commitments of many scholars of educational leadership to a presumptive color-blind knowledge base that has failed to decenter epistemologies and ontologies that deny Indigenous and racialized students, their families' and communities' racial justice, and an equality of educational outcomes. In many regards, the discourses of educational leadership continue to marginalize Indigenous and racialized knowledges, ways of knowing and of being. Critical race theory provides an opportunity to expose and analyze how the extant knowledge base continues to reify a field of study and practiced that is tethered to Eurocentric White discourses that act as tools of imperialism and neocolonization. This chapter describes how a critical race theory analytic approach when combined with a decolonizing framework can open up the space and create opportunities for practitioners and scholars to develop a more reflexive field. Furthermore, it offers the opportunity for the knowledge base to be rebuilt by braiding Indigenous and racialized knowledges with anti-oppressive Westernized knowledges that when tied together can reorient educational leadership toward racial justice.

**Keywords**

Racial justice · Educational leadership · Critical race theory · Decolonization · Indigenous and racialized knowledges

**Field of Memory**

In general, educational leadership as a field of study and practice has a long history of focusing the work of the formal leader on determining and enacting efficient and effective approaches to move a school or school system as an organization toward a goal or set of goals. Influenced by empiricist theories of knowledge and armed with an unwavering commitment to colonial understandings of intellectual mastery and practical experience, educational leaders have been ushered to deploy their technical-rational expertise to calculate appropriate means that would lead to universal, given ends of schooling. These influences still permeate the field.

**Field of Presence**

While it has been argued that schools have typically worked in ways that reinforce and perpetuate disadvantage and stereotypical understandings of human diversity, resistance is emerging to push back against these forces of oppression. More and more, educational leaders are beginning to understand that schools and school systems as social organizations should not be equated with such objective physical phenomena as a building or a classroom. There is greater clarity that organizations do not set goals or choose ends, as logical-positivistic theories might suggest, without human intervention. Increasingly, schools are being reconceptualized as social inventions in which humans construe and come to understand themselves and their histories in diverse ways. The goals or prized-ends of formal education are matters of choice; human choices are guided by human desires and values. Drawing from diverse knowledges and knowledges systems, the work of

educational leaders and the scholarly field that supports them is beginning to reflect the hopes and aspirations of Indigenous and racialized students, families, and communities.

### **Field of Concomitance**

Fostering community and building trusting relationships among racially diverse school communities is more important now than ever for educational leaders committed to support learning for all students in the midst of the uncertainty. The knowledges that have underpinned educational leadership as a scholarly field, ones rooted to Eurocentric Whiteness as concepts, theories, philosophies, and practices need to be decentered and the field needs to be rebuilt. If there is any chance to effect systemic change and dismantle the systems that perpetuate racial inequities and inequalities, the knowledge base of educational leadership, one that is founded on neocolonial, presumptive race-neutral field of study and practice, must be transformed.

### **Discontinuities and Ruptures**

There is a growing narrative which recognizes the need for educational systems, K-12 and higher education, and those who lead them to undergo a transformational change if they are to create social contexts in which students who have been and continue to suffer from colonization, oppression, and racialization are to flourish. Even as educational leaders focus on the need to equalize and improve the educational experience for Indigenous and racialized students and their families, the fact is that many educational leaders lack an orientation to a scholarly field that can help them understand how many of the current neocolonial epistemologies and practices deny Indigenous and racialized students equitable opportunities for success. In order to improve the health and well-being of Indigenous and racialized students, educational leaders need to have access to Indigenous and racialized epistemologies – the knowledges, skills, and dispositions – that will allow them to engage with families and community members to address educational issues and improve outcomes for students.

### **Critical Assumptions**

Schools must become effective spaces designed to support the success of Indigenous and racialized students. What is needed for this is to occur requires that the scholarly discourses of educational leadership and in its practices become repositioned as commitments to use critical race theory to uncover the purported “color-blind” epistemologies that whitewash the field. It then requires a process of decolonizing educational leadership and decenters Eurocentric Whiteness. Once the space is created for mutually respectful knowledge exchange, a process of braiding Indigenous and racialized epistemologies with anti-oppressive Westernized forms of knowledge can happen. With the development of a new scholarly field educational leaders will be oriented and prepared to dismantle systemic racism and enact the racial justice that is so desperately needed in schools and society.

## Introduction

Khalifa, Khalil, Marsh, and Halloran (2019) contend that scholars of educational leadership have done little to disentangle the practices, theories, or knowledges of the field from their colonizing histories. This unwillingness has led scholars to critique the ways in which the Eurocentric, White discourses of educational leadership have and will continue to fail Indigenous and racialized students, their families, and communities (Darling-Hammond, 1998).

Paraphrasing Carter Woodson's sentiments from 1916 (as cited in Ladson-Billings & Tate, 1995, p. 50), the same educational processes which inspire and stimulate the oppressors with the thought that they are everything and accomplished everything worthwhile, at the same time depresses and crushes the spark of genius in Indigenous peoples and racialized people by making them feel that their races do not matter much and that they will never measure up to an Eurocentric, White normative standard. While much has changed in the 100 years since Carter expressed those insights, in some regards, little progress has been made in understanding how educational leadership might be decentred, decolonized, and rebuilt as a more reflexive and racially just field of study and practice (Khalifa et al., 2019).

If schools are to not only reflect the diversities that exist in society but honor their knowledges, ways of knowing, and being, they require educational leaders who understand the epistemologies and discursive ontologies that exist in the Indigenous and racially diverse communities they serve and the society students are being prepared to enter (Brown & Williams, 2015; Van Langenhove, 2019). A critical element to prepare educational leaders for this work will be accomplished by equipping them with a deeper understanding of the richness of Indigenous and racialized epistemologies, ontologies, and axiologies so that they can advocate, lead, and keep at the center of their practice and in their consciousness the challenges society faces. Many of which are anchored racialized divisions that act to consistently marginalize some while privileging others (Sefa Dei, 2016; Theoharis, 2007).

---

## Weaponizing Education to Serve Colonial Ambitions

The linkages between the imperialist ambitions of European nations such as Great Britain, France, Spain, Portugal, and others through conquest were enacted through colonialism and colonial institutions that allowed for direct and unfettered sociopolitical and economic control over the territories and nations the colonizers invaded (Kelly & Altbach, 1984). Colonialism was never intended as a benign form of sociopolitical and economic exploitation. Rather it was built on an architecture of social institutions that had as their main purpose the exploitation of stolen lands through the labor of stolen lives with the intent of repatriating the economic benefits to the imperial rulers of Europe (Kelly & Altbach).

As one element of the architecture, colonizing nations used their political, military, and economic powers to force a formalized system of education on

Indigenous populations to control and, as the colonial rulers felt necessary, to destroy them (Kelly & Altbach, 1984; Nwanosike, 2011). The colonial school system was designed to extend foreign domination and economic exploitation of the colony and those who were subjugated and, in some cases, shape those who were to be assimilated into the dominant European culture (Nwanosike, 2011). For Indigenous populations the education system was to be directed toward assimilating them by stripping from them their Indigenous languages, cultures, knowledges, spiritualities, and identities and by forcing on them the values, languages, religions, and social order of the colonizers (Kelly & Altbach, 1984; Khalifa et al., 2019).

As part of the colonial architecture of schooling, higher education, that is colleges and universities, were also established in the colonized lands and territories (Kelly & Altbach, 1984). Within them were the knowledges that were held in high esteem by those devoted to notions of higher education and as colonial institutions they were buttressed through staunch commitments to exclude those and their knowledges which were seen as being unworthy. Colleges and universities in the British-North American colonies were established as “instruments of Christian expansionism, weapons for the conquest of Indigenous peoples, and major beneficiaries of the African slave trade and slavery” (Wilder, 2013, p. 17).

Indigenous and racialized peoples were never intended to be the beneficiaries of colonial higher education (Cabrera, Franklin, & Watson, 2017; McGee, 2020). Such a fact should not be surprising as racial constructs have a long history of serving as demarcated lines between those considered literate or illiterate, and have been used as the basis for decisions about who should and should not benefit from higher education (Ladson-Billings, 2013).

Grosfoguel (2015) argues that the canon of thought that forms the knowledge base in almost all disciplines of the social sciences and humanities of Western and Westernized universities and colleges is based on the knowledge claims produced by a small number of men from five countries, namely Italy, France, England, Germany, and the USA. In addition, Grosfoguel contends that the knowledges that are nurtured and guarded in universities reflect a devotion to the superiority of what Moreton-Robinson (2008) labeled as “Eurocentric Whiteness.”

Higher education, and educational leadership as a field of study, must acknowledge that the institutional spaces, literally and epistemically, were constructed to only welcome some while excluding others (Ahmed, 2012). Not only were colleges and universities never intended to educate Indigenous peoples or enslaved peoples, the brutal fact is that a number of colonial campuses were built by the hands of slaves on the lands from which Indigenous people were dispossessed by force (Ash, Hill, Risdon, & Jun, 2020; la paperson, 2017).

Understanding the intersections of colonialism and the creation of a formalized education system intended to initially support imperialistic ambitions that now in many ways serve neocolonial ones are important to illustrate and understand because in many ways educational systems continue to serve the colonial purposes of domination, subjugation, and assimilation of Indigenous and racialized people (Kelly & Altbach, 1984; Ladson-Billings, 2013; Masta, 2019).

## The Colonial Antecedents of Educational Leadership

Initially established as an extension of the colonial ambitions for formal education as a practical field, school administrators were taught to understand how best to go about eliminating all that was Indigenous about the Indigenous students the school system educated (Khalifa et al., 2019). As a field of practice, school administrators “inherited colonial leadership structures and practices that were meant to wipe Indigenous cultures, norms, languages, spiritualities and epistemologies clean of indigeneity” (Khalifa et al., 2019, p. 2). The superordinate positioning of school administrators sanctioned them to impose a Eurocentric White worldview as the only way of understanding the colonial ordering of a social reality on those who were colonized (Kincheloe, 1999; Moreton-Robinson, 2008).

In the twentieth century with the establishment of departments of educational administration in many North American universities, educational administration shifted from being primarily regarded as a practical field substantially oriented to normative concerns to become recognized as a field of study and was granted ontological status (Bates, 2010; Campbell, 1981; Culbertson, 1988; English, 2001, 2002; Griffiths, 1983; Riffel, 1986; Tyack & Hansot, 1982). Echoing many of the changes that were occurring in other professional fields, educational administration with its focus on solving problems of practice became understood as “educational leadership” with a reorientation of its central efforts to support those with formal and informal authority within schools and school systems to create a vision for educational change and needed to develop an organizational culture (Bennis, 1994).

However, even with the reorientation toward a focus on leadership, the knowledge base remained anchored in principles of “scientific management” (Callahan, 1962, as cited in English, 2002, p. 110). Over the course of the latter part of the twentieth century, in significant ways, educational leadership continued to be elevated through discourses of logical positivism as defined by its knowledge base in accordance with the accepted conventions of a modernist and rational-empiricist approach to the social sciences (Culbertson, 1988; Mills, 1997; Scheurich, 1995; Wilkinson & Kitzinger, 1995).

Decades ago scholars such as Hodgkinson (1978), Bates (1980), and Foster (1999) among others began to raise questions of whether educational leadership should be conceived of and enacted in substantially the same generalized forms regardless of the community contexts in which the leaders work. Bates (1980) critiqued the scholarly field by proposing that educational leadership had become a ubiquitous “umbrella term that covers a multitude of ideas and activities representing considerable differences of view between various groups with the profession” (p. 2). Thirty years after offering an initial critique of the field, Bates (2010) noted that the foundations of educational leadership were still based on the artificial partitioning of what Dewey, a century earlier, had labeled the “mechanics of schooling” and “educational ideals,” which were presented as unquestionable universalisms and still remained largely anchored in Eurocentric, White philosophies, social structures, paradigms, and discourses.

As a result, claims have been made for decades that the knowledge base of educational leadership is infused with the norms of the dominant class and more powerful in society to which it is connected, and has a distinctly conservative orientation (Culbertson, 1988). In many ways, the field and the discourses that support educational leadership have obscured many of the connections between the work educational leaders do and the knowledges that exist within the racially diverse communities in which they work (Barakat & Brooks, 2016). Unsurprisingly, the field remains anchored in the traditions of logical positivism and reifies the perpetuation of an existing social order (Hallinger & Chen, 2015; Ikpa, 1995).

## **A Knowledge Base that Reifies Neocolonialism**

Neocolonialism can be described as the subtle propagation of socioeconomic and political activity by former colonial rulers aimed at reinforcing capitalism, neoliberal globalization, and cultural subjugation of their former colonies. As a form of neocolonialism, the organizational structures of schools and school systems continue to reflect a social order and architecture designed for domination, subjugation, and oppression in postcolonial nations (Altbach, 1971).

Arguably, educational leadership, as was the case with “a great many fields in higher education emerged from a White male supremacy paradigm that reflects ideas about non-White peoples’ genetic inferiority and advances White hegemony” (McGee, 2020, p. 635). And, as a result the majority of “leadership theory and practice has been normalized within a white, male, Western, capitalist, Christian hierarchy” (Khalifa et al. (2019, p. 7). Many of the theories of leadership project a worldview that requires force and/or coercive power to maintain order in society (Hickey, 2019). The worldviews represented in such theories of leadership are founded on colonial doctrines of discovery and claims to settler-state land title, and have been used to justify the ongoing oppression of Indigenous populations in postcolonial states around the world (Schabus, 2017).

Educational leadership as a contemporary field of study continues to be heavily dominated by Eurocentric, White social paradigms and theories. Many of discourses of educational leadership remain embedded in the proverbs, myths, rituals, customs, and traditions of Eurocentric, White society. The majority of the current models and theories of educational leadership draw on the perspectives of scholars and practitioners who willingly provide the impression that educational leadership is a universal structure or set of domains even if its foundations are not necessarily relevant in different cultural contexts or racialized communities (Oplatka & Arar, 2016).

A significant force that underpins neocolonialism in higher education is legal status of property rights, which includes the legal ownership of intellectual property such as who owns and controls the knowledges of educational leadership (Cote-Meek, 2014; Ladson-Billings & Tate, 1995). As intellectual property owned by predominately Eurocentric, White scholars the field is protected as intact, and continues to remain void of an understanding of the legacy of colonialism and its

related violence that is enacted by society's neocolonial educational institutions (Cote-Meek, 2014).

Commitments to protect and preserve the existing knowledges of educational leadership as the core – namely ensuring that it remained intact in a recognizable, coherent form and reflects the values and philosophy of the dominant group of society – while suggesting that there might be some space available for other epistemologies and ways of knowing, ones that anchor the nondominant groups' ways of being is simply a manifestation of epistemic injustice, which occurs when the concepts and categories by which a people understand themselves and their world are replaced or adversely affected by the concepts and categories of the colonizers (Bhargava, 2013; Cranston & Whitford, 2018).

The pervasive influences of colonialism have bound many scholars, policymakers, and, in some cases, practitioners of educational leadership to culturally oppressive practices and epistemologies designed to conserve the power and authority of an Eurocentric, White knowledge base (Cranston & Whitford, 2018). In large part the field “has been and remains a field skeptical of the consequences of difference” (Santamaria & Santamaria, 2015). The dominant racial enactments of leadership serve to maintain hegemonic powers which in turn continues to disadvantage Indigenous and racialized people within the education system, beginning in kindergarten and continuing through postsecondary education.

Evidence continues to mount that the majority of the existing theories, practices, and discourses of educational leadership with their adherence to dominant hegemonic, most often Eurocentric, White epistemologies and ontologies repeatedly fail to support the success of Indigenous and racialized students (Cranston & Whitford, 2018). As long as the field remains, as Garcia and Natividad stated (2018, p. 30) “grounded in colonial ways of knowing and being with little effort to understand how minoritized people engage in leadership and/or how leadership practices affect colonized groups,” Indigenous and racialized students, their families, and communities will be subjected to the ongoing effects of colonization through what Nkrumah (1966) referred to as “neo-colonialism,” imperialism's final and potentially most dangerous stage of domination.

---

## **Disrupting Discursive Eurocentric White Knowledges**

If all children and families, but in particular those who have been sociohistorically disadvantaged because of their Indigeneity or racialization, are to be served well by the education system then those responsible for leading schools and school systems need a deeper understanding of “Indigenous perspectives and the epistemic traditions of knowledge of colonized/oppressed/Indigenous peoples” (Sefa Dei, 2016, p. 27). In fact, the needs of Indigenous and racialized students, families, and communities cannot be met unless the dominance of Eurocentric, White knowledge, practices, and beliefs is disrupted and decolonized to make equal room for the experiences and knowledges of the peoples who have been colonized and suffer under neocolonialism (Lopez & Rugano, 2018; Nkrumah, 1966).

Knowledge is largely acquired and refined by discourse and discursive practices. Both discourse and knowledge are fundamental concepts of the humanities and social sciences, and are tied together (van Dijk, 2014). Drawing from the works of Foucault, Weedon (1987) claimed that discourse refers to:

ways of constituting knowledge, together with the social practices, forms of subjectivity and power relations which inhere in such knowledges and relations between them. Discourses are more than ways of thinking and producing meaning. They constitute the 'nature' of the body, unconscious and conscious mind and emotional life of the subjects they seek to govern. (p. 108).

Therefore, there is much work to be if the discourses of educational leadership represent and are involved in the creation of knowledge (van Dijk, 2014). There is a need to ensure that the knowledge and the processes for producing and recognizing it represent a multiplicity of knowledges and ways of knowing (Sandoval, Lagunas, Montelongo, & Díaz, 2016).

Even though scholars and practitioners of educational leadership are positioned as ideological political actors who produce and control power/knowledge discourses that "make true" and determine what is accepted as "true" (Hall, 2001; Torfing, 1999), it appears that many scholars of educational leadership have expended little energy to disentangle the knowledges or the espoused practices of educational leadership from their colonizing legacies (Khalifa et al., 2019). In fact, Mills (1997) argues that there has been a blithe indifference paid by scholars to the traumatic, cognitive consequences that have resulted from the strict adherence to the mainstreaming of Eurocentric, White epistemologies of educational leadership that have been imposed on Indigenous and racialized peoples.

The reality is that despite calls to reconceive and rebuild educational leadership as a reflexive and scholarly field, the knowledge base and its discourses have largely remained rooted to concepts, theories, philosophies, and practices that continue to reflect and reify a dominant colonial, cultural context and social order that continues to disadvantage Indigenous and racialized students (Cranston & Whitford, 2018; Khalifa et al., 2019). As Leonardo (2002) suggested, scholars and practitioners need to work together to name, reject, and dismantle the dominant discourses of Eurocentric Whiteness that are reified within the field, and actively work together to disrupt their discourses and unsettling their codes.

---

## **Recognizing the Centrality of Race in Educational Leadership**

Race has been and continues to act as an invisible, basic categorical object in the production of knowledge and acts epistemologically given in almost all academic disciplines (Moreton-Robinson, 2008). If there is any chance to affect systemic change and dismantle the systems that perpetuate inequities and inequalities across demarcated racialized lines, the only way forward is through to forge paths that critique the Eurocentric, White understandings of education and its practices (Lopez & Rugano, 2018).

Regardless of the disciplinary field, critical race theory allows scholars to challenge claims that knowledge is somehow color-blind or race-neutral (Bell, 1980; Delgado Bernal & Villalpando, 2002; Delgado & Stefancic, 2012). As Ladson-Billings and Tate (1995) stated:

Race has become metaphorical — a way of referring to and disguising forces, events, classes, and expressions of social decay and economic division far more threatening to the body politic than biological ‘race’ ever was. Expensively kept, economically unsound, and spurious and useless political asset in election campaigns, racism is as healthy today as it was during the Enlightenment. It seems that it has a utility far beyond economy, beyond the sequestering of classes from one another, and has assumed a metaphorical life so completely embedded in daily discourse that it is perhaps more necessary and more on display than ever before (p. 49).

Applying a critical race theory analytical framework to the knowledge base and the discourses that support it provides an opportunity to first decolonize it to create space and then braid in Indigenous and racialized understandings of leadership. What are needed are epistemologies and discourses that recognize Indigenous and racialized peoples, their rights and knowledges, and also reorients educational leadership in ways that works for the benefit of those who continue to suffer from the ongoing effects of colonization (Lopez & Rugano, 2018; Sefa Dei, 2016).

---

## A Critical Race Theory Analysis of Educational Leadership

Critical theories applied to educational leadership can help to “analyze asymmetrical power relations and inequities in educational contexts” (Santamaria & Santamaria, 2015, p. 26). Specifically, critical race theory, oftentimes referred to as “CRT,” has become an important analytic framework to better understand education and to analyze how racism is embedded within its systems (Khalifa, Dunbar, & Douglass, 2013).

CRT begins with the fact that racism is ordinary, deeply ingrained and a permanent part of postcolonial societies and exists in all of their social institutions (Bell, 1980). Iverson (2007) noted that CRT reveals that racism “is well disguised in the rhetoric of shared ‘normative values’” (p. 74), and that it “elucidates the ways in which specific forms of knowledge, skills are valued over other” (p. 602).

