify, measure, and address major concerns, demonstrating ongoing gaps between policy and implementation in practice. Furthermore, longstanding bipartisan legislation concerning sexual and gender-based violence prevention (e.g., Title IX, VAWA, Trafficking Victims Protection Act, (TVPA, 2001)) have been politicized in ways that not only reproduce existent inequality but create new forms of violence at individual and institutional levels.

### **Discontinuities and Ruptures**

With the onset of the #MeToo Movement (founded in 2006 and revived in 2017), cultural norms within public and private sectors were disrupted as a new collective consciousness emerged regarding the rates of and cultural factors contributing to sexual violence in the United States. and globally. K-12 educational leadership was not exempt from this shift in awareness. As previously discussed, policies have sought to promote gender equality. At least within international and federal policy intent, and dependent upon state objectives, this included a shift away from “victim blaming” toward victim-centered approaches. It involved emphasis on increased resources related to sexual harassment prevention, sexual assault victim needs, and community-based responses such as bystander intervention training. Finally, bullying laws and trainings have focused on identifying and addressing the root causes of violent behaviors, which manifest in children and adolescents in public spaces such as schools.

Yet, where implementation is concerned, feminist and other critical educational research documents major gaps between policy and practice. This, in part, is tied to the maintenance of white, able-bodied, heteropatriarchal, middle-class values in public sector systems, including education and law, which do not center conversations that affect survivors and thus often exclude them from informing future policy,

research, and related leadership action. This also is despite empirical evidence that sexual violence affects BIPOC and gender diverse youth at disproportionate rates than their white counterparts. Finally, recent changes at the federal level and within less progressive state contexts have sought to de-emphasize Title IX benefits for schools, as well as VAWA and the Trafficking Victims Reauthorization Act (TVPRA, 2017) benefits for victims, which threatens to undermine policy progress to date.

### **Critical Assumptions**

Educators still wittingly and unwittingly enforce harmful ability status, classed, gendered, and raced norms and discourses in their classrooms, schools, and districts – which ultimately contribute to the high rates of sexual violence in the United States. This is in part due to inadequate teacher and leader program preparation and appropriate continuing professional development training. This includes, for example, culturally responsive TIPP that help educators to sensitively navigate disclosures of violence and/or address violence when it occurs on school grounds. This also is due to the need for such programming and training to take up the dual responsibility of uncovering and disrupting the presence of axiological, epistemic, and ontological dynamics of white, heteropatriarchal, settler colonialism. Where well-intentioned and empirically grounded policies do exist, they often are ill-enforced and poorly communicated, to both educators and students, who themselves cannot identify proper protocols and available resources. Thus, there is a need for comprehensive TIPP in schools that outline connections between child abuse, bullying, and TDV, in a manner that does not flatten complex relations along ability status, gender, nationality, sex, and race. To this end, leadership discourse might help undo those neoliberal conditions that contribute to “additive” problem-solving within schools that delimit the identities, behavior, and agency of girls, BIPOC, and gender diverse youth.

Feminist critical policy analysis and Women of Color feminist frameworks are mechanisms, which provide deep insight into these conditions where gender violence is concerned. Leadership discourse rearticulated through these lenses might open up educational spaces in ways that tangibly counter forms of historic, material, and epistemological violence, which often is perpetuated along interdependent and intersectional lines of ability, class, gender, nationality, race, and sexuality. So too, policy might be deconstructed and reenvisioned in a manner that eliminates doctrines, which support the agenda of power, silence, and pathology, as well as narrows long-standing gaps between equity-centered, gender violence prevention policy that supports prosocial adolescent behavior and implementation in practice.

---

## **Introduction**

Documented to disproportionately affect females, the primary sites of sexual and gender-based violence remain the family, community, and state. Where youth are concerned, in the United States one in three teenagers reports experiencing some

form of abuse in their dating relationships, yet teens often fail to report dating violence incidences, including to school personnel, and thus episodes of violence go widely unreported (Noonan & Charles, 2009). We know that girls continue to face disproportionate rates of violence and in particular sexual harassment within public places, including on school grounds (Hill & Kearl, 2011), with 15 being the average age of forced or coerced sexual initiation among females (Hawks et al., 2019). Disproportionate rates of sexual violence also are reported for Black, Latinx, and LGBTQ+ girls (Patrick & Chaudhry, 2017), girls with disabilities (Caldas & Bensy, 2014), and immigrant females (Decker et al., 2007). Yet, limited educational leadership research focuses on adolescent female sexual violence and relevant K-12 responses. The recent movement to institute trauma-informed policies and practices (TIPP) in schools could be one avenue to address such forms of violence – or is it?

Most recently, it was found that the role of educators is under-examined in research on trauma-informed practices (Thomas et al., 2019) and where protocols for sexual violence do exist, educators report needing more training (Lemke et al., 2021). A comprehensive literature review also found multiple limitations in terms of how school systems address the intersection of student race and trauma, as well as within research and intervention on behalf of those same students (Alvarez, 2020). This means that while educational policy and practice conversations have shifted, it seemingly is easier to talk about trauma-informed approaches than to operationalize them within educational settings.

In short, it could be argued that policies and practices are meaningless without the will and capacity to address in schools, more complex issues such as sexual violence, including dynamics of capitalist heteropatriarchy and white settler colonialism – aspects of the power structure tasked with implementing those policies designed to eliminate sexual and other forms of violence. As communities have not been “impacted by white supremacy in the same way” (Smith, 2016, p. 1), there is an ever-present need to push policy and related processes to account for specific forms of gender violence against BIPOC and gender diverse bodies. Educational leaders bear the responsibility to promote the prevention of violence, as well as understand their role in proper response and reporting when violence does occur. This chapter discusses how TIPP on sexual violence, which are representative of diverse student populations, and comprehensive sexual education curricula can work in tandem to address issues of sexual violence among youth in K-12 public education.

---

## Teen Dating Violence

Teen dating violence (TDV) is defined as: a range of abusive behaviors that preteens, adolescents, and young adults experience in the context of a past or present romantic or dating relationship. The behaviors include physical and sexual violence, stalking, and psychological abuse, which includes control or coercion. Abuse may be experienced in person or via technology. (Mulford & Blachman-Demner, 2013, p. 756)

The exact etiology of TDV remains elusive, but a correlation exists between the attitudinal and cultural acceptance of violence in relationships generally, and teens' involvement in dating violence in their own relationships (Reeves & Orpinas, 2012). Children who are exposed to domestic or sexual violence in the home, as well as violence within their communities, can normalize violence as an appropriate method of conflict resolution into adulthood (Felitti et al., 2019; Spriggs et al., 2009). As such, teens who experience violent crime outside of their relationships also tend to experience violence within their relationships, and are at higher risk of relationship violence into adulthood. This normalization of violence not only was found in dating relationships among adolescents but also was connected with violent interpersonal relationships and bullying. Teens who had peer groups that promoted aggressive norms and accepted bullying in platonic relationships were found to engage more regularly in perpetration of dating violence in their romantic relationships as well (Miller et al., 2013).

One in three teens have reported some form of dating violence in their relationships (Noonan & Charles, 2009), with some research finding significantly underreported TDV incidences arising from a lack of trust in authorities, specifically parents, teachers, and the police (Hébert et al., 2014). Adolescents reported concerns that the adults in their lives would marginalize their experiences of violence, or inversely that those adults would create a chain reaction of reporting with which the individual was not comfortable (Hébert et al., 2014). Furthermore, research evidenced that adolescents frequently did not recognize relationship abuse as harmful, nor did they identify it as such because their peers were experiencing the same behavior in their own relationships (Foshee et al., 2013). This “echo chamber” of problematic behavior has been argued to normalize TDV – reinforcing the negative behavior and concomitant lack of reporting or help-seeking behavior (Reeves & Orpinas, 2012).

In recent years, TDV was found to occur more frequently in digital spaces, as adolescents increasingly use cell phones and various online social modalities to communicate (Madigan et al., 2018). In multiple studies, this violence occurred most often in the form of coercive texts, with one member of the relationship pressuring the other to send nude or provocative photos against their will, or within the context of cyberbullying or revenge porn (Choi et al., 2016; Kernsmith et al., 2018; Madigan et al., 2018). Abusive behavior online also was found to be predictive of offline dating violence (Kernsmith et al., 2018), and again, adolescents were frequently unaware that the behavior they experienced was abusive due to the prevalence of coercive sexting and cyberbullying among their peer groups that normalized the behavior (Wolak et al., 2018). Furthermore, much of the legality surrounding sexting relies on child pornography laws, which can create punitive systems for students that fail to support prosocial sexting behaviors among teens (Lemke & Rogers, 2020). Thus, adolescents reported reticence in disclosing the practice to their teachers, particularly in the capacity of relaying concerns they might have surrounding coercive sexting or safety (Albury et al., 2010).

Importantly, TDV does not impact all adolescents equally. TDV in the form of psychological or emotional abuse affects teens across all genders and race/

ethnicities, but the more aggressive expressions of abuse – physical and sexual violence – impact females (particularly Black females) and transgender and gender diverse youth disproportionately (Storer et al., 2019). Research found that 20.9% of females, and nearly 30% of gender diverse youth, compared to 10.4% of males, reported the experience of either physical or sexual violence in their adolescent dating relationships (Miller et al., 2018; Storer et al., 2019). While females reported perpetration of psychological abuse and even some forms of physical abuse toward their boyfriends, they were far more likely to become victims of serious injury due to physical aggression from their boyfriends, and significantly more likely to report sexual violence from their male dating partners (Foshee et al., 1998; Reeves & Orpinas, 2012). It is noteworthy that much of TDV research has focused on white, heterosexual demographics, and utilized heteronormative gender roles and cultural norms to inform violence education and prevention mechanisms. This framing could unintentionally misinform educator audiences and marginalize nonwhite, non-heteronormative subgroups, particularly gender diverse, immigrant, and refugee youth who subscribe to different cultural and social norms.

Many school district policies, along with several state and federal laws, place emphasis on anti-bullying policies, but often do not hold the same regulations for dating violence, or make regulations transparent (Grant et al., 2019). As educators, recognizing the parallels between bullying and TDV can be useful in mitigating how violence is normalized among teens, and help to prevent bullying behavior from escalating into violent relationships (Debnam et al., 2014). This is a critical step as TDV is a strong predictor of continued intimate partner violence (IPV) into adulthood. TDV also carries heavy immediate and long-term health consequences, including increased risk for physical injury, sexually transmitted infection (e.g., HIV), unwanted pregnancy, substance use disorders, depression, suicidality, and being involved in a violent relationship into adulthood (Madkour et al., 2019; Miller et al., 2018).

Adolescence is the time when teens begin to explore their sexuality and individuality, and normative beliefs play a critical role in that exploration (Reyes et al., 2016). When aggressive, controlling gender norms are established, power imbalances develop and violence perpetration is likely to be more accepted (Reyes et al., 2016). Since these gender norms intensify in early adolescence, it makes the teen years a critical point to intervene and provide education for violence prevention (DeMeyer et al., 2017). This requires educational leaders and staff, as well as advocates and policy-makers to understand the scope of risk factors and complexities that lead to TDV, along with the protective factors and prosocial norms that can work to prevent it (Lemke & Rogers, 2020).

## **Social Norms and TDV**

Norms are deeply ingrained in communities. They indicate appropriate and accepted behavior, and motivate specific behaviors through consequences and social disciplining for those behaviors that are deemed not compliant

(Reyes et al., 2016). Defined by Reeves and Orpinas (2012) as “cultural phenomena that prescribe and proscribe behavior and are partly responsible for regulating social behavior” (p. 1679), injunctive norms vary by culture and dictate what is and is not socially acceptable for individuals and communities. For teens, there is an intersection of social norms and peer pressure that poises them to be uniquely influenced by the behavior of others, for better or worse (Foshee et al., 2013). In particular, social connection (or lack thereof) plays a major role in TDV. Teens reported lower levels of perpetration and victimization of violence when they had prosocial networks of friends (Foshee et al., 2013). Inversely, higher levels of violence (i.e., victimization and perpetration) were reported as social status increased, particularly for girls. This fluctuation indicates that teens are impressionable and that their peer group values are predictive of their own personal values and behaviors (Foshee et al., 2013).

Gender norms that reinforce femininity as inferior to masculinity create power imbalances and a sense of male entitlement that can lead to controlling and violent relationships (DeMeyer et al., 2017). When traditional gender role scripts are applied to relationships, they can inhibit healthy relationship dynamics and exacerbate gender stereotypes (Noonan & Charles, 2009). Males who viewed dating violence and traditional gender roles (e.g., male aggression and decision-making as a mechanism of control) as acceptable in a relationship were associated with increased rates of TDV (Reyes et al., 2016). Importantly, social norms supportive of multiple partners and high levels of sexual activity for boys also were associated with gender inequality and violent sexual beliefs held by those boys, including rationalizing abuse in the form of rape (Silverman et al., 2006).

Teen attitudes, norms, and behaviors are influenced by the interactions they observe in their social environments (Storer et al., 2019). If dating violence is the norm, that behavior is less likely to be viewed as problematic, and therefore teens may be more accepting of violence because there are less social consequences to this behavior (Reyes et al., 2016). This means that adolescents tend to be more accepting of controlling behaviors like cyber-stalking and power imbalances such as controlling and demeaning communication, and they are less likely to recognize emotional abuse overall. When seen through the lens of gender role conformity, teens also might view sexual coercion as a normative relationship obligation (Storer et al., 2019). Thus, injunctive norms and gender role attitudes work together to increase the risk of TDV (Reyes et al., 2016). Conversely, addressing teen injunctive norms has the capacity to decrease TDV incidences, since gender norms are negotiated based on regular peer influence (Gupta et al., 2019).

It is critical for educational leaders, staff, and others working on educational issues not only to understand the influence that norms have on adolescent behavior but also recognize the role their biases play in directing the norms, attitudes, and beliefs of their students. If an institution’s culture serves to reinforce problematic able-bodied, classed, raced, and gendered student identities, and if the district’s policies reflect outdated or nonexistent mechanisms for resolving sexual harassment, or fail to understand TDV as a separate issue, school administrators are complicit in a culture that allows violence perpetration to manifest (Grant et al., 2019). Thus,

school and district policies and leadership practices must depart from the reinforcement of such roles and provide educators with the resources to understand, identify, and address TDV at individual and system levels.

## **Teen Bullying, Harassment, and TDV**

Anti-bullying legislation has been adopted in 49 out of 50 states (Cornell & Limber, 2015). Parent and advocate calls for legal reform also eventuated in restorative justice focused bullying prevention programs within K-12 institutions (Lemke, 2016). Policies designed to explicitly address bullying perpetration, along with mandatory educator training to recognize the warning signs of bullying and provide resources for bullying victims underscores recognition of the short- and long-term negative effects on adolescent health (Yerger & Gehret, 2011).

Similar to overlap between bullying and maltreatment such as harassment, there are parallels to between TDV and bullying. Victims of both share similar long- and short-term health outcomes including anxiety, depression, drug use, risky sexual behavior, and suicidality (Madkour et al., 2019; Miller et al., 2018; Yerger & Gehret, 2011). Adolescents who bully their peers are more likely to become abusive in their relationships as they age into adulthood, and similar to health outcomes, bullying risk factors mirror those of TDV (Yerger & Gehret, 2011) – meaning, children who witness violence as an appropriate method of conflict resolution can normalize that violence in their own interactions and relationships as they grow (Felitti et al., 1998). Research has suggested that adolescents are uniquely positioned to experience dating violence and bullying concurrently, as they simultaneously explore their sexuality, solidify views of injunctive norms, and gauge their behavior with peers – with male adolescents being most likely to perpetrate sexual violence in their dating relationships as well (Miller et al., 2013). Specific to the social hierarchy of adolescents, this behavior either is reinforced by the peer group if the individual has strong social capital or shunned if they do not (Foshee et al., 2013; Miller et al., 2013).

These overlaps illustrate two things – that bullying prevention policy, programs, and educator training can be informative in developing comprehensive TDV policies and practices. Furthermore, recognizing bullying behavior in younger students may help to prevent TDV. Still, while legislation such as Title IX, designed to help prevent gender-based discrimination such as harassment in educational settings, captures under it the concept of TDV prevention, the lack of accessibility and awareness of this legislation for both students and educators is in stark contrast with the emphasis on bullying prevention in K-12 settings (Lichty et al., 2008). Thus, while there are distinctions between bullying, harassment, and TDV, it would behoove policy-makers and educational leaders to connect these behavior intersections so to more comprehensively address their root causes. This means going beyond student-to-student behavior to interrogate structural inequalities, such as the ways educators are complicit in bullying and harassing students and one another – each of which helps to normalize violence within school settings (Lemke, 2016). This also will take an understanding of the strong influence that peers have on

adolescent social norms, and require a trauma-informed framework that includes a holistic view of the teens themselves (Blitz et al., 2020).

---

## **Policies, Practices, and Resources**

Laws exist at federal and state levels to protect students from bullying, harassment, and various forms of gender-based discrimination. Violence prevention programs across the K-12 spectrum focus on engaging students as positive bystanders to create safer communities for their peers (Coker et al., 2020). Currently, there is limited training for educators to reinforce these prevention programs, and confusion among educators as to what actions fall under the mandated reporting law, and what differentiates aspects of child abuse from TDV. If educators are to provide leadership in this arena, for students and their peers, it is essential that they have a strong baseline understanding of policies and resources meant to mitigate TDV. To navigate and stay current with the ever-changing landscape of violence prevention, they also must have administrative support to participate in relevant and culturally informed professional development.

## **Title IX**

The enactment of Title IX affirmed that, “no person in the United States shall, on the basis of sex, be excluded from participation in, be denied the benefits of, or be subjected to discrimination under any education program or activity receiving Federal financial assistance” (Education Amendments of, 1972, Title IX, Pub. Law 92–318). Because TDV falls under the umbrella of sexual harassment, which court rulings determined a form of sex discrimination (Lichty et al., 2008), Title IX is a critical component to addressing TDV. The Office for Civil Rights of the U.S. Department of Education mandated that all educational institutions, in order to be in compliance with Title IX regulations, must publish and make accessible to the public the following: a policy opposing sex discrimination; a grievance procedure for complainants; and procedures to ensure efficient and equitable resolution of complaints (Lemke, 2020; Lichty et al., 2008).

While each educational institution that receives federal funding is mandated to make their Title IX policy publicly available, vast inconsistencies across policy inclusion and accessibility remain across educational systems (Jackson et al., 2014; Lichty et al., 2008). When first introduced, Title IX’s limited technical and financial components (Marshall, 1999; Stromquist, 2013) also signaled it as token legislation that did not countenance interventions to alter the patterns in schooling that reproduce inequitable gender relations. Recent political opposition has further complicated Title IX monitoring and enforcement efforts (Lemke, 2020).

Importantly, while copious research literature exists on the history and implementation of Title IX, and particularly at the higher education level, there is a dearth of research on connections between Title IX enforcement and TDV, and particularly

at the K-12 level. Existent research has found, for example, that fewer than 14% of Title IX policies were available online within Midwest secondary school contexts (Lichty et al., 2008). Another study found that the majority of educators interviewed were unaware of district policies and procedures surrounding Title IX at all, rendering them ineffective in providing reporting to the district or resources to the student (Grant et al., 2019). Such inaccessibility and lack of awareness have been argued as contributing to the persistent, disproportionate rates of TDV perpetrated against adolescent females, particularly Black and transgender girls (Lichty et al., 2008), and the continued lack of reporting and provision of resources to students in the wake of dating violence (Grant et al., 2019). While research has examined Title IX implementation when a teacher has sexually harassed a student, or when teachers experience harassment from their colleagues, little involves the effectiveness of Title IX on a student-to-student level. Given that TDV falls under the purview of sexual discrimination in much the same way that abuse from teachers to students is covered in this legislation (Jackson et al., 2014), additional research in this area is needed.

### **State- and Local-Level Mechanisms to Address TDV**

Appropriate policy formation and resource allocation for TDV relies on effective school district and school building leadership. If a school policy is not comprehensive and/or transparent, educators are left to their own devices to provide assistance to students following a violence disclosure. When educational policy-makers and leaders prioritize TDV identification and prevention in their districts, there is a trickle-down effect to teachers and students, and in a manner that shapes school culture.

Still, more cohesive educational policy across federal and state legislation is needed, as the laws regulating bullying and harassment vary from state to state with some states taking a stronger stand on both than others. For example, education laws enacted by New York State (NYS) to address bullying and harassment may be informative in the future of TDV regulations for schools. In NYS, students are protected from being subject to harassment, bullying, or discrimination by employees or fellow students on school property or at functions (NYS Law, 2012). NYS also required that the board of education for each district create guidelines to inform trainings that discourage bullying and harassment and make educators aware of the effects of the same (NYS Education Law, 2010). While the term “harassment” is broad, and incorporates the prohibition of discrimination based on sex, there currently is a lack of application of these laws to TDV. Expanding these laws to include training for educators about TDV warning signs and risk factors, as well as providing students with the full knowledge of their rights and responsibilities through comprehensive violence prevention education, could be helpful in both response to and prevention of dating violence (Lemke & Rogers, 2020).

Second, harm caused by gender-based discrimination and violence is addressed by other key pieces of federal legislation and Supreme Court precedent. Thus, individuals can sue school districts for compensatory and punitive damages resulting

from sexual harassment, and educational leaders also can be held liable if they fail to address harassment of students by employees and/or other students (Laible, 1997). The Jeanne Clery Disclosure of Campus Security Policy and Campus Crime Statistics Act (1990) and Violence Against Women Act (1994) both sought to increase campus accountability by requiring crime and missing person's data be reported, and through oversight mechanisms like fines, student aid suspension, and resource reallocation (Wies, 2015). The Matthew Shepard and James Byrd, Jr. Hate Crimes Prevention Act (2009) expanded federal hate-crime law to include crimes committed because of a victim's actual or perceived gender, sexual orientation, gender identity, or disability. It also added "gender" and "gender identity" to the Hate Crimes Statistics Act (1990) (Lemke, 2020). Finally, in *Grimm v. Gloucester County School Board* (2017), a US district court held that Title IX and the Fourteenth Amendment applied to transgender students (Lemke, 2020). Akin to calls to broaden bullying legislation, expanding legislation in this area to address linkages with TDV and connections between TDV and continued violence in adulthood covered under their purview, could be helpful in response to and prevention of TDV.

Third, though considered mandatory reporters by state law, educators often lack professional development, receive prescriptive information, and/or have limited access to service referral information to fulfill this legal obligation (Lemke, 2019a, 2019b). Mandated reporter training requires educators to report confirmed or suspected cases of child abuse, including multiple forms of sexual violence, to social services. What mandated reporting does not require is that educators inform students' parents about the disclosure of TDV between peers, or that educators report dating violence to child welfare services. This confusion comes from inconsistent or nonexistent policies surrounding TDV for schools. The lack of differentiation between child abuse and TDV responses can drive mistrust of students who disclose concerns of dating violence to a trusted teacher or counselor, only to have those concerns divulged to other district authorities, parents, or even the police, against the will of the victim (Hébert et al., 2014). Thus, there is a need to address in educational research, policy, and practice how educators can unwittingly re-traumatize the victim and reinforce adolescents' lack of trust in the authority figures in their lives. Educators also need to receive comprehensive and ongoing training to reinforce their understanding of Title IX versus mandated reporting, and how they can appropriately support students in the wake of varying disclosures of violence.

Finally, though potentially inapplicable to other demographics, TDV prevention curriculum administered at district and school levels among primarily white, heterosexual adolescents has been shown to reduce rates of sexual violence among adolescents who have received the training (Coker et al., 2020). Often partnered with local rape crisis agencies, which have a lengthy history of proactively addressing violence against women within local communities and on college campuses, bystander intervention models focus on peer hierarchy, social capital, and injunctive norms to prevent sexual violence; they also aim to engage teens in violence prevention at an individual level in order to make their communities safer at the population level (Coker et al., 2020; Foshee et al., 1998). Programs like, "Bringing in the Bystander High School Curriculum," place heavy emphasis on

healthy relationships among peers and within romantic relationships; they also positively reinforce prosocial relationship behaviors, as well as identify relationship red flags and how to prevent them from manifesting to violence. Programming that addresses bystander behavior through building prosocial behaviors among students (Edwards et al., 2015) have shown positive results among students, but these programs often lack an evaluation component concerning the reinforcement of learning among educators (Coker et al., 2020).

Still, research has found that educators often not only are ill-equipped and under-qualified to have conversations about adolescent sexuality (Starker, 2017), but that state-level policy designed to prevent sexual violence and/or train educators about relative dynamics are normatively prescriptive (Lemke, 2019a, 2019b). As such, historic, institutionalized, and policy-driven violence is maintained through the perpetuation of rape myths about raced and colonized bodies (Davis, 1981; Smith, 2005). In the same vein, where information about LGBTQ+ youth sexuality is censored or misinformation allowed, heteronormative violence continues (Mayo, 2014; Pascoe, 2007; Sears, 1992). Simply put, even equity-minded educators have implicit biases that risk perpetuating racist and heteronormative gender roles, and injunctive norms that normalize rape culture (Starker, 2017) – all of which should be accounted for within state and local policy efforts. One way to do so is through feminist critical (Marshall, 1999) and Women of Color (Pillow, 2016) policy approaches to the implementation of comprehensive sexual violence prevention education and training in schools (Lemke & Rogers, 2020).

---

## **Best Practice in TDV Prevention: Recommendations for Leadership**

Policies, practices, and programs exist to address sexual violence in schools, as well as to create reporting and resource structures concerned with violent behavior. Yet, there remains a paucity of support for both educators and students, barriers to accessibility of rights, and an underutilization of comprehensive prevention curricula and training. For educational leaders and staff, as well as policy-makers to truly understand the scope of TDV and have the resources to combat it, the following steps are recommended.

To begin, educators require proper training on culturally responsive TIPP in order to address their students as whole beings. For example, cultural awareness and humility in shaping trauma response has been found to be beneficial to refugee student development (Isakson et al., 2015) and will be important in cultivating a truly holistic response to each student who experiences violence. Trauma-informed responses to students of concern aim to augment knowledge on student vulnerability, signs of distress (including within behavior), and ways to avoid triggering memories that can prompt re-traumatization (Substance Abuse and Mental Health Services Administration [SAMHSA], 2014).

This depth of training would allow educators to address disparities (including recognition of students who might be more vulnerable to TDV) and promote

resiliency in each student based on their individual backgrounds (Blitz et al., 2016). Yet, such a trauma-informed framework was found to be unavailable to educators, leaving them underprepared to handle disclosures of violence in a trauma-informed capacity (Blitz et al., 2016; Grant et al., 2019). Research also has identified a range of educational limitations in addressing trauma where race is concerned (Alvarez, 2020) and schools that aim to enforce culturally responsive TIPP still lack uniform staff awareness about standard operating procedures for identifying and reporting sexual violence (Lemke et al., 2021). As discussed previously, educator training to delineate the difference between child sexual abuse, bullying, harassment, and TDV is a critical component to bridging this gap. Appropriate and thorough TIPP to student experiences of violence require in-depth understanding of particular student subpopulations, along with the trauma-informed theory for disclosure of trauma. This training also can provide resources for students who are victims of trauma, but more importantly, it will allow educators to understand the drastically different support systems that each unique experience of trauma requires.

Another major step needed involves comprehensive school policies to address rape culture and social norms at district- and school-wide levels. These policies can work in tandem with already existing anti-bullying and harassment protocols, as many risk and protective factors are shared between these and TDV. Where policies already exist, greater emphasis should be placed on frequent and mandatory training for practitioners to empower them with inclusive resources for students who experience sexual violence, and that clearly delineate the differences between child sexual abuse, harassment, and TDV, and the reporting structures therein. Consistent sexual violence disclosure protocols must exist across districts and this protocol should be accessible to educators and students alike, with culturally responsive TIPP that recognize the multifaceted ways that adolescents present to the world.

Comprehensive sexual education, and policies to enforce it, also could also serve as a sexual violence prevention tool for adolescents. Research found that while teens did garner much of their knowledge about sex and relationships from the media (particularly pornography) and their peers, formal sexual education programs still were critical sources of information about sex for adolescents (Starker, 2017). Currently, only 24 states and Washington, D.C. mandate sexual education at all, and as previously discussed, much of that curriculum assumes a heteronormative lens that fails to comprehensively address gender diversity, digital sexual modalities, and/or sexual violence (Starker, 2017). Using the rape crisis model of bystander intervention as part of a comprehensive sexual education curriculum would provide adolescents with the foundations of healthy sexuality. Reinforcement of prosocial norms, gender equity, and protective factors to promote healthy relationships within this curriculum would allow adolescents to identify unhealthy patterns in relationships, both their own and their peers', and stop the normalization of control and coercion in dating relationships (Coker et al., 2020). Policies that require comprehensive sexual education programs to address sexual violence and student responsibility for one another not only would be a gain for individual student well-being, but for overall school and district culture.

---

## Conclusions and Reflections

Despite progress made to address gender-based violence among adolescent youth, and in particular female teens, systemic structures that impede these efforts remain. Heteronormative values are institutionalized in schools and reflected in district policies, curricula, and school culture (Grant et al., 2019). District protocols exist to prevent and address violence, but students and practitioners often lack awareness or the resources for appropriate access (Grant et al., 2019; Lemke et al., 2021; Lichty et al., 2008). Punitive responses to disclosure of TDV for victims fail to embrace the complexity of risk factors and tend to disproportionately negatively affect already underserved subpopulations, putting them at higher risk for sexual violence victimization and perpetration when already disproportionately affected (Storer et al., 2019). The dilemma of addressing violence at the implementation stage is compounded by a victim-blaming culture that invalidates victim experience particularly if the person is gender nonconforming and/or a female of color (Epstein, Blake, & González, 2017). Finally, inappropriate responses to TDV disclosure can garner mistrust in an already tenuous relationship between adolescents and adults, further isolating the victim (Foshee et al., 1998; Hébert et al., 2014).

Schools and institutions bear a strong responsibility for the well-being of their students, both in and outside of the classroom. Structural sexism, racism, nativism, and classism have long limited the protection of students labeled “different” or “other,” and often times those systems that are intended to help, including educational research or the lack thereof, create a ripple effect of more harm for already disadvantaged populations. Feminist critical and Women of Color analyses are by design intended to empower educators, challenge institutions, and progress educational research to be transformed through thought and action beyond implicitly biased, normatively distorted, and politically constrained modes of the past (Bensimon & Marshall, 2003; Childers-McKee & Hytten, 2015; Lemke, 2019a, 2019b; Marshall, 1999; Pillow, 2003, 2016). In particular, they remind us that class, gender, and race are constitutive to enacted policy, reform efforts, and any substantive understanding of educational politics. When brought to bare on leadership practices and needed research, such analyses can help illuminate ways individual actions prevent TDV victims from seeking help and norms that shore up gender-based violence. Furthermore, they provide examples for how educational policies and schooling practices can dismantle gender and racial hierarchies and engender a more egalitarian approach to educational leadership, teaching, and learning.

## Abstract

Politics is about the authoritative distribution of values, and the discourse around distance education, at all levels, is laden with value statements. This starts with a failure to recognize that distance education or online learning is not a monolith. Furthermore, efforts to try to define these and related terms are fruitless, and reflect values related to a need to count things rather than educational values such as growth and human potential. Nevertheless, advocates explicitly argue that distance education can make schooling more accessible both in terms of reach and cost, without sacrificing quality. This value proposition represents the

prevailing institutional logic of distance education. Yet, if we could psychoanalyze educational policymakers and stakeholders who advocate for distance education, we would see a different set of values. These values, or institutional *illogics*, go largely unstated, though they ultimately emerge as disavowed assumptions and shared fantasies. These values include neoliberalism, technological solutionism, and credentialism. This tangled web of values causes discontinuity in the discourse resulting in value conflicts and a political quagmire. This, in the end, prevents us from moving forward and considering the affordances of the modern internet for achieving our shared educational values.