While no simplified definition can do justice to the richness of it as a scholarly field, for the purposes of providing an entry point to understanding CRT, there are, in general “six key tenets connected to the social justice goal of leading to combat racism in education” (Amiot, Mayer-Glenn, & Parker, 2020, p. 201). These six tenets that CRT focuses on are:

1. The permanence of racism
2. Whiteness as property
3. The importance of counternarratives and counter-stories
4. The critique of liberalism

5. Importance of interest convergence
6. Intersectionality (Amiot, Mayer-Glenn, & Parker, 2020)

CRT as a specific form of critical theory allows scholars and practitioners to pose the important question of how power is constructed in human interactions, how democracy is subverted, and how domination takes place based on racialized demarcations (Amiot et al., 2020; Kincheloe, 1999).

The concept of racialization refers to the processes by which a group of people is defined by their “race.” Processes of racialization begin by attributing racial meaning to people’s identity and, in particular, as they relate to social structures and institutional systems, such as housing, employment, and education. In societies in which “White” people have economic, political, and social power, processes of racialization have emerged from the creation of a hierarchy in social structures and systems based on “race.” The visible effects of processes of racialization are the racial inequalities embedded within social structures and systems.

The rejection of a static and universally accepted, objective reality within the field of educational leadership is essential if schools as their leaders are to better serve the hopes and aspirations of Indigenous and racialized students (Amiot et al., 2020; Kincheloe). CRT challenges claims presented by scholars of educational leadership who attempt to present its knowledge base as an objective, race-neutral field that is somehow built on a foundation of equality of educational opportunity for all (Parker & Villalpando, 2007).

It is necessary for leaders to engage in essential conversations while applying a critical lens to their work in order to create space for voices not central to the traditional discourse of educational leadership (Santamaria & Santamaria, 2015). Scholars and practitioners of educational leadership need to shift away from notions of management in favor of “educational leadership as imperative for global human development and social betterment” (Santamaria & Santamaria, 2015, p. 25) as part of a commitment to create more just and equitable outcomes for Indigenous and racialized students and their families.

What is needed is a dismantling of the structures that reify the existing knowledge base of educational leadership and a commitment to a newer foundation that relies on a race praxis approach that allows scholars to develop a more robust epistemic and ontological orientation that braids Indigenous and racialized knowledges, ways of thinking and ways of being with those existing ones that are not mutually exclusive (Parker & Villalpando, 2007).

## **Eurocentric Whiteness and Educational Leadership**

Eurocentric Whiteness can be understood in broad terms as: “the production and reproduction of dominance rather than subordination, normativity rather than marginality, and privilege rather than disadvantage” (Frankenberg, 1993, p. 236) based on racialized social constructs. Eurocentric Whiteness is a legacy of global White colonialism based on a racialized worldview anchored on an ideology of White

European supremacy (Gillborn, 2005; Leonardo, 2002). Eurocentric Whiteness, according to Ansley (1992), can be understood as:

a political, economic, and cultural system in which whites overwhelmingly control power and material resources, conscious and unconscious ideas of white superiority and entitlement . . . [that] are wide spread, and [how] relations of white dominance and non-white subordination are daily re-enacted across a broad array of institutional and social settings (p. 592).

The interconnected features of neocolonialism, Eurocentrism, and Whiteness intersect and amplify the effects of Eurocentric Whiteness (Ansley, 1992).

### **Eurocentrism**

The term Eurocentrism denotes a worldview which, implicitly or explicitly, posits European history and values as normal and superior to all others, thereby helping to produce and justify Europe's dominant position within the global capitalist world system (Mills, Durepos, & Wiebe, 2010). It has been variously defined as an attitude, conceptual apparatus, or set of empirical beliefs that frame Europe as the primary engine and architect of world history, the bearer of universal values and reason, and the pinnacle and therefore model of progress and development (Sundberg, 2009).

### **Whiteness**

Whiteness can be defined as a system of domination that upholds a White identity "as an essential something" (Fine, Powell, Weis, & Wong, 1997, p. 9). Its meaning and status depend on racist structures that associate Whiteness with normality so that people who deemed White, independent of their social status, can assert their "property rights in whiteness" (Harris, 1993). Thus, Whiteness exists as a "property" that operates "socio-discursively through subjectivity and knowledge production" (Moreton-Robinson, 2008, p. 85). A property in which White people have invested in and profited from as a result of the asymmetrical power relations between those on the margins and those in the center of power forging what Mills (1997) describes as a "racial contract."

In addition, Whiteness represents race without ethnic or cultural context except for privilege and exclusion of those determined not to be White by those who are White (Leonardo, 2013). As Moreton-Robinson (2008) stated, "Whiteness is constitutive of the epistemology of the West; it is an invisible regime or power that secures hegemony through discourse and material effects in very day life" (p. 75).

### **Amplifying the Effects of Eurocentrism and Whiteness**

When the two interrelated concepts of Eurocentrism and Whiteness are integrated within the apparatus of neocolonialism, Eurocentric Whiteness becomes the foundation of ongoing colonization, systemic racism, and cultural imperialism (hooks, 1990). The amplification results in Eurocentric Whiteness taking on the appearance of being normal, natural, and fair, as it operates in the background in activities like

theoretical framing and the generation of theory (hooks, 1990). Discourses of race-neutral epistemologies or color-blind theories stifle deeper reflections about inequity and precludes interrogations of White privilege or conversations about how best to equalize the outcomes of the education system (Davis, Gooden, & Micheaux, 2015).

Thus, Eurocentric Whiteness is rendered invisible, yet remains dominant and pervasive as it influences every aspect of life every day (Moreton-Robinson, 2008). “There are,” as Davis et al. (2015, p. 337) stated, “material implications around race for how people live their lives and how educational leaders do their work,” and suggestions that educational leadership should be color-blind or race-neutral will only serve only to disenfranchise non-White students and their families even more (Cranston & Whitford, 2018; Khalifa et al., 2019).

The dominant, hierarchical models of educational leadership preparation controlled by colleges, universities, ministries of education, and professional associations draw from a limited rather self-referent “expert” knowledge base that reflects hegemonic values associated with Eurocentric Whiteness and values that are continually reinforced by colonial discourses and practices (Battiste, Bell, & Findlay, 2002; Cranston & Whitford, 2018; Kovach, 2009). The fact is that a majority of the published theory and empirical research on educational leadership continue to perpetuate an implicit assumption that leadership ought to be enacted in an Eurocentric White racial and cultural context is highly problematic because race is not just a factor to be considered in discussions about educational leadership, but is, in fact, an integral dimension of what it means to effectively lead schools and their communities.

López (2003) contends that by ignoring the broader sociological web of power in which racism functions and by relegating Indigenous and racialized theoretical understandings of educational leadership to the fringes it “not only relegates race to a theoretical footnote within the larger discourse of educational leadership but also fails to probe how issues of race intersect and permeate the educational landscape” (p. 69). If they are to nurture the vibrant knowledges that support students and the communities they live in, scholars of educational leadership and practitioners “have a duty to know and raise questions about race and racism in society, as well as an ethical responsibility to interrogate systems, organizational frameworks, and leadership theories that privilege certain groups and/or perspectives over others” (López, p. 70).

Although there is a growing cohort of scholars documenting the value in understanding culturally relevant stories and narrative accounts that Indigenous and racialized educational leaders and scholars share about the ways in which educational leadership can be conceived and enacted, ways of knowing and doing that are qualitatively different from historically mainstream leadership practices, these rich epistemic traditions are all too often overlooked in the discourses of educational leadership or placed on the margins of the presumptive knowledge base (Cranston & Whitford, 2018; Dantley & Tillman, 2006; Jean-Marie, 2008; Jean-Marie, James, & Bynum, 2006; Tillman, 2007).

Indigenous and racialized scholars continue to champion the call for the field to be interrogated and for the knowledge base to be redeveloped in ways that honor the

knowledges of Indigenous and racialized communities. Increasingly, they are being joined by their White colleagues who heed their calls for epistemic and ontological racial justice (for examples, see Cranston & Whitford, 2018; Dimmock & Walker, 2000; Hallinger & Chen, 2015; Lopez & Rugano, 2018; among others).

---

## Decolonizing Educational Leadership

Decolonization critiques the effects of colonialism on Indigenous and non-Indigenous peoples (Alfred, 2004; Smith, 1999). Smith (1999) defines decolonization as “a process which engages with imperialism and colonialism at multiple levels” (p. 20). A decolonial framework invites scholars and practitioners to question and examine the impacts of colonialism on the knowledge base of educational leadership as it provides an opportunity “to reimagine and rearticulate power, change and knowledge through a multiplicity of epistemologies, ontologies and axiologies” (p. iii).

Decolonization at the individual level requires flexibility in thinking as it challenges the thinker to accept multiples ways of knowing and of being as they strive to understand social reality from another’s perspective (Berryman, Nevin, SooHoo, & Ford, 2015). More broadly, decolonization requires the collective efforts of an “epistemic community who can develop and nurture hope, dreams and aspirations and transmit the energy of this work” (Sefa Dei, 2016, p. 37).

Drawing on the insights of a number of scholars (for example, see Bacchi, 1999; Bell, 1980; Sefa Dei, 2016; Ma Rhea, 2015; Smith, 1999, among others) in order for educational leadership to be decolonized, three central tenets should guide the work. Firstly, decolonization rests on a willingness to critically confront the effects of colonization, including racialization, marginalization, and other forces of oppression. Decolonizing educational leadership also requires challenging the epistemic discourses of the field that only serve the masters of neocolonialism, those who control discourses that are “larger than language, more than words” (Bacchi, 1999, p. 40). It means interrogating what is allowed to be said, who is permitted to speak, when they are permitted to speak, and with authority is given to the words they speak (Bell, 1980).

Secondly, decolonization means recognizing and accepting that current, dominant model of education, one that is in many aspects a form of neocolonialism, fails to recognize the rights of Indigenous peoples and is therefore oppressive to Indigenous children. It requires a deep commitment to an Indigenist, rights-based mindset, which implies a commitment to learn and an openness to understand Indigenous worldviews and the worldviews held by many racialized peoples (Ma Rhea, 2015).

Finally, decolonizing educational leadership requires a reflexivity that can “capture and lift out of the culture and (un)consciousness of academia that which is oppressed, suppressed and disavowed” from the field (Sefa Dei, 2016, p. 41). This requires recognizing the legitimacy and the authority of Indigenous and racialized forms of knowledge that are often times relegated to the margins of the field, and also

ensuring that processes were in place to enable their articulation and inclusion in the knowledge base (Cranston & Whitford, 2018).

## Creating Space

The result of decolonizing educational leadership is that it creates an equal space for the inclusion of Indigenous and racialized knowledges and ways of both knowing and also ways of being. Their acknowledgment and inclusion as legitimate forms of knowledge that are considered equal to anti-oppressive Westernized forms of knowledge is essential because if they are not used as a foundation to move forward the effects of colonization and neocolonization will continue to permeate the education system (Cote-Meek, 2020; Kovach, 2009; Moosa-Mitha, 2005; Sefa Dei, 2016; Smith, 1999).

According to Cote-Meek (2020), the space that must be created needs to be more than one of reconciliation, it must also be one that confronts the truth. Among the truths that Cote-Meek (2014) identified is the physical and epistemic violence that has been perpetrated on Indigenous and racialized peoples by educational institutions through its colonial structures of oppression.

---

## Braiding Indigenous and Racialized Knowledges with Anti-Oppressive Western Knowledges

The process of braiding Indigenous and racialized knowledges with anti-oppressive Westernized ones (Moosa-Mitha, 2005) can be described as a process of co-learning that allows for multiple forms of meaning-making (Bartlett, Marshall, & Marshall, 2012; Marshall, Marshall, & Bartlett, 2015; Vukic, Gregory, & Martin-Misener, 2012). As a metaphor and process, braiding the knowledges together can be described as a commitment to acknowledge and listen to the discourses of those who have deep Indigenous understandings and racialized knowledges who collaborate with colleagues who are knowledgeable with Westernized knowledge forms to bind the knowledges together in ways that are reciprocal and respectful (Aikenhead & Michell, 2011; Bartlett et al., 2012).

Braided knowledges demonstrate how diverse ways of knowing can be braided to create new understandings and insights when considered together (Hopkins et al., 2019). As Snively and Williams (2016) described:

braiding Indigenous Science and Western Science is a metaphor used to establish a particular relationship, an obligation of sorts to give, to receive, and to reciprocate. We braid cedar bark to make beautiful baskets, bracelets and blankets. When braiding hair, kindness and love can flow between the braids. Linked by braiding, there is a certain reciprocity amongst strands, all the strands hold together. Each strand remains a separate entity, a certain tension is required, but all strands come together to form the whole. When we braid Indigenous Science with Western Science we acknowledge that both ways of knowing are legitimate forms of knowledge. For Indigenous peoples, Indigenous Knowledge (Indigenous Science) is a gift. It cannot be simply bought and sold. Certain obligations are attached. The more something is shared, the greater becomes its value (p. 3).

## Indigenous Epistemologies

Indigenous knowledges comprise a specific way of knowing based upon oral tradition of sharing knowledge. It is akin to what different Indigenous scholars and researchers, the world over, identify as storytelling, yarning, talk story, re-storying, and/or remembering (Kovach, 2009). The International Council for Science of the *United Nations Educational, Scientific, and Cultural Organization* (2002) described Indigenous or “traditional” knowledges as:

*a cumulative body of knowledge, know-how, practices and representations maintained and developed by peoples with extended histories of interaction with the natural environment. These sophisticated sets of understandings, interpretations and meanings are part and parcel of a cultural complex that encompasses language, naming and classification systems, resource use practices, ritual, spirituality and worldviews.* (p. 9)

Foundational to Indigenous epistemologies is a worldview of interrelationships among the spiritual, the natural and the self, forming the foundation or beginnings of Indigenous ways of knowing and being (Battiste & Youngblood Henderson, 2000).

## Racialized Epistemologies

“Race-based epistemologies serve to de-center and contextualize western ways of thinking and knowing, to define their limits. They advocate that other forms of knowing and understanding need to be respected, included, in order to deconstruct past and resist future epistemological colonization” (Almeida, 2015, p. 85). Hill Collins (199) names and discusses the four “contours” (p. 206) or characteristics of race-based epistemology, which are: “concrete experience as a criterion of meaning” (pp. 208–212), “the use of dialogue in assessing knowledge claims” (pp. 212–215), “the ethic of caring” (pp. 215–217), and “the ethic of personal accountability” (pp. 217–219).

## Anti-Oppressive Westernized Epistemologies

Anti-oppressive Western epistemologies push back against the active or passive distancing of oneself from the social reality that people form the lives of people, where they work or attend school (Ngũgĩ, 1986). These epistemologies “would have to be the result of the critical dialogue between diverse critical epistemic/ethical/political projects towards a pluriversal as oppose[d] to a universal world” Grosfoguel (2007, 212).

---

## Toward Braiding

Braids are regarded by many African people as a symbolic representation connected to culture. The history and tradition of African hair braiding within tribes and the cultural significance of braiding is deep and long (Kiros, 2020). The significance of

braids to African American culture is also connected to the impact of slavery on African women (Kiros). As Kiros noted:

Slavery brought not only physical and psychological trauma, but it also brought erasure. In an attempt to strip them of their humanity and culture, traffickers would shave the heads of women. Colonizers effectively attempted to take away the women's lifeline to their homeland. Hair was an important piece of a complex language system, in which it communicated the identity of the person wearing the braids (para. 3).

Within some Indigenous communities braided hair is regarded as symbol of strength, wisdom, and is something that reflects aspects of an individual's identity. While for other Indigenous communities braids have a cultural significance and reflect a connection to the creator, their ancestors, and the earth (Monkman, 2016).

Braiding is focused on what Jimmy, Andreotti, and Stein (2019) refer to as "thread sensibilities" and thread sensibilities "are oriented towards relationality" (p. 15). Thread sensibilities:

require that we sense entanglement in order to weave genuine relationships, which will in turn command responsibility for collective wellbeing as a grounding force for adequate (new) political and institutional systems (i.e. adequate relationships will build adequate capacities to work together that will secure adequate processes) take language to be both practical and metaphorical. Language can never describe the unknowable wholeness of the world, but it is extremely useful to move things in the world. In this sense, both language and knowledge are "entities" whose impact is evaluated not by their accuracy in describing something, but in their impact in the world (i.e., what they enable and what they foreclose). In this case, knowledge can come from many places (the land, altered states of consciousness, non-humans) and is something that is earned (not an entitlement) (p. 15–16).

In a metaphorical way, the similarity of what braiding represented and still represents for and among Indigenous and racialized peoples illustrates a fundamental similarity between Indigenous and those from African descent as peoples bonded through the trauma of colonization and an ongoing racialization that is anchored in the lack of humanity that the Eurocentric, White establishment presumed each group to possess.

## **Braiding Knowledges**

The process of braiding recognizes the mental constructs that guide, organize, and regulate their peoples' way of living and making sense of their world. These stand in opposition to imposed colonial norms and practices that center imperialism (Sefa Dei, Hall, & Goldin Rosenberg, 2002). Broadly understood Indigenous and racialized knowledges can be understood as "pragmatic and ceremonial, physical and meta-physical" (Kovach, 2009, p. 56). Little Bear stated, "no matter how dominant a worldview is, there are always other ways of interpreting the world" (p. 77).

Braiding diverse yet distinct knowledge systems create opportunities to develop a deeper understanding of historical and present events and their consequences on people's lives. Braiding allows for a respectful, reciprocal knowledge exchange that

can lead to more robust insights and innovations in thinking, and can result in decisions and actions that are informed by Indigenous and racialized knowledges and not only the extant knowledge base (Hopkins et al., 2019; Raygorodetsky, 2017; Sefa Dei, 2016; Snively & Williams, 2016).

In practical terms, the inclusion of Indigenous and racialized knowledges would illustrate how educational leaders might “see from one eye with the strengths of Indigenous ways of knowing and to see from the other eye with the strengths of Western ways of knowing, and to use both of these” to lead schools and communities (Bartlett et al., 2012, p. 335). Indigenous and racialized epistemologies value different ways of knowing that inherently acknowledge the heterogeneity of knowledge (Martin-Hill & Soucy, 2007; Sefa Dei, 2016). Braiding knowledges respect that there are diverse understandings of the world, and acknowledge and respect a diversity of perspectives without perpetuating the dominance of one over another (Martin, 2012).

In spite of the history of colonization and its ongoing effects, braiding these distinct but not incommensurable ways of knowing is a continued practice of resurgence and demonstration of how Indigenous and racialized scholars and communities can work and cocreate knowledge (Battiste & Youngblood Henderson, 2000). The process of braiding together the three strands of knowledge acknowledges that Indigenous and racialized worldviews, and anti-oppressive Westernized ones each have something to offer.

When they are commensurate and are considered tightly braided together in ways that respect and value the different perspectives that each offers, as a braided thread they are stronger than when considered in isolation. By drawing on the rich and robust epistemologies offered by Indigenous peoples and racialized communities, scholars and practitioners of educational leadership can work to braid together different ways of knowing to motivate people, Indigenous, racialized and White, to use their collective understandings to create more just schools and communities through more equitable educational opportunities (Iwama, Bartlett, Marshall, & Marshall, 2009). Braiding enriches the existing knowledge base and expands it. The act of braiding moves Indigenous and racialized knowledges from the fringes and instead highlights the epistemic knowledge traditions of Indigenous, colonized, and oppressed racialized peoples (Sefa Dei, 2016). Thus, when Indigenous and racialized knowledges are braided together with close meaning together in solidarity they demarcate the relationship between communities who forced through the violence of colonialism and slave labor can be drawn together through their shared experiences of oppression, and resistance to an imperialist, White supremacist, capitalist, patriarchy.

Braiding distinct but not incommensurate Indigenous and racialized knowledges with Westernized anti-oppressive knowledges (Moosa-Mitha, 2005) is a continued commitment to lead schools through the diversities of knowing and ways of being (Sefa Dei, 2016). Indigenous and racialized knowledges allow for an equitable approach to valuing the knowledges that people possess by focusing on reciprocity and obligation in the development of curriculum, the recognition of authoritative voices, and through the distribution of power of educational leadership. Such an

approach to braiding honors the diversity and richness of Indigenous and racialized knowledges without seeking to cancel the strengths that can come from Eurocentric White forms.

---

## Conclusion and Reflections

López (2003) warned of the danger that comes from minimizing race in educational discourses by explaining that a “decontextualized and deracialized narrative” can foster “an inability to critically confront racism and racist educational policy” (p. 72). As Almeida, (2015) articulated, “Race-based epistemologies serve to de-center and contextualize western ways of thinking and knowing, to define their limits. They advocate that other forms of knowing and understanding need to be respected, included, in order to deconstruct past and resist future epistemological colonization” (p. 85). Race-based epistemologies illustrate the contradiction that emerges when dominant discourses and commentaries “begin to eulogize about universities being a site for equity and social mobility” when the reality is that the dominant Eurocentric White “canons” denigrate the value of Indigenous and racialized knowledges (Arday, 2018, p. 194).