Distance education · Online learning · Politics · Values · Logics · Illogics

**The Field of Memory**

Distance education or online learning is not a monolithic entity. Efforts to try to define these and related terms are fruitless, and reflect values related to a need to count things rather than educational values such as growth and human potential.

**The Field of Presence**

The field of distance education is buoyed by stated values such as access, quality, and cost. That is, advocates explicitly argue that distance education can make schooling more accessible both in terms of reach and cost, without sacrificing quality. This value proposition represents the prevailing institutional logic of distance education. Individual parts of that value proposition may be truthful on their own, but it is not clear that, at scale, distance education can be more accessible, lower cost, and high quality all at once.

**The Field of Concomitance**

If we could psychoanalyze educational policymakers and stakeholders who advocate for distance education, we would see a different set of values. These values, or institutional illogics, go largely unstated, though they ultimately emerge as disavowed assumptions and shared fantasies. These values include neoliberalism, technological solutionism, and credentialism.

**Discontinuities and Ruptures**

The major discontinuity or rupture in the politics of distance education occurs between stated and unstated values. Educational policymakers and stakeholders make assertions or value statements about distance education that dominate the policy discourse, while unconsciously they are driven by a set of shared fantasies. This tangled web of values causes a discontinuity in the discourse and policy communities resulting in value conflicts and a political quagmire. This, in the end, prevents us from moving forward and considering the affordances of the modern internet for achieving our shared values.

---

### Critical Assumptions

This, of course, assumes that we have shared values around education.

---

## Introduction: Politics as Values and Value Conflicts

Like all aspects of education, the politics of distance education are complex. To write about those politics, though, first requires some definitional work. That is, it is important to clarify, to the degree possible, some terminology before moving forward.

Politics, believe it or not, may be the simplest term to define for the purposes of this chapter. According to López (López, 2003), the study of educational politics has focused on questions of who gets what and how; the “authoritative allocation of values” (Easton, 1965).

López (2003) cites Stout, Tallerico, and Scribner, who, in the first chapter of the 1994 Politics of Education Association Yearbook, assert that we can understand the politics of education as a field by examining divergent values and belief systems, and the areas of schooling most vulnerable to value conflicts. They do this by citing Easton’s (1965) definition of a political system as:

... patterns of interaction through which values are allocated for a society and these allocations are accepted as authoritative by most persons in the society most of the time. It is through the presence of activities that fulfill these two basic functions that a society can commit the resources and energies of its members in the settlement of differences that cannot be autonomously resolved. (p. 57)

In other words, the claim is that in education, at least, politics is about values, value conflicts, and their influence on political processes.

The purpose of this chapter is to apply that conceptualization of politics to distance education. The question underlying the chapter is, *if* politics is about values and value tensions, what are the values and value tensions underlying distance education? The short answer to that question lies in the claim that educational policymakers and stakeholders have a set of stated values (or logics) that are largely unsupported by evidence, and are unconsciously driven by a different set of values. The result, if you will forgive the pun, is that the politics of education involve a complex, tangled *web* of values.

---

## The Field of Memory: The Monolith of Distance Education

As we consider the discourse on politics and distance education, the very concept or definition of “distance education” is contested, at best. In Foucauldian terms, we can leave behind the idea that “distance education” is a monolithic entity. And, this conceptual or definitional uncertainty has significant implications when we consider

the politics of education as “patterns of interaction through which values are allocated” in education.

In modern discourse, “online learning” is used interchangeably and now more frequently than “distance education” or “distance learning.” Figure 1 below shows the change in usage of those terms over time via Google’s NGram Viewer. The latter terms, though, tend to be the language used in policy documents and discourse, largely because most definitions emphasize the physical separation or distance between the instructor and the students.

In higher education, institutions are required to report distance education enrollment data to the Integrated Postsecondary Educational Data System (IPEDS), which defines distance education as:

...education that uses one or more technologies to deliver instruction to students who are separated from the instructor and to support regular and substantive interaction between the students and the instructor synchronously or asynchronously. Technologies used for instruction may include the following: internet; one-way and two-way transmissions through open broadcasts, closed circuit, cable, microwave, broadband lines, fiber optics, satellite or wireless communication devices; audio conferencing; and video cassette, DVDs and CD-ROMs, if the cassette, DVDs, and CD-ROMs are used in a course in conjunction with the technologies listed above.

This definition is consistent with what Singh and Thurman (2019) found in a systematic review of definitions of online learning. Across 46 definitions from 37 sources, the common themes were: technology, time (synchronous-asynchronous), interactivity, and physical distance.

One problem with the IPEDS definition, though, is around the idea of time and students being separated from the instructor for any given course or program of study. IPEDS defines a distance education course as: “A course in which the instructional content is delivered exclusively via distance education. Requirements for coming to campus for orientation, testing, or academic support services do not exclude a course from being classified as distance education.” So, per IPEDS, even when taking a distance education course, students might still be required to come to campus for an orientation or testing.

In the K-12 realm, in 2011, The Aurora Institute (then iNACOL) undertook *The Online Learning Definitions Project* “to provide states, districts, online programs, and other organizations with a set of definitions related to online and blended learning in order to develop policy, practice, and an understanding of and within the field.” That project yielded separate definitions for “distance education” and “online learning” and “blended learning.”

- *Distance education* – General term for any type of educational activity in which the participants are at a distance from each other – in other words, are separated in space. They may or may not be separated in time (asynchronous vs. synchronous).
- *Online learning* – Education in which instruction and content are delivered primarily over the internet. The term does not include printed-based [sic]

**Fig. 1** Usage of online/distance learning/education phrasology over time.

correspondence education, broadcast television or radio, videocassettes, and stand-alone educational software programs that do not have a significant internet-based instructional component (U.S. Department of Education Office of Planning, Evaluation, and Policy Development Policy and Program Studies Service, 2010); used interchangeably with virtual learning, cyber learning, and e-learning.

- *Blended learning* – Blended learning is any time a student learns at least in part at a supervised brick-and-mortar location away from home and at least in part through online delivery with some element of student control over time, place, path, and/or pace; often used synonymously with hybrid learning.

Here, too, notice the language of “primarily.” Also, for the definition of “distance education,” who are the participants and what counts as “at a distance from each other?” And, do students and teachers have to be at a distance from each other for the duration of the course or class to be considered “distance education?” Imagine a high school computer lab where students show up for one period per day to work on internet-based coursework delivered by a statewide virtual school. If a teacher shows up once per week to provide additional instructional support and help answer questions, is this distance education or online learning?

The point here is that distance education, online learning, and blended learning are conceptually very difficult to define, particularly as newer technologies are developed. There is no monolithic thing called “online learning” or “distance education.” And, frankly, this matters exactly because of the politics of distance education. If politics is about the authoritative allocation of values, consider just the values around costs when we cannot neatly define what it is for which we are trying to understand costs. For example, in the K-12 world, we might be able to figure out the costs of running a full-time, statewide virtual school. But, those costs are not comparable to the costs of, say, one school district contracting with a university to offer an online course to the students. They are not comparable to the costs of a school district paying a statewide virtual school so that students can have access to, say, a handful of online courses. And, one school’s blended learning program could look very different from another school’s blended learning program given the range of what is possible with blended learning technologies. That makes cost comparisons near impossible rendering the allocation of values difficult.

In a moment of skepticism, one might find themselves wondering things like: *If formal schooling had existed in the United States when Gutenberg invented the printing press, would there have been lots of discussion and hand-wringing about the inevitable move towards print-based learning? Would formal learning organizations have created new units and positions around print-based learning?* From there, it is easy to imagine that, someday, we will look back upon the present time and laugh at the idea that we used terms like “online learning” and/or “blended learning.”

There is no better time than the present to move the discourse away from labels and related efforts at bean counting. We should move the discourse beyond simplistic ideas and, more so, we should embrace the ambiguity that modern technologies

bring to the educational policy discourse. We should consider what our *real* values are in education and consider the affordances of modern technologies, including the internet, towards those goals. We need a discursive break, though, to be able to do that. The longer we spend tilting at windmills over definitions, the longer it will take us to achieve any agreed upon ends in education.

---

## **The Field of Presence: Values, Value Conflicts, and Institutional Logics of Distance Education**

To Foucault, the “field of presence” consists of those statements, understandings, concepts, practices, ideas which are considered to be truthful “involving exact descriptions, well-founded reasoning, or necessary presuppositions.” The previous section noted how efforts to develop exact descriptions in the field of distance education are complicated, at best, and how that should encourage us to move beyond simplistic ideas and even embrace the ambiguity. The distance education policy arena and the politics of distance education are also rife with a set of value statements that are considered to be truthful. Those value statements might be better understood as institutional logics. That is, in organizational theory terms, in the distance education space, we might think of the field of presence as institutional logics of distance education.

Friedland and Alford (1991) stated that institutional logics are the “organizing principles” that organizations use to guide decisions within a particular area (p. 248). Similarly, Scott, Ruef, Mendel, and Caronna (2000) referred to institutional logics as “belief systems and associated practices that predominate in an organizational field” (p. 170). These organizing principles crystallize at certain periods of time in ways that both enable certain kinds of actions while also constraining the set of options available to an institution or organization. Logics enable individuals and organizations to make sense of environmental ambiguities by prescribing and proscribing actions that reenact institutional logics and make them durable. Institutional logics embody both the symbolic (culture and cognitive structure) and the material (practices and processes) that form into taken-for-granted rules and organizing principles.

Rigby (2014) has argued that within institutions or organizations, there is a generally accepted and practiced set of beliefs called the “prevailing logic.” Similarly, Bastedo (2009) says that institutional logics become “convergent” when they gain legitimacy among different types of actors within a field or an organization.

Convergent institutional logics convey the idea that there may be a single dominant principle, idea, or approach to policymaking. But logics are also a template for action, a set of characteristics that define the theory of action to be used in policy development. They embody the concept of an archetype. . . . An archetype is an array of multiple, interrelated features that need to cohere to provide direction for organizational action. An archetype is a representation of a contested whole, the result of a process where advantaged individuals and groups have consolidated their political position and gained control over organizational resources. (p. 211)

So, what are the convergent institutional logics of distance education? In a 2018 article (Smith) about how the nonprofit National University System was purchasing the for-profit Northcentral University in order to grow their capacity to offer online graduate programs, Michael Cunningham, chancellor of the National University System, is quoted as saying:

This is very mission-driven for us when we think about affordable, accessible, quality education to the masses. Our mission is about giving folks an opportunity to increase their station in life and to meet them where they need to be met at a cost affordable to them and their family.

Affordable. Accessible. Quality. Those sorts of statements about distance education from higher education leaders and stakeholders have been pervasive over the last decade or so. In other words, this has been the prevailing institutional logic, or at least the stated and explicit institutional logic, the archetype around which policy decisions have been made regarding distance education.

In 1999, Daniel, Kanwar, and Uvalić-Trumbić wrote about “Breaking Higher Education’s Iron Triangle” (2009). In that article, the authors write about burgeoning demand for higher education in a knowledge economy. To meet this demand, without sacrificing on cost or quality, they propose a system that looks to outcomes and external examinations as a driver of quality. They conclude the article by stating:

... perceptions of quality are changing, and the growing emphasis on outcomes and standards heralds the possibility of a model of higher education that could achieve the ministerial aims—one that centers on examinations and allows students to choose different ways of preparing for them. **Although this type of system has a long history, contemporary technologies such as eLearning and open educational resources promise to make it even more cost-effective today.** (p. 35)

These beliefs about distance education, or eLearning in Daniels’ terms, have been persistent ever since. When Massive Open Online Courses (MOOC) came on the scene, they were touted as free and available to anyone. Furthermore, much of the higher education industry media suggested that since they were being offered by the “top” or “elite” universities, they must also be, therefore, high-quality learning experiences.

The truthfulness of these individual values (access, cost, quality), though, is unclear. That institutions could realize all three values simultaneously, is less clear.

## **Distance Education and Access to Education as an Institutional Logic or Political Value**

For K-12 education, the issue is not so much about access to schooling as it is choice and opportunity. That is, the goal of virtual schooling at the K-12 level is not to capture some unserved segment of the population; there is always a free public school available to any family that wants it. However, virtual schooling, particularly full-time, fully virtual or blended schools, offer additional schooling choices for families and additional coursework options for many students. According to Miron

and Elgeberi (2019), in 2017–2018, 501 full-time virtual schools enrolled 297,712 students, and 300 blended schools enrolled 132,960 students. This represented increases of about 2,000 and 16,000 students, respectively, from the prior year. Also, as of 2018, 39 states had either virtual or blended schools. In many states, those virtual schools offer students in traditional public schools the opportunity to take coursework that would not otherwise be available. For example, a statewide virtual school might offer online foreign language courses to students in schools that are unable to hire a teacher to teach that language. Thus, in the K-12 sector, distance education does expand choices for schooling and access to additional coursework.

With respect to access in higher education, at first glance, the numbers about enrollments in distance education in higher education would appear to suggest that distance education has, in fact, made higher education more accessible. According to a 2018 report from the National Center for Education Statistics (NCES) from Fall 2016 to Fall 2017, the number of all students who took at least one course online grew by 5.7%. Additionally, the number of students who were enrolled exclusively online went up over one-half of a percent. Yet, during this same time period, overall postsecondary enrollment dropped almost one-half of a percentage point. From 2010 to 2017, undergraduate enrollment decreased by 7%. And, whereas enrollment in postbaccalaureate degree programs increased by 36% over the first decade of the twenty-first century, enrollment in those programs only increased by 2% from 2010 to 2017 (Ginder, Kelly-Reid, & Mann, 2018). Thus, distance education enrollments are growing while overall postsecondary enrollment is dropping or plateauing. At best, then, distance education is countering declines in overall postsecondary enrollment.

## **Distance Education and Educational Quality as an Institutional Logic or Political Value**

In the early days of efficacy research on distance education, much of the work went into simple comparisons between online and face-to-face sections of the same course, sometimes even taught by the same instructor. In general, the research showed that online courses were at least as good as face-to-face classes. A 2013 meta-analysis by Means et al. concluded similarly and even found that blended learning (a mix of face-to-face and online within the same course or program) was the most effective modality. For a while, for the most part, this became the prevailing understanding of the efficacy research in the field of distance education. In fact, among those who studied distance education in higher education, the “no significant difference” phenomenon became a prevailing belief memorialized by databases documenting the phenomenon.

These days, those doing research in distance education in higher education have largely moved on from efficacy research and turned their focus to understanding specific practices that are related to student success in distance education. This is an important research, particularly as it allows stakeholders to get a glimpse inside the black boxes of online courses to see what best practices need to be disseminated to practitioners. However, the “no significant difference” phenomenon still

needs some unpacking. Aggregate claims of effectiveness gloss over some nuances and inequities that need additional empirical understanding. For example, there is growing evidence that distance education is not particularly effective for low-income students and/or for community college students. Additionally, there is a body of research that says that self-regulated learners are the most likely to succeed in online courses. In other words, those students who are best able to do the things that the most successful students do are the most likely to succeed in online courses. Yet, these days, distance education is particularly seen as a way to reach “non-traditional” students, those adults who have not been in school in a long time and, therefore, the least likely to be self-regulated learners. Thus, while distance education can be at least as effective as face-to-face education, there is a real concern that distance education could reinforce, and perhaps exacerbate, inequities in student success.

In the K-12 sector, the research consistently shows negative outcomes for distance education. Cavanaugh (2001) found a positive effect in favor of the K-12 distance education students. Just 3 years later, though, Cavanaugh, Gillan, Kromrey, Hess, and Blomeyer (2004) conducted another meta-analysis and found a negative effect for the K-12 distance education students. Since then, the research has been consistent. In a 2012 National Educational Policy Center (NEPC) examination of virtual schools, Miron and Urschel concluded that the percentage of virtual schools that achieved adequate yearly progress was approximately half that of public schools (i.e., 27.4% of virtual schools vs. ~52% of public schools). Subsequently, NEPC has conducted annual reports on virtual schools and has reached the same consistent conclusion. The 2019 review reported that the 4-year graduation rate for students attending virtual schools was significantly lower than the national average. It is rare to find the kinds of consistent results in any area of educational research as we have seen in the body of research on K-12 virtual learning.

## **Distance Education and Educational Costs as an Institutional Logic or Political Value**

The cost issue is equally if not more tricky. Does it cost less to offer courses and programs from a distance? At first blush, the answer would seem to be an obvious “yes.” Facilities and maintenance costs would essentially be eliminated because physical classrooms are eliminated from the cost equation. That alone should result in lower costs. But, the limited available research and reporting that exists on the costs of distance education show great variation in costs. Despite eliminating costs for classroom space, to ramp up the delivery of online courses and programs, K-12 schools and institutions of higher education have had to invest in other areas including instructional design, marketing, and technological infrastructure.

There have been efforts to track the costs of providing distance learning in the K-12 sector, but they are few and far between and methodologically debatable. In 2006, Anderson, Augenblick, DeCesare, and Conrad (2006) concluded that “...the

operating costs of online programs are about the same as the costs of operating brick-and-mortar schools.” In 2012, associates of the Thomas B. Fordham Foundation found the costs of full-time secondary offerings to range from about \$5,100 per pupil to \$7,700 per pupil which they then compared to a national average figure for brick-and-mortar per pupil expenditures of approximately \$10,000. However, as King Rice (2012) suggested in a comprehensive critique of that report, the methodology was fraught with problems. Baker and Bathon (2012) try to tackle some of the methodological challenges of calculating the costs of providing education from a distance, but they note that costs vary tremendously depending on factors such as size and geography.

In higher education, too, there have been mixed conclusions about the cost of distance education. Poulin and Straut (2017) produced a report of their study on the costs of distance education in higher education. They conducted a survey of 197 institutions of higher education and followed up the survey with interviews of key stakeholders. They found that almost two-thirds (66.4%) of the survey respondents reported that distance education costs are higher than face-to-face costs. For their study, they “. . . did not ask for actual cost figures, which would be difficult to compare due to different methodologies used.” These differences in cost methodologies across institutions is a real challenge for understanding the costs associated with distance education.

A 2018 report from the Boston Consulting Group in partnership with Arizona State University found that the cost savings for online courses ranged from \$12 to \$66 per credit hour. That study, though, was focused more on the “return on investment” than straight costs, and the six institutions involved had large-scale and mature distance education operations, making it difficult to generalize to institutions more newly come to distance education. The authors state that “[d]igital learning can help institutions reduce costs and pass along savings to students through three primary mechanisms: raising student-to-instructor ratios, drawing on a broader network of adjunct faculty, and avoiding additional operational costs.” (Bailey, Vaduganathan, Henry, Laverdiere, & Pugliese, 2018, p. 3).

That conclusion points to the interconnected nature of these issues. In other words, costs for distance education can be lower by offering larger classes taught by contingent faculty members. This is true, though, of face-to-face classes, too, and is a common cost-cutting strategy by higher education administrators. The difference, of course, is that, online, there are no constraints on the degree to which class size is increased. But, does increasing the enrollment in a given online course negatively impact the quality of the course? Again, it depends, but there is a significant body of research that concludes that there are negative effects of using contingent faculty members to teach courses in higher education.

Thus, distance education can make education more accessible. Distance education can be high quality education, at least in the postsecondary market. And, distance education can be less costly to deliver. Distance education can almost assuredly be two of the three simultaneously. But, can distance education break the iron triangle and increase access, lower costs, and be high quality education all at once? Decades into the growth of distance education in higher education, the answer is unclear at best. It may be that distance education can break the iron triangle in

distinct disciplines for distinct groups of students. But, at scale, the evidence suggests that, for the most part, the dominant institutional logic of distance education as a means to break the iron triangle is more myth than reality. In other words, discursive value statements around access, quality and cost could individually be truthful, to use Foucault's term, but it is not clear that all three value statements can be true at the same time.

---

## **The Field of Concomitance: The Institutional *Illogics* of Distance Education**

What, then, continues to power the train that is distance education? Again, turning to Foucault, if the field of concomitance is, in part, about considering ideas which have originated in other disciplines, how might we look outside the field of education or leadership studies to understand the politics of distance education? Asked differently, using the language of the politics of education, are there perhaps other values that might explain the relentless pursuit of growth in distance education? For this, we return to institutional logics and then, a new framework that combines organizational theory with psychoanalytic theory.

Lewis (2019) writes about technology change through the lens of institutional logics. "Technology change is an external force that can jolt an institutionalized field into a state of flux or destabilization. These jolts are difficult to anticipate and can threaten an organization's viability." (Lewis, 2019, p. 142). The World Wide Web is a technology that, as an external force, has changed higher education. Unlike most industries, though, the Web was not so much of a jolt to higher education as it was a nudge. Despite the theorizing of some who saw the relationship between the World Wide Web through the framework of "disruptive innovation," the Web has not disrupted higher education so much as it has caused higher education to slowly come to grips with its affordances. Distance education is a good example here as the Web has afforded new opportunities for schooling and education and some institutions have been able to successfully take advantage of those affordances and opportunities.

In times of change, where external forces threaten stability and institutional order, institutions must make sense of the change and respond with their own innovations or adaptations. With these innovations or adaptations, institutions try to remain competitive and stave off irrelevancy or, in the worst case, failure. This convergence towards the new order or "new normal" could be seen as a shift away from the prevailing institutional logics towards a new dominant institutional logic. Or, it could be seen as a turn towards less explicit or less publicly stated values.

Vince (2019) developed institutional illogics as a conceptual framework "...that can help scholars of organizations and institutions to deepen analysis and understanding of how people's organizational lives can be shaped by dynamics that are beyond reason, as well as how such dynamics are embedded in social structures" (p. 953). Tying psychoanalytic theory to institutional theory, institutional illogics as

a conceptual framework is defined as “[u]nconscious dynamics that have both structuring and unsettling effects on the rules of the game. Underlying assumptions can be defensive, illusory or irrational despite also feeling natural or normal” (p. 955). Vince (2019) adds, “Illogics are never fully revealed, but can emerge through language slips, projective relations and irrational practices. They are manifested in social defences, disavowed assumptions and shared fantasies that can become persistent aspects of ‘living institutions’” (Lok, 2010).

With respect to distance education, the prevailing or dominant institutional illogics involve a set of disavowed assumptions and shared fantasies. Like the broken iron triangle, this institutional illogic is tripartite; it is a tangled web of at least three sets of -isms: neoliberalism/academic capitalism, technological solutionism, and credentialism.

## Neoliberalism, Academic Capitalism, and Distance Education

Rowe, Lubienski, Skourdoumbis, Gerrard, and Hursh (2019) wrote about how “[n]eoliberalism as a concept, ideology, or theoretical lens has emerged in the last couple of decades as a monolithic presence in education research” (p. 150). They also point out how neoliberalism is “over-utilised but also under-examined as an explanatory or descriptive theoretical lens for studying education reform” (p. 151). In pointing out that many scholars capitalize the N in neoliberalism, they offer Ong’s (2007) explanation, which also serves as a useful framing of the term for this section of this chapter:

Neoliberalism is cast as an entity, a unified state apparatus totally dedicated to the interests of unregulated markets. There is a suggestion of a standard neoliberal state, one that combines neoliberal institutions and liberal democracy . . . These are models of serial repetition based on comparing units of equivalents . . . Neoliberalism is viewed as a dominant structural condition that projects totalizing social change across a nation (another big N concept). (Ong, 2007, p. 4)

Thus, neoliberalism, at least as a keyword, signifies, at least, privatization, commercialization, etc., or a “market-driven policy assemblage” (Rowe et al., 2019, p. 156).

There is now a fairly deep pool of literature on the expansion of market logics in education. The market logic is an ideal type of the logic related to the market institutional order (Friedland & Alford, 1991). Characteristics of this logic include a strategic interest in increasing efficiency and profit and legitimacy derived from value obtained through return on investment (Thornton, Ocasio, & Lounsbury, 2012). In 1999, Thornton and Ocasio mapped market logics to publishing in higher education. Slaughter and Rhoades’ foundational text on *Academic Capitalism and the New Economy* was first published in 2004. Many studies since then have been framed in the context of market logics and academic capitalism.

Jessop (2018) suggests that there are five “analytically distinct and potentially overlapping stages” in the growth of academic capitalism. The very first stage is what Jessop calls the commercialization stage where education and research are produced for sale.

Examples include private tuition, fee-paying universities, distance learning, and commercial research. This stage involves various forms of simple commodity production that are not yet subject to the competitive pressures of profit-oriented, market-mediated capitalist production to reduce the socially necessary labor time for production and the turnover time of capital. Even in this early stage, students become sought-after mobile customers, knowledge and creativity are commodified, and intellectual property rights are claimed and then retained or traded. (p. 105)

In other words, commercialization co-opts the ideal of education for the public good. In the distance education space, as Jessop suggests, courses and programs become commodities and potential students become sought-after mobile consumers. And, there are a host of other ways that the neoliberal values drive the distance education train. Core educational functions are outsourced to private, for-profit entities under the guise of “public-private partnerships.” We see this in the K-12 sector when local education agencies partner with private entities such as K-12, Inc. to run full-time virtual schools. In their study of blended learning (BL), Grimaldi and Ball (2019) “. . . show how BL and digital technologies are being enacted as part of an assemblage that crystalizes the conditions of possibility for the neoliberalisation of the experience of education” (p. 18). This assemblage “remakes the world of education, and learning specifically, in the form of an economic game, mediating and softening neoliberalism” (Grimaldi & Ball, 2019) in a way that purports to be about care and agency, but “. . . which looks, ultimately to the market for its answers” (Mitchell & Lizotte, 2014, 89).

In higher education, universities partner with for-profit online program management (OPM) companies for a range of services including marketing and instructional design, resulting in what Carey (2019) refers to as “the creeping capitalist takeover of higher education.” Also in higher education, fully online programs are often built on the back of contingent labor in order to cut costs. And, universities craft intellectual property policies that frame online courses and the artifacts contained within them as commodities that are packaged and transferrable between instructors. As university administrators ask the question of who “owns” an online course, they invoke the language of neoliberalism and commercialization. This is the kind of “language slip” indicative of institutional illogics.

## **Technological Solutionism and Distance Education**

Nicoll (2016) points out how, in the field of distance education, neoliberal values overlap with shared fantasies about technology as a means to solve big societal problems.

The common thread throughout these studies is the relationship between the growth of the market logic and field-level change. Supporters of online education are advocating for change because of their desire to bring efficiency to teaching, what they perceive as a very inefficient institution as seen through the lens of the market logic. The benefit of framing their arguments for online education in this way is that the market logic aligns

with other, related societal beliefs, such as technology as the means of solving society's problems . . . This helps administrators and external stakeholders, already in a privileged position of power, to appeal to broader society as evaluators of legitimacy. (Nicoll, 2016, p. 100)

Morozov (2013) coined the term “technological solutionism” to refer to the tendency to see technology as a simple answer to questions that have not even been fully asked. Morozov refers to a number of examples, including the use of analytics and the quantified self-movement. He does not use any education-specific examples, but it is not a stretch to see how “internet centrism” and “solutionism” have individually and collectively permeated the policy ecology of education across the lifespan. There is a strong argument to be made that the internet has, in fact, transformed a significant number of aspects of education.

The solutionism part of Morozov's argument, though, is where the educational system, and the educational technology community, is most guilty. Solutionism argues that focusing on solutions constrains our ability to think critically about the nature of the problems they are supposed to solve. Anyone who has worked in the educational technology space for any length of time has experienced the barrage of emails, promotions, advertisements, etc. from vendors all pushing a solution, often to a problem that is not even a problem. Riffing on the old saying about hammers and nails, to an educational technology solution-provider, everything looks like a problem.

Distance education is, too often, viewed by educational policymakers as an internet-centric solution to a problem or set of problems that are not always so clear. Where the state disinvests in public higher education, individual institutions look to fill those revenue gaps by pursuing new tuition dollars from new students who may not have seen higher education as an option before. In other words, the problem is one of lower state support, but instead of advocacy and making the case for at least stemming the tide in disinvestment, the internet, or distance education, is seen as one of many solutions to the problem.

Even within the field and practice of distance education, there is a tendency towards technological solutionism. For example, email listserv discussions, conferences, and meetings dedicated to distance education are sometimes dominated by discussions around issues like student authentication and cheating. One oft-asked question in the field of distance education is: “How do we know who is submitting the work or taking tests when we do not see or know our students?” The solution is almost always some form of technology. Learning management systems (LMS) in which online courseware resides now have “lockdown” browser functions that purport to prevent students from doing anything else in the Web browser while a student is taking an exam. Also, vendors offer proctoring solutions that include software that works with webcams so that students taking exams are automatically watched and/or recorded. The artificial-intelligence powered chatbot as an automated student service provider is another contemporary effort to use technology to solve what is really a human problem. This kind of offloading of solutions to technology is at the heart of technological solutionism and is very

much a shared fantasy among those advocating for the scaling of distance education in higher education.

## Credentialism and Distance Education

In the same way that educational policymakers increasingly choose to offload core teaching and learning functions to Web-based technologies, we see an increasing offloading of the cost burden of education to students. This is part of what Cottom (2017) writes about with respect to the for-profit education sector. We have long been told and convinced that we must have a credential for quality work. That credential, that signaling mechanism, is very often some kind of formal degree from a formal institution of higher education. However, the idea that employees must bear the burden of financing that education is now prevalent and “a historical peculiarity.” “To be competitive we are all told that we have to pursue and pay for credentials over our entire working careers.” This is credentialism.

Bills and Brown (2011) suggest that there are at least three conceptions of credentialism. Credentialist hiring is about an occupational hierarchy built around educational qualifications. Credential inflation is where the expectations for educational requirements for jobs continually and unexplainably rise. Finally, there is “credentialism as non-linear wage returns to schooling;” the idea that “given levels of schooling are rewarded beyond their contribution to marginal productivity” (p. 2).

One of the foundational assumptions of education is formal degrees as exclusive or ideal signaling mechanisms to employers. Furthermore, this assumption very much undergirds efforts to expand distance education. The thinking goes that higher education is inextricably linked to the workforce and if more people had more degrees, then our workforce and economy would be strengthened. And, distance education is a means to advance the degree completion agenda.

But what happens if and when credentialist hiring and credential inflation go away? What happens if we enter an era of credential deflation? What if, to be an expert in high-demand areas such as cybersecurity does not mean one needs a graduate degree, or even an undergraduate degree for that matter? What happens when a critical mass of employers decide that they can train employees on their own, in-house? What happens when, as a society, we disavow ourselves of the assumptions underlying credentialism?

---

## Conclusion and Reflections

... conflicts which escalate into realignment of coalitions and a redirection of policies, are reflections of ‘intrinsically unresolvable issues about... fundamental tensions inherent in American society’, Because continued political conflicts about such issues are likely to destroy a society, a substitution of conflicts takes place around a different mix of issues which promises a future solution to the problems posed by irreconcilable tensions. But precisely because they are irreconcilable, at least within the limits of their current

circumstances and technology, the new mix of issues and related ideas provides an illusion of solving the old conflicts. (Iannaccone, 1988, p. 58)

Within the policy arena of distance education, at all levels of education, conflicting values have caused coalitions to form and align. Thus, we can say that this reflects “intrinsically unresolvable issues about. . . fundamental tensions inherent in American society.” In the case of distance education, these tensions are as fundamental as the very purpose of education and questions over who should be served by the public educational system. As a result, we get a substitution of conflicts around a different set of issues which promise a future solution to those fundamental tensions. But, per Iannaccone (1988), the new mix of issues and related ideas provides an illusion of solving the old conflicts.