By drawing on the work of critical race theorists, an avenue can be opened for a decolonizing approach to reform the knowledge base of educational leadership (Bell, 1980; Crenshaw, Gotanda, Peller, & Thomas, 1995; Ladson-Billings, 2013). A decolonizing approach allows for the critical examination of the ways that racism and Eurocentric White privilege operate together to dominate the knowledges valued and reified in many educational institutions and systems including departments of educational leadership (Cranston & Whitford, 2018).

According to Lopez and Rugano (2018), “The dominance of Eurocentric knowledge, practices, and beliefs in education must be disrupted and the experiences of people with a colonial past must be centered for authentic meaningful change to occur” (p. 2). There is a need to eliminate the existing colonially oriented power relationships that positions non-Indigenous and nonracialized educators and educational leaders as the experts of other people’s children and reifies that they know what is best for someone else’s children even more than their own Indigenous or racialized families or communities do.

Following the recommendation of Kincheloe and Steinberg (2008) there is need to dismantle the knowledge base of educational leadership through a decolonizing dialogic process where both intra- and intercultural knowledge traditions, namely Indigenous and non-Indigenous forms, can be used to inform each other. Foster (1999) ardently declared that “knowledge is always produced in specific contexts, which are time and space dependent” (p. 104), which means that the knowledge base of educational leadership is unlikely to be universal. In order to disrupt the extant knowledges that dominate educational leadership, new perspectives must be included that respect the diverse communities that schools serve (Lichtenstein et al., 2006).

Educational leaders “working in diverse cultural landscapes need sophisticated understandings of the concept of culture as a learned and adaptive response to

contextual needs. They need to see that manifest levels such as roles, rituals, regulations and policies are frequently based on inheritances that may be explicit or assumptive” (Collard, 2007, p. 750). They need to understand and learn from the discourses and discursive norms of Indigenous and racialized peoples because language is not simply descriptive or a reflection of the social order of the world, insofar that it does not just mirror social reality. Educational leaders require opportunities to reflect on and respond to the diverse cultural forces at play in society if they are to construct new and deeper understandings of historical traumatic effects of colonialism if they are to be prepared to face the diverse social contexts they will encounter in many contemporary school settings (Collard, 2007).

More than 30 years ago Cuthertson (1988), and Beare, Caldwell, and Millikan (1989) called for a commitment to dismantle and rebuild the whole field of educational leadership for both practitioners and scholars. Rather, the discourses of educational leadership actively shape the way scholars and practitioners perceive and understand it as a field of study and practice, and the discourse has a profound influence on the way that individuals act and think (Hajer & Wagenaar, 2003; Mills, 1997). However, such efforts are needed now so that scholars can better understand how they can decolonize and reconstruct educational leadership as a field of study and practice and how they can create a reflexive field that illuminates the shadows that continue to cloak the ongoing effects of colonialization and racialization.

As a result, if the field of educational leadership can reject its colonial epistemic discursive base, it can make spaces for other knowledges, Indigenous and racialized ones. It can then become a truly transformative field of study and practice. The knowledge base could be reconstructed “from new fundamentals” and undergo “a reconstruction that changes some of the field’s most elementary theoretical generalizations as well as many of its paradigm methods and applications. When the transition is complete, the profession will have changed its view of the field, its methods, and its goals” (Kuhn, 1970, pp. 84–85).

The pathway forward requires scholars and practitioners of educational leadership to avoid the tendency to search for essentialist solutions that invoke simplistic binary oppositions between Indigenous and non-Indigenous epistemologies and ontologies because such “either/or” approaches leave little space or afford sufficient time for real dialogues to occur. What is required is for the scholarly community to engage in this decentering of Eurocentric Whiteness out of a sense of humanitarian responsibility as opposed to reactionary guilt (Santamaria & Santamaria, 2015).

It is clear that school leaders need to be given formal opportunities to learn about epistemologies and ontologies quite different from the dominant ones they hold through a process that is designed as mutually respectful and reciprocal process of knowledge exchange that leads to new understandings. It can be fostered through relationships firmly set to allow for an even understanding of Indigenous, racialized, and non-Indigenous assumptive worldviews and cultural values. It is through this exposure that educational leaders can opt for frames of reference through which to lead schools other than the historical and predominant colonial frames rooted in Eurocentric Whiteness that continue to dominate and guide the field.

An approach that is framed through a critical race theory analysis that uses decolonizing methods scholars of educational leadership can eliminate those practices and theories that leave no room for other epistemologies to be considered as valid, and thereby create space for Indigenous and racialized forms of knowledge. Such space would allow scholars of educational leadership to collaborate across their differences to braid the rich knowledges of the peoples who have historically been omitted from the discourses of higher education. Despite the resistance of the institution and some of its agents to make this type of work intrinsic, it is a necessary recalibration of the scholarly field of educational leadership.

What is needed now, perhaps more than ever before, is the active decolonization of the knowledge base of educational leadership so that Indigenous and multicentric racialized ways of knowing, being, and leading become equally important central tenets for practice and theory. This active decolonization must cautiously consider how to avoid institutionalizing these often-excluded knowledges within the framework of White supremacy, but instead needs to shift the foundation of the institution and the field. This is where equal doses of reconciliation and truth, described by Meek-Cote, become essential ingredients.

By acknowledging and responding to the different sociopolitical and ethno-cultural differences of experience that exist in pluralistic societies and are part of the fabric of Indigenous, racialized, and non-Indigenous/racialized students' lives, educational leaders cannot only challenge power and privilege that advantages a few while oppressing many, but they also have the opportunity to leverage their individual and collective agency to further educational opportunities for students who – because of the continued effects of colonialism – deserve and need them the most. If the needs, hopes, and aspirations of Indigenous and racialized students and their families are to finally be served, educational leaders will require a knowledge base that reflects a deep understanding of Indigenous peoples' and racialized peoples' historical struggle against colonialism, cultural assimilation, and systemic racism to support their work.

A reconstructed field ought to position Indigenous and racialized ways of knowing and knowledges in ways that hold equal weight and validity to the anti-oppressive Westernized ones that currently dominate the field. Such a process relies on the intricate work that is required from scholars from diverse backgrounds to work to braid them together. The result would be a field that is explicit about what is implicit in terms of what educational leadership values as a field of study and practice. A field that can truly be directed to serve the public good.

## Abstract

Human trafficking is widely regarded by experts today as “modern slavery.” Research consistently reveals that survivors of the sex trade are disproportionately women of color in the United States. Such racial disparities are explained by a long history of structural racism and inequality resultant of colonialism. Colonial knowledge production systems are responsible for producing and maintaining anti-black sexual archetypes premised on the pornographic objectification of Black women’s bodies. The hypersexual scripting and adultification of the Black body help to explain why sex trafficking impacts Black girls at higher rates compared to other groups. This also explains why Black youth are less likely to be perceived as victims. In this chapter, we connect the disproportionate impact of sex trafficking to reporting

barriers and the often harsher, exclusionary discipline and punitive treatment of Black female youth experienced in the K-12 setting. Although sex trafficking awareness among educators is improving in the United States, we call attention to the pivotal role that educational leaders can play in the prevention of sex trafficking by working in collaboration with the community and local stakeholders to create a shift in culture, response, and policy.

**Keywords**

Sex trafficking prevention and education · Racial disparities · Anti-racist education · Black body politics · Colonialism · Vulnerability · Black youth · Discipline

**The Field of Memory**

Education is a vital dimension of the human trafficking prevention toolkit. Many of the highest-risk populations to sexual exploitation are school-age youth in the United States, a country which ranks among the three worst in the world for human trafficking (U.S. Department of State, 2019). Among these youth, Black females are disproportionately vulnerable to sexual exploitation. This is attributable to the complex trauma experienced because of systemic racism and the legacies of colonial body politics. The modern fetishization and sexual exploitation of Black bodies is a product of European colonial expansion and a key dimension of enslavement both then and now. Colonialism has produced ways of knowing, seeing, and understanding the bodies of Black women as innately lustful beings. This “Jezebel” imaginary was premised on a juxtaposition of Black, corrupt, evil, immoral, or dirty bodies (Roediger, 2010; Sherman & Clore, 2009) with white, pure, clean, ethical, and even Godly ones (Sherman & Clore, 2009). This produced a category of subjects perceived as hypersexual and “deserving of punishment” (Butler, 2015b; Phillips, 2015, p. 658). Sexually objectifying the body made it commodifiable and exploitable, another piece of territory to America’s manifest destiny. Despite the abolition of slavery, the Civil Rights movement, and multiple waves of feminism, this commodification of bodies continues at epidemic proportions through the sex trafficking industry today (UN.GIFT, 2008).

**The Field of Presence**

Global urgency to address sex trafficking has come from an increased attention to violence against women (VAW) and the trafficking industry’s connections to drug trafficking, commercial sex, coercive labor, and the HIV/AIDS pandemic. Yet there is an overall lack of deep public awareness about human trafficking and misunderstandings about victimology. That Black youth are disproportionately sex trafficked is the result of racial biases, which have led to the criminalization and adultification of Black youth. Although the Trafficking Victims Protection Act (TVPA) and recently enacted “Safe Harbor” laws recognize that all youth under the age of 18 are victims, Black juveniles remain more likely to be arrested for prostitution and experience violence by law enforcement (FBI, 2017; Phillips, 2015). This barrier to

identification is compounded by the reluctance of trafficking survivors to identify themselves as victims out of shame, fear of law enforcement or authorities, and concern about retribution by traffickers. This makes trafficking victims intrinsically hard to reach. These same racial and sexual stereotypes have created a culture of punishment within schools, wherein youth of color face greater exclusionary discipline. This chapter draws attention to the important intersections of the role that school systems play in systematically making criminals of Black youth and the vulnerability of this population to trafficking.

### **The Field of Concomitance**

The integration of trauma theory, drawing on the field of psychology, offers a way to make education more equitable for historically marginalized students in the United States by addressing how educators may reproduce criminality and reinforce vulnerability. This is essential to intervening with at risk populations. Historical and familial trauma not only have a predisposition to post-traumatic stress disorder (PTSD) and lower academic achievement but are at higher risk of substance abuse and other risky behavior (Brave Heart et al., 2011; Maxwell, 2014; Wesley-Esquimaux & Smoleswski, 2004). Studies have revealed histories of adverse childhood experiences prior to being trafficked heighten vulnerability to deception and recruitment of a trafficker (Choi, Klein, Shin, & Lee, 2009; Evans, 2019; Smith et al., 2009; Wilson & Butler, 2014). Therefore, knowledge about adverse childhood experiences (ACE) and generational trauma by educators is essential to mandated reporters' ability to identify and assist Black sex-trafficked youth, as well as prevent retraumatization.

### **Discontinuities and Ruptures**

Trauma-informed attention must be called to multiple intersecting identities to address the vulnerability of "sex-trafficked Black female youth." Black feminist and intersectional research on gender and sexuality has played a vital role in confronting and challenging racial and sexual stereotyping by interrogating the colonial gaze that has fetishized the Black body in schools, as well as society at large. Alongside feminist activism, this literature has helped to expose Black women and girls' experience, which has otherwise remained silent within society and the academy. Nevertheless, even within the recent #MeToo and Black Lives Matter (BLM) movements, Black feminists recognize the continued marginalization and exclusion that women and girls of color experience within the larger (White) feminist movement in US society. Interrogating the colonial gaze and recognizing Black women's experience are some of the first steps to understanding how the Black body can become a strategic site of postcolonial resignification (Netto, 2005). This is needed to liberate and recognize agency of Black women's sexuality and dismantle the systems of oppression and criminalization that have made disciplinary practices and sexual violence against Black women and girls permissible.

### **Critical Assumptions**

This chapter works from the following critical assumptions. Blackness is fetishized and hypersexualized. Western social thought associates Blackness with an imagined

uncivilized, animal-like sexuality. These dehumanizing colonial body politics oppress and subjugate by producing acquiescent subjects, who are perceived to be always consenting either passively or enthusiastically. This rationale has been used to justify exploitation, oppression, and sexual violence. These ideologies have lingered centuries after the Transatlantic Slave Trade, continuing to manifest in how Black sexuality and Black bodies are perceived and treated in contemporary society. Black youth are not free from this hypersexualization, as a maturity is inscribed onto them, becoming sexualized through a process of “adultification.” The convergence of these imaginaries means that Black female youth are increasingly vulnerable to sexual abuse and exploitation. Adultification also shapes identity and how Black female youth come to navigate and conform to the social and political order. Many Black sex-trafficked youth in the United States go unnoticed and struggle to receive societal support because of these body politics. Racial inequity and bias in schools mean that Black female youth are greater targets of punitive practices, such as exclusionary discipline, making an already vulnerable population at risk for human trafficking. Therefore, adopting anti-racist and anti-trafficking practices within the educational system can play a decisive role in reducing vulnerability among Black female youth.

---

## Introduction

Colonial body politics produced a legacy of dehumanizing and injurious stereotypes for Black men and women in the United States. The objectification of the Black body has served to justify violence, exploitation, and marginalization in all dimensions of life, from the streets to the classroom (Butler, 2015a; Morris, 2016; Phillips, 2015; West, 2009). This chapter begins by discussing the genesis of the hypersexualization of Black womanhood as a product of colonial body politics. Next, it recounts the issue of sex trafficking in the United States, drawing special attention to racial disparities among trafficking survivors. The vulnerability of Black female youth to sexual exploitation is then tied to issues of racial discrimination within education as they relate to disciplinary practices. By assessing present day K-12 responses to Black youth, this chapter proposes a set of school-based anti-racist strategies for educational leaders to use as trafficking prevention.

---

## Colonial Body Politics: A History of the Fetishization and Hypersexualization of Black Women

Slavery, servitude, and coerced human labor existed long before the development of the Transatlantic Slave Trade in the sixteenth century. These colonial power structures relied on racial hierarchies and taxonomies of power based on biological determinism (Quijano, 2000). Pseudoscientific ideas such as phrenology rationalized Black inferiority, slavery, and centuries of social and economic domination. Black people were animalized and dehumanized, scripted as barbaric and subhuman, and often situated between humans and primates along the evolutionary ladder (Albarello & Rubini, 2012;

Davenport & Steggerda, 1929; Ferguson, 1916). This racial hierarchy was also sexualized. The genesis of anti-black sexual archetypes begins with the arrival of European colonizers to Africa (Magubane, 2001). These European travelers were both perversely fascinated and appalled by their encounters with the bodies of Africans (Holmes, 2007). Their writings and pseudoscientific practices characterized Black bodies as having an insatiable, primal, and animal-like sexuality. This codified the Black male as a brute and a potential rapist and the Black woman as lascivious by nature.

These anti-black sexual imaginaries thrived in the United States, a country founded on white supremacy, where 40 of the 56 signers of the Declaration of Independence and 10 of the first 12 presidents owned slaves and the Constitution only counted slaves as three-fifths of a free person. The hypersexualization of the Black body was essential to the sexual economy of slavery. This rationalized and normalized exploitive sexual relations between White men and Black women, especially sexual unions involving slavers and slaves (Butler, 2015b; Davis, 2002; Hooks, 1981). Black women, who were reductively characterized as innately seductive, promiscuous, alluring, predatory, and lewd, were constructed in contrast to White women, who were considered pure, modest, and civilized. These narratives suggested that Black women had an insatiable appetite for sex, which could not be satisfied by Black men. Even more, this logic excused slave owners' sexual exploitive abuse (Butler, 2015b; Lindsey & Johnson, 2014). This also created the basis for which slave women were property and could not, legally speaking, be raped (Kendi, 2017). In contrast, Black men convicted of raping White women were usually castrated, hanged, or both (Jordan, 2012, p.150–163). *Plaçage* and other long-term relationships that existed between White men and women of color certainly complicate this story. Entering a sexual relationship with a White man who was not her owner could sometimes be a path to freedom or offer better economic stability for free women of color (Clark, 2013). However, “the rape of a female slave was probably the most common form of interracial sex” (D’Emilio & Freedman, 1988, p. 102). Practices that treated slaves as “breeders” and “encouraged reproduction” relied on the belief that Black fecundity was proof of an insatiable sexual appetite (Roberts, 1999; White, 1999, p. 31). Contracted concubinage and the Fancy Trade also promoted prostitution, especially of light-skinned, mixed-race enslaved women at genteel sex markets, such as “quadroon balls.” Like *plaçage*, mixed-race people and the experience of free women of color challenged the racial binaries that slavery was premised, though this was countered by anti-miscegenation laws. Nonetheless, an open attitude of prostituting Black women was present and continued till the next century, though it became underground thereafter (Kendi, 2017).

Even as old racist ideas were discarded, new ones were produced for renewed consumption. Emancipation, reconstruction, desegregation, and the eventual passing of the Civil Rights and Voting Rights acts did not end white supremacy in America nor Black women's sexual exploitation. The portrayal of Black women as sexually lascivious remains commonplace in American media. Over time, injurious images of Black womanhood in political and popular culture have evolved from the “Hottentot [Black] Venus” (embodied by Sarah Baartman) to the “sapphire,” “Jezebel” whore, “bad-black-girl,” and “welfare queen” (Collins, 2000; Holmes, 2007; Jewell, 1993; White, 1999;

Woodard & Mastin, 2005). These archetypes have been produced and reinforced through literature, drawings, sculptures, and figurines (West, 1995), as well as the evolution of print media, film, and television. The Jezebel trope has dehumanized, objectified, and overshadowed the complexity of Black sexuality and agency. Despite advances in racial consciousness and Black feminism, even when Black women now play central characters of the movies, Hollywood continues to typecast Black women in demeaning, sexually aggressive, or deviant roles. This is also profoundly demonstrated in the pornography industry, which remains a bastion of explicit anti-black stereotyping – raw, obscene, and increasingly mainstreamed. Collins (2004) argues that race and gender are commodified in systems of colonialism and patriarchal capitalism. The sexual violence and abuse toward Black females is evident in present-day pornography where they are generally exhibited as animals and gagged, in chains, or bound by the White male who rapes her (Benard, 2016; Collins, 1991, 2005, 2008; Dines, 2006; Jensen, 2007). This has occurred alongside popular constructions of Black masculinity that glorify the pimp and glamorize the ghetto (Jackson, 2006; Staiger, 2005).

The scripting of Black women's bodies has created an incredible pressure for Black women to adhere to "respectability politics" and work toward dismantling representations and social structures that cast them as sexually promiscuous and deserving of rape, abuse, and stigma or as less deserving of justice (Higginbotham, 1993). Black women had to learn a "culture of dissemblance," which Darlene Clark Hine (1989) describes as tactics of masking and a disavowal of sexuality to shield themselves from sexual exploitation. Nonetheless, the impacts of the hypersexualized imaginaries of the Black women's body are profound. Among the many institutions where the legacies of these colonial body politics persist is human trafficking.

---

## **Racial Disparities Among Sex Trafficking Survivors: The Vulnerability of Black Female Youth**

Long after the Emancipation Proclamation was signed in 1863 in the United States, anti-trafficking activists and advocates argue that slavery persists today. Trafficking is now widely regarded as "modern slavery" (Kara, 2008, 2017; UN.GIFT, 2008). Just as colonialism involved practices of domination and dispossession, sex trafficking operates through the exploitation of another person for the purpose of a commercial sex act through force, fraud, or coercion. The United States' first federal trafficking law, the *Trafficking Victims Protection Act of 2000* (TVPA), states that force, fraud, or coercion does not have to be proven if the individual is under 18 years of age because, by law, they are a minor and are unable to give consent (H.R. 3244, 2000).

Although trafficking victims can be of all genders, races, ethnicities, sexual orientations, nationalities, or income levels, women and girls of color are of special concern. The International Labour Organization (2017) notes 99% of the victims involved in sex trafficking are women and girls. While there is no current clear data on how many individuals have been victimized in the commercial sex industry, it is estimated that 200,000 American children are at risk for trafficking into the sex

industry (U.S. Department of Justice, 2004). Within this data, survivors of the sex trade are disproportionately LGBTQ+ youth, marginalized youth of color (e.g., Hispanic, Latinx, Native American), youth with developmental disabilities, and immigrant youth. In a 2-year review of all suspected human trafficking incidents across the country, 94% were female, 40% Black, and 24% Latinx (Bureau of Justice Statistics, 2011; The National Center for Victims of Crime, 2013). While this statistic may sound racially balanced, one must consider that the percentage of Black individuals residing in the United States only amounts to 13% of the population (US Census Bureau, 2010). In Cook County, Illinois, 66% of sex trafficking victims between 2012 and 2016 were Black female youth (Cook County Sheriff's Office, 2017). In Nebraska, 50% of individuals sold online for sex are Black female youth, though Black people comprise only 5% of the general population (Women's Fund of Omaha, 2017). These disproportionate statistics are also prevalent in studies looking at minors (Carey & Teplitsky, 2013; Louisiana Department of Children and Family Services, 2018; Puzanchera, Sladky, & Kang, 2018; Richey, 2017). Studies also reveal that Black women and girls are more often arrested for prostitution-related offenses rather than being seen as victims of crime (Federal Bureau of Investigation, 2017). Thus, Black female youth are disproportionately trafficked at higher rates. Factors such as limited educational opportunities, poverty, structural inequalities, and historical hypersexualization of Black female youth contribute to their victimization (Crenshaw, 1989; Fredrickson, 1989; West, 2009).