As part of her confirmation process, Betsy DeVos, the current United States Secretary of Education, wrote to Senator Patty Murray “High quality virtual charter schools provide valuable options to families, particularly those who live in rural areas where brick-and-mortar schools might not have the capacity to provide the range of courses or other educational experiences for students.” In other words, in response to a conflict over how to better serve schoolchildren in certain parts of the country, DeVos looked to distance education, despite the mounting and consistent evidence that distance education does not serve K-12 students well. Thus, we might say that DeVos’ valued solution would provide an illusion of solving an old conflict (inequitable educational resource distribution in poor, rural areas).

Like DeVos, educational policymakers and stakeholders at all levels make illusory assertions or value statements about distance education that dominate the policy discourse; statements about access, cost, and quality. Unconsciously, though, they are driven by a set of shared fantasies related to neoliberalism, technological solutionism, and credentialism. This tangled web of values causes a discontinuity in the discourse and policy communities resulting in value conflicts and a political quagmire. This, in the end, prevents us from moving forward and considering the affordances of the modern internet for achieving our shared values.

---

## **Coda: Remote Learning and the Covid-19 Pandemic**

This chapter was written during the Covid-19 pandemic, a time when students at all levels of education across the globe were forced into emergency virtual learning experiences. In the United States, 6–8 months into the pandemic, some students returned to face-to-face learning, but most are still learning from a distance. The near- and long-term effects of these virtual learning experiences are still to be determined, but early returns indicate that opinions are forming around prior biases and values. That is, while some educators and students have come to see the value of distance education, confirmation bias has shown its strength.

It may be that new, additional distance education opportunities emerge post-pandemic in both K-12 and higher education. The likelihood of that happening is not clear. What is clear, though, is that the necessary pivot to remote teaching and

learning has shined a bright light in significant inequities in our society and our education system. For example, too many students lack sufficient computer and internet access to be able to meaningfully participate in distance education. Policymakers and school leaders have worked hard to bridge some of these gaps, purchasing laptops and WiFi devices for students in need. Additionally, the national dialogue about treating broadband internet access as a right or even a public utility has reemerged in the wake of the pivot to remote teaching and learning. In other words, the policy arena and policy dialogue are dominated by fixes to the problem of digital inequity.

However, it is not clear that we have properly framed the problem that many people see only as an access problem.

Neither digital education nor broadband access alone can promote a more equitable society. Rather, it is the critical engagement by and with individuals and groups on issues of social importance and worth... and the role of new information technologies in fostering this critical engagement and mobilization that can lead to concrete changes that improve the lives and working conditions of marginalized individuals and communities. (Bach, Wolfson, & Crowell, 2018, p. 36)

Our political discourse around distance education should be focused on the root causes of any digital inequity or access issues. Our discourse should be laden with value statements focused on improving the lives of marginalized people beyond just providing computers and internet access.

## Abstract

This analysis uncovers the roots of social justice leadership in the field of educational leadership. Social justice leadership intentionally seeks to disrupt power and systemic inequities rooted in oppression, discrimination, and prejudice. Specific attention is placed on understanding key terms, such as social justice, power, and oppression. Prominent theories and frameworks to social justice are also explained, such as intersectionality, critical theory, critical race theory, anti-racism, feminist theory, and queer theory. The chapter concludes with reflections on social justice and implications for the future of educational leadership for social justice.

**The Field of Memory**

Social justice is primarily attributed to early religious thought (Burke, 2010), and as Bogotch (2000) reminds readers, the “context of social justice” has been discussed for over 2000 years. Plato, Aristotle, Marx, Locke, and Aquinas all worked to untangle notions of justice (Turhan, 2010). These early thinkers focused on a communitarian approach to social justice, which focused on “principles of deserve (e.g., what is deserved), need (e.g., what is required), and equality (e.g., what is equivalent)” (Turhan, 2010, p. 1358). The field of education moves away from these early conceptualizations of social justice to center justice and equity for all students. In particular, those who are historically marginalized (e.g., People of Color; lesbian, gay, bisexual, transgender, queer, non-binary [LGBTQ+]; students with disabilities; immigrant and undocumented students; emergent bilinguals; students of low-socio-economic backgrounds; and religious minorities; among others).

Traditionally, educational leadership for social justice is driven by notions of fairness, equality, and democracy. Social justice theories in education draw from the thoughts of John Dewey (1859–1952) and John Rawls (1921–2002). In *Democracy and Education* (1916), Dewey focused on equality of opportunity in a democratic society and the opportunity for the “pursuit of happiness” (Weitz, 1993). Rawls (1971) *A Theory of Justice* focuses on equality of opportunity and redistribution of resources. Weitz (1993) untangles the works of Dewey (1916) and Rawls (1971) to contextualize equality and liberty within the field of education. According to Weitz (1993), fairness and justice were contemplated in the eighteenth century, within the frame of fairness. At that time, it was revolutionary to believe that “all do not have the same quality of freedom when some are advantaged, while others are encumbered at birth merely by virtue of their social class” (Weitz, 1993, p. 422). Liberty and equality were foundational to a democratic society and meant that one could pursue their destinies regardless of social class. Dewey furthers this notion of democracy and equality in education. For Dewey, equality means that all individuals equally have the opportunity for self-fulfillment. Young (1990) builds on democracy and social justice and posits that “democracy is both an element and condition of social justice” (p. 91). Rawls (1971) Theory of Justice is heavily focused on the distribution of goods and individual natural abilities. Rawls justice as fairness has been critiqued to be limited (Papastephanou, 2005), yet its contributions to understanding justice and fairness are evident.

**The Field of Presence**

Theories of social justice are undergirded by the notions of equality put forth by Dewey and Rawls. Social justice in educational leadership or social justice leadership moves beyond fairness to consider how educators can advocate for equity and justice while interrogating resources and power distributions. It is

often assumed that equality provides for equal opportunity to achieve one's goals. Social justice leadership challenges that assumption and argues that equality does not consider how power dynamics influence opportunity or advocate for forms of inclusion. More so, the hope for an equal society drives social justice leaders to question, why is it that in a society that claims "equal opportunity," injustices continue to be practiced? In educational leadership, social justice theories exist because society is unequal, and access to equitable educational opportunities for historically marginalized communities is limited. Inequities persist in systemic ways through schooling and policy. Educational leadership for social justice commits to disrupting inequality in practice and policy and advocating for justice, equity, and social change for all students, particularly those from historically marginalized communities.

Literature in social justice leadership exemplifies that at the heart of social justice is an emphasis on moral values, justice, respect, care, and equity (Cambron-McCabe & McCarthy, 2005). Social justice leadership can be embodied by individual leaders (Theoharris, 2008) or be a system-wide approach that aims for a cultural shift in school-wide/district-wide changes using a social justice framework (Capper & Young, 2014). Capper and Young (2014) highlight the importance of social justice leadership as a system-wide approach instead of having a single individual do social justice work. While the individual might be effective in advancing social justice, only having one individual promoting equity and justice might not be a sustainable practice for systemic change. Social justice leadership is coupled with action and advocating for historically marginalized communities by linking theory to practice and tackling structural inequities.

### **The Field of Concomitance**

The theory of social justice is derived from theology and philosophy (Burke, 2010) and developed into many other fields. Educational leadership for social justice is often coupled with several theories that originated in other disciplines. Scholars note that social justice leadership works well with several theories. Social justice issues are rooted in historical, social, and political factors and target intersecting identity markers, such as race, gender, class, dis/ability, immigration status, language, and many more. Literature highlights that educational leadership for social justice is often accompanied by other theories and frameworks such as Critical Race Theory (CRT; Ladson-Billings & Tate, 1995, Parker & Stovall, 2004) or Queer Theory (Duarte, 2020; Lugg, 2006), and anti-racist educational leadership and policy (Diem & Welton, 2020).

### **Discontinuities and Ruptures**

There have been several discontinuities and ruptures over time in the field of educational leadership for social justice. North (2006) builds on the conceptualization put forth by Sturman (1997), which warns that the term social justice, increasingly used in the field of educational leadership, has become a "catchphrase" that often ignores the social, cultural, economic, and political backdrops to the meaning of social justice. Dantley and Green (2015) argue that "a diluted and homogenized rendition of social justice has seeped into the discourse and practice, thus positioning

social justice leadership to be reradicalized” (p. 820). Dantley and Green urge the field and educational leadership preparation programs to be radical about social justice and prepare leaders to promote social justice in their practice and research.

During her acceptance speech for the Social Justice in Education Award at the American Education Research Association (AERA) conference, Ladson-Billings shares that the term social justice does not fully embrace all the injustices that manifest within the world, the nation, and the field of education:

I fear that social justice has become a kind of buzzword that we use to suggest that we are serious about confronting disparity, racism, sexism, heterosexism, ableism, and other forms of human asymmetry and the lack of equity and equality (2015).

She adds to the argument that the term social justice has become an empty buzzword that lacks depth and clarity of what it stands for. Scholars like Dantley and Green (2015), Ladson-Billings (2015), and North (2006) push the field to be aware of how social justice has, over time, lost its radical meaning. Historically, the meaning for the term seeped in care, respect, fairness, equality, and equity for all communities, including those with marginalized intersecting identities. It is critical to move beyond social justice leadership as a “catchphrase” and exercise its once-radical roots to challenge social, historical, and political oppressions toward historically marginalized communities. To move away from social justice as an empty buzzword, social justice must be coupled with action; one must do social justice to uphold equity and justice for all communities.

### **Critical Assumptions**

Social justice leaders focus on reducing or eradicating social, political, educational, and economic inequities perpetuated through schooling or policy by focusing on institutional policies and practices (Tillman, 2002). Social justice leadership “investigates and poses solutions for issues that generate and reproduce societal inequities” (Dantley & Tillman, 2010). The critical assumptions outline that while social justice leadership is always evolving and is a continuous struggle, with commitment, social justice leaders can implement strategies to disrupt social injustice. To achieve this, educators must understand the social, historical, and political roots of social injustices and how they intersect in historically marginalized students’ lives. Therefore, another assumption is that educational leaders for social justice understand intersectionality (Crenshaw, 1989) and how identity intersects with power structures and disproportionately marginalizes specific communities through systemic oppression.

Another critical assumption is that Bogotch (2002) acknowledges that educational leadership cannot be separated from social justice. Social justice – as an educational intervention – he argues, “is a continuously relevant topic for every era” (p. 3). With this in mind, one concrete definition of social justice cannot exist as social justice issues are consistently developing. As time moves forward and our society changes, various social issues become more prevalent, pushing the need to reevaluate and reposition social justice efforts and connect them with other theories and frameworks to uncover manifestations of injustice.

Another critical assumption is that educational leadership preparation programs take on training and sustaining leaders for social justice. To show a commitment to the theme of social justice, it must thread through all courses, programming, and research and practice of faculty to help future leaders grapple with notions of power and privilege (Dantley & Green, 2015). While preparation programs often interweave social justice in courses and programming, it should not only be relegated to a few courses but rather be discussed in each course as social justice issues exist in multiple educational arenas.

---

## Introduction

This chapter explores the conceptualization of educational leadership for social justice and essential terms and theories that are frequently coupled with the theory and practice. Terms explored include power, discrimination, and oppression. Several critical theories inform social justice efforts. These theories and frameworks are discussed in this chapter: intersectionality, critical race theory, anti-racism, feminism, and queer theory.

---

## Social Justice in Education

Social justice in education intentionally seeks to disrupt power and inequities rooted in oppression, discrimination, and prejudice (Marshall, Gerstl-Pepin, & Johnson, 2020). Conceptualizing educational leadership for social justice is complex, as it embraces multiple theories and frameworks and is consistently evolving. Many do not specifically utilize the term “social justice,” yet are categorized as part of a social justice agenda due to their commitment to critical dialogue and diverse theoretical perspectives (Cambron-McCabe & McCarthy, 2005). A social justice agenda acknowledges that inequities are prominent in institutions structured to maintain the status quo and systemically disadvantaged students of historically marginalized backgrounds. Social justice leaders would argue that educational systems uphold systemic inequities through policy, practices, curriculum, and more.

An ideological belief in US democracy is that equality and justice exist and that rewards are attributed to individuals through their own merit. The myth of meritocracy posits that as long as one works hard, they will succeed. This is considered a myth as it ignores the social, historical, and political structures that systematically creates barriers and widens opportunity gaps for historically marginalized communities. This belief is so ingrained in US ideologies that learning about social justice issues which uncover inequality and disrupt power and privilege is often faced with resistance (Marshall & Oliva, 2010). Marshall and Oliva (2010) state that it is difficult to understand that institutions, such as schools, continue to perpetuate injustices, albeit unconsciously. Learning about these concepts is often perceived as a direct challenge to an inherent ideology that the United States is the land of equal opportunity. Indeed, social justice is a contested topic (Kretchmar, 2019; Marshall & Oliva, 2010). Being an educational leader for social justice comes from resistance to

dominant ideologies and power structures that sustain oppression and discount social justice efforts. To be an educational leader for social justice, one must understand systemic, historical, social, and political practices that undergird institutional and individual oppressions in educational settings.

---

## Critical Theory, Power, Discrimination, and Oppression

Social justice is grounded in critical theory, which deconstructs social stratification, power, and oppression. Rooted in critical theory is the questioning and critiquing of social inequalities, with the inherent belief that society should work towards equality. Critical theory argues that society remains stratified, institutions perpetuate marginalization of specific communities and maintained through the distribution of resources and power structures (Sensoy & DiAngelo, 2017). Critical theory began in the early twentieth century. This work is referred to as “The Frankfurt School,” as initial conceptualizations of critical theory began in the Institute of Social Research in Frankfurt, Germany (Sensoy & DiAngelo, 2017). Similar to the Frankfurt School, critical theories also began increasing in France around the same period. In the United States, critical theory movements can be understood as beginning in the 1960s, with the civil rights movements, which began the mainstream attention towards naming individual and systemic nature of power and oppression (Sensoy & DiAngelo, 2017; Young, 1990).

Nonetheless, understanding the fluidity of where and how systemic power and oppression persist in education continues to perplex educational researchers and leaders today – especially since schools are where equality is understood to exist. Duncan-Andrade and Morrell (2008) write, “[t]he paradox of educational inequality is that schools remain among the few institutions that produce opportunities to contest structural inequalities” (p. 43). Having a foundational understanding of critical theory and systemic inequities is crucial for social justice leaders to provide the tools necessary to see where inequities exist and combat them.

Sensoy and DiAngelo (2017) provide useful ways for thinking about concepts, such as power, discrimination, and oppression. Sensoy and DiAngelo draw from Foucault’s (1977) theory of power and its reproduction in a prison panopticon to describe power. Foucault describes a prison panopticon as a central tower that would allow a guard to observe the prisoners. However, the prisoners could not see when the guard was observing – knowing that the guard could potentially be observing spurred the prisoners to behave in ways that would not cause any penalty. Foucault uses this metaphor as an example of how power is “transmitted, normalized, and internalized through social institutions... and how these institutions socialize us into compliance with norms that serve controlling group interests” (p. 76). The decisions behind the panopticon design were made by people who held power and wanted to enforce their power over the prisoners. In this way, they held institutional and political power and could enforce that power unto others. Sensoy and DiAngelo (2017) explain further that Foucault describes power as not fixed and as a function that could be negotiated or challenged to create more equitable societies.

Young (1990) describes that power, oppression, and domination are all structural phenomenon and are systematically reproduced in economic, political, and cultural institutions. Young (1990) also draws from Foucault (1977). She writes:

...to understand the meaning and operation of power in modern society we must look beyond the model of power as “sovereignty,” a dyadic relation of ruler and subject, and instead analyze the exercise of power as the effect of often liberal and “humane” practices of education, bureaucratic administration, production and distribution of consumer goods, and so on. The conscious actions of many individuals daily contribute to maintaining and reproducing oppression (p. 41–42).

Understanding how power is exercised within systems and structures can unfold how individual actors might maintain and reproduce oppression. There might be times the practice of power that creates a reproduction of oppression might be unbeknownst to the actor but only visible to the oppressed. Delpit (1988) writes, “those with power are frequently least aware of—or least willing to acknowledge—its existence. Those with less power are often aware of its existence” (p. 282). Discrimination, prejudice, power, and oppression have become normalized and invisible. Without a critical approach to deconstructing marginalization or understanding how oppression and power permeate institutional structures, these dominant ideologies are replicated by educators, even well-intentioned educators.

Sensoy and DiAngelo (2017) define oppression as “the prejudice and discrimination of one social group to another backed by institutional power” (p. 62). They further describe that oppression can occur because of its connections to historical, social, economic, political, and institutional power. Oppression can manifest as ableism, anti-Blackness, anti-Semitism, classism, heterosexism, homophobia, Islamophobia, racism, sexism, Sinophobia, and xenophobia, among others. They clarify that the difference between prejudice and discrimination from oppression is that prejudice and discrimination are a phenomenon that happen without the backing of power. In comparison, oppression has the backing of “legal authority, and historical, social and institutional power” (p. 62). This is not to say that discrimination and prejudice are not hurtful and do not have implications on social justice efforts. As noted by Young (1990), individual actions of prejudice and discrimination can contribute to systemic oppression, even when these actions are unconscious or by well-meaning actors.

Critical theory functions to disrupt systemic forms of power, oppression, prejudice, and discrimination. With a theoretical understanding of power, oppression, prejudice, and discrimination, educational leaders for social justice can apply it to their practice to uncover injustices and engage in practices and scholarship that lead classrooms, schools, and communities toward a more just educational experience.

---

## Conceptualizing Educational Leadership for Social Justice

The concept of educational leadership for social justice has expanded over time. Whereas educational leaders compose of school leaders and administrators, and faculty in educational leadership programs, social justice leaders are educational

leaders who uphold a social justice agenda in research and practice. Marshall et al. (2020) describe that social justice in education is both a process and a goal. There is a process to be social justice oriented, which includes action to achieve social justice agendas' goals. Social justice leaders are action-oriented by asking critical questions that center historically marginalized communities and disrupt the status quo by working toward equity and justice. Lewis (2016) describes three forms of justice. First, there is distributive justice, which focuses on economic distribution. There is also a cultural distribution that emphasizes respect for all and associational justice, which hones in on members of historically marginalized communities. Lewis writes that social justice in education moves beyond these previous conceptualized visions of justice and includes the sociohistorical and sociopolitical influences on identity. This approach allows for social justice leaders to examine areas of oppression, their root causes, and how these disproportionately affect communities.

Social justice in education comprises three key aspects: leadership for social justice, moral transformative leadership, and social justice praxis (Dantley & Tillman, 2010). Dantley and Tillman (2010) assert that leadership for social justice "interrogates the policies and procedures that shape schools and at the same time perpetuate social inequalities due to race, class, gender, and other markers of otherness" (p. 19). Moral transformative leadership, which derives from critical theory, deconstructs power and abuses of power in institutional settings; it also brings forward how school leaders' practices can cause and reproduce inequities. Lastly, social justice praxis can be used to enhance the field of social justice with conference presentations, scholarly articles, pedagogical methods, and more (Dantley & Tillman, 2010). With these three key components of social justice in education, the authors bring together principles of democracy and equity so that the social justice agenda becomes part of everyday practice for school leaders.

This conceptualization of leadership for social justice highlight how ultimately, "leaders for social justice take the moral position to critically deconstruct as well as to reconstruct schools in a fashion that demands schools be sites for the equitable treatment of all students" (Dantley & Tillman, 2010, p. 27). In this way, it takes a commitment to practice social justice to create schools as sites for equity and opportunity for all students, particularly students of historically marginalized backgrounds, amid policies and practices that perpetuate oppression and other disadvantages that undergird school systems.

Definitions of educational leadership for social justice vary across scholars and have multiple operationalizations from theory to practice. While social justice focuses on equity, inclusion, and cultural diversity, it primarily seeks to rectify "the deep roots of injustice emanating from competitive market forces, economic policies, political practices, and traditions that maintain elite privilege" (Marshall & Oliva, 2010, p. 5). Theoharris (2007, 2008) conceptualizes leadership amid individual actors to focus on how individuals can inform larger social justice efforts in school and leadership settings. Theoharris (2008) defines social justice leaders as principals who "advocate, lead, and keep the center of their practice and vision issues of race, class, gender, disability, sexual orientation, and other historically marginalized and currently marginalized conditions in

the United States” (p. 5). Social justice leaders are faced with challenges ingrained into systems and structures.

For social justice to be advanced, systemic culture shifts need to happen among those in power (Marshall et al., 2020). Therefore if only one person is advancing a social justice agenda, systemic change is unlikely as inequity is still an ingrained cultural practice. Collaboration and the co-creation of equitable, just, and inclusive practices can help implement and sustain social justice leadership (Capper & Young, 2014; Theoharris & Causton, 2014). It is essential also to be mindful of the efforts, dedication, and resistance it takes to contribute to social justice agendas. In light of the systemic nature of power and oppression and contradicting educational policies that further disenfranchise students, advancing social justice leadership can be exhausting and feel never-ending. To uphold social justice as a leader is to engage in efforts that emphasize justice, inclusion, equity, moral values, care, and respect (Dantley & Tillman, 2010), for all groups, including historically marginalized communities, while disrupting power structures.

Educational leaders for social justice play important roles in leadership and policy. Power and values undergird educational policy and politics and uphold the status quo (Marshall et al., 2020). Marshall et al. (2020) argue that educational leaders for social justice can make schools more equitable by centering justice to influence schools’ politics and policies. According to Marshall et al. (2020), social justice centered approaches to policy “suggests that conceptions of educational politics require an understanding of how inequitable outcomes, processes, and power relations manifest and operate” (p. 5). As leaders for social justice, educators need to be critical of how power structures unfold and marginalize students’ policy and politics. Policies and practices that are rooted in the free-market enterprise have influenced educational policy and standards. Advocates for social justice in education uncover how such ideologies and practices contradict social justice efforts and, in many ways, continue to perpetuate injustice (Diem & Welton, 2020). Some argue that amidst neoliberal or market-driven education policies, as well as contradictory policies, it becomes exceedingly difficult to advance a social justice agenda (Capper & Young, 2014; Marshall et al., 2020).

The responsibility of preparing social justice leaders to work among contradictory policies and practices while upholding a social justice agenda falls onto preparation programs that support educational leaders in the field. Preparation programs must move beyond social justice rhetoric and interweave social justice in all class curriculum to equip leaders “to disrupt inequitable power relations and privilege in wise, strategic, and community-building ways” (Dantley & Green, 2015, p. 832). Additionally, Dantley and Green (2015) urge preparation programs to be accountable to their students and the communities they serve. They recommend having professional development opportunities, having one-on-one follow-ups with graduates, and collaborating on school and community projects that center social justice. Educational leadership must continuously heed the warnings from Dantley and Green (2015) and North (2006) – without commitment and intentionality, social justice efforts can be dismissed as a buzzword.

---

## Privilege and Positionality in Educational Leadership for Social Justice

An important aspect of educational leadership for social justice is understanding one's privilege and positionality. To practice social justice is to center the community, students, and families to create more equitable educational opportunities. It is critical to be mindful of one's privilege and positionality, as these inform practice, how one's leadership is perceived, and how leaders understand the students' and families' experiences. Educational leadership research points to the fact that educational leaders and administrators often come from very different backgrounds in the communities they serve. Whereas the demographics of schools are becoming increasingly racially diverse (Diem & Welton, 2020), school leaders and administrators' demographics remain predominantly white and male (Marshall et al., 2020). In the call to action to be a social justice leader, one must also reflect on their positionality and interrogate their privileges, biases, and misconceptions (Marshall et al., 2020) to understand their power dynamics in relation to the community they serve and the structural educational system.

---

## Intersectionality and Social Justice

In 1989 Crenshaw introduced the theory of intersectionality. She argued that in race discrimination cases, Black women are "theoretically erased" as the law only accounts for discrimination based on race or sex, ignoring the intersection of minoritized identities. Drawing from critical race theory and Black feminist theories and initially introduced in law, the term is now in several academic fields. As a theory, intersectionality breaks down how identities mutually shape each other and how they connect to sociohistorical and sociopolitical power relations and structures of domination (Harris & Patton, 2019). When not used correctly, intersectionality, like social justice, becomes a buzzword and can easily undo its foundational social justice agenda. Harris and Patton (2019) advocate that a pivotal aspect of using intersectionality to advance social justice agendas is to ensure that the definition of the theory embraces its original roots and pays attention to intersections of identity with sociohistorical, sociopolitical, and sociocultural structural forms of domination.

Collins and Bilge (2016) explain how intersectionality as an analytical tool can address the complexities of educational equity. They write that "social inequality lies neither solely in school structures nor in the cultural attributes of students, but rather in the interaction between the two" (p. 164). Educational leadership for social justice embraces that issues of social justice are not singular or isolated issues. As noted throughout this chapter, social justice issues often target people of historically marginalized backgrounds. Harris and Patton (2019) remind us that intersectionality moves beyond identity. To maintain social justice and intersectionality's radical roots, we must account for power structures that maintain and uphold systemic injustices. Historically marginalized students' identities and lived experiences do not exist in solitude and are embedded within sociohistorical, sociocultural, and

sociopolitical forms of power and oppression. Social justice agendas must account for how identities and structures of power and domination overlap and intersect to inform how systemic inequities persist in historically marginalized students' educational experiences.

---

## Social Justice Leadership and Complimenting Fields

Given that educational leadership for social justice is broad and focuses on intersecting identities and forms of power and marginalization, it is often coupled with other theories or frameworks for analysis. Some of the frameworks that supplement a social justice agenda are anti-racist theories, critical race theory (CRT), feminist theories, and queer theories. Using these frameworks provides social justice leaders and researchers further tools to draw from as they analyze cases, research, and engage in the practice.

---

## Anti-racist Theories in Education

Anti-racism has an explicit focus on dismantling racism and challenging the field of education to be actively anti-racist in pedagogy practice (Kishimoto, 2018), leadership (Diem, Carpenter, & Lewis-Durham, 2019; Gooden & Dantley, 2012), and policy (Diem & Welton, 2020). Drawing from Blakeney (2005) and Bonnet (2000), Diem and Welton (2020) describe anti-racism as “the system of thoughts and practices that aim to confront and eradicate racism as well as ideologies and practices that promote equality for racial and ethnic groups” (p. 3). In scholarship in education, anti-racism is mostly centered on teacher education with limited studies in educational leadership and policy (Diem & Welton, 2020). Studies in anti-racism in educational leadership and policy are increasing, with attention to leader preparation programs and engagement in anti-racist efforts (Diem & Welton, 2020).

Important to anti-racist research in education is having a working definition of whiteness and anti-Blackness. Whereas whiteness is a racial identity, it exists within a sociohistorical and sociopolitical context that makes it a privileged and dominant racial identity (Ansley, 1997). Whiteness and white supremacy are often used interchangeably. The definitions of whiteness also bring forward the systemic nature of whiteness as superior, thereby maintaining social, economic, and political power among white communities (Ansley, 1997; DiAngelo, 2011). The concept of white fragility (DiAngelo, 2011) highlights that when whiteness and white supremacy are interrogated as systems of power, white individuals often feel victimized and might respond emotionally, defensive, and angry. Whiteness and white supremacy as institutional power structures focus on systems, not individual people, that does not take away from the influence of white privilege. There continues to be contention when whiteness, white supremacy, or white fragility are studied, as there is resistance to recognizing and accepting its influence on systemic structures, in part, due to the notions of meritocracy, individualism, equality.

Critical understandings of how historical racism, anti-Blackness, and white supremacy have manifested to maintain one group as socially, economically, and politically superior to others validates the need for social justice and anti-racist work that interrupts anti-Blackness. Anti-Blackness strategically deconstructs racialized inequities and violence toward Black communities (Dumas & Ross, 2016). Dumas and Ross (2016) posit the necessity to theorize Blackness and “the specificity of anti-blackness, as a social construction, as an embodied lived-experience of social suffering and resistance” (p. 416) and how Blackness is despised and “in opposition to all that is pure, human(e), and White” (p. 417). Anti-racist educational leaders for social justice are in positions to respond and contest anti-Black school policies and practices (Diem & Welton, 2020). Both CRT and anti-racism are necessary lenses for analysis and praxis when engaging in social justice work. In particular, at the time of this writing, in 2020, the Black Lives Matter Movement and attention toward dismantling institutional racism and anti-racism have crucial implications for the field of education and educational leadership for social justice.

---

## Critical Race Theory

Ladson-Billings and Tate (1995) introduced Critical Race Theory to the field of education. Since then, it has been used as a toolkit to analyze access, curriculum, opportunity, pedagogy and practice, and policy, among others (Ledesma & Calderón, 2015). CRT’s roots are in the legal field and explored by scholars, such as Bell (1980), Crenshaw (1989), Matsuda, Lawrence, Delgado, and Crenshaw (1993), and many more. Drawing from the legal field, ethnic studies, and sociology, CRT offers a conceptual and analytical toolbox to uncover racism in systems, laws, and policies (Ladson-Billings & Tate, 1995; Lynn & Parker, 2006). More so, it disrupts power structures and dominant ideologies that uphold white supremacy (Ansley, 1997) and how racism permeates educational institutions and policies (Gillborn, 2005). CRT brings forward the experiential knowledge of Communities of Color in educational settings and challenges dominant ideologies such as color-evasiveness (Annamma, Connor, & Ferri, 2012), meritocracy (Park & Liu, 2014; Viesca, Schoepner Torres, Barnatt, & Piazza, 2013), and white supremacy (Gillborn, 2005).

CRT disentangles how racism in education continues to marginalize Students of Color and how white supremacy as a dominant ideology undergirds curriculum and policy practice (Ledesma & Calderón, 2015). In CRT, white supremacy is understood as a set of political, economic, and cultural structures that sustain power and distribution of wealth and resources amongst one group (Ansley, 1997). This dominant ideology informs conscious and unconscious ideas of white superiority and entitlement in institutional, social, and political settings (Ansley, 1997).

CRT has multiple branches to analyze the experiences of racial and ethnic groups and how race and ethnicity intersect with other marginalized identities. Branches of CRT include AsianCrit (Museus & Ikitikar, 2013), BlackCrit (Dumas & ross, 2016), LatCrit (Solorzano & Delgado Bernal, 2001), and TribalCrit (Brayboy, 2005). CRT

also informs Critical Race Feminism (Delgado Bernal, 2002), Critical Race Praxis (Lynn & Parker, 2006), and Disability Critical Race Theory or DisCrit (Annamma et al., 2012).

---

## Feminist Theories

Feminist theories in education deconstruct the overlap of power, gender, and sex and the implications that constructed gendered identities have on educational policies, systems, and leadership (Marshall et al., 2020). Feminist theories, in particular, feminist theories written by Women of Color, bring forward the intersections of race, gender, power, and class (Collins, 1991; Moraga and Anzaldúa, 1983). These theories highlight how the marginalization, silencing, and erasure of Women of Color throughout history in various institutions, including academia, and in scholarship (Moraga & Anzaldúa, 1983; The Latina Feminist Group, 2001; Sanders-Lawson, Smith-Campbell, & Benham, 2006). Before the 1970s, scholarship on educational leadership primarily excluded women and People of Color (Sanders-Lawson et al., 2006; Skrla & Young, 2003). Literature about women leaders was written by men and often through a gender-free position (Sanders-Lawson et al., 2006).

When analyzing early foundations or theorizations of social justice, the primary thinkers were white men (e.g., Plato, Dewey, Rawls, among others). Historically the voices and experiences of women, in particular Women of Color, have been excluded from the scholarship on educational leadership. Nevertheless, they have made and will continue to make invaluable contributions to social justice and education.

Feminist theories, such as Borderlands theory (Anzaldúa, 1987), acknowledge that oppressions are not singular; they are “fluid systems that take on different forms and nuances depending on the context” (Cantú & Hurtado, 2012). Borderlands theory highlights multiple forms of oppression in social worlds (e.g., class, language, sexualities, cultures, and colonization) rooted in contradictory social systems. However, there is also resistance to these oppressions (Cantú & Hurtado, 2012). Borderlands theory brings forward the contradictions of what it means to navigate and live in “the borderlands,” or at the intersections of multiple social worlds and marginalized identities, particularly in a monolithic, monocultural, and monolingual culture. Some feminist theories include borderland theory (Anzaldúa, 1987), intersectionality (Crenshaw, 1989), Black Feminist Thought (Collins, 1991; hooks 1989; King, 1988), and Chicana Feminist Thought (Delgado Bernal, 1998; The Latina Feminist Group, 2001; Méndez-Morse, 2003), among others. Using feminist theories and Women of Color feminist theories can contribute to center gender, sex, race, class, disability, and more as units of analysis to “uncover institutional and cultural forms of gender discrimination and patriarchy” (Marshall et al., 2020, p. 19).

Feminist research in educational leadership has uncovered inequities toward women students and inequitable treatment toward women in leadership positions (Skrla & Young, 2003). There remains a need to utilize feminist methods in social

justice research and practice to continue working toward dismantling oppressions and its various manifestations. In 2020, gender is understood as a social construct, performed on a spectrum, and sex and gender are not synonymous (Marshall et al., 2020). It is crucial to use gendered and queer epistemologies or frameworks to illuminate how oppression rooted in gender, sex, and sexuality and other intersecting identities are prevalent in educational leadership.

---

## Queer Theory

Heterosexism and heteronormativity function as power structures that sustain power among people perceived to be heterosexual. Heterosexism and heteronormativity are the belief that heterosexuality is normal or natural (Habarth, 2014). Heterosexism and heteronormativity exist in individual prejudices and structural laws, policies, and social practices that stigmatize and deny social membership and maintain privileges for people whose identity performance upholds heterosexual norms (Habarth, 2014). Heterosexism and heteronormativity are reinforced by homophobia and harassment toward LGBTQ+ individuals (Mayo, 2014).

There is no doubt that heteronormativity, heterosexism, transphobia, homophobia, and queer erasure continue to plague educational institutions. Students, staff, faculty and who are members of LGBTQ+ communities, or who identify as gender non-conforming, are marginalized and targeted (Koschorek & Slattery, 2010). Several scholars (Duarte, 2020; Lugg, 2006; Mayo, 2008; Rottman, 2006) unearth how students and educators from LGBTQ+ communities are targeted by sodomy laws (Lugg, 2006) and traditional practices in schools and educational policies that normalize heterosexism (Duarte, 2020) inadvertently erasing and silencing queer identities and the experiences of LGBTQ+ communities. In addition, scholarship shines a light on harassment, bullying, and other forms of prejudice and oppression faced by LGBTQ+ students (Koschorek & Slattery, 2010; Mayo, 2014). Despite the vast research unpacking the need to address LGBTQ+ issues, they are often left out of social justice professional developments (Jennings, 2012; Lugg & Tooms, 2010; O'Malley & Capper, 2015). Research highlights how some school leaders even show resistance toward no-cost LGBTQ+ focused professional development for fear of how the training will be perceived by the community, school board, and school personnel (Payne & Smith, 2018).

To address injustices that members of the LGBTQ+ community face, educational researchers point to educational leadership for social justice. “[S]exual orientation and gender identity is part of the responsibility of a social justice leader and reflection on one’s personal location within cis/heteronormativity and heterosexism may be a useful tool for school leaders to address the needs of LGBTQ+ individuals” (Duarte, 2020). This work should not only be advanced by LGBTQ+ individuals (Duarte, 2020; Goodenow, Szalacha, & Westheimer, 2006). Instead, disrupting heterosexism, heteronormativity, homophobia, transphobia, and more belongs to all educational leaders for social justice.

## Conclusion and Reflections

Issues of social justice and equity have always been timely and urgent. Yet, only recently are they at the forefront of academic, media, and political concerns. In the current era, proponents of social justice are facing juxtaposed climates. On the one hand, movements across the country have been calling for anti-racism, dismantling anti-Blackness and white supremacy. On the other hand, educators operate within a set of policies and ideologies that often contradict or minimize social justice agendas (Capper & Young, 2014; Marshall et al., 2020). Historically, social justice concerns have been addressed by band-aid policies and practices that do not eradicate the root cause of the issue, allowing the pervasiveness of oppression to continue. To achieve social justice, one must pay attention to and work toward eradicating the root causes of inequities, which are grounded in power, oppression, and white supremacy. Bogotch (2000) highlights the social justice agenda is always evolving, and contemporary issues arise as systems, structures, policy, and practice are reevaluated.

Educational leadership for social justice embraces several critical theories that center on overlapping oppressions, which allow for social justice agendas to address multiple injustices and unpack power structures. The field of educational leadership for social justice continues to develop and challenge power structures amidst national movements calling for anti-racism and a redistribution of funds into education, health care, and other social services. The Black Lives Matter Movement and the global pandemic of COVID-19 highlight the urgency of social justice in education to work toward equity, democracy, and social justice. The year 2020 will provide significant data points and justifications to continue growing the field and scaffolding emerging educational leaders for social justice.

Indeed, now is an impeccable time to reflect on ways that social justice leaders can be mindful of how the global pandemic affects the lives of historically marginalized communities. Educational leaders for social justice should lead with authenticity and intentionality to prevent what several scholars warn about social justice, that it can become an empty, de-radicalized, buzzword (Dantley & Green, 2015; North, 2006). In their book, Marshall et al. (2020) describe tools that educational leaders can use when centering justice in policy, yet their recommendations also fit all social justice leaders. They state that educational leaders who center on justice “work with the system but also attack it” (Marshall et al., 2020, p. 193). In this way, social justice leaders can leverage the tools available to them and work within the system. At the same time, be critical of the system as it replicates systemic injustices and oppression. Social justice leaders reject the status quo and are reflexive of how their own practices might unintentionally replicate marginalization. To be reflexive and mindful of one’s positionality and practice means moving away from comfort zones and challenging oneself to critique their own policies and practices. In a time like now where inequalities are reaping throughout the educational systems, embracing social justice leadership is a commitment to take action toward eradicating inequity and center historically marginalized communities.

### Abstract

Connecting schools and colleges with the community through forms of civic engagement and service-learning is a strategy for leveraging learning, developing informed citizen-leaders, and creating locally empowered change. Educationally, outcomes include increased cognitive knowledge and affective skills, and correlate with student retention and graduation rates. Organizationally, teachers and faculty demonstrate increased teaching efficacy and scholarly productivity. Concurrent, partnering community agencies demonstrate increased capacity and outreach effectiveness in assisting vulnerable populations and addressing plaguing social, economic, educational, and environmental issues. However, inattention to sound pedagogical methodologies

and ill-construed charity-minded approaches can miseducate students, undermine community assets, and reinforce systemic inequities and stereotypes. This chapter traces historical foundations, terminology, participation rates, research outcomes, high-impact educational practices, and contemporary challenges of community engagement and service-learning including critical reciprocity and solidarity. The chapter concludes by emphasizing the need for equity-based principles in guiding curricular and co-curricular community engagement pedagogy, policies, and programs in helping to realize social justice.

**Keywords**

Civic responsibility · Community engagement · Active participation in public life · Volunteerism · Service-learning · Community service-learning · Community-based learning · Community-based research · Engaged scholarship · Equity-centered engagement

**The Field of Memory**

Historically, forms of community engagement and service-learning were based on notions of charity both individually and organizationally. Individually, beliefs and motivations were guided by helping others, rescuing others, doing good for those less fortunate, and saving those who cannot help themselves. Organizationally, schools and colleges extended their resources (fiscal and human resources) to nonprofit and social service agencies as gestures of goodwill from the haves to the have-nots and as representations of power and privilege.

**The Field of Presence**

Whether co-curricular in nature (such as volunteer programs) or curricular in format (such as intentional integration of service-learning into an academic course), community engagement at schools and colleges – and their respective teachers and faculty – tend to embrace concepts of community reciprocity and educational solidarity that rely upon mutually defined goals, collectively articulated programs and processes, and iterative practices that integrate constructive reflection, communication, feedback, assessment, and revision.

**The Field of Concomitance**

Community engagement and service-learning is a merging of organizational leadership theory and educational psychology. Leaders and educators in schools and colleges are influenced and motivated to try new teaching and learning approaches dependent upon organizational cultural norms, human resource interactions, and symbolic and real rewards and benefits. Additionally, there are crossover influences from management, fiscal resources, and adaptive change theories both individually and organizationally including the disciplinary fields of school and administrative leadership and higher education leadership (inclusive of the student services

profession). Educationally, theories such as constructivism, epistemology (learning styles and multiple intelligences), critical theory, feminist theory, critical race theory, and specific academic discipline theory (in the case of integrating service-learning into particular courses) influence pedagogy (teaching strategies) including forms of assessment and scholarship.

### **Discontinuities and Ruptures**

Historical notions of charity as motivating the purpose of community engagement and service-learning have been replaced by concepts of solidarity that value communities as sources of knowledge, power, creativity, and capacity that should be partnered with in critical reciprocity in collectively attempting to realize mutual benefit. Community engagement and service-learning as a form of experiential learning has continued to be viewed as a novel educational approach for attending to multiple modalities of epistemological processing that advance understanding and empowerment. However, equitably inclusive pedagogical methods including intercultural preparation, critical reflection, epistemic justice, and community-centered assessment are key contemporary instructional design and educational engagement practices.

### **Critical Assumptions and Presuppositions**

The collective well-being of individuals and communities locally, nationally, and internationally is dependent upon mutually defined educational initiatives that engage teachers, faculty, and students cognitively, affectively, and behaviorally with the real challenges of contemporary life that demand expansive problem-solving and committed action within locally contextualized community solidarity, inclusivity, equity, and justice.

---

## **Introduction**

Forms of community engagement and service-learning have been conducted for decades at schools and colleges as a democratically focused pedagogy for teaching civically related knowledge and skills through collaborative efforts to improve communities. The research outcomes of such experiences are quite substantial across student learning, community enhancement, and expansion of community-based disciplinary scholarship.

However, inattention to service-learning design and facilitation, lack of intercultural preparation, and failure to deconstruct systemic privilege imbalances have led to interactions that can denigrate community members, perpetuate power inequities, and prevent individuals and communities from capacity-building. As Baker-Boosamra, Guevara, and Balfour (2006) assert, “Educators must address the pitfalls of privilege that often go unexamined in relationships between groups of affluent university students and the underprivileged populations that service-learning programs traditionally seek to serve” (p. 479).

Scholars at the Creative Reaction Lab (2018) argue that societies – and thereby organizations, systems, policies, and programs – are a product of individual

decisions and designs. As such, if oppression, inequalities, and inequities are designed, then they can be redesigned. Thus, teachers, educators, and community leaders need to recognize their roles and common purposes as educational designers who can disrupt power and privilege and design for economic opportunity and cultural solidarity. Moreover, they have a responsibility to collaboratively co-create with others (especially those in the community) as “design allies” since their perspectives on inequities are key to identifying innovations that address equitable common purposes (Creative Reaction Lab, 2019).

Comparably, Astin (2016) argues that within schools and colleges, “smartness” all too often emphasizes academic excellence as the capacity for passing standardized tests rather than measuring and elevating one’s interpersonal capacities and emotional intelligence skills for effectively contributing to our communities. Astin (1999) has long asserted that educators should dispense with obsessing over grade point averages and instead cultivate and develop students’ “talents” through educational involvement such as service-learning and community engagement (Astin, Vogelgesang, Ikeda, & Yee, 2000).

This chapter traces historical foundations, terminology, participation rates, research outcomes, high-impact educational practices, and contemporary challenges of community engagement and service-learning including critical reciprocity and solidarity. The chapter concludes by emphasizing the need for equity-based principles in guiding curricular and co-curricular community engagement pedagogy, policies, and programs in helping to realize social justice.

## Foundations of Engagement and Service-Learning

John Dewey (1916) is perhaps the best-known early educator who argued that schools and colleges should connect educational content to the community in order for learning to have individual and collective relevance. Dewey believed the point of education to be the “intellectual, moral, and emotional growth of the individual and, consequently, the evolution of a democratic society” (Rodgers, 2002, p. 845). As Giles and Eyler (1994) highlight, “For Dewey, pedagogy and epistemology were related – his theory of knowledge was related to and derived from his notions of citizenship and democracy” (p. 78).

From a similar perspective, Bowen (1977, p. 49) contended that “higher education should equip students to discover what is right in society as well as what is wrong” in order to become intellectually connected to their communities and to develop the skills and abilities to engage in positive social change. Bowen articulated civic competence as a primary goal of education.

## Definitions and Terminology

Civic engagement is “working to make a difference in the civic life of our communities and developing the combination of knowledge, skills, values, and motivation

to make that difference. It means promoting the quality of life in a community through both political and non-political processes” (Ehrlich, 2000, p. vi). While not universal, countries in Europe, North America, and South America tend to hold inevitable that a thriving pluralist democratic society depends upon active participation of its citizens, characterized by informed deliberation and collaboration to address public problems and work toward common goals (Colby, Beaumont, Ehrlich, & Corngold, 2007).

The origin of the term civic is derived from the Latin *civicus* relating to city or town and *civis* meaning citizen. Likewise, Gottlieb and Robinson (2002) define the attitudinal precursor to civic engagement as having a sense of civic responsibility which is “active participation in the public life of a community in an informed, committed, and constructive manner, with a focus on the common good” (p. 16). Similarly, although not necessarily couched in democratic terminology, many countries in Africa and Asia tend to adhere to the corresponding belief that the inclusion of multiple voices in decision-making and problem-solving leads to thriving communities.

As well, most nations seem to understand that citizen participation alone is not sufficient for collective success. Rather, prosperous societies require citizens competent enough to engage effectively in the tasks of maintaining civil society and government (Dahl, 1992; Verba, Schlozman, & Brady, 1995). Thus, civic engagement of individuals requires knowledgeable as well as active participation in the affairs of community and concomitant attitudinal dedication toward socially-beneficial public purposes and outcomes.

Civic engagement as a concept is an overarching learning process and outcome that encompasses multiple forms including: volunteerism (which may also be called community service); service-learning classes (course-based civic engagement); community-based learning (including experiential activities and internships); and community-based research or engaged scholarship (undertaken by students as well as faculty) (Cress, Stokamer, & Kaufman, 2015).

Each of these educational methods usually begins initially as pedagogical approaches, teaching strategies, and inquiry paradigms for examining community issues. However, over time, teachers and students alike usually evolve their perspectives into more complex cognitive, affective, and behavioral avenues for critically understanding and addressing community challenges through experiences that intentionally examine, integrate, and reflect upon the symbiotic relationship between individual and community with respect to quality of life issues (Cress Collier, & Reitenauer, 2013). Therefore, the ultimate aim of civic engagement (no matter the instructional or research mode) is to bolster the socioeconomic, environmental, political, and physical health of individuals and groups within communities (local, national, and global).

Importantly, the phrase “learning through serving” is perhaps more educationally representative than service-learning in capturing the intents and purposes of such efforts, but the terminology is rather wieldy as a course designation. As such, both in the USA and internationally, service-learning is still the most frequently used and recognized phrase for course-based integrated community engagement.

Although not yet highly popular, some colleges have adopted the term community-engaged learning as a way to rectify any confusion over the term “service.”

Advocates for this terminology assert that the phraseology implies a more contextualized relationship with the community by engaging them in and with learning; as compared to notions of service that often connote charity work.

## **Civic Engagement and Education**

Education has long played a part in developing the civic competence needed to effectively engage in democratic processes (Dewey, 1916; Galston, 2001). Cogan (1999) argued that civic competencies “do not just occur naturally in people. They must be taught consciously through schooling to each new generation” (p. 52). Though the relative importance of the civic mission of educational institutions varies across institutional type and geographic region, preparing graduates for personal and professional lives as citizens has been the historical mission and goal of most schools, colleges, and universities.

Respectively, Keeter, Zukin, Andolina, and Jenkins (2002) remarked, “Engaged citizens are made, not born” (p. 28). As well, Harkavy (2006) highlights the central role of schools and colleges “to educate students for democratic citizenship, and help create a fair, decent, and just society” (p. 9). Moreover, Astin et al. (2000), Battistoni (1997), Ehrlich (2000), Colby et al. (2003), Boyte (2008), and Saltmarsh (2005) are among the many scholars who have affirmed the community, national, and global necessity of education in developing students’ civic competencies through community engagement.

Beyond facilitating students’ capacities for making informed decisions about and involving themselves in political processes, civic engagement is the ethos, advocacy, and action for collaboratively transforming community (Cress, 2011; Sandy & Holland, 2006; Stoecker & Tryon, 2009). Not to be confused with civic education, the teaching about city, state, and national policies and procedures as a part of democratic citizenship (primarily voting behavior), civic engagement requires not just knowing about, but actually connecting the self to community activities for broader societal gain.

## **Pedagogical Approaches**

Colby et al. (2003) defined pedagogy as “all the things teachers do and ask their students to do to support students’ learning” (p. 141). Given the complexity of issues facing cities, nations, and the globe, the future livelihood of communities depends upon the ability of graduates to make headway on even the most perplexing problems. Civic engagement connects and intersects learning and living in efforts toward leveraging more equitable communities.

Examples of civic engagement, particularly in the form of service-learning, are found in virtually every academic discipline. A sociology instructor, for instance, might assign students to work in a homeless shelter to illuminate concepts such as social inequality or classism. In the sciences, a course in biology might analyze

stream samples for an anti-pollution program. Or, an accounting program might send undergraduates to help low-income high school families prepare their financial aid forms for college admission. In each case, the civic engagement experience is accompanied by reflection that deepens students' understanding of the academic concepts as exemplified in actual community contexts.

Further, Howard (1998) described forms of civic engagement such as community-based learning as a “counter-normative pedagogy” (p. 21) because of the numerous ways in which it diverges from traditional classroom instruction. Civic engagement learning varies from traditional pedagogy in terms of epistemology, goals, degree of faculty control, learning processes, student contributions to their own learning, and critical reciprocity shared with community partners (Abes, Jackson, & Jones, 2002; Cress et al., 2013; Gottlieb and Robinson, 2002).

Another pedagogical complication of community-based learning is whether social justice or social change is an intended outcome. Einfield and Collins (2008) asserted, “an ideal democratic society is a socially just society” (p. 105). The social change perspective in community-based learning means that reflection leads to action on the problem addressed by service (Mitchell, 2008).

Similarly, a social justice approach uses community-based learning to empower students with the tools to question social structures and power dynamics to create a more just and equitable society, emphasizing the importance of learning for the purposes of taking action (Freire, 1970; McLaren, 2003; Wang and Jackson, 2005). The alternative is what may be deemed the “charitable approach” in which students strive to meet an immediate need without necessarily seeking to understand or eradicate its root causes (Lewis, 2004; Moely, Furco, & Reed, 2008).

## High Impact Practices

Research evidence points to high impact pedagogical and programmatic practices in the community engagement and community service-learning field (Cress Burack, Giles, Elkins, & Stevens, 2010; Finley, 2012; Hurtado and DeAngelo, 2012; Kuh, 2008; Prentice and Robinson, 2010; Stokamer, 2011). Namely, these high impact strategies include the following:

### 1. **Intentional Campus, Community, and Conceptual Connections**

Whether curricular or co-curricular, activities are purposefully constructed to support serving and learning. Community engagement objectives are mutually defined by campus and community partners, aligned with students' service and reflection experiences, and assessed for future iterative improvement.

### 2. **Collaborative Learning Relationships between Instructors, Students, and Community Participants**

Effective partnerships encourage and cultivate culturally considerate interactions that foster personal and community empowerment. Instead of directing expertise solely from the campus to the community, roles and responsibilities are instead crafted as shared learning opportunities for all.

### 3. Integration into Educational Expectations and Organizational Performance

Institutional proclamations regarding civic preparation of students are realized through multiple opportunities for engagement. Infrastructures facilitate long-term, reciprocal campus–community partnerships and the development of civically engaged courses across disciplines. Promotion and advancement policies stimulate and honor wide-ranging student, administrator, and faculty involvement.

These three overarching principles are proven approaches across the globe for creating a culture of community service-learning that benefits students, faculty, and communities alike.

For example, in Ireland, at the National University, Galway, the *Community Knowledge Initiative* encompasses volunteer and classroom-connected community service for linking academe with the social fabric of Irish life. As a multifaceted approach, the Irish initiative includes college service-learning courses across dozens of academic disciplines and professions; EPIC (Engaging Public in Communities) to facilitate community-based research and knowledge exchange; and the Youth Academy to support primary school children’s development. See: <https://cki.nuigalway.ie/>

In India, at Lady Doak College in Madurai, the college president and faculty have adopted community service-learning as its signature pedagogy for producing civically and socially committed women leaders. Referred to as the Life Frontier Engagement (*LiFE*) Programme, students use interdisciplinary community-based applied research, reflection, and active engagement to investigate societal and industrial problems, sharpen insights about how to leverage academic learning in the community, and gain a deeper understanding of one’s role in civic responsibilities. See: [https://www.ladydoakcollege.edu.in/Life\\_lfe.html](https://www.ladydoakcollege.edu.in/Life_lfe.html)

In Illinois (United States), the State Board of Education has created an online service-learning resource guide as part of its kindergarten through postsecondary education initiative to increase school attendance, academic learning, and personal and social responsibility. See: [https://www.isbe.net/Documents/service\\_learning\\_resources.pdf](https://www.isbe.net/Documents/service_learning_resources.pdf)

As well, some higher education institutions, like Portland State University, now offer Master’s degree specializations and Graduate Certificates in service-learning and community-based learning for those pursuing a professional career in the community engagement field as a teacher, researcher, or administrator (see: <http://pdx.edu/elp/service-learning>). In addition, undergraduate minors in civic leadership and community engagement have burgeoned across the United States from Penn State University in the East to the University of California, Irvine in the West.

## Participation Rates

Colleges, schools, and communities across the globe participate in various forms of civic engagement; those that are solely local or domestically focused as well as those that involve international collaborations and partnerships. For instance, the

UNESCO group in Community Based Research and Social Responsibility in Higher Education has partners in Africa, Arab states, Asia, the Pacific, Europe, North America, Latin America, and the Caribbean.

Likewise, the Talloires Network is an international association of institutions committed to strengthening the civic roles and social responsibilities of higher education. Specifically, their goal is to expand higher education civic engagement programs through teaching, research, and public service and includes such organizations as AsiaEngage, Arab University Alliance, Engagement Australia, and Service Learning Asia Network. Related, the International Association for Research on Service-Learning and Community Engagement (IARSLCE) boasts members from over 35 nations.

In the United States, estimates vary as to the number or percentage of higher education students participating in civic engagement learning. According to Campus Compact's annual survey – now reaching nearly 1200 campuses – approximately one third of students participated in service, community-based learning, and civic engagement activities at their campuses (Cress et al., 2010). Largent and Horinek (2008) reported that 80% of community colleges offer community-based learning, and Musil (2003) claimed that 78% of students participate in a service experience as part of undergraduate education.

Furthermore, statistics reveal that at both the K-12 school and higher education levels, students who participate in service-learning and community engagement experiences (either as facilitators or receivers of the service) are more likely to graduate from high school, attend college, and become future volunteers in their communities (Cress et al., 2010).

Moreover, such service-learning had a significantly positive effect on the educational achievement and aspirations of first-generation and low-income students (Plaut, Cress, Ikeda, & McGinley, 2013).

## Research-Based Outcomes

Civic engagement has been consistently characterized as having modest, but positive effects on students' academic, personal, and civic development (Astin et al., 2000; Eyler & Giles, 1999). A steady stream of scholarship has associated various civic engagement approaches with student engagement, academic achievement, intercultural competence, and other outcomes (Vogelgesang & Astin, 2000). Furthermore, civic engagement improves grade point averages and academic skills, such as critical thinking and writing (Cress, 2004).

Gallini and Moely (2003) reported that community-based learning students demonstrated more engagement with academic content, greater interpersonal and community connection, and increased likelihood of persisting in school than their peers. Organizationally, teachers and faculty demonstrate increased teaching efficacy and scholarly productivity. Concurrent, partnering community agencies demonstrate increased capacity and outreach effectiveness in assisting vulnerable populations and addressing plaguing social, economic, educational, and environmental issues (Cress et al., 2010).

Specifically, research indicates that students improve their abilities to think critically, problem-solve, negotiate, and participate in democratic deliberation. The civic goal is more than simply learning how to express themselves verbally and in writing. Students are challenged to listen to a range of voices, to empathize with people different from themselves, and to compromise with others in the name of a common good that is often contested and tentative (Gray, Ondaatje, Fricker, & Geschwind, 2000; Ward and Wolf –Wendel, 2000).

In sum, service-learning promotes students making connections between coursework and community issues, seeing themselves as having community leadership capacity, and identifying themselves as future agents of positive community change – key skills that are critical to the success of neighborhoods and communities around the globe (Battistoni, 1997; Cress, Yamashita, Duarte, & Burns, 2010; Colby, Ehrlich, Beaumont, & Stephens, 2003; Stokamer, 2011).

## Liberal Education Versus Neoliberalism

Daloz Parks (2000) suggests that this intersection of individual, education, and community is a new “commons.” She asserts that this “commons” is both global in scope and personal in impact requiring educational cultivation in the formation of “citizen-leaders.” This pragmatic outcome of community engagement and service-learning (citizenship preparation) is a unifying theme of the principles of liberal education (Cress & Donahue, 2011). Of course, a “Liberal Education” is not a specific political affiliation or social position. Rather, the term Liberal Education refers to a teaching and learning approach (often codified within the context of community engagement and service-learning) that empowers students and prepares them to deal with the complexity, diversity, and constant change of the modern world.

Liberal education should not be confused with neoliberalism. Neoliberalism is the resurgence of ideas of laissez-faire economic liberalism and free market capitalism. Neoliberalism is characterized by deregulation, privatization, and the shift away from state welfare provision. Indeed, neoliberalism emphasizes the commodification of education and undermines the purpose of liberal education that is to enable students to live more alertly, more responsibly, and more fully (Deresiewicz, 2014).

In response, Quaye et al. (2018) assert that policies, practices, and curriculum in schools and colleges have too often contributed to, exacerbated, and profited from intersectional systems of exclusion and dehumanization. They and other scholars argue that educators must transition from laudable organizational statements and “fast-track” the journey toward justice by partnering with our communities and neighborhoods in curricular collaborations that have as a common purpose reshaping our policies and institutions (Reese, 2020).

## Contemporary Challenges

While some students are intrinsically motivated to involve themselves in community service activities (usually because of cultural, religious, and familial experiences

with providing service and trying to “make a difference” in the world), others explicitly question “why” they have to be bothered with involving themselves with non-school issues. In fact, some students openly object to service-learning course requirements and ask skeptically why they are being “forced to volunteer in the community” (Sylvester, 2011).

Having a comprehensive understanding of the broader historical foundations of civic education and the field of community-engaged learning can help contextualize responses to resistant students, skeptical colleagues, and unsupportive leaders in the common purposes of the why and how of community engagement. In addition, this knowledge base provides educators with the language and research evidence for what is individually and collectively gained by connecting classrooms with communities. Indeed, Reese (2020) and others (Perron, 2018) call for teachers to engage in “exceptional exegesis” with the community – to draw out their wisdom and collaboratively seek innovations that will lead to equity for individuals and communities.

Local communities, individual countries, and the world need educators’ energy, passion, compassion, drive, creativity, and innovation. Indeed, issues of racial injustice, health crises, educational inequities, economic unfairness, and environmental degradation demand that teachers be academically audacious (Salomon-Fernández, 2020). It is an audacious curricular act to go beyond traditional education boundaries by connecting classes to the community. It is an audacious scholarly act to see the community as a source of learning, expertise, and wisdom that can conjoin with professional disciplines. It is an audacious personal act to collaboratively address the most vexing and complex challenges of societies, neighborhoods, and communities. To that end, Quaye et al. (2018) assert that educators must engage boldly forward in strategizing for decolonization and racial justice and be commonly emboldened in their capacities to effect change in a world that has been impacted by turmoil, pain, and social injustice.

Unfortunately, service-learning performed from a notion of charity assumes a “savior” mentality where privileged college students come to “save” the community from their own “self-inflicted evils” (Cress et al., 2015, p. 41). Lupton (2015) termed this form of service-learning as “toxic charity.” He argued that good intentions, passion, and hard work of those “providing service” are not enough to prevent the demoralization of individuals and communities of those “receiving service.” Likewise, Mitchell (2008) articulated the distinction between traditional service-learning and critical service-learning that intentionally promotes socially justice.

In other words, simply learning through serving is insufficient since service itself is “a concept steeped in issues of identity and privilege which must be wrestled with for students to be effective” (Mitchell, 2008, p. 55). Instead, service-learning courses must be framed as collective efforts of solidarity. Heldman (2011) explains that service-learning as a form of solidarity seeks social justice through collaborative empowerment of individuals and communities that interrupts patterns of privilege. Indeed, teachers and educators must guard against perpetuating service-learning as a “pedagogy of whiteness” (Mitchell, Donahue, & Young-Law, 2012). Instead, the contemporary challenge is to redesign and reformulate community engagement as educational empowerment for collective gain.

## Conclusion and Future Actions

The equity work of Gonzales and Griffin (2020) compels educators to consider how individuals, groups, and communities are situated within the contexts of privilege, power, and inclusion. They admonish administrators, teachers, and faculty as having the obligation to rectify such inequities through revisions in policies, programs, and the curriculum.

By extracting high impact strategies from the critical service-learning research literature (evidence-based) and uniting these key educational elements with equity-centered solidarity concepts (equity-principles), what emerges is a reimagined delineation of community engagement and service-learning. Namely, “Equity-Centered Engagement” (Cress, Stokamer, Van Cleave, & Kaufman, 2021).

Service-learning courses and community engagement activities should not just send students out into the community to do “good works.” Rather, equity-centered engagement is a specific epistemological and pedagogical stance. This approach is not learning “about” the community. This approach is not learning “from” the community. Equity-centered engagement is about instructionally solidifying how students learn “with” the community.

Learning with the community requires critical pedagogical construction of service-learning and engagement experiences. The relative merits of course construction include decisions about academic content, educational resources, instructional activities, service tasks and responsibilities, and assessment methods. To wit, in the *Archaeology of Knowledge*, Foucault (1971) scrutinizes what “counts” as learning and knowledge. He asserts that viewpoints and perspectives are fluid, dynamic, and influenced by social and political forces that validate and invalidate ways of knowing. Likewise, he argues that the reasons for the dominance of some ideas, theories, and concepts are often hidden. He urges educators to investigate, expose, and discuss the implications of hidden logic that rationalizes certain types of knowledge.