Literature has begun to explain how the impact on a victim of human sex trafficking is layered, complex, comprehensive, and difficult to describe or enumerate. One contributing factor to this complexity is the prevalence of childhood experiences that made them vulnerable to further sexual exploitation. The physical violence, sexual violence, and psychological control of a trafficker and the events during the time of sexual exploitation are factors that create symptoms of trauma and compound early childhood trauma (Choi et al., 2009; Hardy, Compton, & McPhatter, 2013). Complex trauma or DESNOS, while not an official diagnosis listed in the *Diagnostic and Statistical Manual of Mental Disorders, 5th Edition*, is a term that more accurately describes the trauma seen in victimization within human sex trafficking (Busch-Armendariz, Busch Nsonwu, & Cook Heffron, 2014; Choi et al., 2009; Evans, 2019), because it further assists in understanding the impact of trafficking on a victim. Complex trauma emphasizes alterations in six areas: regulation of affect and impulses, attention or consciousness, self-perception, relations with others, somatization, and systems of meaning (Spinazzola, Blaustein, Kisiel, & Van der Kolk, 2001). In turn, to cope or regulate, victims who present with complex trauma may resort to substance abuse, self-injury, disordered eating, suicidal ideation, or other forms of self-destructive behaviors (American Psychiatric Association (APA), 2014). In exploited youth, there have been high rates of suicide and depression, sexual health issues, long-term health problems, and delayed progress in school (Phillips, 2015). Exploited youth face higher risk of mortality through murder and HIV/AIDS. Research also indicates that exiting the sex trade is extremely difficult for youth with recidivism rates indicating that it can take numerous relapses before an exploited youth is free from her exploiter (Abu-Ali & Al-Bahar, 2011; Clawson & Goldblatt Grace, 2007).

Traffickers commonly target individuals with characteristics of vulnerability and isolation (Clawson, 2009). These vulnerabilities include age, history of abuse (Carpenter & Gates, 2016; Finkelhor & Browne, 1985; Lloyd, 2012; Varma, Gillespie, McCracken, & Greenbaum, 2015), mental health, LBGQT youth, and homelessness. Other factors that encourage general vulnerability to sex trafficking include involvement in the welfare system, being a native or aboriginal youth, experiencing familial difficulties, and lack of social support (Fedina, Williamson, & Perdue, 2019; Littrell, 2015). Vulnerability, involvement, or history of exploitation inevitably impacts our youth and results in trauma that derails development and will therefore hinder their education process (Courtois & Ford, 2009). This is further compounded for Black female youth, since race is often overlooked as a predictive factor (Beegan & Moran, 2017; Butler, 2015b). While the current culture promotes sexualization of youth, Black youth have a particular challenge because of the ongoing narrative of Black femininity, which includes a “Jezebel” stereotype (Epstein, Blake, & González, 2017). She is not only presented as a hypersexualized “vix-en” in hip-hop videos but also present in the social discourses that produce public policy responses to child welfare, health, and criminalization or incarceration (Morris, 2016).

Thus, racial disparities heighten the risk of sex trafficking among Black female youth where they are less likely to be perceived as a victim and less likely to receive help in comparison with White female youth (Butler, 2015a; Sedlak et al., 2010). The notion of sex-trafficked Black female youth as a victimless crime stems from historical narratives about Black females in which they are perceived as sexually promiscuous and incorrigible (Morris, 2015; Phillips, 2015; West, 1995). Data reveals that when a sex-trafficked Black female youth is identified, the criminal justice system treats them more harshly (Phillips, 2015). For example, they are at higher risk for criminalization and spend more time detained in comparison with White sex-trafficked youth (Phillips, 2015). In receiving supportive services, White females are favored in treatment centers (Gerassi et al., 2019). As health treatment and counseling are primarily led by White individuals, Black female youth are often not a priority. Additionally, youth from Black communities are hesitant to receive supportive services due to mistrust stemming from a history of being harmed by health professionals during studies such as the Tuskegee Syphilis Study (Maultsby, 1982). Furthermore, across juvenile justice and education systems, Black female youth face more punitive treatment compared to peers. *Girlhood Interrupted: The Erasure of Black Girls' Childhood* (2017) emphasizes how the adultification bias influences adults' perceptions of Black girls. They are seen as less innocent, more adult-like, and more culpable for their actions. For example, past research has shown that prosecutors dismissed an average of three out of every ten cases for Black girls and seven out of ten cases for White female youth. In addition, Black female youth have not received equal opportunities for diversion compared to their White peers. Black female youth are three times more likely to be removed from their homes and placed in state custody in a secure or locked facility than White peers (Epstein et al., 2017). In the education setting, adultification results in harsher treatment and higher standards for Black girls in school.

## Sex Trafficking Prevention Efforts and Barriers Within the US Educational System

Schools are a mirror into our society (Beachum et al., 2008). As Black female youth struggle to receive support from the community, their needs are often overlooked within the context of school (Batchelor & Lane, 2015). An institutional lack of support for this population hinders identification of potential sex trafficking victims. Achievement gaps, school-to-confinement pathways, and the school-to-sex trafficking pipeline are all connected.

School region, resources, demographics, and practices influence the level of academic quality and achievement (Gardner & Miranda, 2001). Low-income schools have fewer resources, such as limited course offerings, little to no after-school programs, and limited teacher experience (Johnson et al., 2004; Lacour & Tissington, 2011), which can lead to unequal opportunities, such as lack of quality education, support, and student guidance (Gardner & Miranda, 2001). Across the United States, a large portion of Black youth attends low-income schools (Hussar & Bailey, 2018). Skiba et al. (2011) note that regardless of socioeconomic factors, race is a significant contributor to disproportionate discipline outcomes. Districts with more youth of color experience harsher exclusionary discipline punishments such as suspension and expulsion than White youth (Anderson & Ritter, 2019). Although Black youth only amount to 15% of the youth population, 36% of expulsions and 44% of multiple suspensions are experienced by Black youth (Hussar & Bailey, 2018; U.S. Department of Education & U.S. Department of Justice, 2014). These forms of school discipline are associated with future misbehavior, lower academic achievement, school dropout, and involvement in the juvenile justice system (Anderson & Ritter, 2017). In addition, youth who have received three or more suspensions are five times more likely to be involved in sex trafficking (Gerassi, 2020).

As Black female youth experience suspension at a high rate, their time out of school can increase their involvement in criminalizing pathways such as sex trafficking (Morris, 2016). Sex trafficking behavioral indicators are overlooked due to lack of training and racial biases, which steer educators away from questioning inappropriate age group behavior. Training and awareness programs play an important role in educators' ability to support sex-trafficked youth. One study that looked at 76 principals in North Carolina noted that teachers were not prepared to address sex trafficking among youth in comparison with social workers, school resource officers, and guidance counselors (Rizo et al., 2019). Teachers' inability to respond to sex trafficking cases may be attributed to the lack of adequate training (Khubchandani et al., 2017). This leaves teachers feeling ill-equipped to identify and respond to sex-trafficked youth. Although policies and practices are developing to enhance sex trafficking awareness, various factors contribute to lack of identification, especially among Black youth.

Changes in educational policies and programs across the United States are slowly heightening sex trafficking awareness (Clay, Okoniewski, & Haskett, 2019; Cornyn, 2015). These shifts influence educators' role as mandated reporters, whereby they are legally required to report any forms of child abuse (physical, sexual, and/or

emotional) (Clay et al., 2019). Out of the number of child abuse and neglect reports made in the United States, educators account for most reports (U.S. Department of Health & Human Services, Administration for Children and Families, Administration on Children, Youth and Families, & Children's Bureau, 2020). To align with the TVPA standards, policy amendments such as the 2015 Justice for Victims of Trafficking Act (JVTA) noted that states must treat sex-trafficked youth as victims of abuse (Cornyn, 2015). In addition, the federal Child Abuse Prevention and Treatment Act of 2010 (CAPTA) added the term "exploitation" to the definition of child abuse and neglect; thus, mandated reporters such as educators are legally required to report sex trafficking cases (Clay et al., 2019; Williams, 2017). Although educational state-level policies on sex trafficking require educators to be trained, cases still go unreported.

There are many factors that contribute to reporting barriers where contextual policies and practices vary. Lack of training depth or inconsistency of training poses barriers to assisting these victims (Rizo et al., 2019). In some cases, policy to practice has yet to be fully enforced in all districts, or when implemented, surface-level knowledge does not lead to enhanced safety of sex-trafficked youth (Williamson, Perdue, Belton, & Burns, 2012). For example, the Florida Department of Education (FDE) lists Florida as top three states for trafficking prevalence, and in 2019 the FDE mandated training for all students and educators. However, districts are required to develop an educational prevention strategy and curriculum (Khabbaz, 2020, February 10). Thus, the quality of program and practice is incumbent on districts to ensure adequate qualifications and design effective materials. To date, there are no well-established sex trafficking training evaluation measures to determine the effectiveness of programs (Gerassi & Nichols, 2018; Rizo et al., 2019). In addition, school sex trafficking programs for educators primarily provide an overview of sex trafficking, leaving educators feeling unsure when identifying and responding to suspected sex trafficking cases (Khubchandani et al., 2017; Williamson, 1 July 2020, personal discussion). Blanket knowledge of sex trafficking is expanding but is limited when addressing the efficacy of school and community response to trafficking (Williamson, 1 July 2020, webinar).

In addition, trainings relating racial inequality to sex trafficking are limited (Butler, 2015a; Khabbaz & Zungu, 2020). Hardly any programs address racial inequality in conjunction with sex trafficking in the K-12 context. Development of programs in this area and research is needed to determine if intended practice is in alignment with desired outcomes. Khabbaz and Zungu (2020) conducted a pre- and post-pilot test to examine the influence of a sex trafficking training on educators' perception, likelihood to report a sex-trafficked youth, and determine if race of supposed victims would play a role in educators' response. The individuals who participated in the study were primarily white, K-12 educators. The pre-test results suggest that although educators felt more empathetic toward Black sex-trafficked youth, they were more likely to report and help White youth. The scholars attributed this finding to ingroup-outgroup distinction, with people being more willing to help members of their group (Aron, Aron, Tudor, & Nelson, 1991). After the sex trafficking training intervention, Khabbaz and Zungu's (2020) post-test findings

indicate that educators were less likely to report on behalf of a sex-trafficked youth and felt less empathetic for those exploited. A potential explanation for these results is preconceived stereotypes about sex trafficking, such that a person who is sexually exploited is forcibly pressured against their will into the situation of harm. The intervention instead highlighted the complexity of sex trafficking and the various vulnerabilities that influence individual's likelihood of sex trafficking. Therefore, when having increased awareness of the nuanced dynamics involved in exploitation, it may have shifted participants' perception of agency. Although pre- and post-tests were underpowered, responses revealed the need for multiple trainings to overcome bias and misconceptions so that educators will report all sex-trafficked youth, despite the circumstances in which one is trafficked. Novice programs on sex trafficking and racial inequality need rigorous assessment so that proper school amendments are made to ensure implementation practice helps to protect at-risk Black female youth.

---

### **Conclusions and Reflections: Combatting Racial Discrimination as Trafficking Prevention**

Racial disparities among sex-trafficked youth in the United States must be understood within a broader context of body politics. Although the hypersexualization of Black bodies can be traced to the history of colonialism and chattel slavery, injurious images of Black bodies persist and are maintained through modern systems and structures of racial injustice. Stereotypical perceptions of the sexually active, deviant, defiant, and insubordinate Black female harmfully impact how society treats Black female youth. Such imaginaries infiltrate and affect how Black female youth are treated even within the school context. Racial disparities are evident when assessing school suspension and expulsion discipline patterns. These forms of discipline play a role in the school-to-prison pipeline as well as the school-to-sex trafficking pipeline. The ubiquity of injurious images and stereotypes of Black bodies that perpetuate bias among school educators and administrators contributes to the vulnerability of Black female youth to sex trafficking. This means that educational leaders must work to promote anti-racism at the same time as trafficking prevention.

School leaders' practice and policies can lead to problems or prevention (McCray & Beachum, 2014). Continuous and purposeful action is required to bring about effective change regarding sex trafficking prevention and racial equity. Equity-based school practice can help to reduce racial discrimination and help to identify and support sex-trafficked youth. As school leaders influence educators' willingness and desire to improve student relations, genuine dedication to equity-based outcomes is required (Kennedy, 2019). This can be done by providing professional development training for school personnel and amending school policies with the support of parents and community, as well as structure school programs that help to identify local needs through collaboration with local stakeholders.

Professional development training for school personnel on bias can shift discipline practice through perspective-taking, individualizing experiences, and fostering

stronger and more positive teacher-student relations (Gregory, Huang, Anyon, Greer, & Downing, 2018). Improvement in teacher-student relationships is vital in sex trafficking situations, as educators may be more in tune to identify vulnerable youth, or youth may be more inclined to share their experience within the context of a trusting relationship. Additionally, positive relations have shown to reduce discipline practice among youth (Rivas-Drake, Lozada, Pinetta, & Jagers, 2020). Community stakeholders can work with and train school personnel by arming them with equitable discipline and race-conscious pedagogy. This practice can be embedded within the school from dialogue to curriculum where the notion of equity and inclusion becomes a state of being. Uncomfortable conversations about race are inevitable but necessary to break down stereotypes that have been ingrained into our society for centuries (Singleton, 2014). Sex trafficking trainings should be handled somewhat differently. Through collaboration with local anti-trafficking stakeholders, together parties can develop a training to meet the needs of the community. Factors to help the success of prevention efforts include comprehensive weekly training, varied teaching methods, fostering positive relationships, enhancing socioculturally relevant content, and development of evaluation outcomes (Nation, Keener, Wandersman, & DuBois, 2005). Through this process, educators should feel more confident and competent in their ability to identify sex trafficking red flags (Rizo et al., 2019). Additionally, the breakdown of racial bias and sex trafficking trainings should help educators accurately interpret Black female youth behavior.

In addition, schools should consider if pre-existing policies are in alignment with equity-based goals, and if not, amendments are needed (Losen & Gillespie, 2012). Anderson (2020) notes that schools should brainstorm potential unintended policy outcomes such as hair or dress code. When amending policies, schools can collaborate with parents and community members, specifically those underrepresented (Anderson, 2020; Banks & Obiakor, 2015). The collaborative process will enhance positive relations and provide perspectives that may alleviate or prevent future conflicts (Anyon et al., 2016; Gregory, Bell, & Pollock, 2016). If policies are not already established, schools should develop a sex trafficking response plan to be able to clearly identify, assess, and report sex-trafficked youth. Sources such as the US Department of Education's Human Trafficking in America's Schools (2015) report can provide a guide to structure response protocols and policies. To ensure policies and protocols are based on school needs, schools can work in collaboration with an anti-trafficking organization to develop sex trafficking response and support measures.

As shifts are required at the school level, educator level, and policy level, change is also needed at the student level. Schools can implement race-conscious and equity-based approaches (Welsh & Little, 2018). For example, schools can implement curriculums which promote critical thinking and engagement with difficult conversations related to controversial policies, ethnicities, and values or beliefs (Banks, 2015). Utilization of anti-racist curriculum has the potential to incite evaluation and demotion of stereotypes and forms of systemic discrimination. Regarding sex trafficking, age-appropriate trainings can be incorporated into health class curriculum. As sex trafficking is not an isolated phenomenon,

additional discussions on healthy relationships, sexuality, sexual violence, and the impact of pornography are needed. When developing a training for youth, schools can work in alignment with community stakeholders to ensure that the practice is tailored to authentically meet school and youth needs. In addition, knowledge and use of community resources may be useful when needing to refer to students who are particularly at high risk (Banks, 2015). By schools working in collaboration with the local community and stakeholders to promote school equity practice, and response, through sex trafficking trainings and anti-racist curriculum, educators will be more equipped to identify and support sex-trafficked Black female youth.

## Abstract

This chapter organically troubles justice, as a means to explore public scholarship within authentic contexts, in which interventions are implemented. The authors of this work focus on new principle preparation standards, as a means to “go-deeper”

with public scholarship. Additionally, this chapter employs a frame of improvement inquiry to reveal how leadership practice in education has been driven by accountability imposed on leaders and the systems they lead. The chapter concludes with a proposal to consider a new frame for understanding and improving the practice of educational leaders within and across specific contexts.

---

**Keywords**

Public scholarship · Justice · Improvement inquiry · Principle preparation · Educational leadership

**The Field of Memory**

The notion of investing leadership decisions within a position that enjoys power and privilege within a system is problematic. If problems are identified and then solutions imposed from the top of an organizational chart, the voices of those who are users of the system do not inform what problems are identified and how those problems are addressed. Educational *reform* efforts have typically come from spaces of privilege and power. Efforts are underway to replace the *reform* approach to educational leadership with efforts that are distributed across sectors and across spaces within educational systems.

**The Field of Presence**

Recognizing that collecting and analyzing outcome data for purposes to meet criteria of system accountability does not serve the purpose of continuous system improvement. Practical measurement undertaken for the purpose of improving educational systems looks different than measurement that seeks to judge summatively educational systems and, in some cases, the people who work in those systems. Measurement that is designed and undertaken with improvement in mind engages those who are – and who engage most closely with – the learners in the system. Argumentation is a frame that serves improvement and provides a way to focus on the *impact* of educational leadership practice rather than the *intention* of leaders and others who exert power and privilege.

**The Field of Concomitance**

Community organizing, political activism, and community-based research and development have contributed notions of democratic engagement to the work of understanding and addressing the problems that lead to unacceptable outcomes in too many educational systems. The work now more closely aligns with scholarship that is of public consequence. The field of healthcare improvement has been engaged in the science of improvement for over half a century. The Carnegie Foundation for the Advancement of Teaching has worked closely with – among other organizations – the Institute for Healthcare Improvement to bring improvement science to the work of improving educational outcomes for all learners.

### Discontinuities and Ruptures

Framing disparities in performance as achievement gaps and holding systems responsible for those disparities have attached to many reform efforts. That frame has also led to practices that serve the system more than those the system was meant to serve. Ladson-Billings (2006) reframed *achievement gaps* as the *education debt*. That reframing exposed needs of learners and needs of the systems meant to serve learners in ways that have challenged normative practices in educational leadership. It has also assisted in focusing on how students who are owed the education debt experience obstacles in authentic contexts. One other challenge to normative educational leadership practice has been movement from privileging the knowledge and experiences in the academy over the knowledge and lived experiences in schools and communities to a more democratic valuing across the sectors.

### Critical Assumptions

Critical assumptions attach to each of the three frames through which shifts in educational practice are examined. Justice in the realm of the practice of educational leadership requires that values of righteousness and love must be enacted. Educational leadership that is of public consequence rests on scholarship that focuses on the implementation in real practice contexts. Improvement inquiry proceeds from what is referred to as the *central law of improvement*: “Every system is perfectly designed to deliver the results it produces” (Langley et al., 2009, p. 79). A proposal to view educational leadership practice as argumentation assumes that leadership decisions and actions are claims that need to be explicated in order to improve educational leadership practice.

---

## Introduction

In this chapter, the authors examine how normative practice of educational leadership has shifted and the nature of the leadership practice that is emerging. In general, the authors map how practice that privileges power and position within an insulated educational system has moved toward an emergent practice that privileges (1) cross-sector, democratic engagement and (2) interrogations of practice that focus on the *impact* that leaders’ decisions and actions have on learners rather than leaders’ *intention* and intellectual justification.

The nature of the shift is traced through three frames: *justice, public scholarship, and improvement inquiry*. Each frame is used first to focus how leadership practices have looked and then to bring into focus the assumptions and reasoning that underlie newer, emergent leadership practices. Observing educational leadership practice through a frame of justice reveals how values of righteousness and love must be enacted if *just action* is to emerge as a new norm of practice. Using a frame of public scholarship reveals how traditional leadership practice – and preparation – has focused more on generalized descriptions, prescriptions, and proscriptions of

interventions and how a greater focus on the *authentic contexts* in which interventions are *implemented* is emerging. Employing a frame of improvement inquiry reveals how leadership practice in education has been driven by accountability imposed on leaders and the systems they lead and how collaborative *design thinking* – undertaken by multiple stakeholders – is emerging in pursuit of *continuous quality improvement* of local education settings.

The chapter concludes with a proposal to consider a new frame for understanding and improving the practice of educational leaders within and across specific contexts. The proposal is to view *practice as argumentation*: to treat leadership decisions and actions as claims of practice, identify the reasons for making decisions and taking actions, determine what evidence is used to support the reasoning and, if necessary, show how the supportive connection between reasoning and evidence is warranted. The proposal yields a call to action to advance emergent leadership practice across the domains of culture, community, justice, and policy.

---

## Framing Justice

On April 3rd, 1968, just four days before the Rev. Dr. Martin Luther King, Jr., was scheduled to preach his sermon Titled: “Why America May Go To Hell” (Dyson, 2009), and less than 24 h before he would be assassinated at the balcony at the Lorraine Motel, Dr. King delivered his prophetic “I’ve Been to the Mountaintop” speech at the Mason Temple Church of God in Christ. In this timeless address, passionately articulated the following statement: “*the world is all messed up. The nation is sick. Trouble is in the land; confusion all around. That’s a strange statement. But I know, somehow, that only when it is dark enough can you see the stars.*”

It is within the context, of the aforementioned claims by Dr. King; that the authors trouble justice within the context public scholarship and improvement inquiry. To that end, since the nation is still sick, trouble is still in the land, and confusion is still all around, educational leaders need to rethink our notions around educational leadership, through courageous practices around justice.

Specifically, this chapter’s notions around justice also align with Schubert’s (2010) assertions around love, justice, and education, when he writes:

The intertwined and dynamic force of love and justice is the driving force to overcome acquisitiveness and oppression. In Deweyan terms it may be more integrative than merely two entities to be balanced once and for all; therefore, we wrestle constantly with the emphasis on love and activism in every situation (p.219).

Therefore, if educational leaders are really going to be serious about facilitating leadership practice that are emerging, innovative, but most importantly, infused with equity, then substantive concepts of justice, need to align with prophetic love. To embellish the Old Testament prophet Amos pronunciation to “to let justice roll down like waters, and righteousness like an ever-flowing stream” (New

International Version, 2011, Amos. 5:24). In other words, this chapter declares that it cannot be justice, if it is not righteous (love), and it cannot be righteous (love), if it is not justice!

---

## Public Scholarship When the Knowing Is Not Enough (Non Satis Scire)

The new PSEL/NELP national standards seek to heal and balance injustices for all students especially those students owed from the “education debt” (Ladson-Billings, 2006) These new standards have either been adopted or adapted by most state licensure and accreditation bodies carried out in education preparation programs. The standards are established to bring equity into public education using specific standards with indicators and prescriptive actions. While there exists a continuum of how these standards are interpreted by education preparation programs for aspiring leaders my claim is that there does exist overlapping fluency factors calling for the Principal to enact, embody and lead with *equity*, and to do so by interpreting and implementing *policy for justice*; to be an instructional leader across the campus and its broader community; intentionally practicing and modeling culturally responsive leadership; and to be an informed *communal* advocate for students, staff and families in solidarity with academic success for all students. The depth and breadth of the standards can be distilled down to expectations for the building principal to be fluent across four overlapping areas of education leadership: culture, community, justice, and policy.

Holding all the above as true, candidates in principal preparation programs will be served well with preparation that happens in real-time school settings offering opportunities to apply critical praxis triangulation frameworks of “reflection and action directed at the structures to be transformed” (Freire, 1970, p. 126) while engaging in transformative andragogy for self and other adults in the building. Riley and Hawe (2005) make a provocative analysis from their study involving teaching and learning interventions and preventative educational practices for health promotion practitioners. As discovered by the growing field of Improvement Science, the education sector as an interdisciplinary field can benefit from cross-sector andragogical investigation.

Riley and Hawe (2005) also argue that the teaching and preparation interventions or interruption practices trend is, to “focus on the technology of the intervention without informing... about how the context in which it was implemented affected the technology” (p. 226). The authors find this trend to also exist in educator preparation. In fact, the design of “*how to*” of education practice must not be disjointed from the concentrically interconnected levels (e.g., individually, organizationally, politically, historically) of “*what, who and why*” of policy, practice, and/or belief in education practices. Simply, this is what it looks like when “knowing is not enough.”

Ball (2012) argues that to improve, let alone dismantle or interrupt inequitable practices in schools the building principal must be intimately aware of the system. Humans, build realities based on understandings, experiences informed, and zones

of proximity – individual networks, institutions (structures & systems), cultural (beliefs, behaviors, assumptions values), and historical (e.g., the journey toward adult development). When aspiring principals and other school leaders are up against “facilitating a situation so entwined with complex issues [and] challenged by where to start or when to intervene as well as how to bring closure” (Lindsey, Nuri-Robins, Terrell, & Lindsey, 2018, p. 27) more than the “how to” or “technology” of practice is needed. A critical awareness of adult development in conversation with the “how to” or technology of equity, culture, policy, and justice fluency is a leadership cocktail and paramount in preparing aspiring principals and other educational leaders’ writ large. Yet, knowing that inequity exists and subsequently produces predictable grave life outcomes historically for Black and Indigenous students of color in the system of public, has not been enough to produce sustainable transformative change. There appears to be a gap not only in the knowledge practice continuum of preparation but also in how education researchers understand the that “how to” is informed by the “who, what and why” of educators when making sense of inequitable practice. To intersect the how to with the who, what and why of an inequitable practice requires fugitivity frameworks. By investigating problems of practice in schools as public scholarship – an applied education research methodology – operationalized as a collaborative research effort, is to invoke education researchers to be accomplices for justice.

Dr. Jeanne Oaks in her Presidential address at the 2016 AERA meeting listed engaging in public scholarship as one of three priorities for conducting education research in the twenty-first century and beyond. Oaks defines public scholarship as a cross-sector collaborative process that aims “to produce and use knowledge in concert to shift cultural norms and political power toward equity and inclusion” (p. 91). Oakes (2018) calls education researchers to be in authentic partnership with “educators, political leaders, storytellers and activists” (p. 91) to move toward this way of thinking about and practicing public scholarship work in motion.

Further, Oaks provides a powerful reframing of public scholarship by explicating its purpose as an “applied” research methodology to the purpose and measure of tenured track faculty to be in service. While Oaks way of framing public scholarship resonates profoundly, it does require a decolonizing. Precisely, educational leaders continue to engage in a fugitive process of principal preparation practices the notion of producing and actionizing knowledge systems that aim to transform school practices into equitable practices and just learning environments. This chapter makes a connection of Oaks thinking about public scholarship through the lens of Givens’ (2021) description of “abroad mentorship,” a fugitive practice of Black leaders to pass critical information and messaging about teaching and learning while oppressed, thus influencing others. An influencing that, for better or for worst, has sustained to influence how Black educators think about teaching and learning.

Oakes (1990) sets out to investigate student tracking - a practice she names as one of the “failings” (p. 2) in public schools and as an education debt. The study examined several schools in California and a key finding unearthed as an educator’s knowing deepened about “failing” practices and specifically the disproportionate impact on historically marginalized students that the educators became activist. These educator

activist exhibited determination to put an end to the failing practice of tracking. The study exposed a connection to the deepening of an educator's knowing – their activation of self-determination and activism – and classrooms becoming less segregated.

In addition, these educator activist in collaboration with the researchers, employed the research findings and reduced the racial gap of enrollment and achievement in accelerated courses. A galvanizing implication from the study: when educational researchers engage with educators investigating problems of practice as public scholarship; then, educators become more informed activists and accomplices with students and their communities and ensure that all children have successful academic outcomes and outputs. While the findings and results proved promising, the team could not replicate nor scale the process out. This is another great example of why knowing is not enough! It appears that for the education researcher delivering empirical research illustrating grave indicators of inequity alone is not enough to replicate successful outcomes, disrupt disparate outputs, foster policy change, and improve the learning environment.

For educators, it appears that knowing inequitable practices exists and being equipped with tools to respond and improve it, it is not enough to engage their resistance to inequitable practices. Situating the problem requires engaging in deeper work, work that examines how the cognitive development of educators inform the ways in which they enact and embody equitable practices in schools. Robinson (1998) recommends that the problem be engaged by placing the examination of the practice as the primacy of critique – seeking out what is known about the practice by listening to the current status of research in the field. Robinson argues, “the adequacy of a practice cannot be reached without evaluating the adequacy of the reasoning that supports it” (1998, p. 23). As we consider public scholarship research, improvement inquiry and justice in practice, let us embrace the claim, an actionable awareness, that knowing about a problem and being exposed to empirical practice strategies to address the problem continue to not be enough. To prepare school leaders to enact transformative change as justice in the 21st century public education system, let us investigate the “how to” or technology of school leadership practice while bound to the who, what and why of the individual networks, institutions (structures & systems), cultural (beliefs, behaviors, assumptions values), and historical informants of inequitable problems of practice in public schools.

---

## Improvement Inquiry

After a brief introduction to improvement inquiry and how it fits with the previously discussed frames of justice and public scholarship, this section examines the normative shift in the practice of educational leadership through the lens of improvement inquiry. Improvement inquiry provides a systems improvement frame to focus the normative shift as movement from the reform efforts of the late twentieth century to a focus on enhancing system capacity through design-based, cross-sector collaboration. Thus, the normative shift described in this section is from “reforming education” toward the emergent practices that “builds organizational capacity for continuous quality improvement.” The section concludes with a brief discussion of

how the general principles of improvement inquiry and, more particularly, the principles of design-based implementation research can support and sustain emergent educational leadership practice.

Historically, the three general purposes of educational research have been (1) to create new theory, (2) to develop new methods or materials for educational interventions, or (3) to evaluate policies or programs (c.f., Kerlinger, 1973; LeMahieu, Bryk, Grunow, & Gomez, 2017; Tuckman, 1974). Improvement inquiry differs from traditional approaches to educational research in that it purports to improve educational systems in the course of serving the users of those systems. An approach that might be characterized as “improving while doing”.

Improvement inquiry proceeds axiomatically from a critical assumption that is sometimes referred to as the *central law of improvement*: “Every system is perfectly designed to deliver the results it produces” (Langley et al., 2009, p. 79). Educational systems can exist in different settings (e.g., after-school programs, community centers, museums, churches, dojos, schools, etc.) and educational systems can exist on different scales (e.g., classrooms, schools, districts, college consortia, etc.). Whatever the unit of analysis, an educational system that is producing inequity, marginalization, and other unacceptable outcomes is a system that presents opportunities to design and rigorously test potential improvements. The central law also means that examining and investigating system structures and processes can reveal laudatory results that point to the assets in the system.

Improvement inquiry seeks to understand how educational systems work, what results a system is producing, and how to change the system in order to produce better results. This approach is characterized nicely by the subtitle of foundational work by the Carnegie Foundation for the Advancement of Teaching: *Learning to Improve: How America’s Schools Can Get Better at Getting Better* (Bryk, Gomez, Grunow, & LeMahieu, 2015). The previous frames—justice and public scholarship—combine with improvement inquiry to create an analytic space that focuses generally on how educational systems can get better at getting better. More specifically, there needs to be a focus on a call for getting better at implementing just leadership practices that produce outcomes of public consequence and that increase system capacity for continuous quality improvement.

## **The Normative Shift: From Reform to Improvement**

Part of the shift from reform to improvement can be characterized as movement from top-down leadership to leadership that engages practitioners throughout the system. There is considerable evidence to document the failure of changes that are imposed on educational systems from the top down (Fishman, Penuel, Allen, Cheng, & Sabelli, 2013; Penuel & Spillane, 2013).

Too often, the press of urgent action and immediate resolution of unacceptable results has led to selecting solutions before clearly and comprehensively understanding the problem (Bryk, 2020). The desire for quick action and immediate results can push those who hold power and privilege within an educational system to (1) decide,

with insufficient consultation, what the system's most critical problem is and (2) decide what needs to be done in order to solve that problem. As a result, those who serve in the system are required to implement solutions even when they have played no role in identifying and defining the problem (c.a., Datnow & Castellano, 2001). This kind of top-down leadership practice contributes to a condition that has been called *solutionitis*: deciding quickly on a change to the system that is thought to be a solution before comprehensively and usefully understanding the problem as it exists within the particular practice context (Bryk, 2020; Bryk et al., 2015). *Solutionitis* contributes to failed initiatives when those with power and privilege impose solutions on those who live and work in that system.

When leaders decide and act to impose solutions from the top-down rather than consult from the bottom-up, they are committing themselves to what Mintrop (2016) calls the *buy and buy-in mode* of innovation. When leaders encounter major problems in their educational system they often look outside the system for solutions:

They scan the environment for programs, consultants, or packages that seemingly address the problem. Their preference is to find solutions that carry the label 'research-based' or 'best practice.' Solving the problem then becomes a matter of implementing a package, a script, or a consultant's directions—solutions that have a supposedly proven record of success. Innovation is all about buy-in the package and, afterward, creating buy-in for it. (Mintrop, 2016, p. 5)

Many school and district initiatives have failed to address the unacceptable outcomes that are being produced by the local system that is perfectly designed to produce those outcomes. Some of those initiatives have been imposed via recent educational reform efforts.

## **A Reform Paradigm**

While improvement inquiry represents a departure from the traditional purposes of educational research, it also represents a departure from recent educational reform efforts (Bryk, 2020). Bryk identifies three types of reform initiatives that sought to propel US education to the top of the list of countries in math and science: performance management; evidence-based practice; and school-based learning communities. Each reform initiative is acknowledged as having strengths, but also weaknesses that prevent them from driving continuous quality improvement in authentic and localized practice contexts. Each initiative is characterized and then strength and weakness are addressed.

---

## **Performance Management**

Performance management initiatives to reform education – of the type that grew from and aligned with NCLB, for example – focused on holding educators and the educational systems in which they worked accountable for meeting goals. Policy-

makers would set goals, expect educators to meet those goals, and provide incentives that were, for the most part, punitive. Measurement for accountability can be contrasted with measurement for academic research and measurement for improvement. According to Bryk et al. (2015), measurement for accountability includes the following characteristics:

- Its purpose is to identify either commendable or problematical teachers, schools, or school districts (e.g., identification of teachers to be placed on an individualized improvement plan).
- The measures that are taken tend to be end-of-line outcomes (e.g., end of year achievement tests or graduation rates).
- The measurement methods seek inter-rater reliability and standardized administration.
- The measurements are used to make summative judgments of performance and are applied to all who are assessed.
- The data generated from measurements are not clearly linked to specific practices and so have limited formative – or improvement – value.

The strength of the performance management reform effort is that it focuses educators on data. Because local educational systems were held accountable for demonstrating that outcome goals were reached and that they were reached on time, the data from accountability measures are scrutinized by school and district leaders. That said, such scrutiny was often focused for reasons other than equitable practices in service of all learners. In an effort to reach targets for proficiency on standardized test, many schools and districts focused on students who performed just under the defined proficiency range. Such students are sometimes referred to as “bubble students” (Blazar & Pollard, 2017). Another weakness in performance management efforts are the lack of contextually-informed theories of action. Typically, there are not clear, localized plans for how to improve practice of professional educators within a particular educational system in order to yield better outcomes for learners served by that system.

---

## Evidence-Based Practice

In evidence-based practice efforts, the typical pattern of an initiative would start with an idea generated within an academic or commercial enterprise that produces and sells education products. The reform ideas might be new educational materials, new programs, or new tools for educators and those evaluating educational practice. The new designs would be refined through small-scale, applied research and, many times, become the subject of a large-scale test over a longer time-frame (e.g., a multi-year randomized control trial) to determine the design’s effectiveness. These kinds of efforts are what is reviewed and eventually what was documented in the *What Works Clearinghouse* (WWC) in the Institute of Education Sciences that is part of the US Department of Education (2012).

If an intervention—a new program to support English language learners (ELL), for example—is judged to be a success, that intervention is designated by WWC to be an effective program. School districts that decide to try the ELL program – designated as effective based on evidence over time – can justify the investment of considerable resources such as materials, training, evaluation, and data systems. According to Bryk (2020), the strength of the evidence-based practice movement is that it brought to the education profession a more disciplined approach to the design and testing of educational interventions. The weakness is that the evidence that is used to judge effective educational practice – i.e., to claim that a program “works” – focuses on average differences in outcomes across contexts. There is a failure to account for the variability in outcomes, often considerable variability that occur in most educational interventions (Weiss et al., 2017). Knowing that average differences between groups exist without knowing how specific contexts contribute to those group differences does not serve efforts to provide just and equitable learning opportunities to all learners.

---

## School-Based Learning Communities

School-based learning communities – sometimes referred to as localized communities of practice – represent the third type of reform initiatives. The school-based learning community approach to reform deviates considerably from evidence-based practice efforts. School-based learning communities are formed to identify problems and address issues in a particular school. The practice context is a critical determinant of local outcomes that are problematic. Understanding “what works” in general is not the goal. In this approach, the goal is to understand what works in a specific practice context.

Consider, for example, a group of 4th and 5th grade teachers in a school who form a learning community in order to engage in lesson study. The purposes of the lesson study group are to improve the quality of specific lessons and advance the professional learning of the group’s members. The lessons that are the focus of improvement and the learning that occurs in the course of the lesson study are situated within particular classrooms in a particular school and community. What the students in that community bring to the classrooms and the lessons that are studied will necessarily influence how the lessons are designed, delivered, and assessed. The particular student characteristics, the particular school and community assets, resources, and challenges, the particular professional experiences of the teachers, the particular culture of the school and leadership support are all contributors to the outcomes of the lessons.

Context matters in school-based learning communities because context contributes to variations in teaching performances and, in turn, learning outcomes. Sometimes variations in teaching performances are subtle and nuanced and sometimes they are dramatically disparate. The same can be said for what students learn in response to teaching performances. The strengths of the school-based learning communities approach are (1) that the issues or problems are addressed within a specific practice context, (2) that problems are identified and addressed by the educational practitioners who live and work in the system, and (3) learning communities encourage and support

collaboration among teachers rather than the isolation that has long been the norm for many teachers (Artman, Danner, & Crow, 2020; Bautista, Stanley, & Candusso, 2021; Lortie, 2002). The weakness that attaches to school-based learning communities is that what is learned in the specific practice context tends to stay in that specific context. Education lacks a mechanism for clearly and usefully documenting the practical learning in one school and then communicating it to other school-based learning communities. As a result, while much practical learning is being done, it is not contributing to a professional knowledge base that could improve educational practice at scale (Hiebert, Gallimore, & Stigler, 2002).

The three approaches to the reform of educational practice attest to the education profession's aspiration to improve educational practice. Bryk (2020) argues that each of the approaches described above “. . .has distinctive strengths, but none alone or even in combination will help close the aspirations chasm. Instead, educators need to draw on the best of what these strategies offer . . .” (p. 8). By synthesizing the strengths of education reform efforts with what has been learned from other fields and professions about improvement, an improvement paradigm has emerged and is influencing significantly the practice of educational leadership.

## **An Improvement Paradigm: Six Principles**

Across cultures, it is a truism that effective educational leaders build relationships with, among, and across people that serve in the educational system they lead (Fisher, 2021; Simons, 2020). As mentioned at the beginning of this section, improvement inquiry is built on the *central law of improvement*: “Every system is perfectly designed to deliver the results it produces” (Langley et al., 2009, p. 79). Those who work in educational systems are aware of the differences in background, experiences, and expertise that human beings bring to the enterprise. There is a human tendency to commit what is known as the *fundamental attribution error* (Langley et al., 2009; Ross, 2018). The error is that while most people explain their own behavior as being influenced by environmental circumstances, they attribute the behavior of others to some personal deficiency (e.g., lack of commitment, dedication, knowledge, etc.). The improvement paradigm, based on the central law of improvement, helps focus our aspirations for improvement on the systems in which people live and work rather than on assumed deficiencies of others. An unacceptable result in an educational system is an opportunity to improve the system rather than place blame on the system's people.

---

## **The Six Principles**

The focus on system design is illustrated by the six principles that form the improvement paradigm. The Carnegie Foundation for the Advancement of Teaching has been the major driver of the improvement paradigm in education. The book, *Learning to Improve: How America's Schools Can Get Better at Getting Better*, authored by leaders at the Carnegie Foundation, (Bryk et al., 2015) is organized

around the six principles. The principles also frame the stories of how six educational systems worked to “get better at getting better” (Bryk, 2020). The principles are described briefly below.

1. *Be problem-focused and user-focused.* Ask, what specifically is the problem that needs to be solved? Ask the question of those working in the system and ask it often.
2. *Attend to variability.* The key question is not, What works? Rather, the key question is: What works for whom and under what set of conditions?
3. *See the system.* It is hard to improve a system that is not fully understood. Observing and collecting data about the system and from those in the system is necessary in order to learn how local conditions shape practice and contribute to unacceptable results.
4. *Embrace measurement.* It is critical to measure not just key outcomes but the processes by which designs are implemented. The idea of “practical measurement” is important here.
5. *Learn through disciplined inquiry.* Using the data collected to fuel cycles of improvement means not just successes but also failures. To fail is not the problem, failure to learn from failure is.
6. *Organize as networks.* Create networks that shift practice away from telling educators what to do toward building and supporting collaborative learning focused on both the how and the why of making systems better.

The above principles offer general guidance for learning how to improve an educational system. These principles have guided a variety of improvement approaches in education (c.f., LeMahieu et al., 2017). Among those approaches is one that clearly embodies the shift of educational leadership practice away from top-down efforts driven by external criteria and toward collaborative design thinking to address unacceptable outcomes. That approach is called design-based implementation research.

---

## Design-Based Implementation Research

Design-based implementation research (D-BIR) is guided by several key imperatives (c.f. LeMahieu et al., 2017). First, D-BIR focuses on persistent problems of practice, but only as those problems are understood from multiple stakeholder perspectives. Second, D-BIR requires a commitment to a collaborative and iterative approach to design, development, implementation, and improvement of well-understood problems of practice. Third, D-BIR reflects a deep concern for developing theory, knowledge, and practice-based expertise; and fourth, D-BIR seeks to develop organizational capacity for sustained system improvement.