Equally, critical theorists including postmodern critical theorists, feminist critical theorists, and critical race theorists challenge the notion that ideas and knowledge are neutral and subjectively free (Kutten, 2020; Rendón, 2014; Walpole, 2008). Rather, they assert that educational “canons of knowledge” upon which many classical education ideals are founded actually perpetuate systemic oppression and exclude equitable participation in educational and community capacity-building.

In other words, equity-based community engagement and service-learning is dependent upon carefully orchestrating student connections to the course, to each other, and the community as a model of democratic processes. Indeed, for critically, reflective and responsive educators, the future action imperative is to counter educational processes that delegitimize ways of knowing and to engage in strategies that value the assets of each individual and the contributions that everyone can make to the collective (Loggins, Nayve, & Plaxton-Moore, 2020). Equity-centered community engagement validates the epistemological experiences of students and community alike and offers empowering opportunities to contribute that knowledge for the common good (Cress et al., 2021).

## Abstract

The American education system has been marked by racial inequality, segregation, and systemic racism. These realities are symbolic of a past built on the enslavement of Blacks and the marginalization of people of color. These themes are therefore central to education as they have invariably created a framework for its development and the practice of educational leadership. This chapter utilizes a Foucauldian approach by including his three enunciative fields: the field of memory, presence, and concomitance. In the field of memory, this chapter demonstrates how the legal and political institutions were the genesis of inequality for people of color, while in the field of presence, education and educational leadership have evolved as theories around race and social justice have emerged to address issues of oppression. Finally, in the field of concomitance, the chapter interrogates how fields such as scientific management, legal studies, and science influence the current practice of educational leadership. Importantly, through this approach, this chapter provides insight into what is required for the future practice of educational leadership to tackle the inequality that remains a feature of the US K-12 education system.

**Keywords**

Desegregation · Critical consciousness · Culturally relevant leadership · Educational leadership · K-12 education · Oppression · Racial inequality · Segregation · Systemic racism · Social justice

**The field of memory**

Race and racism have been instrumental in shaping the narrative of the experiences of people of color in the USA. From the practice of eugenics to intelligence testing, the implication for education has been reflected in the deficit ideology surrounding the ability of students of color.

**The field of presence**

The historic *Brown v. Board* (1954) ruling led to shifts in the education system for students of color. Although the “separate but equal” rule was overturned, there remains a disproportionate application of disciplinary sanctions and availability of equal academic opportunities for students of color.

**The field of concomitance**

Racial inequality in the US education system has been influenced by history, legal studies, management, and business, among others, which have impacted the practice of educational leadership.

**Discontinuities and ruptures which form the different viewpoints of this area or field**

Social justice, the agitation of various movements, and the creation of critical theories have created shifts in the educational landscape as well as the leadership discourse that place race and racism at the center of the US experience for people of color.

**Critical assumptions or presupposition**

Race and racism are essential parts of US history which cannot be overlooked since those elements manifest in the education system, thus requiring educational leaders who are aware of this phenomenon and lead in ways to systematically address it.

---

**Introduction**

Trends within the current K-12 education system indicate that schools have increasingly become segregated (Orfield & Frankenberg, 2014; Orfield & Yun, 1999; Thompson Dorsey, 2013; Wells, Keener, Cabral, & Cordova-Cobo, 2019). This is a break from the spirit enshrined in the historic ruling of *Brown v. Board* (1954) which overturned the “separate but equal” judgment of *Plessy v. Ferguson* (1896). Furthermore, it is a greater undoing of the strides made to create equality between Whites and people of color, not only within the educational system but also within

the larger society as that court decision was the framework for “dismantling state supported racial segregation in education, housing and other important areas of life” (Schofield & Hausmann, 2004, p. 83).

More recently, protests over the killing of Blacks at the hands of law enforcement have turned the lens once again on the systems of inequity that continue to define the society within which we currently exist – a system which is grounded in segregation, redlining, Jim Crow laws, inequitable distribution of resources, considerable gaps in wealth and income (Dettling, Hsu, Jacobs, Moore, & Thompson, 2017; Kochhar & Fry, 2014; Petrella, 2017; Rothstein, 2017), and a general “othering” of people of color based largely on socially created identities (Harro, 2018; Johnson, 2018). This is the same system that influences the ways in which education is administered and the concomitant negative outcomes, particularly, for Black and Brown children.

For example, research has indicated that de jure or government-sanctioned segregation has had a psychological impact on those belonging to the segregated group and those enforcing segregation. Specifically, Blacks from a lower socioeconomic background developed feelings of inferiority and self-hatred and rejected their blackness, whereas Blacks who originated from the middle and upper echelons of the society tended to be submissive, withdrawn, or conformed to the expectations and standards of the dominant group (Cook, 1984). Conversely, Whites developed feelings of superiority (Clark, Chein, & Cook, 2004) due to the value society attributed to being White, which the research suggested was an “unrealistic basis for self-evaluation” (Cook, 1984, p. 820). Consequently, Whites became hostile and aggressive toward Blacks. A gradual shift in society’s attitudes and concurrent judicial decisions, however, reduced interest in desegregation research, which has eventually led to the increased resegregation of schools (Horsford, 2010).

Therefore, the chapter aims to frame the trajectory of racial inequality in K-12 schools and its implications for educational leadership. More specifically, it examines this inequality from a Foucauldian framework, tracing the history of racial inequality within K-12 schools throughout the last 100 years, and explores the antecedents which have shaped the current education system. Foucault (1972), in his seminal piece *The Archaeology of Knowledge*, espouses that the way in which concepts develop within a specific discipline is due in part to developments in other fields which contribute to an overall understanding within that specific discipline or field. In this case, we argue that the development of educational leadership has been shaped by the shifting discourse, not only in education but also in other fields such as sociology, psychology, and management.

According to Foucault, there are moments of rupture which create a kind of discontinuity, but inherent in that discontinuity is a utility that assists in the progression of a discipline. In other words, discontinuity is to be embraced rather than ignored or eliminated. Subsequently, we frame our discussion on the basis that the various ruptures, conflicts, and discontinuities that have occurred in the last 100 years in the USA have been fundamental in creating and buttressing racism that is systemic. Additionally, we argue that systemic racism through the country’s economic, political, and social institutions continues to influence educational decisions, policies, and outcomes (Beachum, 2011, 2020).

## Foucault's Methodology

In order to preface this discussion, this chapter references Foucault's (1972) approach to knowledge and its development. In his text, he focuses on how a particular set of ideas and concepts which are prominent during one period eventually change over time. These ideas are what he refers to as discourse or a group of statements that are historically bound and determine, in large measure, what societies know and accept as current and valid. Importantly, Foucault's approach to this history of knowledge rejects the methods historians adopted, who traditionally advocated for a linear approach to unfolding events. Instead, Foucault embraces the "phenomena of rupture, of discontinuity" (p. 4) Therefore, instead of an inclination to examine historical events or the development of knowledge within the framework of identifying patterns or "linear successions," Foucault suggests that there is greater value inherent in "the interplay of transmissions, resumptions, disappearances, and repetitions" (p. 5). By his own admission, however, he indicates that it is not a precedence of one approach over another, but rather an acknowledgment that there is a dynamic interplay between the development of knowledge and power.

According to Foucault, there is a framework within which this knowledge evolves, those being the field of memory, the field of presence, and the field of concomitance. Foucault refers to these as "enunciative fields in a discipline" (p. 57) and indicates that these fields are susceptible to change. Furthermore, he highlights the interaction and inherent dependence among these three enunciative fields as knowledge develops and changes throughout history. Combined, these enunciative fields help to contextualize the discussion which will ensue in this chapter. The field of memory represents "statements that are no longer accepted or discussed" (p. 58) but whose impact still resonates in contemporary discourse. Additionally, the field of memory includes those concepts, statements, and ideas which are no longer considered to be factual. Foucault's argument in the field of memory lends credence to the statement that "discourse has not only a meaning or a truth, but a history, and a specific history that does not refer it back to the laws of an alien development" (p. 127). It is critical, then, to examine the development of the field of education, not only from the perspective of what is current but also from the thoughts and ideas which previously existed and the discontinuity that created a shift in those ideas.

The field of presence, on the other hand, includes "all statements. . .acknowledged to be truthful, involving exact descriptions, well-founded reasoning, or necessary presuppositions" (p. 57). Interestingly, the field of presence also consists of those concepts which are considered factual but which may also be critiqued or repudiated. However, the field of presence is indicative of those statements which have exerted significant influence throughout a field's discourse and are identified as having authority. By contrast, the field of concomitance reflects the statements, ideas, and concepts from other fields which resonate within the field under discussion, that of education. Foucault's method of archaeology reveals that "discourse is not the majestically unfolding manifestation of a thinking, knowing, speaking subject, but on the contrary, a totality, in which the dispersion of the subject and his discontinuity

with himself may be determined” (p. 60). In other words, attention must be paid to the way in which humans discuss historical events as it reveals insight into a larger social order and the underlying assumptions. Foucault is less interested in a singular individual’s pronouncements on a concept, but rather in the discourse itself as well as the gaps within the discourse. There is also the tacit acceptance that the development of discourse is far from linear and more so fraught with contention.

In his *Archaeology of Knowledge*, Foucault challenges the description of history, or discourse, confined to a document and instead seeks to uncover the layers of human understanding that have developed over time as humans have tried to interpret the world in which they exist. Subsequently, Foucault approaches discourse as “monument” (pp. 137–138) and further indicates that these monuments uncover “discourse as practices” (p. 131). Therefore, the central ideas of change within the field of education as well as the embedded practices of its discourse form the basis of this chapter’s discussion. Moreover, the chapter discusses the implications of those practices for educational leadership.

---

## The Field of Memory

As Johnson (2018) states in his explanation of James Baldwin, “race and all its categories have no significance outside systems of privilege and oppression in which they are created in the first place” (p. 16). It would therefore seem pointless to consider the tiered and unequal K-12 education system without tracing the history of its development. Taking into account Foucault’s ideation behind discourse development, it is important to understand how education is presently experienced in the USA and how educational leadership is enacted, as a consequence.

Foucault’s (1972) field of memory points to the ways in which society has come to understand those events and occurrences around which there is no universal consensus. However, it is these events that are critical to framing the future trajectory of a specific field or discipline – in this case education and educational leadership – and how knowledge within that discipline is to be understood and accepted. Furthermore, Foucault’s interpretation of ruptures and discontinuities is essential to establishing the development of discourse. Therefore, this section will interrogate how racism as a construct developed, the systems that came into existence as a consequence, and how those systems continue to manifest in education and by extension, educational leadership.

The current functioning of the US K-12 education system did not develop within a vacuum. The ruptures in time can be attributed to events which have been fundamental to creating a legacy of segregation and racism that appear difficult to undo. More specifically, issues such as student tracking, the “education debt” (Ladson-Billings, 2006) between White students and students of color (National Center for Education Statistics, 2016), the disparity in student discipline (Civil Rights Data Collection on School Climate and Safety, 2018), and the school-to-prison pipeline (Wacquant, 2001) have all been shaped by past events. It is critical to understand “the historical roots of the policies that drive the practices of adults and

the experiences of students” (Jones, 2019, p. 1). Firstly, the impact of slavery on the US education system is undeniable. Although slavery was legally abolished in 1865, the imposition of Jim Crow laws subsequent to the end of slavery persisted to extend the servitude of Blacks and segregate them from Whites. Furthermore, these laws significantly disenfranchised Blacks and created separation in the use of public facilities, from restrooms, drinking fountains, and public transportation.

Moreover, the inability to vote, be elected for public office, or serve on juries further marginalized Blacks from the US political process. Essentially, “within a decade of disenfranchisement, the white supremacy campaign had erased the image of the black middle class from the minds of white North Carolinians” (Pildes, 2000, p. 12). The reduction in that black middle class also had implications for schools that were established in those Southern states. There was a conspicuous distinction between schools for Black and White students regarding resources, quality of facilities, and available books (Anderson, 1988; Bond, 1934). Within that same period, although there were attempts through the Civil Rights Act of 1875 to guarantee rights to persons regardless of race or creed or former status of servitude, the Supreme Court ruled the Act unconstitutional in 1883.

Following the Supreme Court decision in the *Plessy v. Ferguson* case in 1896, which upheld the “separate but equal” doctrine, segregation became more widespread, especially in Southern states already marked by an era of Jim Crow laws which separated Whites from Blacks in every facet of society. The *Plessy* decision essentially sanctioned legal segregation against Blacks, converting them to “second-class citizenship” (McKanders, 2010) since they were excluded socially, economically, and politically. The combination of segregated facilities, little to no voting rights, and inferior schools wrought an education system for Blacks that was bound to be problematic. Historians and researchers alike have indicated that such segregated schools, which typically reflected significant variation in poverty between Whites and Blacks, are most significantly correlated to the achievement gap between the two sets of students (Reardon, 2016). Evidently, segregation was a deliberate act to undermine the participation and self-worth of Blacks (Wacquant, 2001). Moreover, segregation was considered “a device of economy” (Myrdal, 1944, p. 169) which was intent on perpetuating harmful stereotypes and negative attitudes toward members of the segregated group (McClung Lee & Humphrey, 1943).

This device has precipitated an education debt, which Ladson-Billings (2006) suggests is as a consequence of the twinning of the political and economic systems to exclude Black students from the education system. Additionally, this led to the perception that Black students were academically inferior and therefore incapable of making academic progress. However, this perception was reminiscent of a period during which psychologists and medical science advocated eugenics – a practice lauded as scientific which theorized that Whites were genetically superior to their non-White counterparts who were described as having less desirable characteristics. Eugenics surfaced as a response to the threat of racial decline of Whites (Stoskopf, 2002, p. 74) and thereby focused on “better breeding” of persons most suited for American society over those considered less so (Black, 2003).

Additionally, the spread of eugenics was further enhanced via mass media as journalists, scientists, and medical practitioners widely published works, crafted as opinion pieces and results of research, which served to perpetuate this dominant and harmful ideology. The premise of eugenics which espoused the superiority of one race over another based on genetics became identified as “scientific racism” as an ode to a set of indisputable “facts” around the inferiority of a certain breed of persons. Incidentally, these facts often originated from so-called experts (scientists, anthropologists, medical practitioners, for example) who were White, elite males whose authority was neither questioned nor opposed (Schwartz & Schlenoff, 2020).

Moreover, scientific racism was a precursor of Social Darwinism that advocated “the survival of the fittest” (Spencer, 1874). Spencer extended Darwin’s theory on the evolution of animal species by asserting that it could also be applied to humans in a similar way. According to Spencer, inferior breeding was a natural occurrence which led to conflict between races. This racial conflict, Spencer opined, was essential to progress as it included “a continuous over-running of the less powerful or less adapted by the more powerful or more adapted, a driving of inferior varieties into undesirable habitats, and occasionally, an extermination of inferior varieties” (p. 85). This philosophy essentially suggested that only those of true and proper breeding were able to survive harsh or difficult circumstances. In other words, science was repeatedly utilized to justify, “propose, project and enact racist social policies” (Dennis, 1995, p. 243). Subsequent to the use of Social Darwinism, there was further scientific propagation of the measure of human intelligence based on race. Sadly, these “scientific facts” were largely based on social preconditioning connected to deeply biased assumptions and attitudes, what Whitten (2019) refers to as the “social embeddedness of science.”

Gould (1978, 1981) takes a similar view in his critique of Morton (renowned for collecting and measuring human crania), noting that “unconscious or dimly perceived finagling is probably endemic in science, since scientists are human beings rooted in cultural contexts, not automations directed toward external truth” (1978, p. 503). Similarly, Roberts (2011) opines that these biased preconceptions often resulted in the misuse of science to confirm an already flawed reality. Incidentally, Samuel Morton’s work (Morton, 1839, 1844) on measuring the brain’s “internal capacity” is often touted as the genesis of scientific racism. As he collected and studied crania from different parts of the world, his measurements were used to classify and rank intelligence based on race, to confirm White superiority, and to justify slavery (Mitchell, 2018). Furthermore, Morton is considered the father of physical anthropology, and his work has been critical to framing the work of other polygenists within and external to the scientific field who, like Morton, believed that Black and White people descended from separate species (Biewen & Kumanyika, 2020).

Eventually, scientific racism as the underlying theory of eugenics was weaponized in Nazi Germany, leading to the widespread slaughter of Jews and non-Aryans. Consequently, the ideology that formed the basis of racial, mental, and physical superiority began to decline. However, not before it had already infiltrated the US society in other ways. There seemed to be a “perfect fit” in education for the

reproduction of these beliefs (Selden, 1999; Winfield, 2007). This belief became evident in intelligence testing from Binet to Goddard, the latter who built on Binet's procedures to test the "feeble-minded" as a way to explain differences in capabilities based on race. Hundreds of educators were then trained to administer these tests, the results of which were used to segregate the "morons" from the "normal" students. Furthermore, prominent psychologist, himself a eugenicist, Edward Thorndike (1927) who was instrumental in shaping school curriculum based on notions of inherited intelligence suggested, "Men are born unequal in intellect, character, and skill. It is impossible and undesirable to make them equal by education. The proper work of education is to improve all men according to their several possibilities, in ways consistent with the welfare of all" (para. 5).

Later, Terman, another psychologist and eugenicist, would apply Binet's intelligence tests in the context of American schools, later referred to as the Stanford-Binet Intelligence Scale. He believed that schools should rank students in society according to their academic prowess, which was largely founded on race and intelligence testing. Commenting on the ideal of "fitness of mind," Terman (1916) said:

No amount of school instruction will ever make them intelligent voters or capable citizens in the true sense of the word. . . The fact that one meets this type of frequency among Indians, Mexicans, and [N]egroes suggest quite forcibly that the whole question of racial differences in mental traits will have to be taken up anew and by experimental methods. . . Children of this group should be segregated in special classes and be given instruction that is concrete and practical. They cannot master abstractions, but they can often be made efficient workers, able to look out for themselves. There is no possibility at present of convincing society that they should be allowed to reproduce, although from a eugenic point of view they constitute a grave problem because of their unusually prolific breeding. (pp. 91–92)

Psychology has not been the only field in which problematic practices have influenced and shaped education. The management literature is replete with examples of efficiency and effectiveness which have been fundamental to the development of educational leadership. Taylor's (1911) principles of scientific management and the factory model have shaped how policymakers and educational leaders have treated schools and students as products for improvement (Rury, 2005) without fair consideration of their contexts, historical, sociopolitical, and otherwise. First, intelligence testing and eventually standardized testing are based broadly on the belief that all students can and should meet a standard which is historically based on measures of middle-upper class whiteness (Winfield, 2012). The focus on efficiency has been instrumental in perpetuating the belief that students and schools that did not match these expectations were somehow unfit or defective.

Within the practice of educational leadership, the wrongs that have been perpetuated against Black students and, by extension, students of color cannot be addressed in a systematic way unless there is an admission of those wrongs. Although Jim Crow laws have been disbanded and the practice of eugenics has "disappeared" from education's lexicon, the current policies and practices within the education system continue to be shaped by those beliefs, attitudes, and actions (Winfield, 2012). The "continued ignorance of the knowledge that educational

theory, philosophy, and practice were developed both within and as a mandate of this atmosphere” (Winfield, 2007, p. 105) is inherently problematic.

As Foucault indicates, the discourse of scientific racism and eugenics, though no longer accepted as valid, continue to shape the present field. Standardized testing, tracking, and unfair disciplinary practices that favor White students create an atmosphere in which students of color continue to pay a heavy price. This disproportionality will persist if educational leaders within and external to educational institutions do not agitate to disrupt the problematic policies and practices purported as “educational reform” within the system. As Cuban (1990) asserts, “Reforms return because policymakers fail to diagnose problems and promote correct solutions. Reforms return because policymakers use poor historical analogies and pick the wrong lessons from the past” (p. 6).

---

## The Field of Presence

The field of presence, according to the Foucauldian framework, embodies those ideas and practices, those statements which are representative of what is acceptable within a specific field or discourse. Importantly, this is not limited to those concepts which are included, but also extend to that which has been excluded from the discourse. This is critical to consider as Foucault recognizes that discontinuity is essential to a field’s development. Race-based tracking (Domina, Penner, & Penner, 2017), unequal disciplinary measures (Irwin, Davidson, & Hall-Sanchez, 2013; Payne & Welch, 2010), unequal school funding and resources (Darling-Hammond, 2010; Horsford, 2011; Reardon, 2016), and dropout rates (Carter, 2009) brought about by systemic political and economic injustices (Kozol, 2005; Selden, 1999) and a curriculum that is largely irrelevant and culturally biased (Sleeter & Grant, 2011) have served to further marginalize students of color in general and Black students in particular.

The legacy of segregated schools, which has seen a resurgence in the last 30 years (Frankenberg, Lee, & Orfield, 2003; Orfield, Bachmeier, James, & Eitle, 1997; Orfield & Monfort, 1992; Orfield & Yun, 1999), continues to impact the educational outcomes for students of color (Frankenberg, 2009; Freeman, Scafidi, & Sjoquist, 2005). Much of this resurgence is partially due to the court ruling in *Milliken v. Bradley* (1974) which disallowed desegregation efforts across school districts. Moreover, research into desegregation explains how students’ racial interaction in their formative years influences their adolescence as segregation tends to be repeated “across the stages of the life cycle and across institutions when individuals have not had sustained experiences in desegregated settings earlier in life” (McPartland & Braddock, 1981, p. 149). A return to school stratification, therefore, based on race and ethnicity carries broader implications for educational leadership practice and policy against the background of an increase in racial and ethnic diversity (Orfield & Frankenberg, 2014; Stroub & Richards, 2013). However, school resegregation, albeit contrary to the former “separate but equal” doctrine, underscores what Foucault (1972) articulates as repetitions in discourse development and the lack of linearity which pervades.

After the *Brown* ruling, desegregation efforts within the American public education system began earnestly and were a precursor to the Civil Rights movement, a period during which activists agitated for the protection of the civil and political rights of Blacks. Although de jure segregation had purportedly ended, de facto segregation was harder to eliminate since people were less inclined to suddenly change their perceptions, attitudes, beliefs, and behaviors concerning Black individuals. There was great opposition to desegregation efforts with the sole purpose of avoiding desegregation at all cost (Bell, 2004; Ladson-Billings & Donner, 2005). Whites moved from desegregated districts in what is known as “white flight” to suburban areas, opening private schools for Whites only. In some instances, school boards, through their local authorities, implemented legislation which permitted districts to close schools and grant tuition vouchers to Whites only who would then use the vouchers to attend schools which had no Black students (Horsford, 2011).

Following President Barack Obama’s election in 2008, there was the assertion that America’s political system had now transformed beyond seeing race as a predictor of success – a so-called era of “post-racialism” (Carter, 2009). However, the deficit ideology concerning Black students and students of color continues to pervade education as researchers advocate the notion of either their “inappropriate” behavior or lack of academic success on the foundation of inherited or socialized traits (Wright, Morgan, Coyne, Beaver, & Barnes, 2014). Furthermore, Alexander (2011) maintains that there is now a new racial caste system in place through “the mass incarceration of poor people of color in the United States. . . one specifically tailored to the political, economic, and social challenges of our time” (p. 7). In defining this caste system as the “*New Jim Crow*,” Alexander (2010) asserts that:

Rather than rely on race, we use our criminal justice system to label people of color "criminals" and then engage in all the practices we supposedly left behind. Today it is perfectly legal to discriminate against criminals in nearly all the ways it was once legal to discriminate against African Americans. Once you're labeled a felon, the old forms of discrimination—employment discrimination, housing discrimination, denial of the right to vote, and exclusion from jury service—are suddenly legal. As a criminal, you have scarcely more rights, and arguably less respect, than a black man living in Alabama at the height of Jim Crow. We have not ended racial caste in America; we have merely redesigned it. (p. 2)

A noted disruption of that deficit ideology, though, has come in the form of multicultural education (Banks, 1989; Nieto, 1992). Its common goal is to ensure that students from diverse racial, ethnic, social, and cultural identities are the recipients of educational equality, favorable outcomes, and progress (Klein, 1985; Sadker & Sadker, 1982). This multifaceted goal is achieved through the use of culturally relevant examples, building student awareness of how knowledge is constructed as well as strengthening teacher capacity to facilitate students’ academic success, regardless of background (Banks, 1993). Fundamental to multicultural education is the reduction of negative racial attitudes in students and a school culture that is democratic and empowering. Teacher preparation programs, national organizations, and various journals advanced the work of multiculturalism and multicultural education. Simultaneously, students from marginalized groups were the

beneficiaries as layers of oppression were being identified and challenged (Linton, 1998; MacGillivray, 2000).

On the other hand, the neoliberal context within which education exists serves to disrupt the goals of multiculturalism as it appears to demand a more “palatable” approach that does not create discomfort for White individuals (Case & Ngo, 2017). Consequently, multiculturalism’s goal to tackle racism was perceived unfavorably as an unnecessary challenge to market-driven forces (Kymlicka, 2013) and soon was co-opted by neoliberal theorists and practitioners to reflect the ideal of “some cosmopolitan market actor who can compete effectively across state boundaries” (p. 111). The status in classrooms of most faculty being White created another disruption to multicultural education as efforts to create a common understanding and application of the concept proved to be problematic (Sleeter, 2018; Sleeter & Grant, 2009). This led Gay (1995) to comment that there was now a fundamental difference in the theory and practice of multicultural education, the result of which was a “brand” of multiculturalism that focused more broadly on diversity, rather than ways in which to confront racism within education.

Multiculturalism preceded other concepts such as culturally relevant pedagogy, culturally responsive leadership, and social justice as educators of color functioned as shapers of curriculum, social activists, and intellectuals on leadership discourse (Gooden, 2010; Johnson, 2006). Santamaria (2014) notes that though a leadership approach to achieve equity in schools while supporting staff could be perceived as utopian, “innovation, activism and empowerment” (p. 354) are essential to effecting educational change. Educational leadership practices grounded in experiences of marginalization, oppression, and systemic racism add texture to leadership discourse, which is evident in the development of the field (Dantley & Tillman, 2010; Gooden, 2010). As Foucault (1972) notes, it is the inherent ruptures in the field that are precursors to the unfolding of theory and the resultant change in practice.

Though the rules and laws of racism have morphed, the resegregation of schools and communities has become more apparent, and the change in the US demographics has become more evident, education’s current state is a clarion call for research-based practices that will encourage positive educational outcomes for all students.

---

## The Field of Concomitance

Foucault’s (1972) final enunciative field, the field of concomitance, addresses the influence exerted by external fields and includes statements and ideas which have shaped educational leadership and its continued development. The discourse happening in other fields and thereby transferring into education and educational leadership supports Foucault’s prior assertion that discourse development does not exist within a vacuum but instead is “always given through some material medium, even if that medium is concealed” (p. 100). From *Plessy v. Ferguson*, *Brown v. Board*, and *Milliken v. Bradley*, the education landscape is replete with examples of struggles occurring in the court which directly or indirectly have either hampered or encouraged progress within the education system.

As previously highlighted, race and racism have been linchpins in shaping US history and sociopolitical and economic discourse (Scheurich & Young, 1997; Lopez & Parker, 2003; Yosso, 2005) and continue to be the case. This history also highlights how the US legal system has conspired to keep people of color on the fringes of American society. The Civil Rights movement was defined by a struggle for freedom, citizenship, and equality under the law for Blacks (Horsford, 2019). Through the Civil Rights Act (1964) and later the Voting Rights Act (1965), Blacks began to actively protest against institutionalized racial control (Alexander, 2010; Reed, 2004). Additionally, Blacks were now able to access traditionally occupied White spaces and experienced a shift in resource allocation for schools, although not to the extent of their White counterparts (Kozol, 2005).

A seminal influence in education has also been Critical Legal Studies (CLS), which emerged as a critique to the ways in which the US legal system had been used to sanction and create inequality in the society. According to Mezey (1994), “by making the legal maintenance of the social order look neutral, natural and even just, law helps convince subordinated classes that the state is the best option for protecting their interests” (p. 1838). Consequently, these subordinated classes become complicit in their own oppression.

The apparent lack of attention in CLS to how race and racism have shaped the rights of marginalized groups (Crenshaw, 2002; Ladson-Billings, 1998), however, drew significant criticism from critical race and feminist theories, which are amalgams of ethnic and women studies, law, history, and sociology (Yosso, 2005). Critical Race Theory (CRT) initially focused on those yet achieved goals of the Civil Rights movement, which was grounded in the struggle between Black and White individuals (Bell, 1986). Therefore, women and other people of color challenged CRT’s focus as they felt their various identities rooted in gender, class, and immigration and language status were not being sufficiently addressed (Espinoza & Harris, 1998). Furthermore, these intersecting identities result in a “unique compoundedness” (Crenshaw, 1989, p. 150) in the way these groups experience oppression.

Other branches of CRT have emerged such as FemCrit, LatCrit, WhiteCrit, and AsianCrit theories as ways in which to center the oppression experienced by those particular group members. However, as Moraga (1983) suggests, it is not about creating a hierarchy of oppression but rather about “naming the enemy within ourselves and outside of us” (p. 53). Within education, these theories emphasize the centrality of race and racism in understanding how the US society operates (Bell, 1992; Russell, 1992) and have influenced the interrogation of knowledge construction and ideologies of dominant groups based on flawed concepts such as meritocracy and colorblindness (Delgado Bernal, 1998; Ladson-Billings, 2000) as well as neutral or unbiased inquiry. Importantly, however, CRT and its accompanying branches have also shaped educational leadership in terms of its focus on social justice as a way to “liberate students to make social changes. . .and nurture participatory, equitable, and just relationships” (Sernak, 2008, p. 115).

On the other hand, influences from the fields of business and management have created a sort of tension for educational leaders. This tension is inherent in the

expectation to balance the effective management of programs and services in schools (DeMatthews, 2015; Sernak, 2008) with the need to identify and address inequity experienced by the “underserved, underrepresented, and undereducated” (Dantley & Tillman, 2010, p. 23). Principles of scientific management based on efficiency and productivity (McGregor, 1960; Taylor, 1911) dictated that educational leaders created schools which were high-performing, results-driven, and data-oriented (Cunningham, 1985). These leaders would also possess the necessary skills and competencies such as emotional intelligence (Goleman, Boyatzis, & McKee, 2002), strategic vision, and purpose to lead, manage, and develop staff and students (Bolman & Deal, 1994; Leithwood, Seashore Louis, Anderson, & Wahlstrom, 2004). Invariably, educational leaders were required to be agile thinkers who could respond to change within and external to their educational institution based on empirical evidence (Collin & Porras, 1994).

The work of Senge (2006) in the field of science and engineering has also created a framework for educational leadership. Leaders are encouraged to apply a systematic approach to viewing organizations not only from the sum of their parts but also how each part affects the whole. This “systems thinking” allows leaders to evaluate the connections between entities and devise solutions that address the “right” problems (Åström & Murray, 2008). Educational leaders, principals in particular, were encouraged to use systems thinking to develop more effective skills at managing and interpreting data for school improvement (Kensler, Reames, Murray, & Patrick, 2011), implementing and sustaining educational reform (Fullan, 2005), and raising education outcomes (Daly & Finnigan, 2016). Such principals were perceived as more effective at accomplishing school goals, creating a learning environment, and encouraging staff commitment to school goals (Pang & Pisapia, 2012a, 2012b).

More recently, globalization and neoliberalism have impacted the structure and focus of education systems worldwide. Neoliberalism is a nod to scientific management as aspects of the market are encouraged to frame school choice and societal advancement. Politicians and policymakers increasingly view education as a solution to social and economic woes (Lubienski, 2009; OECD, 2014; World Bank, 1995). Therefore, educational leaders are expected to be properly prepared to respond appropriately to diverse student problems while also ensuring students gain optimal educational experiences and attain outcomes which may afford them a greater level of economic autonomy (Brighouse, 2006; Rivera-Batiz, 2007; Schultz, 1963) in a highly competitive global economy.