D-BIR is one of several *design-thinking* approaches to building knowledge in education. The 2013 volume of the *National Society for the Study of Education Yearbook* is devoted to accounts of D-BIR (e.g., Dolle, Gomez, Russell, & Bryk, 2013). The imperatives of D-BIR have been used by a collective action network to guide improvement efforts across educational contexts that include the following:

- Principal preparation at the graduate level.
- Community learning exchanges that convene cross-sector and often intergenerational learners on matters of just educational practice.
- Classes taken by police cadets inside prisons and taken with incarcerated classmates.
- A community effort to interrupt gun violence by treating violence as a contagious disease.
- An urban elementary charter school focused by environmental justice.
- The professional development of a group of elementary teachers designed to improve math outcomes.
- A program in urban high schools for African-American students combating the narratives of toxic masculinity and misguided manhood.

The D-BIR imperatives, along with the six principles of improvement informed the improvement efforts listed above and yielded a set of “rules of engagement” that were used across the contexts (Duquesne Collective Action Network, 2020). The application of those rules of engagement have also informed our use of the term *improvement inquiry*. Some authors prefer the term *improvement science* (e.g., Langley et al., 2009) or *improvement research* (e.g., Bryk et al., 2015; Russell et al., 2017). The Duquesne Collective Action Network (D-CAN) employs the phrase improvement inquiry rather than science or research. Community partners at a D-CAN Community Learning Exchange in 2017 suggested that the terms *science* and *research* carry connotations that send the wrong message: that the knowledge of those who practice in the academy—scientists and researchers—should be privileged over the knowledge of those who practice in schools and/or the community. The use of improvement inquiry is an effort to better communicate a commitment of democratic engagement across the boundaries of school, academy, and community.

The Duquesne Collective Action Network employs the phrase improvement inquiry rather than science or research. The terminology resulted from a lesson learned during a SAC partnership convening in May 2017. Community partners at the convening suggested that the term also science and research carry connotations that send the wrong message: that the knowledge of those who practice in the academy – scientists and researchers – should be privileged over the knowledge of those who practice in schools and/or the community. The use of improvement inquiry is an effort to better communicate a commitment of democratic engagement across the sectors represented by multiple stakeholders. The lessons learned from across those contexts of improvement inquiry have informed our proposal for building capacity to get better at making educational leadership practice better.

## Reframing Practice as Argumentation

To close this chapter, the authors offer a modest proposal for improving the practice of educational leaders within and across specific contexts. The proposal is to reframe the

way educators observe and analyze leadership practice. The reframing has implications for the self- and professional development of practicing educational leaders, for the preparation of aspiring educational leaders, and for research on educational leadership practice.

The authors also propose to view practice—in this case, educational leadership practice—through the frame of argumentation. After briefly describing the particular model of argument highlighted in this chapter, and how that model can focus our observation and analysis of leadership behavior, this chapter concludes with a call to action to advance emergent leadership practice across the leadership domains of culture, community, justice, and policy.

---

## The Elements of an Argument

The model of argumentation that we will use as a new frame for viewing educational leadership practice is from the fourth edition of *The Craft of Research*, a venerable volume that has, for many, defined the structure of a research argument (Booth, Colomb, Williams, Bizup, & FitzGerald, 2016). According to Booth et al., there are five elements to consider in a research argument: a claim, reasons, evidence, acknowledgement and response, and, sometimes, a warrant.

Research arguments are typically understood as verbal phenomena: they are either written or spoken with the intent to have a reader or listener understand and accept claims made by the writer or speaker. That is certainly the context in which Booth et al. describe the elements of a research argument and the context in which they address how to construct an argument. They introduce the elements of a research argument by describing a verbal exchange between two people. The elements are characterized as answers to questions. When the verbal context is reading rather than conversation, the author—who is building the argument—asks the following questions on behalf of the unseen reader.

1. **Claim:** What do you want me to believe? What's your point?
2. **Reasons:** Why do you say that? Why should I agree?
3. **Evidence:** How do you know? Can you back it up?
4. **Acknowledgement and Response:** But what about...?
5. **Warrant:** How does that follow? What's your logic? Can you explain your reasoning? (Booth et al., 2016, p. 111)

---

## Conclusions and Reflections

This chapter concludes by conceiving an argument of practice. Specifically, every argument begins with a claim. In the case of a research argument, that claim is a statement made by the researcher. An example might be the researcher's hypothesis: the a priori answer to the research question stated in advance of data collection, analysis, and interpretation. Looking at the questions that Booth et al. use to

characterize a research claim, it is what the researcher wants a reader to believe, it is the researcher's main point. In the case of an argument of practice, the claim that initiates the argument is not a statement, but rather a leadership decision and/or action. An example of a claim of practice might be a leadership decision—made individually or collectively—to implement a new teacher evaluation system. A claim of practice might also be any one of a number of actions taken by, say, a middle school principal. One example might be implementing a new set of prompts designed to elicit more information about formative assessment from teachers and students during walk-throughs.

Although arguments of leadership practice might be initiated by claims of collective decision-making or action, they can also start with an individual's decision or action. The authors revisit the questions that characterize the elements of an argument below. This time, the questions pertain to building an argument of practice rather than a research argument.

- **Claim:** What is the decision you made? What action did you take?
- **Reasons:** Why did you decide that? Why did you do that?
- **Evidence:** How do you know your decision was correct? How do you know that your action was the right thing to do?
- **Acknowledgement and Response:** But what about . . . a different decision/action?
- **Warrant:** What's the logic that underlies your decision/action? Can you explain your reasoning? Is there a theoretical or conceptual framework that justifies your decision or action in this particular context?

The form of the questions assumes that an observer directed the questions to a leader (or leadership group). The questions could be asked by leaders themselves in order to reflect critically on their own decisions and actions (e.g., What action did I take? What were my reasons? Why did I do that? How do I know . . . etc.).

People make arguments, researchers make research arguments; and practitioners make arguments of practice. Both types of arguments must, of course, be tested; data are required to determine the strength or weakness of an argument. In the case of an argument of practice, the data required document the impact of leadership decisions and actions. Being able to examine system impacts via arguments of practice moves our observation and analysis practicing beyond leadership intentions to the impacts on the people and processes of the systems they lead.

Our proposal to reframe educational leadership practice as argumentation provides practicing leaders with a systematic way to reflect critically on their own leadership behavior. It provides aspiring educational leaders a way to systematically analyze leadership practice in authentic contexts. Imagine an aspiring leader interviewing a master principal in order to better understand how the master's knowledge base, reasoning, and theoretical and/or conceptual frameworks informs their practice. Those who research educational leadership practice can use the reframing as a model for data collection and a tool for data analysis.

This chapter's call to action is an experiment with arguments of practice in an effort. Explicitly, the authors see the reframing of practice as argument to enable educational leaders to engage in design-based implementation research collaborate with practicing leaders and the professionals with who they work to improve the cultures of their systems through just practice, that yields outcomes of public consequence, and that builds systems' long-term capacity to improve continuously.

## Abstract

Leadership is a cultural construction that is studied, theorized, and practiced in multiple fields, including education. Educational leadership as a cultural construction has various manifestations. In the USA, educational leadership has as one of its aims to bring vision and organization to an effort or project through a central actor, such as the figure of the school principal, the superintendent, or the teacher. Although many can partake in the leadership construct, the term or role in the USA is inscribed with individualism and exceptionalism. Considering the cultural situatedness of the construct, it may not have the same meaning when one crosses borders. This chapter examines educational leadership within a Mexican context and examines the ways in which distinct actors contribute to the educational leadership construct, how these constructions speak to and against each other, and what is left after these interactions that are negotiations take place.

## Cultural Constructions of Leadership

Williams-Boyd (2002) offers a history that highlights key moments in the development and transformation of the field that we now refer to as “educational leadership.” She notes that the word “principal,” referring to the figure of the school leader, first appeared in print in 1835 both in the Common School Report of Cincinnati and in the writings of educational reformer and “father” of the Common School, Horace Mann (p. 102). Williams-Boyd argues that these early references mark the emergence of a separate profession from that of the principal-teacher, who as the title suggests, was both teacher and school overseer, to that of a school leader attending to staff, student, and site needs, while being positioned as a “manager of virtues” (p. 104). As such, the principal of the late 1800s was expected to “embrace and reflect the values, norms, beliefs, and ideals that the United States holds...” (pp. 103–105), a provocative notion in a moment of Indian Removal, the arrival of 25 million people to the USA from western and eastern Europe, the arrival through formal, albeit unfair, labor agreements, as was the case with Chinese men, or legalistically fused into the USA upon losing a war, such as Mexican nationals who lived in Arizona, New Mexico, Texas, Nevada, and other states when these were annexed in the aftermath of the US-México War. This conceptual shift from teacher/overseer to manager of virtues marks a moment of deliberate ideological reinforcement, a move that ensured that White supremacy, as expressed through Anglo-conformance and Eurocentricity, could prevail, both in embodied ways in the figure of the principal and in constructed ways through curriculum, pedagogy, and who was allowed to teach and to learn.

This chapter pursues the idea that educational leadership is a cultural construction, one that serves as embodied ideological reinforcement and which functions within and is constitutive of a social formation that is characterized by a racialized labor and knowledge hierarchy in which Black, Indigenous, and People of Color (BIPOC) are prefigured by the State and constantly recast using the same mold. As BIPOC continue in abolitionist, liberatory struggle, the leader adapts to the clamor for equity, racial justice, equality, and educational uplift, migrating from managerial/bureaucratic forms of leadership to transformational models. However, schools are embedded in communities and communities are part of larger geographies and politics, which unfold in a society that does not adequately fund schools, does not adequately prepare educators or educational leaders, does not adequately educate children, any of them, and does not decisively dismantle the racist systems that seek to block BIPOC progress. The shape-shifting of the leader, then, becomes a symbol of benevolence but also of intransigent resistance to change. As BIPOC work daily toward emancipatory self-determination, they are faced with this contradictory

figure, that of the shape-shifting principal who is at once benevolent but a staunch representative of “the values, norms, beliefs, and ideals that the United States holds” (Williams-Boyd, 2002, pp. 103–105). Another way to view this principal is that s/he is a person living a moment of hyper-heterogeneity. As a principal, s/he must find a way to *manage* the diversity for the good of the nation. Hence, the reactionary discourse and embrace of traditional US values (e.g., Anglo-conformance, and upholding homogeneity, monolingualism, Christian values, etc.).

### **The Field of Memory**

Deficit discourse: There is a culture of poverty that can be readily found throughout the world, and it is characterized by parents who just do not care about their children’s education. The public wants to blame the teachers and the principal for the children’s academic failure, but they do not see that the children come to school knowing nothing, which makes teachers’ work difficult and require of the principal the enforcement of rules with this student population.

### **The Field of Presence**

Nuanced deficit discourse (Emerick, 2021): Systemic and structural racism denies BIPOC education and jobs, and this reverberates into future generations. The children come to school with little academic knowledge and the parents are too overwhelmed to help. The school does what it can to help the children and their families. The school’s goal is to have the parents become more involved so that they can support their children’s academic growth and the children can eventually prosper. The principal encourages parent meetings and sending pedagogical materials home (e.g., books, games) for parents to use with their children to foment academic growth.

### **The Field of Concomitance**

The growth discourse is grounded in the field of economics. Spangenberg (2010) outlines how a growth discourse has multiple purposes: to ensure economic and societal development and improvement, to meet the needs of the poor, and to promote social, economic, political, and environmental progress (pp. 551–552). That is, growth, development, improvement, and progress are interlinked discourses informed by, says Spangenberg, neoclassical economics’ dynamics of supply and demand (p. 551). It is in this way that education is recruited into the larger economic projects of nations and regions. It is in this way that BIPOC children and youth globally are situated within schooling in ways that ensure that they become the workers and technicians of the world, and rarely its creators and leaders.

### **Discontinuities and Ruptures**

Social justice, abolitionist, liberatory discourses reject growth and dependency discourses, recognizing that these lead to compliance with polices that are generated in places far from the communities they seek to target. Liberatory discourses reject the standardization of curricula, pedagogy, and assessment. Teachers might camouflage their dissent, and this is one way to navigate complex landscapes, but many

teachers do not dissent. The entanglement of growth, development, improvement, the poor, and progress emerges from modernity and the establishment of nation-states and a world order in which economies of extraction of colonizing nations leave former colonies economically dependent and in a perpetual state of need. Former colonies agitate for change, and economic and political sovereignty but are politically and economically intervened by colonizing nations that continue to wield power and control.

In schools, this is mirrored in processes of dominance and subordination of certain groups and in assessments that measure BIPOC students' academic growth on tests not designed with them mind; hence, the students are positioned to be in a state of perpetual need. The discourse shifts from families not caring, to teaching families how to do school-centric things at home to support their children's academic growth, to schools becoming more community-centric and engaging culturally relevant (Ladson-Billings, 1995), culturally responsive (Gay, 2000), and/or culturally sustaining practices with BIPOC students. That is, schools begin to offer BIPOC students what they historically have always offered White, middle class students: a curriculum that reflects their lived experience, histories, values, and languages with a culturally sustaining pedagogy of care and regard.

### **Critical Assumptions**

Educational leadership is culturally constructed in ways that position personnel who are among the highest paid, highest educated, and perhaps also having the most work experience within the field of education, as privileged bodies who rely on standardized measures, bubble sheets, sharp pencils, computers, and other artifacts of a global bureaucracy and project to demonstrate pedagogical knowledge about how to grow children and youth academically and to demographically, politically, and socially locate children and youth on the social landscape, an act that can determine futures of opportunity and futures of exclusion or expulsion from opportunity.

---

## **Introduction**

This chapter examines the cultural construction of leadership. This refers to the meanings and understandings that are imagined, nuanced, assigned, enacted, accepted, rejected, and revised in continuous fashion which inform or drive the development of particular constructs, such as leadership, by members of a community. That is, that the cultural construction of leadership is a dialogic process that involves actors – historical, social, and philosophical ones; ideologies, writings, events, human figures, and more – that reference both local and global phenomena and the personal, the intimate, or that which is lived by each actor. The mutually constitutive role played by ideology and willing or consenting and unwilling or non-consenting participants of ideological discourse is at the heart of these cultural constructions and representations of leadership. Useful references here are Bakhtin and Hall in helping us think about representation. Holland et al. note that Bakhtin

helps one understand “history-in-person,” which they theorize as, “... the sediment from past experiences upon which one improvises, using the cultural resources available, in response to the subject positions afforded one in the present. The constraints are overpowering, yet not hermetically sealed. Improvisation can become the basis for a reformed subjectivity” (p. 30). Hall (1997) understands that representation helps ideologies circulate, inserting themselves into the everyday practices and aims of certain processes, such as schooling. While the historical example offered by Boyd that marks how ideology is embodied, and in that example, by the principal advancing traditional American values, it can also be embodied by actors whose ideology is not reactionary but revolutionary. How is it that different actors take up different projects? Does history-in-person have explanatory value in this process?

Presented is a historical example of how distinct actors take up contrasting ideologies, and how these confront each other to advance their respective visions. Such is the case of México’s democratic teachers, who resist subordinating Mexican education to a global, economic order co-constructed by the Organisation of Economic Development and Cooperation (OECD) and participating nations. Key nodes in this process are the Programme for International Student Assessment (PISA) and the discourse of “educational reform.” Cultural construction refers to both the process of developing shared meanings about phenomena and the resulting construct; here, the process is carried out by humans though nonhuman actors, such as ideology, tests, roles, and curriculum, for example, also participate.

---

### **Cultural Constructions of Leadership – Construction 1: José Vasconcelos, Race, and Nation-Making**

A key figure in Mexican education, leadership, and educational history is José Vasconcelos, the first secretary of education in the then newly formed Ministry of Education, la Secretaría de Educación Pública (SEP), which was created in 1921. The SEP was to expand educational opportunity beyond the country’s capital into all corners of the nation as part of its democratization efforts in the aftermath of the Mexican Revolution. The SEP would oversee public education from prekindergarten to the university level, as well as libraries, and the arts. President Álvaro Obregón appointed José Vasconcelos to the position of secretary, a man who supported the social justice project of the Mexican Revolution, a commitment that marked his tenure (1921–1924). His was a period of great cultural production when murals celebrating critical moments in Mexican history, indigeneity, and mestizaje were created by Aurora Reyes, Diego Rivera, José Clemente Orozco, and David Siqueiros, among others (Palacios, 2017). Composer Carlos Chavez wrote and conducted symphonies that integrated indigenous instruments and rhythms. Through the commissioning of these projects, Vasconcelos, a former dean of the Autonomous University of México, advanced the revolutionary ideals of indigenous triumph over the latifundismo and other vestiges of colonialism through his work with muralists. At the same time, his theory of “la raza cósmica” [cosmic race] was criticized for its

eugenic desires to have a whiter, more Eurocentric race (Manrique, 2016; Palacios, 2017). The cosmic race is a superior race that would result from the mixing of all the races of México (Manrique, 2016; Palacios, 2017). The erasure of indigenous people goes beyond the cosmic race theorization: indigenous people are missing from Vasconcelos' school curricula (Palacios, 2017, p. 418) and through an insistence on assimilation. Although Vasconcelos launched critiques of social Darwinism and Spencer's evolutionary theory, notes Palacio (2017), he was, nonetheless, ensnared by eugenics, being sympathetic to Nazism and the fascism of Franco, and stating late in life that his views on mestizaje were mistakes of his youth (p. 243). Manrique (2016) explains, "The members of the Mexican Eugenics Society viewed indigenous peoples as an object of redemption that needed to be incorporated into the nation. In this way, heterogeneity could be eliminated, and the Europeanized mestizo could rise. Indigenous peoples were only accepted in this vision of the nation to the extent that they adapted to modernity and adopted the dominant way of life" (p. 4). These observations illuminate how Vasconcelos understood México's unique positioning: Human evolution and social progress were being linked (Palacios, 2017, p. 420) while miscegenation was considered transgressive and believed to result in an inferior type of human being. To have achieved the first modern revolution that called for land redistribution and a lay, free, and public education along with the constitutional reforms to make the victories a reality, but still have an "Indian problem" as it was referred to (Castañeda, 1919; New Century, 1902), pointed to the racism and anti-indigeneity still entrenched in Mexican society and expressed the deep ambivalence felt toward México's mestizo identity.

Vasconcelos was aware that social and economic uplift was necessary in the aftermath of the Mexican Revolution (1910–1921). Theorizing the multiracial mestizo body as a representative of a cosmic race would serve to racially situate a large percentage of the Mexican population in an exalted space, even as it advanced the assimilationist aims he had for Indigenous and Black Mexicans and those of low socioeconomic status. Vasconcelos, a Europhile who inscribed this passion in his work, the choice of books he published and distributed for free, and statements made about the poor and the Indigenous, exposed him also as someone who was either unaware of or flagrant with his classism and racism. About the poor, he said:

By education I mean a direct teaching on the part of those who know something, in favor of those who know nothing; I mean a teaching that serves to increase the productive capacity of each hand that works, of each brain that thinks [...] Useful work, productive work, noble action and high thinking, that is our purpose [...] Let us take the peasant under our care and teach him to increase the amount of his production a hundredfold through the use of better tools and better methods. This is more important than distracting them in the conjugation of verbs, since culture is the natural fruit of economic development. (Vasconcelos, 1920/1992)

About Indigenous and Black people, he said, "The greatest urgency of our school is to put to work these hands of our race, which have been idle since the conquest, put the Indian and the Black to work for the benefit of the urban class" (Vasconcelos, 1981, p. 142). Vasconcelos intended for the Indigenous of México to assume their place in the new social and racial order, and education would do its part to ensure this

would happen. Locating race within the social landscape of post-revolutionary México was a central aim of the discourse of the cosmic race. The “Indian and the Black” were not part of that cosmic race; they were still pure and unassimilated; hence, they would be subsumed into society through a subordinated labor status in the service of the urban/urbane class. In this way, Vasconcelos, like the US principal of the late 1800s, embodied state ideologies, which ensured that the gains of the Mexican Revolution would not upset the racial hierarchies established during colonization. Vasconcelos, with ancient Greek philosophers as interlocutors and a White savior disposition underpinning his work (Manrique, 2016), deployed a contra-revolutionary, anti-democratic education for México’s most marginalized populations, and engaged a cosmic race discourse in a reactionary, racially, and socially retrogressive manner. At the same time, he was critical of the Ivy Tower, which he asserted, “had served for nothing.” Vasconcelos emerges as a complex leader who opts to locate race in a modern Mexican landscape and does so in ways that are racist and reactionary. By doing so, he also ensures that the economic order would not change, and the elite would not be impacted by any new freedoms that might have been gained through the triumph of the Mexican Revolution. At the same time, Mexican modernity, its cultural production, its grand vision of its Indigenous past would not exist without Vasconcelos. His tenure is thought to have left an unmatched legacy, one that is inscribed throughout México City in its public arts projects and the murals within the Ministry of Education complex.