Besides, students’ economic autonomy reinforces Bordieu’s (1986) concept of social capital as instrumental to social mobility. However, the US education system’s racialized history perpetuates the deficit ideology that somehow students of color experience lower academic outcomes as a consequence of their family background and community origins – which are invariably tied to systemic racism. Importantly, this ideology, which is reminiscent of scientific racism and eugenics, highlights yet again Foucault’s argument that there is a dynamic between the history of knowledge development and power. It is this history which educational leaders must understand in order to create necessary ruptures in the education system, especially on behalf of students of color.

## Conclusion and Reflections

Research has shown that leadership is second only to instruction regarding its impact on student achievement which is indicative of the role that school leaders must play to drive school success (Davis & Darling-Hammond, 2012) and prepare students for a “turbulent” future (Cunningham, 1985). Moreover, as Foucault (1989) notes, “behind the visible façade of the system, one posits the rich uncertainty of disorder” (p. 84). Therefore, educational leaders must work explicitly to connect schools and communities from which students of color originate to encourage increased engagement in the educational process while also prefacing the “broader social-cultural and historic roots of blacks, as a people” (Irvine & Irvine, 1983, p. 412). As Miller (2016) opines, effective leadership must be “in place, and in sync” (p. 1).

Importantly, the ruptures that have occurred along the continuum of the US education system that have created entrenched racist attitudes, policies, and legal and economic roadblocks are stark reminders that the work of educational leaders must include social justice and equity. This work, Frattura and Capper (2007) note, is important to prevent educational leaders from interpreting “federal or state policy. . . in ways that result in further segregation and perpetuation of low achievement among traditionally marginalized students” (p. 41). Moreover, social justice’s application in the education system is not limited to a vague interpretation of the redistribution of resources and opportunities, but must also extend to the ways in which educational leaders are willing to upend all forms of oppression and engage staff, students, and parents around actions to end those injustices (Theoharis, 2009).

This chapter has highlighted the development of racial inequality in the US K-12 system, its impact on the educational experiences of Black students in particular, and the implications for educational leadership. Through tracing the history of the field of education and the ideas and concepts which have invariably created racial inequality, there is a need for continued critical consciousness that seeks to disrupt systems of oppression and inequality. The onset of the novel coronavirus (COVID-19) signals another disruptor within the continuum of education and educational leadership and has highlighted the disparities between White communities and communities of color as the latter has been disproportionately impacted by the virus (Laster Pirtle, 2020).

American presidential elections in 2016 and 2020 were marked by overt expressions of anti-Blackness, racism, anti-immigrant sentiments, and a general strategy to divide and sow discord among people who are different from the White middle-upper class norm (Winfield, 2012). However, that period has also been a watershed moment for greater awareness of the Black Lives Matter (BLM) movement and an awakening of the collective conscience of the society. Educational leaders have been forced to adopt creative strategies to address students of color through the provision of devices and learning materials as they manage a hybrid or totally remote instructional delivery.

Furthermore, the more recent proclamation of cessation in funding for diversity training and critical race theory as anti-American (Schwartz, 2020) is suggestive of how political and economic institutions are leveraged to reflect and perpetuate

dominant group ideology. It therefore means that educational leaders' demanding and intricate role (Jacobson, McCarthy, & Pounder, 2015; Pilton, 2015) must necessarily extend beyond previous management principles to prevent a situation in which teaching and learning are further damaged (Blasé & Blasé, 2004, p. 245; Hutton, 2011). Culturally relevant leadership (CRL, Beachum, 2020) is required to contextualize the historical, institutional, and sociocultural experiences of students of color.

Through the combined application of liberatory consciousness, equitable insight, and reflexive practice, educational leaders will be poised to raise awareness of diversity as they challenge biases, prejudice, and stereotypes. Simultaneously, educational leaders should seek to honor and acknowledge the intersecting identities and experiences (Crenshaw, 1989) of students and staff which are then used to dismantle deficit ideologies and create high academic expectations for students. The ability to identify and take steps to end oppression is embedded in Freire's (1972) concept of *conscientização* or critical consciousness. Through reflexive practice, leaders constantly challenge biases and practices and leverage data to make equitable decisions for enhanced "student success." Ultimately, as the US education system prepares for another series of ruptures, its leaders must be ready to transform schools into spaces which embody the "values of liberty, justice and equality . . ." and "where students have an opportunity to reach their full potential" (Beachum, 2020, n.p.).

## Abstract

The purpose of this chapter is to examine the extant literature on lesbian, gay, bisexual, transgender, and queer (LGBTQ+) communities in the United States and the role inclusive laws, policies, and practices play in the lives of K-12 students, educators, social activists, researchers, and sociologists have addressed the diverse needs of LGBTQ+ youth. However, despite nearly three decades of creating safe, welcoming, and inclusive schools across the country, heteronormativity remains the dominant narrative in schools. This chapter begins with a brief overview of contemporary issues facing LGBTQ+ communities, queer theory, and influence of historical events. In conclusion, the author suggests K-12 schools remain part of the solution to creating alliances, culturally responsive language/administrative policies, and historical contexts throughout student learning. The author encourages schools to actively address complicit practices/beliefs/attitudes/policies that often stigmatize LGBTQ+ communities. The author provides a conceptual model to shift from perpetuating anti-LGBTQ+ curricula, policies, and practices to an authentically inclusive LGBTQ+ curriculum in which students learn within a socially just learning community.

**The Field of Memory**

Although California, New Jersey, Colorado, Oregon, and counties in Virginia and Maryland led the charge to integrate LGBTQ+ history in schools, states such as Alabama, Oklahoma, South Carolina, Texas, Louisiana, and Mississippi continue to pass policy prohibiting educators to teach about LGBTQ+ communities. Anti-LGBTQ+ community laws are often referred to as *no promo homo* laws, because they forbid educators from conversing with students about LGBTQ+ communities in a positive light, if at all. This legislation fostered unsafe and unwelcoming school environments. Some K-12 schools require schools to discuss negative perceptions of the LGBTQ+ community in schools. The influence of *no promo homo* laws on LGBTQ+ school communities further influences the promotion of oppressive practices and stigmatizes LGBTQ+ students by perpetuating disinformation, misinformation, and misleading information.

**The Field of Presence**

The implementation of a LGBTQ+ inclusive curriculum depends on individual school districts because school community members have the power and privilege to determine how they will meet educational standards as well as the extent the students will experience a culturally inclusive curriculum. The 2021 Equality Act prohibits discrimination on the basis of sex, an individual's sexual orientation, as well as gender identity. The legislation may encourage educators to introduce appropriate language, diverse voices, counter narratives, and LGBTQ+ history that accurately represents an inclusive curriculum. The safeguard protection for educators, school leaders, families, and/or students who identify as LGBTQ+ may empower this community.

**The Field of Concomitance**

For much of this century, identifying as LGBTQ+ was perceived as natural and biologically based. In other words, people were seen as being born heterosexual or LGBTQ+. People who identify as LGBTQ+ have existed throughout history with diverse responses from societies around the world. In 2011, California attempted to pass policy and become the first state to require K-12 public schools to teach LGBTQ+ history. However, conservative groups, families, and some state officials attempted to pushback this legislation.

Mary MacIntosh (1968) approached homosexuality as a social role due to some societies identifying people as homosexual and others not establishing homosexuality as a part of someone's identity. MacIntosh focused on the responses of being accepted or not accepted for their sexuality. When a society defines homosexuality as abnormal, deviant, or immoral, then individuals who identify as heterosexual

becomes the accepted societal norm or ideal sexuality. Jeffrey Weeks (1991) emphasized the role the health and scientific fields played in creating a medical or psychological view of people who identified as homosexual. These two historical approaches to deepen understanding focused on the microsocial dynamics of an individual's sexual identity formation. Since the 1980s, the sociology of sexual identity developed into two perspectives: (a) diverse homosexual identities and (b) sexual identity is shaped by societal factors.

### **Discontinuities and Ruptures**

Queer theorists focus on broadening the lived experiences of sexual life when freed from state and institutional control. The major breakthrough in the 1970s and 1980s stimulated a national gay rights movement. Around the world, in cities and town ranging from England, Denmark, the United States, France, Holland, and Australia, the LGBTQ+ community began to create subcultures. These subcultures included, but were not limited to social clubs, political organizations, and community centers. The institutionalization of LGBTQ+ communities encouraged people who identified as LGBTQ+. This identity created safe havens for LGBTQ+ populations because they became members of a group, had the capacity to participate in social events, and engage in political movements. These subcultures not only created safe spaces for people to openly participate in the LGBTQ+ community, but also provided positive spaces, which was in contrast to feeling excluded or isolated from society.

In contemporary Western societies, sexuality may be understood as a private and personal matter. A more common view emerged in the twentieth century contending sex was biologically determined, not by society. Marcuse (1970) and Reich (1962) contend there is a need for sexual freedom and sexual expression. However, in order to achieve this level of sexual freedom, society needs to be radically reformed. This suggests a shift from how states dictate what they deem appropriate or not appropriate to inquiring about what assumptions are made about an individual's sexuality. This wave of theorizing centers on the construction of sexuality as being normalized versus ostracized (see Richardson, 1996, 2000). Understanding homosexuality as a social institution can be better understood when considering the institution of marriage. Marriage, which identified distinct roles for men and women, suggests the institution was between a man and a woman. Therefore, those who were afforded the privilege to engage in the institution of marriage were afforded social inclusion, full citizen rights, and all of the privileges afforded to married couples (e.g., medical care, benefits, insurance, taxes, retirement). Feminist and queer theory emphasized the need to challenge heteronormative assumptions. For example, to what extent do these heteronormative assumptions influence how society understands an individual's health (i.e., physical, social, emotional), laws, educational attainment, employment, financial stability, family, citizenship, and/or human rights?

### **Critical Assumptions**

The academic study of LGBTQ+ communities has produced a body of research and theories to deepen understanding of key debates, positions, and future directions for research. Before researchers developed a sociology for LGBTQ+ populations,

medical models of homosexuality seems to achieve considerable social influence. Over a century ago, medical communities proposed homosexuality was an inherited or learned identity or a form of sexual deviance. By the mid-twentieth century, anyone who identified as LGBTQ+ was identified as abnormal, deviant, and/or dangerous. The 1950s contributed to heightened discrimination and harassment for the LGBTQ+ community. As LGBTQ+ communities made themselves more visible, states and institutions decided to criminalize and repress a person's sexuality. As a means to interrupt these oppressive assumptions about people who identified as LGBTQ+, community members advocated for human rights, justice, and equity. For example, the Daughters of Bilitis and the Mattachine Society (see <https://www.nyclgbtsites.org/site/mattachine-society-daughters-of-bilitis-offices/>) established chapters in cities across the United States to broaden society's knowledge of LGBTQ+ history, contributions, and positive influence on this nation. Some aimed to reverse the medical model that identified homosexuality as a psychiatric disorder. The proposal suggested homosexuals were normal people like heterosexuals. During this time, the beginnings of a sociological approach aimed to identify homosexuals as a victimized minority.

In the 1960s and 70s, women and gay liberation movements proposed new insights to homosexuality. At that time, homosexuality was considered a social and political identity. For example, women who identified as lesbian suggesting being a lesbian was both a political act as well as challenging the norms of heterosexuality and men's dominance. At that time, to choose to identify as a lesbian encouraged women to live apart from men and establish their own social and personal lives.

Sociologists began developing a social approach to sexuality. Some sociologists identified homosexuality as normal or abnormal. They suggested homosexuals created their own identities and subcultures within a hostile Western society. Scholars like Howard Becker (1963), Edwin Schur (1965), Kenneth Plummer (1975), John Gagnon and William Simon (1973) were among theorists who emphasized that individuals were born with homosexual thoughts, feelings, and desires. The challenge ahead centered on homosexuals learning to navigate a hostile and unaccepting society. In the mid-1970s, sociologists and feminists developed a sociological perspective. The way in which homosexuals identified their social role in society was determined by the way in which communities responded to them. Therefore, because homosexuality was not a social problem, but an opportunity for society to learn to respond to the discrimination, prejudice, and inequities these communities faced. Furthermore, sociologists no longer questioned why someone identified as homosexual. They questioned the myriad of responses toward individuals in different societies who identified as homosexual. Scholars (i.e., Foucault, 1980; Katz, 1976; Smith-Rosenberg, 1975; Trumbach, 1977; Weeks, 1991) proposed the social construction of someone identifying as homosexual. This new approach to understanding homosexuality attempted to explain social meaning, its origin, and changing forms of sexuality (see D'Emilio, 1983; Faderman, 1981).

In a social environment in which gay and feminist movements existed, a new theory emerged: queer theory. Queer theorists (e.g., Michel Foucault, Gayle Rubin, Eve Kosofsky Sedgwick, and Judith Butler) however, contend there are a myriad of ways to being gay due to an individual's intersectionality of their identity. Specifically, a person's sexual identity cannot be separated due to one's race, class, native language, religion/faith/beliefs, age, nationality, gender, educational attainment, and/or social/emotional/physical/cognitive abilities. They argued that not all homosexuals behaved, thought, valued, or engaged in the same ways of life. Queer people recognized and valued multiple meanings attached to what it meant to identify as gay or lesbian. Furthermore, because queer people are often marginalized in Western society, queer perspectives shifted away from thinking LGBTQ+ people were a separate minority. Rather, these theorists focused on a larger system of sexuality. Therefore, queer theorists emphasized the societal norms, policies, laws, practices, and regulations that control everyone's sexuality.

In the 1980s, social movements around the world created spaces for the LGBTQ+ community to gain visibility. Throughout major cities, LGBTQ+ communities created clubs, support groups, organizations, and institutions to support social and political advancements. Despite the opposition, LGBTQ+ communities made great strides toward the promotion of human rights. This period in LGBTQ+ history is considered a time of social and political advancement as well as the rise of social constructionist perspectives in LGBTQ+ studies. A new wave of thinkers and activists sought to deepen a positive social view of homosexuality. Specifically, constructivist perspectives contend homosexuality always existed throughout civilizations. Therefore, if homosexuality always existed, identifying and living as LGBTQ+ should be considered normal and natural. Michel Foucault (1980), Jeffrey Weeks (1991), Jonathan Katz (1976), Carroll Smith-Rosenberg (1975), and Randolph Trumbach (1977) also proposed the social construction of homosexuality. These scholars explained a new way to understand sexuality with categories such as lesbian and other subcultures associated with an individual's homosexual identity.

Over the last 60 years, LGBTQ communities formed organizations and groups to address the need for engagement and political action. Highly radical or militant LGBTQ+ activists were highly criticized for politically organizing, speaking of protests, revolution, and mobilization. In the 1990s, a new queer perspective suggested the need for LGBTQ+ populations to understand that heterosexuals were placed at the center of privilege. Those who identified as LGBTQ+ were often marginalized. Assimilation into mainstream heterosexual society demanded Western society be accepting of sexual diversity (see Bawer, 1993; Sullivan, 1996). During the 1990s, gay and lesbian studies had grown immensely, changing directions and encouraging pioneering work. Judith Butler (1990) set a new agenda that questioned how people's sexual desires were separated into two camps: (a) homosexuality and (b) heterosexuality. For example, dating, attending prom, family, and/or marriage often place people who identify as heterosexual above or superior to those who identify as LGBTQ+. The artificiality of the heterosexual and homosexual divisions is examined.

Queer theory encourages the need to deepen understanding of the silences, gaps, and absences which suggest the denial of same-sex desires. Theorists provided insights revealing the extent identifying as homosexual was utilized as a method by which heterosexuals used family and heterosexuality as a means to assure superiority, similar to racism and White people claiming superiority to Black and Brown people. Queer theory envisioned the recapturing of a radical movement, celebrating boundary crossers such as people who identified as bisexual and transgender (see Pottie, 1997).

These theorists recognized queer theory did not come without a myriad of challenges including, but not limited to the following: (1) the inclusion of gender (see Walters, 1996) and (2) understanding the role of race (see Samuels, 1999). Although deconstructing heterosexuality may be a primary challenge facing queer scholarship, it seems queer identities remained vulnerable and easy to ridicule. These LGBTQ+ identities were often compared to heterosexual ideologies reassuring that romances, as seen on television and in movies, between a man and a woman were normal, natural, biological, and in many ways, unquestionable. Queer theorists strive to move from reducing identification of being queer as a need to desire to understanding difficult struggles the LGBTQ+ communities face. There was a need for greater diversity, possibilities, self-realization, hope, and assurances (Blumenfeld & Raymond, 1993; Painter & Young, 1996; Zimmer & McNaron, 1996).

Human rights are not dictated by nature. Legislation is contextualized, depending on ever-changing social relations and circumstances. Although the USA is witnessing more rights for LGBTQ+ communities, sexual rights, practices, identities, privileges, employment, housing, and relationships are still challenged. According to the Center for American Progress (2020), the LGBTQ+ community identified the following concerns:

1. 1 in 3 LGBTQ+ Americans faced discrimination, which included more than 3 out of 5 Americans who identify as transgender.
2. Discrimination toward LGBTQ+ Americans negatively affects their economic well-being as well as their mental health.
3. More than 50% of LGBTQ+ Americans chose to hide their personal relationships.
4. For LGBTQ+ Americans attempting to receive medical care, 30% shared they had difficulty accessing necessary medical care due to high costs.
5. Approximately, 15% of LGBTQ+ Americans postponed or avoided their medical treatment due to discrimination.
6. One in three transgender Americans reported obstacles to receiving health care, which included discussions with physicians about their lived experiences as transgender.
7. LGBTQ+ individuals experienced mental health concerns related to the pandemic.

## Introduction

Although scholarly resources focus on LGBTQ+ working with gay or lesbian students (see Fisher & Komosa-Hawkins, 2013; MacGillivray, 2004); creating Gay Straight Alliances (see MacGillivray, 2007; Mayo, 2017; Miceli, 2005); implementing an LGBTQ+ curriculum (see Campos, 2005; Lehman et al., 2019); or addressing challenges facing LGBTQ+ youth (see Peterson & Panfil, 2013; Robinson, 2020; Savin-Williams, 2005), this chapter provides important guidance to school community members navigating how to work and learn with students.

To deepen understanding of the current state of LGBTQ+ political and cultural visibility, educators and school leaders may want to investigate the development of the social movement that promoted this visibility. According to Sidney Tarrow (1994), a social movement encompasses a sustained collective challenge against political dominant elites and authorities, which is led by communities with a common purpose and often do not have access to existing political institutions. As school leaders and educators reflect upon the practices, policies, and rights of those who identify as LGBTQ+, seeking why people participate in movements, how they engage, and when they choose to participate provides school communities with opportunities to develop authentic collectives to facilitate authentic change to mobilize and empower this disenfranchised minority. Endorsing human rights provides a new sense of efficacy and agential power within the school community. A historical analysis of the LGBTQ+ movement may encourage school communities to consider the following: What are the lived experiences of children, families, community members, and/or educators within the school community? To what extent do members of the LGBTQ+ community experience liberation? To what extent do organizations, networks, and/or agencies identify LGBTQ+ experiences in school as a social movement? What responses do practices, policies, and procedures elicit from school community members to support the LGBTQ+ community? What factors, if any, have influenced changes?

The 1970s ushered a new stage for gay and lesbian rights. Gay liberation, in part, resurrected from a victim empowered agent at the Stonewall Inn in Greenwich Village (D'Emilio, 1983). The struggle for gay and lesbian rights in the 1970s unfolded in cities such as San Francisco, Los Angeles, Boston, Miami, New York, Minneapolis St. Paul, Eugene, and others. Activists such as Jim Owles, Craig Rodwell, Marty Robinson, Barbara Gittings, Steve Endean, Jean O'Leary, and a host of countless others attracted national attention. For several politicians, gay and lesbian rights attracted people such as Marion Barry, Jimmy Carter, Ronald Reagan, Jerry Brown, Diane Feinstein, Edward Kennedy, and others. The decade ended with the March on Washington for Lesbian and Gay Rights in 1979. The march attracted an estimated 250,000 participants (see Clendinen & Nagourney, 1999). The use of the words such as "gay" versus "homosexual" suggested a radical shift in self-perception. Phrases such as "gay power" embodied anti-war movements, student movements, Black power, and the feminist movement. The goal shifted from discrimination and structural oppression to the goal of liberation and self-determination (D'Emilio, 1983).

These movements encompassed a new blend of politics and culture. As a means to combat structural oppression, the Gay Liberation Front (GLF) sought to achieve civil rights legislation and worked alongside other oppressed minorities such as employees, Black and Brown people, and women in hope of meaningful social change (see Marotta, 1981). The GLF followed the lead of radical feminists, who raised the consciousness of communities by bridging communities. Together, they shared lived experiences and discovered commonalities. Furthermore, these efforts fostered uncovering that their similarities existed within an oppressive system (see Adam, 1995). Radicals intentionally chose to denounce the term “homosexual,” which was often imposed on gay men and women by the medical community as a term associated with mental illness (Marotta, 1981). In turn, radicals chose the word “gay,” which symbolized self-definition and internal power.

The term “coming out” emerged from this social movement. Gay liberationists transformed the understanding of self-identification of an individual acknowledging themselves as gay in an effort to symbolize the rejection and negative association society often inflicted on this community. Coming out was no longer perceived as a one-time act, but as affirming one’s identity (see D’Emilio & Freedman, 1988; Griffith & Heble, 2002). By acknowledging one’s sexual orientation, individuals also brought the discrimination they often faced to the forefront (i.e., physical assault and verbal abuse). Although the GLF collapsed in 1973, the redefinition of coming out influenced the lives of gay men and women throughout the United States. The process of coming out transformed the individual experience from being regarded as a victim to a source of pride to celebrate oneself (see D’Emilio, 1983).

Despite such strides, a wave of political conservatism made its way across the United States. The Christian right began to interfere with the gay and lesbian movement and fostered a massive counter-movement. The Christian right focused their efforts to remove educators who identified as gay or lesbian from schools; Harvey Milk was assassinated; and the movement to “Save Our Children,” Florida legislation to appeal gay rights was spearheaded (see Clendinen & Nagourney, 1999). By the early 1980s, gay and lesbian rights were debated within all government levels from civil rights to privacy to the Acquired Immune Deficiency Syndrome (AIDS) epidemic. In 1981, five gay men acquired a rare cancer, and within 19 years of its discovery, over 300,000 Americans died from AIDS, including 210,000 gay men (see Vaid, 1995). The AIDS epidemic grew rapidly and was a seemingly unstoppable disease. The onset of AIDS encouraged the number of people who willingly came out. However, the lack of response from politicians, such as Reagan and Bush, felt abandoned by their government. The Gay Men’s Health Crisis (GMHC) emerged (Cruishank, 1992).

Demonstrations to support the AIDS movement led to the creation of the AIDS Coalition to Unleash Power, which gave essential media attention. The movement shed light on the urgency of this epidemic; provided universal awareness and hope to the gay and lesbian community; and encouraged political leverage. As the AIDS epidemic expanded media attention, political attention at local/state/national levels, the New Right utilized this epidemic as a weapon to interrupt the achievements of the 1970s. Traditional heteronormative values, beliefs, and attitudes often returned to

the forefront. For example, although identifying as gay or lesbian was no longer listed as a mental illness, the New Right correlated AIDS as a gay disease and suggested nature was enacting retribution toward gays and lesbians (see Lesbian and Gay Community Services Center, 1996).

Throughout the 1970s and 1980s, the gay and lesbian struggle focused predominantly on White males. In the 1990s, gay Black, Pacific Islanders, Asians, created sexual minority rights organizations revealing the extent AIDS organizations failed to recognize their lived experiences. The Latino/a Lesbian and Gay Organization (LLEGO), the Native American AIDS Task Force, the National Black Gay and Lesbian Leadership forum, and the National Gay Asian and Pacific Islander Network were established (see Vaid, 1995). Furthermore, efforts were made to bridge groups within the gay and lesbian community. Queer Nation was born. The organization sought to unite lesbian, gay, bisexual, and the transgender communities under one term: Queer (see Berlant & Freeman, 1993). This unitary identity promoted the struggle of being queer and unifying as a sexual minority, transforming the derogatory term into a statement of pride. Although such efforts may have been promoted to empower communities to unite under one term, such efforts suppressed differences within these groups, including racial and gender identities to preserve cohesion (Seidman, 1993).

Furthermore, efforts such as President Clinton's "Don't Ask, Don't Tell" military policy intended to maintain gay visibility in the military. However, silencing queer people illustrated the potential threat of queer politics (see Bersani, 1995). The Clinton administration underestimated the increasing power of the religious right. The National Gay and Lesbian Task Force (NGLTF) and the Human Rights Campaign (HRC) lobbied to protect the queer community (Rayside, 1998). The movement was at a crossroads. The movement did not achieve dismantling institutionalized homophobia or national civil rights legislation.

Supreme court decisions to end employment discrimination, legislation such as the Defense of Marriage Act (DOMA), and more recently, Supreme Court decisions to support LGBTQ+ issues help the community achieve politico-cultural freedom. For example (see Issenberg, 2021), in 2000, Vermont legalized civil unions between same-sex couples; the Texas Supreme Court ruled in 2002 that sodomy laws were unconstitutional; Massachusetts legalized gay marriage in 2004; the Logo cable channel facilitated a presidential forum in 2007 focused on LGBT issues including Hillary Clinton and Barack Obama; California's Proposition 8 was passed making same-sex marriage possible in 2008; President Barack Obama signed a Presidential Memorandum in 2008 affording federal employees with same-sex partners to receive some benefits; Congress passed the Matthew Shepard Act, a young man who was murdered and tortured for his perceived sexual orientation, which furthered the 1969 US Federal Hate Crime Law in 2009 to include crimes motivated by a victim's perceived or actual sexual orientation, gender expression, gender identity or ability; a San Francisco federal judge in 2010 contends LGBT people have the constitutional right to marry; the US Senate repeals the "Don't Ask, Don't Tell" military policy affording gays and lesbians to serve openly in the United States military (Belkin & Bateman, 2003); President

Barack Obama demonstrated his support to eliminate the Defense of Marriage Act in 2011, which prohibited same-sex marriage; gay marriage was legalized in New York in 2011 and passed the Marriage Equity Act (see Mezy, 2017); the US Supreme Court decided in 2015 to declare same-sex marriage across all 50 states (see Mezy, 2017); and in 2020, the US Supreme Court ruled workers cannot be fired for being LGBT+ (Esseks, 2020).

Overall, the LGBT+ movements demonstrate a developmental history including cognitive liberation, shifting from imposed victim status from heteronormative society to an empowered agent, and transforming political acts to legislatively shape queer liberation. However, although the movement continues to expand, attaining new allies, and encouraging national long-term human rights legislation, LGBTQ youth and culture continue to face challenges in schools (see Aston, 2001). The next section focuses on the lived experiences of LGBTQ+ groups in US schools.

---

## Windows v. Mirrors

Although the US Supreme Court was established in 1789, rulings regarding the LGBTQ+ community were not established until nearly 170 years later. Today, the nation's highest federal court has reviewed and weighed-in on several cases regarding LGBTQ+ rights influencing the lives of Americans, especially those who identify as LGBTQ+. For too long, students who identify as LGBTQ+ have confronted more windows than mirrors, which is similar to Students and Communities of Color, people living in poverty, first-generation US students, and girls. Although this may be changing in many places across the .SA, there still exists schools who prohibit educators from discussing same-sex attraction (see Alabama State Code, 16-40A-2(c)(8) and North Carolina Code 59-32-30(5)), inclusive bathroom use, and culturally relevant curriculum (e.g., Ohio HB-322) (see <https://ohiohouse.gov/members/don-jones/news/jones-introduces-bill-to-prohibit-critical-race-theory-in-k-12-education-106451>). This legislation fosters unsafe and unwelcoming schools. These stigmatizing laws are not supported by most educators and students; however, teachers who teach in states that do not support LGBTQ+ inclusive curricula less likely to teach in a positive way about LGBTQ+ topics or provide LGBTQ-related resources. There is a need to provide K-12 students with windows to look out and view unfamiliar lived experiences as well as mirrors to afford students with opportunities to reflect on their own lives.

What would happen if youth in K-12 schools were afforded opportunities to deepen their understanding of LGBTQ+ communities, their history, marginalization, and contributions to society? What happens when students learn about human rights? What are possible learning outcomes for youth who are encouraged to advocate for LGBTQ+ communities? What are the consequences of integrating a culturally authentic curriculum to create spaces for youth to show up as their full selves?

## Teaching LGBTQ+ History

In 2011, California attempted to pass policy and become the first state to require K-12 public schools to teach LGBTQ+ history. However, conservative groups, families, and some state officials attempted to pushback this legislation. As a result, California did not approve the first LGBTQ+ inclusive textbooks until the 2017 school year (see Bay Area Reporter:: Slow rollout for LGBT textbooks ([ebar.com](http://ebar.com))). Two years later in 2019, New Jersey became the second state (see <https://www.northjersey.com/story/news/2019/02/01/nj-schools-teach-lgbt-history-new-law/2743028002/>) and Colorado became the third state (see [Inclusion Of American Minorities In Teaching Civil Government | Colorado General Assembly](#)) to join California requiring schools to expand their definitions of US history, civil rights, and advocacy groups. And throughout the passing of these house bills, while Christian Fuscarino, the executive director of Garden State Equality (see <https://www.gardenstateequality.org/>), promoted this work, Alfonso Cirulli, a public school leader (see [Barnegat mayor: Requiring LGBT history in school is “absurdity” \(app.com\)](#)), announced the government was promoting immorality by requiring schools to engage students in learning about LGBTQ+ history.

In 2019, the Illinois Governor J.B. Pritzker announced that his state would be the fourth state to require public schools to teach LGBTQ+ history passing HB0246 (see <https://www.ilga.gov/legislation/fulltext.asp?DocName=10100HB0246&GA=101&SessionId=108&DocTypeId=HB&LegID=114183&DocNum=0246&GAID=15&Session=>). He promoted this work, along with Senator Heather Steans (see <https://www.washingtonexaminer.com/news/illinois-mandates-schools-teach-lgbt-history-to-overcome-intolerance>), to provide students with opportunities to navigate discriminatory practices and policies as well as examining the roles and contributions of lesbian, gay, bisexual, transgender, and queer people under the Illinois Humans Rights Act. In 2020, schools were allotted funds to purchase textbooks to promote the inclusion of all people. However, the implementation of an inclusive curriculum depends on individual school districts because school community members have the power and privilege to determine how they will meet educational standards as well as the extent the students will experience a culturally inclusive curriculum. Furthermore, in 2020, Arizona’s lawmakers voted to overturn a decades-old law prohibiting schools from providing students who identified as LGBTQ+ from receiving accurate health information in school (e.g., HIV, AIDS) (see <https://www.cnn.com/2019/04/11/us/arizona-repeals-anti-LGBTQ-law-trnd/index.html>).

Although California, New Jersey, Colorado, Oregon, and counties in Virginia and Maryland led the charge to integrate LGBTQ+ history in schools, states such as Alabama, Oklahoma, South Carolina, Texas, Louisiana, and Mississippi continue to pass policy prohibiting educators to teach about LGBTQ+ communities. Anti-LGBTQ+ community laws are often referred to as *no promo homo* laws, because they forbid educators from conversing with students about LGBTQ+ communities in a positive light, if at all. This legislation fostered unsafe and unwelcoming school

environments. According to the Gay Lesbian Straight Education Network (GLSEN) (see <https://www.glsen.org/activity/no-promo-homo-laws>), some K-12 schools require schools to discuss negative perceptions of the LGBTQ+ community in schools. In GLSEN's research brief (see <https://www.glsen.org/sites/default/files/2019-10/GLSEN-Research-Laws-that-Prohibit-Promotion-of-Homosexuality-Implications.pdf>), the organization examined the influence of *no promo homo* laws on LGBTQ+ school communities. They conclude the influence of oppressive practices further stigmatizes LGBTQ+ students by perpetuating disinformation, misinformation, and misleading information.

According to GLSEN's 2019 Culture and Climate survey findings (see <https://www.glsen.org/sites/default/files/2021-01/California-Snapshot-2019.pdf>), U.S. K-12 public schools are not embracing an inclusive LGBTQ+ curriculum. Advocates believed the house bill would inspire equitable and inclusive learning environments, encouraging schools to integrate LGBTQ+ contributions, history, and accomplishments. However, the Education Act faced several roadblocks. Less than 20% of educators integrated LGBTQ+ history and did not utilize the largest repository of LGBTQ+ resources in the world (see <https://one.usc.edu/collections/conducting-research>). LGBTQ+ history should be considered an integral part of U.S. history. In order to promote authentically inclusive curriculum, there is a need for schools to create spaces for teaching multiple historical perspectives.

Unfortunately, across the U.S., only 19.4% of public schools promote positive LGBTQ+ representations including events, history, and people. For example, in California, a state that passed LGBTQ+ inclusive curriculum legislation, only 31% of students reported being taught about this specific history in 2019. Some teachers may have lacked support at the local level to promote this inclusive curriculum. Pushback from school leadership, school boards, and families could promote negative consequences to those who embrace counter narratives and histories of disenfranchised populations.

In February of 2021, Congress passed H.R.5, the Equality Act, which prohibits discrimination on the basis of sex, an individual's sexual orientation, as well as gender identity (see <https://www.congress.gov/bill/117th-congress/house-bill/5>). This legislation may influence what may be taught in K-12 public schools. The Equality Act has the potential to enable protections for school communities, specifically, implementing LGBTQ+ history. The Equality Act may encourage educators to introduce appropriate language, diverse voices, counter narratives, and LGBTQ+ history that accurately represents an inclusive curriculum. The safeguard protection for educators, school leaders, families, and/or students who identify as LGBTQ+ may also empower this community. For LGBTQ+ students, promoting an inclusive curriculum is essential to creating a safe and inclusive learning environment. Students learn about histories that may have been silenced, overlooked, and/or altered by the dominant cultural narratives; and in this case, by heteronormativity. GLSEN's climate studies suggest the implementation of an inclusive curriculum influences how often LGBTQ+ students experience bullying and harassment in school (see [The 2015 National School Climate Survey | GLSEN](#)).

The findings also contend that LGBTQ+ history and narratives affect all students positively. Students may have an opportunity to engage in gender-inclusive curriculum, which may support and validate students' lived experiences. For example, 82% of students were more likely to accept LGBTQ+ peers while engaging in a LGBTQ+ inclusive curriculums (see [The 2015 National School Climate Survey | GLSEN](#)). And, in the 2019 GLSEN survey, approximately one third of LGBTQ+ youth considered dropping out of school due to hostile school climates, policies, and practices.

In 2019, the Colorado General Assembly passed House Bill 19–1192 (see <https://www.cde.state.co.us/standardsandinstruction/1192commission>), which concerned themselves with teaching the inclusion of matters aligned with American minorities. The Commission made recommendations to the State Board of Education to review and revise their history curriculum regarding culture, social contributions, and civil government. In 2021, the 1192 Commission (see <https://www.cde.state.co.us/standardsandinstruction/1192commissionmeetingsummary11421>) encouraged culturally inclusive curriculum. Concerns regarding the inclusion of American minorities in teaching civil government in schools, educators are encouraged to include the culture, social contributions, and history of Latinx, American Indians, Asian Americans, African Americans, and LGBTQ+ individuals, and those who face religious persecution, as well as the intersectionality of social and cultural features within these communities. Current legislation (i.e., HB 19–1192) requires school communities to reconvene at least once every 10 years and forums to be held every six years to ensure these educational standards are being met.

In 2021, The Trevor Project, a U.S. national organization focused on suicide prevention for LGBTQ+ youth (see <https://www.thetrevorproject.org/survey-2021/>), conducted a 2021 survey to shed light on the lived experiences of 34,759 youth ages 13–24. LGBTQ youth, who gained access to safe spaces that affirmed their sexual orientation, reported lower rates of suicide attempts than those who did not. Furthermore, the role of social media played both a positive and negative affect on LGBTQ youth with 88% identifying that it played a negative role in their social-emotional well-being. For those who identify as LGBTQ, youth discovered gender-affirming spaces online (69%), at school (50%), and at home (34%). LGBTQ-affirming spaces Transgender and nonbinary youth identified gender-affirming spaces online (71%), in school (47%), and at home (33%).

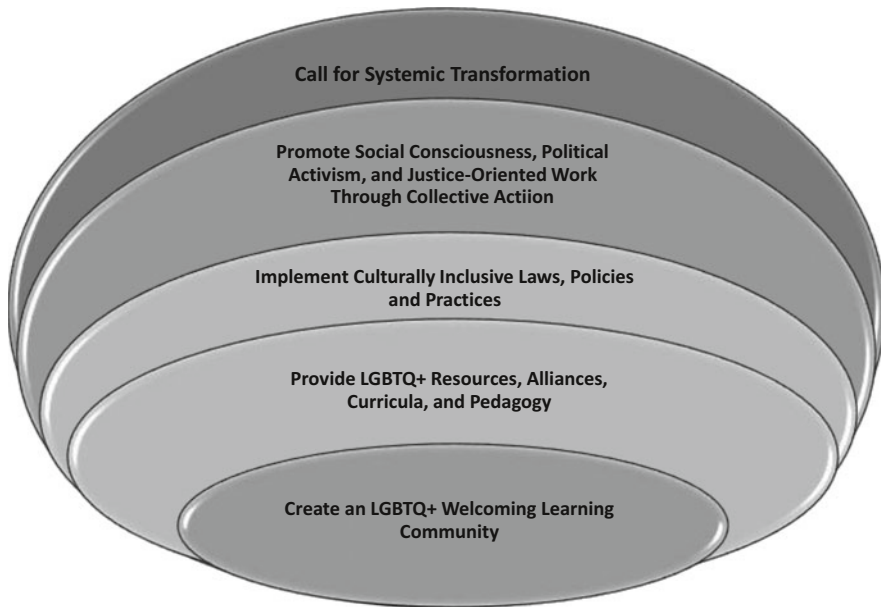

Queer America, an educational podcast released by the Southern Poverty Law Center's Learning for Justice (LFJ), showcases Leila Rupp and John D'Emilio. Together, these historians created podcasts focused on sexual and gender identity in the United States. Queer America provides a resource to educators interested in LGBTQ+ history. Leila and John present curriculum, critical conversations, resources, and activities to integrate LGBTQ histories (see <https://www.learningforjustice.org/podcasts/queer-america/welcome-to-queer-america>). The 13-episode podcast is aligned with Learning for Justice (see <https://www.learningforjustice.org/about>). The organization identifies as a catalyst to advance human rights for all communities.

## Conclusions and Reflections

Discussing sexual and gender identity with students may be emotional, complex, and exhausting. Discovering the history of Queer America, incorporating queer history in curriculum, and creating sacred safe spaces for this work in schools plays a significant role in navigating possible challenges K-12 school communities may face. Beyond a child's home, US schools may be considered primary spaces for educating, socializing, and providing essential services for youth. Schools, however, can be challenging environments for students, especially for youth who often feel unwelcomed for identifying as LGBTQ+ (see Gay, Lesbian, Straight Education Network, 2021). Laws prohibiting discussion about LGBTQ+ communities may forbid educators from discussing LGBTQ+ people, topics, or historical events. Furthermore, some school communities may encourage educators to speak of LGBTQ+ communities in a negative or inaccurate way, or possibly, not at all (see Gay, Lesbian, Straight Education Network, 2021). For many of these students, social pressures are unfortunately part of the K-12 school experience regardless of a child's gender identity or sexual orientation. However, for those who identify as LGBTQ+, they may experience more challenges due to lack of support from family and friends; social isolation from the community-at-large; exclusion and/or demonization from religious/faith-based institutions; and negative messaging about LGBTQ+ people at school, social media, and community.

Focusing on the social and lived realities of sexual minorities suggests political, social, and educational systems critically examine the extent each contributes to the perpetuation of an inequitable educational system that privileges heterosexual identities, heteronormativity, and dominant knowledge/power/narratives. Should students know what led to the Stonewall uprising (see Sanders, 2019) of 1969? Do learners know about Jean O'Leary's legacy as a gay rights activist (see <https://www.youtube.com/watch?v=USWWUVEFLUU>)? Or the literary genius and contributions of James Baldwin (see Brim, 2017)? Should students understand the LGBTQ+ movement (see Adam, 1995), casualties on the community, human rights for public health, and/or prevailing heteronormative gender dynamics (see D'Emilio, 1983)? How many school community members know about the murders of Matthew Shepard (see <https://www.matthewshepard.org/>) and Billy Jack Gaither (see <https://www.pbs.org/wgbh/pages/frontline/shows/assault/billyjack/>) who inspired journalists, filmmakers, activists, school leaders, teachers, and policymakers morally concerned about acts of violence toward LGBTQ+ people to focus on gay-bashing in the United States?

A conceptual model (see Fig. 1) provides a means to strengthen efforts to create a more just educational system. The model encourages communities to examine how they understand the larger heteronormative system; to recognize the extent educators/youth/families participate in the interruption of a heteronormative social organization; the need to develop strategies to interrupt heteronormative thinking/curricula/practices; and creating an inclusive learning environment through systemic institutional changes.

**Fig. 1** Conceptual model for creating an LGBTQ+ inclusive learning community

When comparing how often LGBTQ+ communities and legacies are discussed throughout the curriculum, sexual orientation does not seem to receive much attention (see Harris & Bliss, 1997; Mayo, 2014; O’Conor, 1995; Smith, 1998). A lack of policies, curriculum, and practices that support and affirm LGBTQ+ youth suggests schools have failed to implement protections. Therefore, students who identify as LGBTQ may face harassment, bullying, hostile learning environments, and isolation, which may place LGBTQ+ youth in unsafe physical and psychological educational spaces and possibly limit their education. Exposure to negative effects includes violence as well as health-related disparities between LGBTQ+ youth and their heterosexual counterparts (see Bouris, Everett, Health, Elsaesser, & Neilands, 2016; Russell, Ryan, Toomey, Diaz, & Sanchez, 2011). For example, LGBTQ+ youth are 140% more likely not to attend school at least one day out of 30 days. With LGBTQ+ students having more attendance concerns, lower school performance, and decreased graduation rates may have lifelong consequences for these students. According to Kann et al. (2016), LGBTQ+ youth experience more violence, immunodeficiency virus infections, sexually transmitted diseases (STDs), pregnancy, stigma, social rejection, and family disapproval. Furthermore, these complex combinations also raise concerns for LGBTQ+ youth regarding higher risks for depression, anxiety, suicide, drug abuse, and sexually transmitted diseases. Nearly 29% of LGBTQ+ students attempted suicide at least one time the year before in comparison to 6% of heterosexual youth. Furthermore, in 2014, LGBTQ+ men accounted for 8 out of 10 HIV total diagnoses among young people (Coker, Austin, & Schuster, 2010).

Youth may not be in positions to improve their school climate, propose LGBTQ+ related policies, or supporting school practices to make meaningful connections with their school communities. The outcomes of LGBTQ-bias are often associated with negative outcomes such as lower daily attendance, health concerns, not feeling connected with school, and lower grade point averages (GPA) (see Center for Disease Control, 2021; O'Shaughnessy, Russell, Heck, Calhoun, & Laub, 2004; Poteat & Espelage, 2007; Russell et al., 2011). LGBTQ+ students need learning environments that are safe, supportive, and caring. Creating positive communities provides opportunities for LGBTQ+ youth to achieve, develop/maintain/sustain good physical and mental health.

Although schools and lawmakers may recognize LGBTQ+ youth as a vulnerable and marginalized population in school communities, there is a need to create, design, implement, integrate, and ensure all students feel safe and welcomed in school. Legislation has the capacity to ensure US K-12 schools provide culturally comprehensive and accurate teaching of history. Furthermore, legislation also affirms the contributions, dignity, and civil rights movements that shape society.

In some states, students and teachers may not have as many protections as other states. For example, silencing LGBTQ+ history, narratives, and lived experiences may be exacerbated by state laws (e.g., Alabama, Arkansas, Montana, Tennessee, and Texas) due to antiquated legislation that restricts discussions of LGBTQ+ communities in schools (see Ronan, 2021). Protections may not exist, be inadequate, and/or not enforced. In 2015, 15 anti-LGBTQ+ bills were enacted into law in the United States. In April of 2021, eight anti-LGBTQ+ bills were enacted into law with 10 more proposals awaiting governors' signatures. Furthermore, more than 250 anti-LGBTQ+ bills have been introduced in 2021 with additional bills waiting to be presented before the end of legislative sessions (Ronan, 2021). Although more than 80 US corporations have opposed anti-LGBTQ+ legislation (e.g., American Express, Google, Pfizer, American Airlines, Apple, Verizon, Uber, and Facebook), as a nation, we are approaching a crisis with a need for schools and businesses to play a significant role in taking action against anti-LGBTQ state bills.

As LGBTQ+ youth and educators become more visible, states and schools may need to reconsider the extent they have ignored their needs as well as the extent schools did not provide the same academic and social emotional safeguards as their non-LGBTQ+ counterparts. Areas of concern include, but are not limited to, exclusion from curricula and resources; restrictions for LGBTQ+ youth organizations/clubs/groups; and discrimination and bigotry from school community members. These broad concerns provide starting points for school community leaders and policymakers to ensure the rights of people who identify as LGBTQ+ are respected and protected in K-12 US schools. In order to support K-12 school communities, educators may need support to transform their curricula, practices, and policies in fear of possible community protest. This support may disrupt these constraints and provide educators and youth with innovative instructional approaches, inclusive curriculum, and opportunities to address lived realities facing LGBTQ+ communities across the United States.

Integrating LGBTQ+ history throughout K-12 curriculum is not about attending to covering ever historical figure, body of literature, or historical event. Rather, addressing historical work affords learning communities opportunities to pay closer attention to historically situated populations. Learners are encouraged to ask questions, inquire about counter narratives, and uncover what may have been suppressed. The intersection between sexuality and gender, issues of racial justice, the role of capitalism, social justice, human rights, mental health, equity, and civil rights movements may shape K-12 learning environments. This authentic inquiry may energize pedagogical approaches and consider the extent new ways of thinking and responding provide a springboard for discussions, debates, and new ways of knowing.

Recommendations for promoting authentic action are complex. Awareness may be the first step; however, the historical heteronormative social structures that discriminate, ostracize, and stigmatize sexual minorities must be addressed to promoting authentic change. Some school communities may be proponents of civil rights, sexual minority histories/narratives/contributions, and culturally responsive learning spaces. However, most K-12 schools are not examining the influence anti-LGBTQ+ policies, laws, and activities play within learning communities. In order to address the lived realities facing LGBTQ+ communities, each school community member may need to look within, reflect on one's capacity and responsibility to eliminate LGBTQ+ discriminatory laws/policies/practices, and authentically promote inclusive systemic changes that may eliminate injustice in K-12 schools.

### Abstract

This chapter interrogates how the process of constructing Asian Americans as a monolithic racial category within data collection practices undermines the clarity with which educators can identify inequitable educational outcomes across the plurality of ethnic groups contained by the broader Asian American category. Following a Foucauldian tradition of contesting the underlying assumptions informing contemporary educational practices, the chapter outlines the limits of racial categorization. It illustrates the current issues of Asian Americans’ persistence representation as model minorities and a political wedge in the pursuit of educational equity by focusing on data disaggregation efforts within Washington State.

**Keywords**

Asian American · Model minority · Categorization · Achievement · Affirmative action

**The Field of Memory**

Asian Americans have a long history of unassimilable representation within United States (U.S.) history, often depicted as a foreign threat. From the Chinese Exclusion Act in the late nineteenth century to Japanese internment camps during World War II, peoples of East Asian heritage within U.S. soils have experienced fraught relationships within a state that has sponsored exclusionary practices (Kurashige, 2016, Lew-Williams, 2018; Takaki, 1998). The latter part of the twentieth century, however, forged a distinct narrative for Asian Americans: one where their perceived social, educational, and financial mobility crystallized a new narrative of exemplar assimilation within the nation-state.

**The Field of Presence**

Examining the historical construction of Asian Americans as a racial category offers insights into the narratives that position Asian Americans as a mythical model minority in the U. S. These durable perspectives have been mobilized to integrate Asian Americans within an assimilationist framework of respectability politics. Contrasting with this perspective, Asian American scholars have disrupted these claims by mobilizing efforts to disaggregate racial data to both demystify the model minority narrative and avoid casting Asian Americans as a political wedge in current debates on educational attainment amongst minoritized racial groups.

**The Field of Concomitance**

The contemporary moment offers multiple examples of efforts to disaggregate educational data by enhancing the ethnoracial granularity with which data are produced and disseminated. This is one contemporary strategy seeking to undermine the mythical status of Asian Americans as model minorities. This is the result of important activism in analog fields, such as public health.

**Discontinuities and Ruptures**

Current attempts to mobilize Asian Americans as a political wedge within discourses of educational inequality in US postsecondary education embody the persistent ambivalence of representation of Asian Americans within contemporary educational scholarship.

---

**Introduction**

This chapter examines how racial categorization operates as a naturalized process within educational administration. First, the distinction between “Asian” and “Asian American” is discussed to illustrate how practices of categorical differentiation

across racial groups render Asian Americans as simultaneously foreign and model minorities. A brief history of the shifts in the production of Asian American as a racial category in the U. S. outlines how the multiple experiences, circumstances, and outcomes seldom examine the assumptions undergirding the empirical claims that educational leaders use to allocate resources for racial groups within educational environments. It is concluded that Asian American heterogeneity must be viewed beyond categories, questioning the basis upon which claims of empirical truth about racial distinctions for Asian Americans are made within the educational realm.

---

## Who Counts as “Asian American”?

The U.S. Census Bureau defines “Asian” as:

A person having origins in any of the original peoples of the Far East, Southeast Asia, or the Indian subcontinent including, for example, Cambodia, China, India, Japan, Korea, Malaysia, Pakistan, the Philippine Islands, Thailand, and Vietnam. (U.S. Census Bureau, 2020)

As the nation’s most comprehensive source of demographic information, and self-defined “leading provider of quality data about its people” (U.S. Census Bureau, 2020), the U.S. Census is largely considered a factual repository from which researchers construct knowledge about the nation’s populace and legislators allocate resources, including educational appropriations. The Census has been a critical source in wide-reaching legal verdicts ranging from exclusionary laws (Prewitt, 2016) to redistricting policies (Persily, 2000). And though a cadre of historians and sociologists have amassed extensive empirical evidence nuancing how we come to believe in the technologies of racial categorization within instruments like the Census as scientific truths, these racial checkboxes continue to define both the sociocultural and national boundaries of who counts as Asian and to whom the category’s associated characteristics apply (Anderson, 2015). Thus, when the Pew Research Center reported that Asians are the highest-earning, best-educated, and most satisfied Americans (2012), it reinforced the presumption that such a claim could equally apply to all peoples of origins in the Far East, Southeast Asia, or the Indian subcontinent.

The notion of origins, in and of itself, however must be carefully scrutinized. Changing borders of nation-states and claims to land aside, origins presume the beginnings of any given individual in relation to a specific place. Most obviously, this discounts the viability of claims to group identities, such as Hmong, for whom relationships with land have been nomadic due to forced migration (Vang, 2010). Additionally, this view of spatial origins undermines the inextricable articulations of individuals’ self-identification in relation to geographies. The distinction between “Asian” and “Asian American,” for example, illustrates this point. Consider how an individual may have origins in Japan because a blood relative from five generations prior was born in the city of Mitaka, thus rendering this person’s self-identification

as Asian per the Census' definition. The individual's identification, however, may further modify this categorization as Asian *American*, given their own birth within the boundaries of the U.S. While subtle, the additional modifier is of particular importance: Asians in the U.S. view their social realities differently than Asians born or living in Asia (Pew Research Center, 2012; Teng, 2013). Therefore, symbolic boundaries – “lines that include and define some people, groups, and things while excluding others [based on]. . .normative interdictions (taboos), cultural attitudes and practices, and patterns of likes and dislikes” (Lamont, Pendergrass, & Pachucki, 2015, p. 850) – could be more accurate referents for determining who counts as Asian, and at minimum, should be considered when drawing conclusions about the racial group.

The attachment to origins as the foundation for race is of particular significance for Asians because of the historical contingencies upon which contemporary practices render Asians as perpetual foreigners. In doing so, these narratives advance the belief that Asians are wholly unassimilable (Wu, 2002), and therefore, never fully American. The addition of “American” to the racial group label does little to counter decades of media representations (Lee, Wong, & Alvarez, 2009), news reports (Ng, Lee, & Pak, 2007), and everyday exchanges (Ruiz, Horowitz, & Tamir, 2020) that cements the viability of casting aspersions against Asian Americans to “go back to your country” as consistent with the untenability of Asian peoples. The naming of instances when Asians are attacked, called, or viewed as un-American or “forever foreigner” (Tuan, 1998) casts light to an unexamined assumption within scholarly discourses on Asian Americans. Beyond literary conceptions is the presence of real-life exchanges that are reported as discrimination, whether based on foreignness or not, that should be also be acknowledged as valid. Both viewpoints require attention when considering how to characterize Asian Americans.

There is a third perspective that also deserves attention and that is an equally dominant belief: that Asian Americans neither endure racism nor discrimination. This perspective can stem from the denial of racism in all forms toward all groups (Russonello, 2020) or the opinion that racism does not exist for Asian Americans, specifically. The latter has been theorized by scholars as the “model minority myth” (Takagi, 1992), or the misconception of universal and unparalleled success achieved by Asian Americans. Given life in *The New York Times* by sociologist William Petersen (1966), the model minority was first used in writings that portrayed Japanese Americans as an exemplary group for overcoming discrimination and achieving a measure of educational and financial success deemed laudable by policymakers and media alike. Retrospective accounts of this moment in the late 1960s included the framing of the model minority as a mythical depiction, challenging Petersen's conception, and giving a new vantage point from which to understand the intraethnic heterogeneity of Asian Americans. Based on the extension of the model minority as a myth, individuals within the group could be considered more variable and undefinable by a single characterization.

Collectively, the multiple and contrasting ideas and concepts related to Asian Americans that are considered viable point out one conclusion: the basis of who Asian Americans are is predicated on the sustenance of incoherent assumptions that stitch together disparate groups. Accordingly, documenting the experiences,

circumstances, and outcomes of the racial group – within and beyond education – must acknowledge the presuppositions not of the group, but of the category itself.

---

## Limits of Categorization

Scholars in the social sciences, for the most part, concur that race is a social construct (Omi & Winant, 2015). The broad contributions of humanists and social scientists grounding racial constructs within historical contingencies have dethroned perspectives that argued for a biological basis of racial differentiation. The processual scripts wherein ideals of who counts as Asian American and how specific practices delimit the contours of Asian American-ness are sedimented through quotidian aspects: from food to linguistic practices, to attitudes towards family and education. The history of how social scientists created the boundaries for an Asian checkbox underscores how these empirical practices tangoed with the sociopolitical zeitgeist of their moment. As Kenneth Prewitt (2016) – former Director of the U.S. Census Bureau – documents, Chinese, Japanese, and “Hindoo” all received their own racial categorizations in the late 1800s, which were a direct response to the growth of these groups’ immigration to the U. S. Creating these categories based on nationality had a key aim: “Asians were counted in so they could be counted out” from the apportioning of federal resources (Prewitt, 2016). The shifting nature of who is included within the proverbial Asian checkbox has, at times, included Pacific Islanders. Their inclusion within the Asian category has unfolded like a pendulum – starting separately in Blumenbach’s taxonomy, conjoined by the Census, and detached again by the Office of Management and Budget in 1997 (Prewitt, 2016). As Perez (2002) noted in his exploration of identity formation within the context of US nation-building efforts, the construction of homogenizing ethnic labels (such as “Asian Pacific Islander”) is part of a “nation that romanticises [*sic*] its immigrant history; Pacific Islander experiences are often watered down by these binarism” (p. 457). These practices of selective (in/ex)clusion in the construction of racial categories are the grounds upon which broader narratives of educational opportunities and outcomes are framed across educational discourses.

There are instances, however, when one’s categorization misses the mark entirely. Maghbouleh (2017) documents this phenomena in her book on Iranian Americans who “sit, categorically, at the outer limits of whiteness, and [...] possess social experiences that reflect the outer boundaries and limitations of what ‘official’ whiteness can achieve or mobilize” (p. 9). While categorization as a social practice serves as a process by which material social conditions are both articulated and materialized, the construction of boundaries that delimit the contours of the racial categories also obscures the lives of individuals inhabiting the liminal spaces of the categories. Accordingly, not only must conclusions about Asian Americans, and their outcomes and life circumstances, be carefully considered given the faulty grounds upon which the Census has defined them, but the inevitability of these categories’ changes over time offer a cautionary tale. Ethnoracial categories are bound to temporal shifts and, thus, must be used with caution when aspiring to offer a portrayal of the complex cacophony of lived experiences that these categories aspire to apprehend. For Asian

Americans, racial categories as a basis of truthful representation must be contested by social scientists, educational policymakers, and educators.

---

## Asian Americans in Education

There is no shortage of scholarship admonishing Asian American's representation in educational scholarship as constrained through the enduring tropes of the perpetual foreigner and the model minority (Ng et al., 2007; Poon et al., 2016). Asian American researchers have rightly critiqued prior scholarship for advancing a narrative of Asian American success as indicative of assimilation into the white norms of the U. S.' schooling systems (Teranishi, 2010). Earlier scholarship in the field lamented how targeted policies to enhance educational access (such as affirmative action) had resulted in the exclusion of Asian Americans (Hsia, 1987) despite the growing compositional shifts among the broader Asian American community (Hsia, 1988). Thirty years later, lawsuits against the University of North Carolina at Chapel Hill and Harvard University by the Students For Fair Admissions (a lobbying group funded by conservative legal strategist Edward Blum) have embodied the most recent iteration of scrutinizing Asian Americans' treatment in selective access to postsecondary education in the U. S. (Garcés & Poon, 2018; Hartocollis, 2018).

Asian Americans have often figured as "interlopers" in educational scholarship as they "rarely gain visibility and voice as racial minorities" (Ng et al., 2007, p. 96). Thus, perceptions of Asian Americans' success in educational outcomes have bolstered broader claims about their assimilation into "honorific whiteness" despite empirical evidence demonstrating the centrality of their racialized othering within educational spaces and across multiple social settings. As Lee and Kye (2016) suggest, understanding Asian Americans' integration across educational, economic, and social spheres in the U. S. is better framed through the concept of "racialized assimilation," as way to "to move past binary frameworks of assimilation or racialization as mutually exclusive outcomes" (p. 266). From this perspective, Asian migrants' educational trajectories and achievements as evidenced through researchers' traditional markers of acculturation processes (e.g., intermarriage rates) must also recognize how Asian migrants and Asian Americans "must confront the challenge of their nonwhite racial status, which – unlike the more soluble nature of ethnicity – persists through the years and even generations in a country fundamentally defined by the perception of race" (Lee & Kye, 2006, p. 255).

Understanding Asian Americans' educational trajectories must extend beyond the recognition of their ethnoracially minoritized status. As Espiritu (1997) has previously asserted, contesting the validity of the model minority myth is one strategy by which researchers and educators can fend off the "ideological assaults," on Asian American representation while recognizing the centrality of race. Scholars can also extend this critique further by contesting the imperatives for racial categorization that curtail deeper understandings of intracategorical heterogeneity. Scholarship responsive to this kaleidoscopic representation of Asian American experiences, thus, often relies on the ethnonational and regional differentiations of Asian migrants in the U. S., with some

attention to the trajectories of Asian identity development over time (Chhuon & Hudley, 2011; Shah, 2012; Tang, 2015). This body of work has enabled policymakers, educators, and scholars to develop a more refined understanding of the opportunities and challenges that help to contest broad claims about Asian Americans.

For example, the establishment of Asian American and Native American Pacific Islander Serving Institutions (AANAPISIs) through the College Cost Reduction & Access Act in 2007 represents one of the most notable changes to federal educational policymaking in the late twentieth century targeted at enhancing support for Asian Americans' educational achievement in higher education (Kurland et al., 2019). Through the apportioning of targeted (competitive) federal fiscal resources to institutions enrolling a higher proportion of financially needy Asian American and Pacific Islander students, the establishment of AANAPISIs signals an important moment in the rhetorical shift mainstreaming a disaggregated understanding of Asian American educational success. This type of federal change in educational appropriations was the result of longstanding civic and social advocacy mobilized by both grassroots activists and elected representatives (Park & Teranishi, 2008). Indeed, the flourishing of scholarship and policies geared at transforming monolithic understandings of the "model minority" have largely benefitted from concerted efforts to foreground the kaleidoscope of experiences subsumed in the Asian American category through data disaggregation efforts.

---

## Heterogeneity Beyond Categories

Efforts to interrogate racial categories have been advanced through calls to disaggregate racial group data into subgroups. These efforts have been particularly effective within educational scholarship (Teranishi, Nguyen, Alcantar, & Curammeng, 2020). For Asian Americans, the subgrouping has been constructed largely along lines of differentiated nationality, echoing the Census' original conceptualization of Asian Americanness as distinct from other racial groups given its use of geographic origin in lieu of skin color (e.g., white and Black) and culture (e.g., Native American) as the primary differentiator (Prewitt, 2016). It would seem, then, that the answer to obscurity in racial categories – data disaggregation – hinges on nationality, the very basis of "taxonomic confusion over who belonged to the Asian race" (p. 65) in the first place. This critique does not discount that disaggregated data could and sometimes does offer a more precise view of particular groups (Nguyen, Noguera, Adkins, & Teranishi, 2019), revealing hidden forms of inequality otherwise unseen. However, to be true to Foucault's persistent questioning of knowledge and truth, one must also consider how establishing different boundaries for categorizing Asian Americans is more meaningful or productive than those that presently exist, such that capturing discontinuities and divergences veiled by aggregation remain at bay. An ethnically Chinese individual, raised in Vietnam, for example, falls into an abstraction between categorical boundaries based on nationality. How, then, might education leaders more fully understand the educational experiences and outcomes of Asian Americans?

Educational leaders must view Asian American heterogeneity beyond categorical domains. This perspective does not advocate for the wholesale dismissal of racial categories – this is an implausible and ill-advised strategy. Indeed, the only way to understand persistent educational inequality is by constructing robust data that can trace the durability of inequitable educational outcomes. Rather, there must be an ongoing effort and commitment to critiquing the very basis of knowledge from which “truths” about Asian Americans are drawn by scrutinizing who are included and, also, excluded from the category itself. In doing so, the conclusions made about the racial group – their patterns of academic, economic, and social successes (Pew Research Center, 2012) – can be properly contextualized and scrutinized.