---

## **Cultural Constructions of Leadership – Construction 2: Clara Isela Gómez Rosales**

Clara Isela Gómez Rosales is an elementary school head teacher featured in a documentary about school leaders who participated in a British-based pilot of professional development on school leadership, focused on implementing standards for school leaders. In the documentary, Gómez Rosales is featured in her community, Cosoleacaque, a city in the Mexican state of Veracruz, and in her school, Escuela primaria 22 de septiembre 1972 [Elementary School 22nd of September 1972], where we see her interacting with colleagues and students. She offers an extended definition and demonstrates through actions, her understanding of what it means to be head teacher and, in that role, a leader. Gómez Rosales notes that being a school leader involves “being proactive, getting things done, being a role model, being inspirational, enthusiastic and spread this to others.” She tells the students that school offers opportunities to experience “things that are different to what they are used to,” and she encourages her colleagues to make learning interactive and hands on. In these moments, the film shows how one teacher is dissecting a frog to teach about how the frog breathes, while another teacher follows Gómez Rosales’ instruction to add centimeter lines to a mop handle in order to make the teaching of measurement more concrete. Gómez Rosales has integrated the lessons and language of the professional development:

What should a head teacher know? What should they be able to do? I should be leading on learning, change management, team building, accountability. What would be teachers' ideal actions? What attitude would best serve these changes that we need? We needed to systematize our roles. What we're seeing in the classroom in terms of learning comes from the strategy, "leading learning." I need to know the educational aims and the learning needs of each child so that instead of criticizing the teaching strategies I can suggest a range of activities that a teacher can use with everyone. If a head teacher knows the science curriculum, they can suggest to their third-grade teacher, Why not do a live experiment? Teachers appreciate students' disposition to learn. Before we had the standards, teambuilding was foreign to us. There is a standard that says a team is something you have to build. You can't take it for granted, and so we began to innovate. We write about our participation in the Cosoleaclaque parade. We've now got a project management strategy. Every teacher has her own project to manage, almost like running a business for a day. Through role playing we've learned to adopt. It helps us to think of others and to understand why someone decides to do one thing and not what we told them to do.

Through the language used, a leadership and managerial discourse, Gómez Rosales expresses acceptance, if not submission, to the paradigm she was exposed to through the professional development. Leading, managing, team building, and being accountable speak to specific forms of labor center Gómez Rosales as the one who sets the vision and organizes others to work toward that vision. By centering one person as the leader, the potential of others to participate conceptually is diminished and their contribution becomes more technical in nature, as they faithfully carry out the ideas of the leader. Words like "leading," "managing," "team building," and "accountability" would be better replaced with "serving," "supporting," "inspiring trust," and "collaborating," respectively.

These proposed terms would reflect community values grounded in Mexican Indigenous axiological orientations. Of special relevance here is the practice of "tequio," or collective work that every member of the community is expected to carry out in rotating fashion. This affords each member of the community to serve, collaborate, advance the aspirations of the community, and provide support. Although tequio is labor which is not remunerated, the principle of tequio is that everyone can and should serve and that it is through collective, nonhierarchical relationships that the aims of the community can be met and further be developed. Tequio moves communities away from the protagonism of individuals and instead situates the community and its collective work as the site of change and renovation. Tequio could be adapted as a governance model in schools as well as a model of pedagogical planning and implementation.

Equally problematic is the idea of "systematizing" each colleague's role and making "achieving the standards" the goal of teachers' work together. These actions suggests that the professional development does little to offer participants a space to engage in a process of analysis, in which teams are asked to consider how these ideas might transfer to their unique geographies, places which are inscribed with historical and cultural onto-epistemologies. At the very least, there should be opportunities for educators to contrast new content from the professional development, with what they already do, and to identify the cultural resources they would be able to draw from in order to do work that is relevant and sustaining of their communities. They should be

allowed to ask what would be lost through a partial or wholesale acceptance of the standards set by the professional development and to problematize the role they play as Mexican teachers in advancing US- and Eurocentric- models of educational leadership and teacher learning and development.

In her narration, Gómez Rosales *does* reference a new unity that emerges from working with this model of educational leadership. She notes that she and her colleagues are no longer “grade-level teachers but elementary school teachers,” suggesting that the conversations they are engaged in and the work they are carrying out break down silos and build a sense of unity. The film also features scenes in which the teachers are engaged in reflexive dialogue. The critique offered here, however, is not aimed at Gómez Rosales and her colleagues. They are applying new lessons from the professional development with intention and authenticity and seeing results that they value. The critique, instead, is much more about the disregard large organisms have for localized forms of knowledge, organization, relationship-building, and teaching and learning.

The organisms promote the idea that the ability to influence others should be concentrated in one person, who is referred to as a leader, and this leader should focus on managing learning, managing labor, and managing team building. This is, of course, intentional. By concentrating knowledge, power, and control in one person, and using managerialism as the conduit for establishing the person’s authority, a hierarchy is established (Diefenbach, 2013); this hierarchical understanding of leadership is not consistent with more general definitions of leadership that posit that leaders are more like coordinators who seek dialogue and consensus (Samosudova, 2017) or with *tequio* discussed above. In this way, the professional development is disconnected from community, teachers, and historical and cultural forms of planning, coordinating, interacting, teaching, and learning. It is further disconnected from local experiences through the discourse of accountability, which is used to justify the use of standardized testing, fraught as these are with historical entanglements with eugenics and contemporary class ordering of society along racial lines. The plan is orchestrated with the intent that educators across the world will more uniformly engage practices established in and by historically wealthy, white nations and now willingly, or with little resistance, assume their place and their students’ and nations’ place within the global hierarchy, lining up their students for the PISA test and, like it or not, embracing neoliberal forms of education.

---

### **Construction 3: The Organisation of Economic Development and Cooperation (OECD)**

The OECD is an international organization that uses various approaches and measures to issue educational, labor, and economic policy on a global scale. Since 2000, the OECD has implemented the study, Programme for International Student Assessment (PISA), which relies on a life skills test with the same name, PISA. PISA measures reading, math, and science of 15-year-old students in OECD member and nonmember nations. The test items seek the application of knowledge in real life

scenarios. In 2022, creativity will also be tested. The PISA has been controversial since its inception in 2000 (Araujo, Saltelli, & Schnepf, 2017). The OECD, itself one of the largest publishers in the world, awarded the British education publishing conglomerate, Pearson, a contract to write the 2018 frameworks for the PISA. The PISA is applied every 3 years and the comparative educational data are used to address educational practices and policies within nations.

This approach to changing national educational systems has been controversial, because it is driven by a single test that is applied to nations with historical, cultural, social, and profound economic differences, and because, as members of the academic community have argued, the OECD uses the PISA to subsume national education systems to a neoliberal international economic order (Andrews et al., 2014; Sahlberg, 2011). An important and overlooked argument against the use of PISA is the historical racist legacy of standardized testing (Au, 2016). No doubt, the OECD is a formidable interlocutor. As a powered and monied structure that contributes to structuring and renewing the historical classed and raced world order, it represents a threat to democracy as it undermines decolonial, critical multicultural projects within education.

---

#### **Construct 4: México's Democratic Teachers: La CNTE**

The Coordinating Committee of Educational Workers (la CNTE) within the teachers' syndicate (el SNTE) in México has as one of its aims, the democratization of both the syndicate and Mexican education (Sánchez, 2018). La CNTE has defended teacher labor rights and teacher autonomy in the classroom by resisting neoliberal education reform. Because of such mobilizations and resistance, la CNTE has been positioned as self-serving and against social progress. However, it is important to know that la CNTE was able to stop the further implementation of the neoliberal education reform introduced in México from 2012 to 2018, and it is a legitimate and formidable interlocutor that has a membership of nearly 500,000 educators who shape Mexican education. Further, the CNTE's continuous rearticulation of local, culturally situated critical theoretical frameworks and pedagogies that build upon or emerge from community onto-epistemologies, as well as from the curated and nuanced integration of global theory (e.g., constructivism, Marxism), is inscribed with a desire for an autochthonous, emancipatory, decolonizing education for México's children, youth, and young adults.

La CNTE, thus, was critical of the federal government's massive effort, Programa *Aprende en casa* [Learn at Home Program] that involved the SEP, who coordinated pedagogical content for 30 million students, and the nation's largest private broadcasters (e.g., Televisa, Azteca, Grupo Multimedios, and Grupo Imagen), who televised the content at the onset of the COVID-19 pandemic and into the 2021 spring semester (Salinas Maldonado, 2020, August 5). La CNTE's stance has been in defense of students, many of whom struggled because of a lack of hardware (e.g., smartphone, computer, etc.) and connectivity or unstable connectivity and other problems with infrastructure. Some families and teachers could not afford the cost of cell phone service, which was the primary way they accessed the Internet (Oropeza, 2021).

In part, the technology challenges were due to the economic hardship that also accompanied the pandemic when the country went into lockdown, bringing labor activity to a halt, as it did around the world. Another challenge identified by teacher Saúl Elizarraras Baena, who was interviewed by *La Izquierda Socialista* media (2020, September 9), was that although students were native to social media, they have neoliberal understandings of using technology; that is, youths' interest in technology is guided by consumption rather than engagement. Social media are for youth a source of entertainment and leisure with very limited and shallow engagement.

Teachers working in remote rural areas across distinct states decided to offer face-to-face classes given that rural students had no access to televised or online classes (Pérez, 2020, April 21). The small class and school population made it possible to observe social distancing protocols without limiting the number of children and teachers in attendance. Overall, however, la CNTE has maintained a skeptical stance toward remote learning, even with México's long history of providing televised middle school for children in remote areas of the country or in areas where middle school enrollment is low. La CNTE asserts that teachers and peers are and represent embodied knowledge and are also powerful mediators of learning and knowledge construction, especially in the context of high poverty that contributes to academic lag.

Elizarras Baena, the teacher interviewed by *La Izquierda Socialista*, acknowledges that remote learning is a challenge but adds that the success and failure of *Aprende en casa* will be defined by each family, because each family has different resources, supports, and challenges. He was critical of televised and online education in general, because of the medium itself which can be manipulative, but he acknowledges that the federal government had to respond to the disruption of face-to-face education caused by the pandemic. He laments that it is always the most marginalized students who will suffer the most because of disruptions. Elizarras Baena rejected the idea that television could replace the teacher:

Television cannot replace the teacher or any other means of digital communication. These tools can only be recognized as a means for teaching, but interaction will always be essential so that the sense of collaboration and solidarity among human beings can be promoted. In this sense, the educational process should always be conceived under a humanistic approach because only in this way will it be possible to contribute to the harmonious coexistence of society. (La Izquierda Socialista, 2020, September 9, para. 13)

In some areas, rural teachers affiliated with la CNTE organized and created their own curricular materials both to support teachers and students. The first set of curricula had to do with understanding what a virus and pandemic are, how family dynamics might unfold and shift under the "stay at home" orders and the importance of nurturing these relationships and emotional ties, how the family is a site of joy, play, and knowledge, and how the family could strategically develop more this way through engagement of games the teachers described in the written curricula, that ranged from pre-colonization to the present moment. Finally, discussions about human rights were included with plans to continue developing these curricular modules (Oropeza, 2021).

Oropeza (2021) writes that in a Mexican urban school whose principal is also the director of a CNTE chapter, the challenge was very similar. Here, again, school personnel together with parents took the lead to devise ways to offer children who did not have access to televised or online lessons, written access in the form of daily assignments notebooks. Parents also had teachers' phone numbers and relied on WhatsApp to communicate. This was overwhelming to many teachers, who not only took calls but also received photographs of student assignments. In short, Mexican teachers and families concluded what has also been concluded in the USA that the pandemic revealed already entrenched educational, and more broadly, societal, inequities and issues with infrastructure and Internet access that impacted student learning. Additionally, although US teachers have been using online platforms such as Google Classroom, Dojo, and other forms of technology to work with students and their families for several years, the pandemic, nonetheless, revealed a lack of adequate teacher and family support to confront such a formidable set of challenges that the pandemic presented.

---

### **Conceptualizing the Cultural Construction of Leadership as Contested Space and a Site of Struggle**

Presented here were four interlocutors: the SEP's first minister of education, José Vasconcelos, who remains a key figure among educators and the public at large; Head teacher in an elementary school, Clara Isela Gómez Rosales who is participating in professional development that is part of a larger global project to standardize educational leadership; the OECD, a structure that structures; and la CNTE, the coordinating committee within the national teachers' syndicate. More actors contribute to the leadership construct – academics, students, families, teachers, and nonhuman actors, such as licensure requirements or policies. Each introduces its own demands, its own politics. What is interesting about the four cases here is that they demonstrate the ongoing tensions between being led by external forces or by relying on the vast epistemological resources within México. Vasconcelos, even when marked by ambivalence, looked to Mexican indigeneity, painters, composers, poets, and history to develop a national plan for Mexican education; this same disposition is evident in la CNTE. Clara Isela Gómez Rosales, a teacher committed to growth and improvement, is ensnared by the OECD's vision of leadership. She is also provoked into new ways of thinking about teaching and leading. She is a critical thinker, but nonetheless is ensnared by these standardized versions of leadership.

Leadership, even when defined as managerial and bureaucratic, must still respond to competing demands that can be seen as vestiges of colonial contestations. In presenting these four constructions of leadership, a theory is advanced: the discursive space in which "leadership" is constructed is contested space and a site of struggle. Vasconcelos was fighting racism and the impact of being "openly Indigenous" could have on the economy of a nation under reconstruction. He introduces the cosmic race, which ends his fight against racism by promoting it through the cosmic race and mestizaje. In this sense, he is reactionary, and his actions further

support racism. At the same time, he hired México's first woman muralist, Aurora Reyes, who was also a member of the Mexican Communist Party, a social activist fighting on behalf of the working class and women, and a federally funded muralist whose murals commissioned by Vasconcelos featured images of brutal beatings teachers endured in the aftermath of the Mexican Revolution (1910–1921) during the counterrevolutionary Cristero War (1926–1929). Vasconcelos is making decisions in a very dynamic space in which race is becoming salient as México continued to liberate itself from the oppression of colonialism, first through independence, and then through the Mexican Revolution. He is situating the brown body on a spectrum that can serve to whiten it, assuring the monied elite that Mexicans will assimilate to the Eurocentric values that accompanied Spanish invasion and colonization. Reyes does the opposite. She situates the brown body in the middle of contested space and lets it be sovereign and triumphant even as it is beat up by the Cristero fighters. Vasconcelos' leadership allows for these contradictions.

Gómez Rosales, the head teacher, is navigating temporalities, geopolitics, the OECD, and her own desire to be a better educator and educational leader. She seems to be inspired by the professional development she participated in, or perhaps because she is being prepared for a specific job, a school leader, she feels some stability and can now ask endless questions as she embarks on this clear/clarified journey. Gómez Rosales does not identify any negative or concerning implications of the training. This may be because the film was produced to tell about successes about the professional development, and professional critique may have been perceived as problematic.

Although Gómez Rosales' reflection on the training seems noncritical because she does not unpack the layers of influence this leadership style will have on pedagogy, student-teacher relationships, student learning, and rich measures of student academic performance, she, nonetheless, compellingly describes the ways in which the professional development is transforming her and her team. She is immersed within the logic and project of the professional development, perhaps the only formal, official, and school-based representation of leadership she has encountered. However, whether she challenges or not the constructs and how the professional development represents these – leadership, management, team building, and accountability – does not mean she is not in contested space. She follows the advice, strategies, and techniques offered in the professional development. While she does not critique the paradigm offered to her on screen, she does interact with it critically, drawing comparisons between her actions before the professional development and after. She does recognize that she and her colleagues are the site of intervention as captured in her comment, “Before we had the standards, teambuilding was foreign to us. There is a standard that says a team is something you have to build. You can't take it for granted, and so we began to innovate.” She understands this moment as a moment of change, and she will change in order to remain relevant and viable as a professional, a decision which requires the critical ability to read the world.

The OECD continues to have enormous power in the world to hold countries accountable to its understanding of education, that it should be standardized and be at

the service of the economy. The president of México (2018–2024), Andrés Manuel López Obrador, committed to reforming the constitution to undo neoliberal education reform. He has kept that commitment, and it was reported that his administration has also decided that Mexican youth will not take the PISA. However, he has stated that tests that are useful will be applied; it remains to be seen how his Ministry of Education will qualify the PISA. This exchange between reporters and the president about the PISA, however, points to another actor that was not introduced above but which is a formidable force in Mexican society: the media, which has on many occasions published fake news about this administration.

Aside from the failed project that testing the world's youth using a standardized test is, it is also a costly undertaking. There are international costs for member nations, which are determined by the Secretariat of PISA; this cost is a "floor contribution." Remaining costs are on a sliding scale of sorts, which takes into consideration "national income data and exchange rates." There are also national costs:

National costs for the implementation of PISA vary by country, according to factors such as sample size, the number of languages to be tested in the assessment, national income statistics and living standards. For example, a small country might spend approximately EUR 75 000 per annum while a medium-sized country EUR 300 000 per annum; a large country could spend up to two or three times the latter amount. (PISA FAQs, [OECD.org](https://www.oecd.org/pisa/faq/)).

For the world's nations, a site of contention are these global organisms, such as the OECD, who in capitalist class unity with the monied elite of various countries, can muscle their way into a nation's agenda and disrupt its autonomy. The OECD has, since 2000, embarked on a project that seeks to subsume education into the economy – no doubt, education plays an important role in a nation's economy, but education should not be subordinated by the economy, nor subsumed by it. The applied focus of the PISA seeks to measure "what students can do with what they have been taught. . . [which] goes hand-in-hand with the view that good educational outcomes imply commensurate economic returns to individuals and societies" (Araujo et al., 2017, p. 22). The question, then, is, Can the PISA make any claims about commensurate economic returns? Araujo et al. (2017) seek to respond to the question and begin to draw out the difference between methodological and ideological claims and criticisms. A first critique that they offer is what la CNTE and other teachers around the world ([www.teachersolidarity.com](http://www.teachersolidarity.com)) have denounced: the OECD's assumption that the life skills needed to function are the same or even similar across all countries.

The authors then ask about PISA's validity. They note that test-takers must know the content and the rules or practices around taking a test and comply with these. It is, therefore, important that the OECD not neglect but rather highlight country-specific observations about compliance with the procedures of test-taking in each country. Cross-national surveys must also be able to create culturally neutral items in order to ensure validity, and they are not certain that the PISA has such items. Finally, an approach is used that summarizes various responses based on a series of assumptions

in order to generate a single score for an individual. This can skew the educational inequity score, for example, the authors argue. They offer more examples, such as concealing some of the questions that point to PISA's problematic cross-sectional methodological approach that could impact its validity and limit its usefulness for policy (p. 24). They also raise questions about representation and conclude that improvements to measurement and representation would make their test more legitimate (p. 25). Araujo et al. then take on the ideological suppositions and note that the OECD has narrow definitions of "global," linking it to the logics of neoliberalism:

The technical agenda implemented through PISA – in what it measures, and how – is entirely congruent with OECD ideals and the vision of the world it supports. Sellar and Lingard (2014) go on to note that “[...] the OECD uses a ‘performative’ semiotic construction of the concept of globalization, implying only a neoliberal reading, and denying other accounts in the process” (p. 922). PISA-based league tables are controversial. . . because of their close-to-hegemonic status and ideological implications... (p. 25)

Araujo et al. (2017) rightly identify the key controversies about PISA: it assumes that “education policy recipes transfer from one system to the other” (p. 27); policy analysts judge the effectiveness of school systems based on country rankings, and countries are targeted for reform when their ranking is low. Taken together, the PISA is not a reliable measure nor a desirable tool to be applying across the world. It is ideologically driven, methodologically confounded, and compromised by its narrow world view that is entangled with neoliberal market logics and which situates it as another tool of Whiteness. The OECD remains a powerful interlocutor that peddles neoliberal forms of leadership, and because it does so, it is not trustworthy.

The teachers of la CNTE remain legitimate interlocutors in Mexican society, reminding the nation of the importance of critical theory in education, emancipatory pedagogies, and a social justice imaginary that honors a student's right to a critical education and a teacher's right to labor protections. They have successfully advocated for the reopening of rural *normales* [Normal schools for teacher preparation] and continue to advocate for more reopenings. They continue to fight for basic labor rights in states with rogue governors and continue to shape the dialogue about education in the public discourse. They are also part of the Mexican Left that currently seeks to redefine itself under a progressive administration.

---

## Conclusions and Reflections

In a return to the beginning, Holland et al. are relevant. They provide examples of how individuals improvise to navigate untenable situations. They focus on an event that occurred when two of the co-authors were conducting research in India, and one of the authors asked a woman to come to her home to discuss hiring her to do chores. The woman was from a lower caste than the persons living on the first floor. Caste rules prohibited the woman from passing in front of the home of the higher caste

family, so she could not use the stairwell to reach the second-floor apartment where the author lived. The woman scaled the wall to reach the author's apartment to avoid violating caste rules.

The example is a bit unnerving; no one should have to go to these lengths to improvise and navigate a challenge, an obstacle, or something new, but improvising new identities can be a way to engage the difficult or the new, like the ongoing impositions that are vestiges of the neoliberal machinery. The cultural constructions of leadership presented here offer citizens representations to critique, to coalesce around, to dismantle, to invest in, to protest against, and so on.