Ignoring the intracategorical disparities of Asian American based on overarching generalizations founded on an incoherent process of categorization has ensured that the specific educational inequalities faced by ethnic subgroups are rendered invisible (Pang, 2006). The lack of representation of Asian American sub-groups within discourses has perpetuated the enduring gaps faced by those who are at the margins of their racial grouping (Pang, Han, & Pang, 2011). To counter these patterns, education leaders must be unwavering in their commitment to carefully understand how racial categories shift over time within their specific geographical contexts. In these moments of racial reckoning, leaders must question the very foundations upon which they execute their decisions to apportion resources to specific groups of students, particularly when doing so on the basis of racial differentiation. Legislative changes in the state of Washington, as described below, illustrate some of the practices that can both facilitate and hinder efforts to advance educational leaders’ responsiveness to shifting racial categories.

---

### **Case Study: Categorical Shifts in Washington State**

The consideration of ethnoracial categories has been a topic at the forefront of education in Washington State for over a decade, with its legislative debut beginning in 2007 (S.B. 5843, 2007). In the years following, two parallel mandates were executed that initiated the persistent effort to add ethnic subgroup categories to demographic forms. The first was the directive for the Office of Superintendent of Public Instruction (OSPI) to produce a “feasibility” report, which in addition to a number of other priorities, investigated the feasibility of expanding race and ethnicity codes (Willhoft, Munson, & Tamayo, 2008). In the report, OSPI recommended that a reasonable change to data collection would include the collection of subgroup categories for Asian Americans, alongside other racial minority groups except Black/African American. In the same year that the feasibility report was released, legislative appropriation was directed toward ethnic commissions in the state, including the Commission on Asian Pacific American Affairs to “conduct a detailed analysis of the achievement gap” (H.B. 2687, 2007, p. 55) for their respective student populations. The funding produced reports, such as Hune and Takeuchi’s (2008) *Asian Americans in Washington State: Closing Their Hidden Achievement Gaps*, wherein they demonstrate the racial achievement gaps that are present in education among

Asian Americans and affirm the need for disaggregated subgroup data to better represent the full range of outcomes within the racial group.

Collectively, the reports converged to serve as the justification for the two major changes to come. The first of the changes came in 2010, which included the addition of subgroups of Asian Americans (National Forum on Education Statistics, 2016). These data were first used by the National Commission on Asian American and Pacific Islander Research in Education (CARE) in 2015, highlighting the wide disparities between Asian American subgroups that were newly collected by the state, and other organizations such as Seattle Public Schools – the largest district in Washington State. The second change was the creation of the Educational Opportunity Gap Oversight and Accountability Committee (EOGOAC), which became central to the advocacy for the first legislative bill to include a data disaggregation stipulation as a mechanism to address educational gaps (H.B. 1680). It failed in both the 2013–2014 and 2014–2015 legislative sessions, but a version passed in the 2015–2016 session as H.B. 1541 and catalyzed the first mandated disaggregated data changes in all K-12 public schools across Washington State (see OSPI Race & Ethnicity Student Data Task Force, 2017, pp. 10–16). In addition to the 26 groupings under the Asian categorization, the task force recommended reconvening 3–5 years after data collection to evaluate the effectiveness of ethnoracial categories. It is this recommendation that reflects Washington State’s understanding of the shifting nature of racial categorization and commitment to rendering it continually suspect to ensure racial groups are well represented.

This commitment is held accountable by several intersecting constituents in Washington State. In addition to legislative mandates, the EOGOAC – now a state-appointed committee that is responsible for providing recommendations related to educational gaps – has prioritized data disaggregation efforts since its inception. Additionally, Washington State benefits from robust participation from community-based organizations (CBOs), many of whom are invested in efforts for better representation through data and have published reports, opinion pieces, and blogs to garner support and bring attention to its significance (Cooley, 2016; Lee & Nguyen, 2019). These CBOs have a direct line of communication to the EOGOAC and are further fortified by ethnic commissions who center their voices. The collective and overlapping legislative-, policy-, and community-based efforts hold the state accountable to forefronting racial categories, continually revisiting its relevance and effectiveness, and to applying the knowledge that emerges from changing categorization to addressing otherwise concealed educational gaps for Asian Americans, and for all marginalized groups.

---

## Conclusions and Reflections

The plight of equitable representation to the stratification of opportunities for Asian American subgroups within the U. S. has most recently surfaced within post-secondary education. The ongoing threat to the constitutional validity of affirmative action in selective admissions processes reifies the assumption of the model minority that requires particular scrutiny from educational administrators and leaders. As Poon and Segoshi (2018) have previously argued, the representation of Asian

Americans as a “racial mascot,” within affirmative action litigation, casts a shadow on the work of educators. Asian Americans are, once again, discursively produced as a mythically homogenous group. In doing so, the possibility of intracategorical nuance outlined in this chapter is undermined. Similarly, these depictions of Asian Americans have also limited the possibilities of intercategorical political coalitions between Asian Americans and other ethnoracial groups by being mobilized as a political wedge between other racially minoritized groups. The disavowal of Asian American heterogeneity, thus, reaffirms the specter of white supremacy that continues to define much of the educational environments within the U. S.

These concerns have only been exacerbated by the global uncertainty stoked by the rapacious SARS-CoV-2 (COVID-19) virus. The advent of a global pandemic has unleashed a social reordering that, in just a few months, has exacerbated both chronic global inequities while deepening the divide across racial categories. In the U. S., the rise of virulent anti-Asian sentiment has further underscored Asian Americans’ precarious racialization (Chen, Trinh, & Yang, 2020). These experiences of racist hatred are hardly unprecedented (Coates, 2020). Rather, they serve as a(n) (un) necessary clarion call to reorient scholarship on racial categorizations with more definitive disruptions into our current frameworks.

## Abstract

In 2016, the United States Department of Education's Office for Civil Rights reported that Black girls were overrepresented among students who face discipline that excluded or criminalized them. Although Black girls constituted only 8% of K-12 students nationwide, 14% had received one or more out-of-school suspensions. Out-of-school suspensions often lead to interactions with the criminal legal system, increasing the likelihood of imprisonment and often beginning the school-to-prison pipeline for the most vulnerable youth. Data from 2011 to 2012 showed that Black females constituted 31% of public-school girls who were referred to law enforcement but represented a staggering 43% of those arrested on school grounds for school disciplinary reasons. These trends are paralleled in the

criminal legal system. It is thus imperative to explore why the basis of Black girls' discipline is less on their behavior and more on how they are portrayed in society. In this presentation, we use the theoretical frameworks of racial and gender identity, along with Critical Race Feminism, to explain the disproportionality in suspension and expulsion rates for Black girls.

Adultification

**The field of memory**

Racial identity refers to the attitudes, perceptions, and beliefs that an individual holds about his or her racial group in relation to the majority racial group (Arroyo & Zigler, 1991). Children's racial identity affects their school experiences and behavioral outcomes.

Research on the racial awareness in African American children can be traced back to the early 1900s. The theoretical perspectives of Allport (1937), Cooley (1908), Lewin (1935), and Mead (1934) emphasized that the key to understanding how individuals develop a sense of personal uniqueness was understanding the process of self-development. "This line of research broadened the scientific discourse on psychological processes, although it was not applied directly to research on African American children, this research was the impetus of Clark & Clark's." "Clark and Clark (1939, 1947) and Clark (1982) who pioneered the incorporation of racial identity into theoretical perspectives for empirically examining self-identification among African American preschool children." Their research focused on the emerging awareness of the self as it relates to one's racial membership.

Identity formation is the primary psychosocial goal of adolescence. Prior to meeting this psychosocial challenge, children must develop a sense of their competence. Competence has both cognitive and contextual aspects. To attain competence, children must gain the ability to (1) initiate action and direct behavior within given environmental constraints and (2) recognize that different roles are required in different contexts and demonstrate behavior that incorporates expectations (Anderson & Messick, 1974). The latter is commonly known as code switching.

Whaley (1993) suggested that the development of African American children's competence integrates interactions among their social experiences, cultural factors, and cognitive development. African American children's racial identity process thus involves basic developmental processes along with the child's gender and situational context. Until school leaders understand children's racial awareness and the importance of affording them time to develop their identity, the disconnect between the school's culture and these children's backgrounds – particularly for Black children – will continue to produce behaviors that are misinterpreted as defiant. For Black girls especially, these misinterpretations can truncate childhood through a process of adultification.

### **The field of presence**

We contend that two central theories explain why Black females frequently face punitive consequences for their behavior. First, and inarguably, today's school discipline issues are rooted in racial discrimination. The differential treatment of children based on race can be documented as far back as the beginning of slavery, when Black children were often put to work as young as 2 and 3 years of age. Often dehumanized and subjected to much of the same treatment Black adults, enslaved Black children were rarely perceived as innocent or worthy of playtime and were often severely punished for exhibiting normal child-like behaviors (Dumas & Nelson, 2016). They thus enjoyed fewer of the basic human protections afforded to their non-Black peers; in fact, the category "children" was itself regarded as less essential for Black people (Goff, Jackson, Di Leone, Culotta, & DiTomasso, 2014).

The perception that Black boys were older than they were and more likely to be guilty justified harsher treatment compared with what their White counterparts received. Black girls were also subjected to these perceptions, in a process known as adultification. Epstein, Blake, and González (2017) posited:

The assignment of more adult-like characteristics to the expression of young Black girls is a form of age compression. Black girls are likened more to adults than to children and are treated as if they are willfully engaging in behaviors typically expected of Black women. (pg. 4)

The assignment of adult-like characteristics to young Black females is based on stereotypes about their presumed behavior including: mature behavior in social settings, being loud, lacking control (Morris, 2007b), and even aggression and domination (Morris, 2007a). Physical growth and development, defined by the onset of puberty, may also play a role in the adultification of Black girls (Muhammad & McArthur, 2015). Such misleading attributions help account for the disparate exclusionary discipline Black girls are subjected to. They also explain how African American females' status and social position within the school system makes them more vulnerable to disciplinary action.

When coupled with adultification, the tenets of critical race feminism (CRF) are particularly suited for understanding the experiences of women of color. CRF focuses on systematic, social justice-oriented change efforts pertaining to race, class, and gender in ways that interact with students' identities in an educational context. CRF also takes an interdisciplinary and multinational approach to social inequality, offering counternarratives to the deficit-based mainstream perspectives commonly associated with Black females.

CRF is particularly useful as a lens for considering the need for school reform from the perspective of Black females. First, CRF identifies areas where larger systemic and structural forces affect historically impoverished and marginalized communities. It also focuses on the dialogue, collaboration, and partnerships to provide a deeper analysis of why the status quo and reproductive schools need to be disrupted (Childers-McKee & Hytten, 2015). Third, CRF changes the stories told about students of color and the economically disadvantaged (Thompson, 2004).

Each of these aspects of CRF is instrumental in changing the narratives of Black female students.

### **The field of concomitance**

Zero-tolerance policies emanated from a policing theory first espoused by academics Kelling and Wilson (1982) called “Broken Windows” (Pelet Del Toro, 2018). Kelling and Wilson asserted that trivial, relatively innocent behaviors signaled that more serious crimes would eventually overtake the community and thus should not be tolerated; they argued such crimes should instead be penalized to deter future crimes (p. 58). From Broken Windows came zero-tolerance policing along with the hyperaggressive policing that emerged during President Reagan’s 1986 “War on Drugs.”

During President Clinton’s administration, the zero-tolerance rhetoric slowly began to infiltrate America’s schools under the guise of making schools safer and reducing gun violence. In 1994, Clinton’s Safe School Act allocated \$3 million to schools that complied with its mandate to formalize punitive procedures with legal authorities (Casella, 2001), incentivizing schools to promote safety and be tougher on disruption and crime which evolved to over-scrutinizing to reap additional school funding.

With the passing of the Gun Free Zones Act, schools were required to expel students who brought weapons to campus. The Columbine Massacre soon after the Act’s passage prompted a call for even greater hyper-surveillance to provide safe learning environments.

While zero-tolerance policies were established to discourage criminal behavior, they somehow increased student suspensions and expulsions for a broad array of school code violations – from violent behavior to truancy and dress code violations (Losen & Skiba, 2010, p. 2). Ultimately, minority students, especially Black girls, received the most severe disciplinary consequences from these policies.

In-school policing led to the term *school-to-prison pipeline*, a metaphor which describes the lived experiences of students of color and how often their school disciplinary infractions result in contact with the criminal justice system.

Today, the legacy of those early policies is felt in very different ways. Schools have become environments where there is seemingly little to no tolerance for what is deemed unacceptable forms of behavior in the classroom, leaving Black girls susceptible to school punishment (Hines-Datiri & Carter-Andrews, 2017).

### **Discontinuities and ruptures**

Black girls are invisible in the school discipline literature, and due to being overshadowed by studies focusing on the outcomes of boys of color, they are also absent from educational policy discussions. However, explosive suspension and expulsion rates of Black girls in K-12 schools warrant a deeper examination of Black girls’ experiences in schools, along with a renewed focus on how the social constructions of gender and femininity, when intersected with race, shape their educational outcomes.

The modern-day experiences of trauma and violence impacting Black girls and their educational experiences cannot be adequately addressed without

acknowledging African American women's historical experiences with sexual assault and its role as a catalyst for the Civil Rights Movement. In that era – and still today – issues of race and gender intersected to perpetuate stereotypes of Black female sexuality, to justify sexual assault and to preserve racially biased social and power structures that discounted sexual violence against Black women and allowed such assaults to persist unpunished. Many Black girls' experiences of assault and violence are still met with indifference, rooted in racism and lack of proper supports and services. This response has a detrimental effect on the academic outcomes of African American girls, especially when the violence is taking place in schools.

The traumatic encounters Black girls have within schools – because of language or actions used toward them – dictates how they interact with school professionals. Often, school professionals respond to Black girls in language that is cold and does not allow room for meaningful conversation, just punitive reactions (Crenshaw et al., 2015). If school professionals had a deeper understanding of the cultural identities, background, and customs of the students they were working with, there would be fewer misunderstandings, more compassion, and more communication between the teachers and their students. When looking at which cultural norms, beliefs, or experiences are represented within schools, it is not uncommon that the customs Black girls, as well as students from other marginalized communities, relate to are not present.

School professionals' lack of awareness about the cultural experiences of their students contributes to a lack of understanding, sensitivity, and connectivity among teachers and students. The narratives of Black girls and the literature surrounding the exclusionary treatment of Black girls exposes that the lack of cultural understanding and sensitivity allows school professionals to perform microaggressions and criminalize Black girls.

To combat the negative experiences Black girls face in school, a comprehensive approach – to include trauma-focused counseling, implicit bias training, along with a review of disciplinary rules and procedures – must occur to change the trajectory for many of America's Black school age females. No longer are zero-tolerance policies necessary to remedy disciplinary infractions, nor do they promote remediation for the infractions. The only benefit is “pushing out” and denial of access to education commonly needed to change and ultimately improve the educational outcomes of these vulnerable youth. It is the responsibility of school professionals and educators to ask questions about how their policies can affect Black girls or students from other marginalized communities.

### **Critical Assumptions**

Several critical assumptions undergird the intersectionality of race, gender, and education of Black girls in K-12 schools.

1. Black girls face both racial and gender bias in the nation's classrooms. As a result, Black girls are often suspended for infractions, including violations of dress code policies resulting in them being pulled out of the classroom to change their clothes. Other objective disciplinary penalties Black girls encounter and are

disproportionately removed from class include being too loud, too assertive, too sexually provocative, too defiant, and for exhibiting adult-like behaviors.

2. “Adultification, defined by Morris, (2007a) as teachers, law enforcement officials and even parents view[ing] black girls as less innocent and more adult-like than their white peers,” begins as early as 3 or 4 years old for many Black girls. This criminalization neglects their social-emotional needs for development. Schools adhering to disciplinary systems like “zero tolerance” are perpetuating a racist culture that creates systematic inequality. Racial bias, along with the denial of intergenerational traumas of racism and social-economic inequities, continues to be an open door for the school-to-prison pipeline. The school-to-prison pipeline is a war on poverty and economic resources that disproportionately impacts students of color, especially Black girls.
3. The adultification bias can make school unsafe, resulting in Black girls finding safety through unhealthy means and makes them prone to risky behaviors (e.g., drug abuse, sexual trafficking, etc.). The overlapping risk factors for relationship abuse, sexual violence, and being “pushed out” or suspended from school easily initiate pipelines to prison, beginning as early as preschool, where the use of terms such as manipulative, shrewd, or intentionally disruptive are the descriptors associated with young girls.
4. The adultification bias against Black girls affects how authority figures (i.e., teachers, parents, and law enforcement) comfort, discipline, and interact with Black girls. This negative bias affects the way Black girls are punished, mentored, and consoled.
5. The intersection of racism and sexism greatly impacts the health and wellness of Black girls, while often portraying them as angry, manly, overweight, overly sexual, or asexual caregivers. These messages force girls to either constantly fight against them or succumb to what is expected and enforce the idea that Black women and girls can handle abuse and are not deserving of the experiences of childhood, often afforded to girls of other races. These stereotypes about Black girls are often reiterated in various forms of media, helping to solidify the narratives around adultification bias.
6. For Black girls who are nonbinary or who identify as transgender, there is an increased likelihood they will face discrimination and violence. In school, it is not uncommon for these Black girls to often receive harsher punishments and are five times more likely to be suspended than their White classmates.
7. Disciplinary actions (e.g., suspensions and expulsions) for infractions are far more consequential, especially for Black girls. Oftentimes, girls who lose class time from suspensions have lower math and reading scores and are less likely to attend a 4-year college and are 15–20% more likely to be arrested and incarcerated as adults (Lacoe & Steinberg, 2019).
8. Trainings and skill development on gender equity in education are needed, coupled with creating curricula, learning activities and assignments that respect and build on students’ gender, and cultural backgrounds are necessary to shift beliefs about minority learners and mitigate more punitive approaches to classroom discipline.

9. The war against Black girls will only end when there is social liberation and acceptance. Releasing societal pressures, eliminating “zero-tolerance” policies in school, community building, and trauma-informed care, is our path to freedom. Along that path is developing a school climate that no longer discounts the experiences of Black girls and their educational experiences.

---

## Introduction

Educational leaders and scholars have been concerned about inequitable school disciplinary practices regarding socially marginalized youth for nearly four decades (Skiba, Michael, Nardo, & Peterson, 2002). Their concern has focused on young males of color, who have elevated risks for exclusionary discipline and perceived criminality (Caton, 2012). When exclusionary discipline is coupled with the widening racial-ethnic achievement gap and growing school dropout and incarceration rates, males of color, particularly Black males, garner attention in the public debate on the lack of disciplinary equity.

While the school discipline issues Black males face are research worthy, those faced by Black females are rarely examined. When they are discussed, it is in relation to the experiences of Black boys (Blake, Butler, Lewis, & Darensbourg, 2011). This inequitable reporting of the disproportionate discipline girls often receive may be attributed to the perception that, because their academic achievement is higher, girls generally have fewer behavioral problems. It may also be due to gendered racial bias toward Black boys (Blake, Keith, Luo, Le, & Salter, 2017). Black males are thought to require more social control than their female counterparts (Rollock, 2007). Although Black males are more likely to receive exclusionary discipline, Black females also experience inequitable discipline practices, including exclusion.

## The Construct of Childhood/the Destruction of the School Experience

When the disciplinary records and school experiences of Black girls are examined, the results are disheartening. Nationally, 45% of girls suspended and 42% of girls expelled from K-12 schools are Black, which are the highest rates among all racial/ethnic groups (Smith & Harper, 2015). Black girls' discipline rates were also higher than 67% of the boys (Office for Civil Rights, 2014). Among 13 southern states, Smith and Harper (2015) found that Black girls represented 56% of all students suspended and 45% of those expelled (see Table 1). It should be noted that many of the southern states examined by Smith & Harper had high concentrations of Black families living in extreme poverty, with limited access to health care, and with no high-quality educational opportunities.

While only 20% of public school preschoolers in the United States are Black girls, they represent 54% of all preschool girls who received an out-of-school

**Table 1** 13 US states with highest suspension and expulsion rates among Black girls

Smith and Harper (2015)

suspension (Morris, 2016). For many of these girls, suspensions begin as early as preschool and persist throughout elementary, middle, and high school, often resulting in permanent expulsion from the educational system and denied access to educational opportunities the educational system.

In 2016, the United States Department of Education's Office for Civil Rights reported that Black girls were overrepresented among students who face discipline that excluded or criminalized them (Morris, 2016). Although Black girls constituted only 8% of K-12 students nationwide, 14% had received one or more out-of-school suspensions (Morris, 2016). Out-of-school suspensions often lead to interactions with the criminal legal system, increasing the likelihood of imprisonment and often beginning the school-to-prison pipeline for the most vulnerable youth. Data from 2011 to 2012 showed that Black females constituted 31% of public school girls who were referred to law enforcement but represented a staggering 43% of those arrested on school grounds for school disciplinary reasons. Similar findings on the disproportionality of exclusionary discipline were reported by Tate et al. (2014). These trends are paralleled in the criminal legal system (Tate et al., 2014). It is thus imperative to explore why the basis of Black girls' discipline is less on their behavior and more on how they are portrayed in society.

---

## **Understanding the Disconnect for Black Girls**

The focus of research on these issues is shifting toward efforts to understand how Black girls become disconnected from or pushed out of school. Several contributing issues must be explored:

- The interaction of race and gender to form Black girls' identities
- The process of Black girls' adultification, in which they are viewed more adult-like or less innocent than their non-Black counterparts
- The role of unseen racial trauma experienced by Black girls
- The highly consequential exclusionary disciplinary policies and procedures

## Race and Gender Identity Struggle

Based on critical race feminism (CRF), or “FemCrit,” we argue that Black girls are held to White standards and definitions of femininity and ideals. These standards on what it means to be a girl or “lady-like” dictate that girls and women should be silent, passive, and harmonious in their relationships. To maintain a nice, pleasant, and respectable image, they must not express authentic feelings, opinions, or displeasure, i.e., they should mask their emotions (Winkle-Wagner, 2009). Black girls are seen as deficit when they do not match standards of White femininity. We also contend that FemCrit offers a deeper understanding of how the nuanced ways in which Black girls are disciplined are affected by dominant narratives about who Black girls are in society – historically and contemporarily.

In direct contrast to the docile imagery applied to White females – the model standard – Black females are portrayed as assertive, independent, and confident in expressing their feelings and thoughts without regard to reprisal (Morris, 2007). Since these racialized gender norms do not align with their cultural identities, Black girls are deemed deficient. FemCrit highlights the importance of multiplicity and intersectionality of identity (Berry, 2010) while also drawing upon critical race theory to assert that the experiences of Black girls are unique from those of their White counterparts. When Black females do not conform to the middle-class social norms of White females, they are scrutinized and penalized, often with the harshest consequences.

## Adultification

Adultification emerges from two processes: social stereotyping process and socialization process. Most detrimental to the educational experiences of Black school age children, especially girls, is social stereotyping, which increases the likelihood girls will be disciplined (Smith et al., 2015). Social stereotyping consists of negative and controlling images based on race, class, and gender. Black females are stereotyped as self-sacrificing, combative, overly aggressive, unfeminine, loud or hypersexualized, and exploiting government policy by having children and refusing to work (Hancock, 2004; Mullings, 1994). Media portrayals of Black girls as more adult-like renders them vulnerable to adultification.

The socialization process involves exposing children – particularly those from culturally diverse families – to adult content before societally-defined norms would dictate. This early exposure encourages children to assume adult roles that may be

necessary for their family's daily living needs (e.g., caretaking roles, household chores) (Burton, 2007). The developmental socialization process affords children the opportunity to develop skills needed for their resiliency.

## **Unseen Racial Traumas**

Collective racial trauma refers to the large-scale impact of historical and/or discriminatory treatment of communities of color. Students, particularly Black females, see systemic racism play out daily on TV and in social media. Their community trauma is often manifest in their schools as well.

The global COVID-19 pandemic exemplifies how community trauma often manifests in schools. Black students and their families have been disproportionately affected by the pandemic: they have higher rates of COVID-19 infection, hospitalization, and death (Centers for Disease Control and Prevention, 2020). These health effects have been exacerbated by economic fallout from the pandemic: Black students and their families had disproportionately higher rates of food insecurity, eviction, internet inaccessibility, unemployment, and job loss as a result of the pandemic (Center on Budget and Policy Priorities, 2021). For Black students – particularly females – this trauma may manifest in different ways in their schools, which puts them at risk of receiving disproportionate punishment for behaviors that instead should be addressed by counselors, social workers, or other professionals.

Racial trauma in schools is reflected in the inequitable access females of color have to advanced coursework and other pathways to postsecondary education (Johnson, 2018). Black students in general are more likely to attend schools that are underfunded, not in culturally-sustaining school climates, and lacking teachers or counselors who look like or who can culturally identify with them (Gershenson, Hart, Lindsay, & Papageorge, 2017). This minimizes opportunities for Black students, particularly Black females, to connect to their schools and school leaders, making it especially difficult for them to thrive and succeed academically.

In order to understand how trauma is affecting their behavior, schools need to create safe spaces for Black girls to talk. A deeper understanding of the traumatic events in the girls' lives – e.g., racism and adverse childhoods – can explain their behaviors, particularly those considered aggressive and dangerous to others. Black girls who experience harsh school discipline are often struggling to overcome multiple forms of victimization (e.g., sexual abuse, poverty, drug abuse, homelessness, incarceration of a parent, etc.), yet leaders discuss their actions as combative or angry behaviors, rather than a response to trauma.

Although Black girls have adopted coping and defense mechanisms to deal with gendered racism, these methods are often misinterpreted by teachers and school personnel as personality and/or cultural characteristics instead of responses to traumatic events or living with daily microaggressions (e.g., administrators, counselors, assessment personnel).

## Exclusionary Discipline Practices

Research has shown that female students of color receive harsher punishment in schools for the same practices that other nonminority students commit (Payne, 2006). They are suspended or expelled for actions that only required a referral to the principal or a phone call to a parent or guardian (Payne, 2006). School policies, many based on zero-tolerance principles, predispose schools to consign Black females to the school-to-prison pipeline.

Significant disproportionality in disciplinary actions may be the result of implicit biases (IB). Implicit biases are preconsciously unacknowledged schemas that distort perceptions of racial outgroup members (Payne, 2006). Skiba et al.'s (2002) research, for example, found that teacher referral bias rather than students' actual behaviors was associated with disproportionate discipline sanctions. These referrals were based on subjective rather than objective measures. The subjective measures included students' "snappy or disrespectful" tone, profanity, or eye-rolling when speaking with teachers (Payne, 2006). Black girls were punished largely for perceptions of threat, noncompliance, and harm, based upon stereotypical images suggesting they were loud, defiant, seductive in demeanor and attire, and aggressive. Such criteria are difficult to measure because they are perception based; they are also shaped and bound by an understanding – or lack thereof – of one's culture and stereotypes.

An overreliance of disciplinary referrals and punitive discipline measures can be explained by teacher inexperience, the absence of cultural understanding between teachers and students, and inept classroom management skills.

While much of the scholarship on IB focuses on race, complex biases are based on an intersection race and gender. This suggests further research is needed on understanding how the intersections of role of race and gender identity can create an alternative space for Black girls to safely explore their femininity. Until this research is conducted, Black females will continue to be vulnerable to unequal disciplinary referral and unjust consequences.

Persistent and severe punishment creates a wide range of negative effects. Females who are regularly disciplined often feel spurned by their educational institution, prompting a cycle of disengagement involving school dropouts and contacts with the criminal justice system (Nicholson-Crotty, Birchmeier, & Valentine, 2009). To combat these effects, alternatives to harsh discipline are needed.

---

## Recommended Alternatives to Harsh Discipline

In order for schools to provide a more culturally sustaining and socially just school climate for Black girls, we recommend the following equitable alternatives to discipline.

*Policies and Practices Reviews:* Review the school district and campus codes of conduct and data with an equity lens to ensure policies do not have a discriminatory impact on Black students. Engage in districtwide trainings on systemic racism and

bias and on strategies to address discriminatory beliefs and behaviors. Develop a districtwide plan to address racial bullying and provide training to all staff and students. Teachers and administrators should be prepared to address racial bullying swiftly, immediately, and appropriately. Develop school policies that reflect the tenets taught in these trainings.

*Social-Emotional Learning:* Introduce workaround reflection and meditation stations for students to center themselves when dealing with difficult situations. Discuss their struggles and celebrate their growth. When conflicts occur, find ways to teach students how to make things right. If a student is having difficulties, bring in peers who can support them in their journey to restoring balance. Have them make commitments by designing actionable steps they can take to progress.

*Restorative Practices:* Get police out of school buildings and end other harmful exclusionary discipline practices that push students out of class and deny them learning opportunities. Instead, train staff, teachers, and families in restorative practices and thoroughly implement those practices. Restorative practices are designed to improve the school climate and strengthen the social and emotional skills of students and teachings, while also addressing the underlying reasons for students' behavior by nurturing their intrinsic desire to be treated and to treat others with care and respect. Also require trauma-informed trainings and implement trauma-informed educational practices for all staff. With these restorative practices, implement, for students and teachers, safe healing spaces that protect them from retraumatization.

The path of restorative justice offers a different perspective in the way educators think about healing harms, consequences, or accountability. It presents educators with an opportunity to teach students the true meaning of justice and harmony. At some point in our history, we misconstrued the idea of justice regarding discipline as needing to be harsh or violent. Restorative justice values allow our students to center themselves around examining righteousness in their thoughts and actions, while also empowering them to develop a process of self-reflection to comprehend their relationship with others. The primary focus of restorative practices should be on providing opportunities for personal growth in which students can understand wrongs and acknowledge the hurt of others while building a sense of compassion and empathy.

*Building a school community:* Building community is an actionable step taken to implement restorative justice. Students should feel a connection to their school in which they are seen and heard. It is important to foster this sense of belonging through various activities. School communities help student to feel as if they are the subject of their school experience, not the object. As a member of their community, students are placed in positions to be active citizens who play a role in their schools.

*Engage with families.* Understanding family dynamics and structure can help provide the much needed structure and connectivity between the two primary entities that dominate Black females' attention – school and family. To help with this connection, encourage Black families to take a leadership role in the school, by creating opportunities to participate in campus and district governance. These opportunities should be scheduled during times that are respectful to working

families' schedules. Engagement with students and their families should be authentic in nature and should include meaningful opportunities for them to reconnect to the school and its leadership team.

*Unbiased Curriculums:* Using more culturally diverse, gender inclusive curriculums helps to engage Black females as they begin to see themselves reflected positively in stories and examples shared in class. Providing this level of culturally responsive pedagogy goes far beyond discussing the importance of culture; it also offers a consistently used racially identifiable method of instructional delivery for all content and subject areas.

*Read the Data:* Collect detailed and contextualized data regularly about how Black female students are faring in school, including how they are accessing opportunities like advanced coursework and how they are being pushed out through harmful discipline practices. Equity audits can help to get a full picture of how school districts are supporting their students. Guidance on college career pathways nurture girls' pathways to college and career readiness by engaging them actively in opportunities to lead and learn in schools.

---

## Conclusions and Reflections

School leaders and others in the field of education can shift the paradigm for Black females and excessive discipline. Critical protective factors are needed to diminish the involvement of the criminal and juvenile legal systems in school-based discipline. By creating a space and culture that nurtures their socioemotional development and academic growth, schools can become more attuned to the needs of Black girls. By doing so, schools will be viewed as powerful agents and coauthors for successful stories and trajectories of America's Black females.