The process of making meaning of and embracing or rejecting these cultural constructions of leadership is also to enter contentious spaces, for there is support for all of the interlocutors presented here by different segments of Mexican and international society, those who want México to join the global world order under Eurocentric paradigms, and those who want México to leverage its Indigenous and rural onto-epistemologies, lessons from invasion, colonization, independence and revolution, and its social movements to establish and drive its own agenda. There is a third group that does not mind integrating aspects of current global governance models. In this way, each of the culturally constructed leadership forms presented here are for Mexican citizens to identify the tolerable, the desired, and the refused. These sites of struggle are ongoing and, in this way, dynamic, allowing for possibility and change. Such spaces should be inscribed with human presence and action.

## Abstract

This chapter provides an overview of general areas of inquiry regarding African American P-12 school administrators and what is known about how African American administrators resisted race and gender oppression. Extant literature makes it abundantly clear that over the course of history, from the antebellum, Reconstruction periods, *de jure* and *de facto* forms of segregation and beyond, African American principals were motivated by a commitment to community, combatting racism, and upholding high academic standards. After a general review of what is meant by the term “resistance,” a review of African American leadership within general categories are explored. These include segregation before and after the landmark *Brown* decision, which deemed racial segregation in public schools unconstitutional in the South, resistance to *Brown*, leadership styles, urbanicity, gender, and research about Black principals across race, gender, and urban schooling.

African American school administrators · Resistance · Community · Leadership styles · Gender · *Brown v. Board of Education* (1954) · Principals · Superintendents · Segregation · Activism

**The Field of Memory**

Research about African American P-12 school administrators is often understood in relation to the 1954 landmark Supreme Court landmark decision, *Brown v. The Board of Education of Topeka Kansas* (Brown v. Board of Education, 347 U.S. 483 (1954)). The Court unanimously decided that racial segregation by law in public education was unconstitutional. The second *Brown* decision, decided in 1955, declared states should implement the *Brown* decision (dismantle *de jure* segregation) “with all deliberate speed” (Brown v. Board of Education, 349 US 294 (1955)). Despite the emphasis on deliberate speed, many school districts in the South delayed integration for decades, created private schools for White students known as segregation academies (Ladson-Billings, 2004), while many states that either never instituted or abolished *de jure* (by law) segregation by 1954, continued *de facto* (by practice or custom, although not formal law) forms of school segregation. Much scholarship about Black education and Black administrators refer to their experiences in the context of pre- and post-*Brown* (shorthand for the *Brown* decision).

While pre-*Brown* studies reveal dimensions of African American school leadership in the North and South in contexts of legal segregation, due to the differences in the context of *de jure* segregation, which remained largely in the South by 1954, researchers have explored the impact of *Brown* vis à vis the employment of African American administrators largely in the South, where *de jure* segregation and the dismantling of it post-*Brown* had particular consequences for Black administrators in the South. Other facets of African American school leadership include an examination of leadership styles, gender, and urbanicity, as well as at the intersection of multiple areas of inquiry.

Increasing research also examines the reality of racial segregation pre- and post-*Brown* in the North (Lowery, 2019; Randolph & Robinson, 2017). This scholarship is important as it acknowledges the existence of *de jure* segregation in the North, even though it was abolished earlier than in the South. Yet, much research about Black administrators in the North pre- and post-*Brown* has generally been conducted as a way of understanding the conditions for those administrators during *de facto* segregation, even before *Brown*.

In sum, one way to organize extant research about Black school administrators is to understand administrators’ perceptions and lived experiences of themselves, students, families, and communities before and the decades after the 1954 *Brown* decision (Butler, 1974; Foster, 2004; Horsford, 2010a, b; Brown, 2005; Robinson & Williams, 2005; Tillman, 2004a, 2004b; Walker, 1996, 2000, Walker & Byas, 2003; Randolph, 2004).

### **The Field of Presence**

Research about African American school leaders reveals that for many, their leadership identities are informed by a legacy of Black activism, which created a calling into the field of education as socially conscious, student-centered leaders. Additionally, the belief that cultural synchronicity is of benefit to African American students is often asserted. This may be in part, because many African American leaders feel a sense of cultural obligation to serve African American students and families in particular, as they serve their school communities as a whole. The vast amount of qualitative inquiry into the professional lives of African American leaders reveals that they often relate to African American students and families because of similar backgrounds, experiences, and heritage. Increasing research reveals the anti-racist leadership practices, or more general social justice leadership practices of African American school leaders. While they are committed to serving all students and families, they may face particular challenges as they increase access and opportunity for African American students and families.

### **The Field of Concomitance**

Explorations into the lived experiences of African American leaders have historically been influenced by theoretical constructs such as cultural synchronicity, critical theories, standpoint theories, and intersectional theories such as Black feminist and womanist theories. The construct of anti-racism, although not always identified as such in the literature, has also shaped inquiry in this area. Constructs developed in the field of teacher education informed by critical theorists that focus on the dismantling of inequities for students and families of identity subgroups such as race and gender, also inform inquiry into Black principal leadership styles. For example, culturally relevant teaching and culturally responsive teaching influenced the development of culturally relevant leadership and culturally responsive leadership paradigms. Similarly, teaching for social justice has evolved into leadership for social justice, which researchers have used as a way to understand the practices of African American leaders in particular.

### **Discontinuities and Ruptures**

Increased understanding about African American school administrators disrupts existing leadership theories by broadening epistemological foundations of traditional leadership theories often based on the experiences of White males. This resulted in a woeful lack of acknowledgment and inclusion of the lived experiences and perspectives of Black men and Black women (English, 1994; Murtadha & Watts, 2005). Through the addition of the knowledge and lived experiences of Black male and female principals, the "histories, purposes, and consequences of racialized [and gendered] school leadership discourses may bring to the foreground a vision for dismantling the old architecture of education as we currently study it" (Murtadha & Watts, 2005, p. 605).

### **Critical Assumptions**

The terms African American and Black are used interchangeably as a matter of personal choice as an African American scholar, and as a reflection of the preferred

terms of scholars who write about African American/Black school administrators. In places where direct quotes are used, the scholar's preferred term is used. Secondly, although discrete categories of research on Black administrators are offered, these categories are not exhaustive, and they should not be viewed as mutually exclusive.

---

## Introduction

In his overview of the community activism of African American educational leaders between 1795 and 1954, Franklin (1990) noted, "historically, the largest group of professionals to provide leadership within the African American community was the educators" (p. 40). Because education was highly valued among enslaved and free Blacks during the antebellum through postbellum periods and beyond, many Blacks entered the education profession. In fact, scholars such as Sizemore (1986) framed research about Black education leaders as part of the struggle for Black education within the larger context of Black history and the fight against inequality in school and societies. Given the realities of racism within society and schools, much scholarship which investigates the lived experiences of Black principals reveals the ways in which they have resisted racism and other forms of oppression.

This chapter describes aspects of African American school administrators' leadership through the lens of resistance to demonstrate how these school leaders were and continue to be agents of resistance against oppression. The chapter is divided by basic categories of the scholarship of Black educational leadership. First, resistance is explained. Second, Black leadership and resistance during the pre-Brown era is followed by the urban North. Next, an explanation of Black administrators' leadership styles is provided, followed by urbanicity, gender, and what is known about Black administrators' leadership experiences and resistance at the intersections of urbanicity, race, and gender.

---

## An Explanation of Resistance

Resistance against oppression is understood by critical theorists as actions taken to disrupt hegemony. Hegemony is rooted in Marxism. Although he was not the only theorist to expound on hegemony, Gramsci's extensive writings about hegemony formed many scholarly understandings about hegemony (Forgacs, 2000) or the dominating societal systems and influences in society, which are reinscribed by institutional structures such as courts and schools, social structures such as families, and is espoused by those with political and social power as well as those throughout society.

Carroll and Ratner (1994) explained,

For Gramsci, hegemony is understood as an historically specific *organization of consent* that rests upon – but cannot be reduced to – a practical material base. In the modern era, formal freedoms and electoral rights exist alongside the class inequalities of the bourgeois state;

therefore, relations of domination need to be sustained with the consent of the dominated. . . .By these means, a general interest or collective identity is constructed that unites the dominant and subordinate alike as members of the same political community. In Gramsci's formulation, power is *both centralized* in the coercive apparatuses of the state and *diffused* across other institutional sites such as the church, the family, and the school. (pp. 5–6, italics, original)

Acts aimed at disrupting or resisting these systems' power are implemented with hopes of disrupting the status quo, which are considered counter-hegemonic.

Freire (2009) expounded upon how oppressed people can resist their oppression. He argued that dehumanization will eventually lead the oppressed to struggle with their oppressor, while not internalizing the acts of their oppressors. Further, Freire asserted that education is central to liberation:

The pedagogy of the oppressed, as a humanist and libertarian pedagogy, has two distinct stages. In the first, the oppressed unveil the world of oppression and through the praxis commit themselves to its transformation. In the second stage, in which the reality of oppression has already been transformed, this pedagogy ceases to belong to the oppressed and becomes a pedagogy of all people in the process of permanent liberation. In both stages, it is always through action in depth that the culture of domination is culturally confronted (p. 54).

Freire asserted that liberation, which is the intended outcome of resistance is a praxis: “the action and reflection of men and women upon their world in order to transform it” (p. 79). Black critical and critical feminist scholars such as hooks (1994) espoused Freire's beliefs that education can be liberatory, and that the practice of education itself “could be the practice of freedom” (p. 14). Therefore, the leadership practices of Black principals that contributed to community upliftment, critical consciousness and citizenship of Black students and families in a society that oppressed, disenfranchised, and under-resourced them are counter-hegemonic. These leaders' actions disrupted various forms of material oppressions enacted and supported through laws and customary practice, as well as narratives of inferiority and a lack of respectability.

---

## Pre-Brown in the US South

The opportunities and structures of the education of Blacks often mirrored the political social limitations for Blacks in the larger society (Franklin, 1990). Additionally, Blacks in other professions such as ministers, lawyers, and business were educators. There is also a rich history of Black school leadership rooted in the Black church, where ministers saw themselves as educators. For example, Richard Allen, founder of the African Methodist Episcopal church in Philadelphia, also provided a day school for Black children and adults as early as 1795. Black women were active school leaders and community activists during the 1800s as well (Murtadha & Watts, 2005). For example, Sarah Smith was the first Black principal in the New York

public schools when she was appointed as principal of the African School in Brooklyn in 1863. Fannie Jackson Coppin, who was born a slave, was appointed principal of Philadelphia's Institute For Colored Youth (ICY) in 1869 and remained so for over 35 years (Franklin, 1990).

The African American community collectively resisted the dehumanization efforts meted out against members by its continued pursuit of education despite persistent efforts to deny it. Therefore, the act of seeking education itself was resistance. Under Coppin's leadership of the ICY in the period immediately after the Civil War, "the ICY had come to be considered one of the best classical secondary schools in the country" (p. 49). This combination of commitment to educational excellence *and* community leadership positioned Black leaders to craft educational goals within the Black community and actively dismantle oppression. For example, Sarah Smith was one of the founders of the Equal Suffrage Club, a group comprised of African American women.

Murtadha and Watts (2005) shed further light on the ways in which African American leaders during this timeframe resisted oppression. They characterized these leaders as "not only educators, they were public speakers, community activists, and civil and women's rights advocates" (p. 592) from the antebellum, Emancipation and Reconstruction periods, through the first half of the twentieth century. The plethora of public acts leaders engaged in, from joining societies, church organizations, crafting public scholarship to fight injustices, and advocating for community resources actively resisted the over-arching narrative of Black inferiority.

---

## Segregation Pre- [Continued into] Post-Brown

The resistance of Black administrators during segregation could be characterized as leading the school as a site of resistance against a status quo of White supremacist, sexist oppression, and dominance of African Americans. Yet, even the narratives about segregated schooling historically portray Black schooling as inferior. Walker (2000) explained,

The more traditional and widely accepted portrait of the schools depicts a theme of almost complete inferiority. In this view, the African American segregated school is depicted as inferior because of inequality in facilities, lack of transportation, shorter school terms, teacher-pupil conflicts, overcrowding, poor teaching, and poor student attendance. (p. 253)

In response, Walker chronicled how histories that are limited to an accounting of resources ignore "the ways in which African American schools strived to become intellectual institutions, despite the expectation of European Americans that any learning beyond menial employment was unnecessary" (p. 254). Therefore, the commitment to high academic standards and preparation for professional opportunities on the part of African American school leaders in this context were acts of resistance. Walker's review of literature about common themes and characteristics of teaching and learning in segregated schools yielded a conceptualization of "valued

segregated schools” (p. 260). She points out that while many of these schools were located in urban areas, many other schools were in rural settings. Walker characterized valued segregated schools as having “1) exemplary teachers, 2) curriculum and extracurricular activities, 3) parental support, and [most important in the context of this chapter] 4) leadership of the school principal” (p. 264).

The principal of segregated schools was both school administrator and “the conduit through which the needs of the school were translated to the community” (p. 274). Therefore, the principal was highly visible as a community leader, counselor, involved in service activities, and as “liaison with the White community,” which required them to advocate for the school’s needs and required a level of political astuteness (p. 275).

Walker’s & Byas’s (2003) depiction of Ulysses S. Byas’s leadership of a segregated high school in the South reveal how he advocated for the school, navigated relations with the superintendent while seeking material support for the school, gained parental support, was a community leader, and engaged in resistance. In 1968, in an act of political resistance, Byas resigned rather than accepting a position as an assistant superintendent, in a district move designed to remove him from the principalship in response to desegregation. This is an unfortunate illustration of the lengths to which White supremacists sought to maintain power and control and what scholars have called an unintended consequence of *Brown* that resulted in the decline of Black administrators (Abney, 1974; Tillman, 2004b).

One of the more well-known African American principals of a segregated school that created nurturing and enriching education for its students was Anna Julia Cooper, who was principal of Dunbar High School (formerly known as Washington High School and the M Street School) in Washington, D. C. Dunbar was the nation’s first Black public high school which gained a reputation for its legacy of rigorous academics, highly educated principals and teachers, and long line of famous graduates (Stewart, 2013; Walker, 2000). In addition to leading the high school and contributing to its stellar academic reputation, Cooper was already an accomplished author in the tradition of what would become known as Black feminisms. *A voice from the South* (1892) articulates her argument that higher education would further equality for Black women and the entire race.

---

## Resistance to *Brown*

Researchers have chronicled the displacement of Black principals in the South in the decades after the *Brown* decision due to a complexity of factors, most notably, the closing of formerly all-Black schools in response to desegregation mandates, which lead to the firing of Black principals (Abney, 1974; Butler, 1974; Karpinski, 2006; Tillman, 2004b), creating job loss and insecurity in a formerly “sheltered market” (Butler, 1974, p. 11) because of racial segregation. Although data collection about principal employment by race was not transparent or always available (Karpinski, 2006), data that is available revealed patterns of Black principal decimation. For example, between 1954 (the year *Brown* was decided) and 1970, the number of

Black principals in Kentucky declined from 350 to 36. In Maryland, between 1954 and 1968, the number of Black principals declined from 44 to 31. This “did not keep pace with the number of White principals, which increased 167%” (p. 252). Concomitantly, researchers also examine the benefits, tradeoffs, and consequences of *Brown*, either through archival or reviews of research (Karpinski, 2006; Tillman, 2004a, b) or through the reflective lenses of retired Black principals who experienced desegregation (Horsford, 2010a, b, 2011; Lyons & Chelsey, 2004). Consequences typically include while noting increased access to resources for Black students, principals recognized the deleterious effects of desegregation on the jobs of Black teachers and principals, as well as a lack of culturally responsive educators and curriculum to meet the needs of Black students (Lyons & Chelsey, 2004).

Black principals were negatively impacted by attempts of state and local efforts to resist the decree to desegregate. These efforts included firing them for belonging to organizations such as the National Association for the Advancement of Colored People (NAACP), widening the scope of standardized teacher exams, and limiting access to teaching licenses either by cancelling certification programs or by revocation (Tillman, 2004b), and school consolidation which resulted in Black principals being disproportionately reassigned or dismissed compared to White principals (Karpinski, 2006). However, Karpinski (2006) chronicled the ways Black principals resisted the concerted, racist efforts. They viewed their professional associations “as weapons to correct injustices” (p. 240) and engaged in education campaigns to prepare the public about the impending *Brown* decision. They also aligned with the NAACP and pursued legal action to address the crisis. Black educators and activists counteracted decimation efforts and eventually received support from some northern school districts who (slowly) increased recruitment of Black teachers and principals. Unfortunately, despite ongoing resistance efforts, the impact of anti-desegregation activities resulting in the dismissal of Black educators continues to contribute to a dearth of Black educators today. As Karpinski noted, “In time, the dearth of minority applicants in education has required federal, state, and local programs to offset the shortage of African American educators. . .through programs designed to encourage ethnic minority teacher recruitment” (p. 269).

---

## Leadership Styles

Black principals’ and superintendents’ leadership styles have been of great interest to researchers interested in understanding “the foundational ground that supports African American leadership in schools and that concomitantly supports African American student achievement” (Foster, 2005, p. 692) and promotes anti-oppression. This perspective is often analyzed through a historical lens of the legacy of Black educators’ community activism, dating back to the eighteenth century (Franklin, 1990; Pollard, 1997) and include an understanding of their commitment and motivation to educating Black youth and developing their communities (Sizemore, 1986). These styles include ethnohumanist identity (Lomotey, 1993), interpersonal caring (Walker & Archung, 2003), and tempered radicals and servant leaders (Alston, 2005). These studies, which

center the voices of Black leaders, are also important because they broaden leadership theories by including Black school leaders' "perspectives on leadership, teaching, and student achievement" (Brown, 2005, p. 586).

---

## Urbanicity

Another body of work focuses on the experiences of African American administrators several years after *Brown*. This research usually focuses on Black urban school principals, who lead schools of predominantly Black children (Case, 1997). Black principals have consistently been underrepresented since the 1980s. Jones (1983) argued that Black school administrators were appointed to large urban school districts largely in response to fulfilling a need for principals in superintendents in majority Black and Brown districts when White administrators did not want them; and where they are expected to fix serious problems (Pollard, 1997). Black principals have steadily comprised 11% of all principals from at least 2002 (Brown, 2005) to the latest data released by the National Center for Educational Statistics (2017).

A related body of research consists of the experiences of Black principals in the context of revealing schooling experiences in all-Black schools in the urban North pre- and post-desegregation (Randolph, 2004), who, because of *de facto* or neighborhood segregation, led schools of predominantly Black students, such as in Harlem, New York (Johnson, 2006), or as among the first hired in predominately White districts (Lowery, 2019). Research about these administrators chronicles both the material challenges they faced, as well as the efforts they made as school and community leaders to create rigorous educational experiences for Black students. Black principals in these contexts were public scholars, who published articles about sociopolitical issues and fostered high academic standards (Randolph, 2004; Johnson, 2006; Muradha & Watts, 2005).

Randolph (2004) examined the schooling practices of an all-Black urban high school North that was all-Black due to *de facto* segregation in Columbus, Ohio. She sought to understand the factors that contributed to memories of goodness associated with the school. One factor was the leadership of the schools' principals, including its first one, an African American woman who was appointed when the school opened in 1910. Characteristic of previous research about the role of Black principals who facilitated outstanding educational experiences and outcomes for Black students and communities during segregation, principal Baker believed her responsibility was to "lift the African American race through educational means" (p. 599). The leadership of Principal Mitchell also contributed to the school's legacy of greatness. He "believed that education would quell racist deprecations of the intellectual abilities of Black youth. As the principal of Champion, he would erase racist notions about Black people, particularly doubts of the educability of Black youth" (p. 600). Through his role as a principal and through his public scholarship, similar to the Black school leaders in other parts of the United States before him, principal Mitchell resisted the racist discourse about the inferiority of Black students by articulating and disseminating writings about the equality of Black children, thereby contradicting long-held beliefs about Black inferiority.

## Gender

Lomotey (2019) asserted, “Black principals make a difference for Black students, and most Black principals are women” (p. 337), yet they are underrepresented in scholarship about principals. Lomotey’s review of extant research published between 1993 and 2017 revealed that most researchers focus on Black women principals’ lived experiences including their gender and race identities, leadership styles such as “passion/mothering/caring” and “servant leadership” (p. 339), the ways in which spirituality informs their leadership, the importance of family, and race and gender barriers faced (Lomotey, 2019). Indeed, research about Black women administrators generally focuses on the unique challenges and experiences they face as Black women or as a subset of the leadership style – what aspects of their intersecting race and gender identities form successful leadership for Black students in particular (Pollard, 1997).

Blair (2009) described the leadership vision of nineteenth-century school founders Mary McLeod Bethune, Nannie Helen Burroughs, and Charlotte Hawkins Brown. Their leadership practices were grounded in character education and community building. Important tenets of their education programming included developing skills (manners and etiquette) to appease White allies, and pairing morality with seeing the value of hard work. Their conception of work included domestic labor to meet the financial needs of their families, given the race and gender constraints of the late nineteenth and early twentieth century (Blair, 2009). These women lauded character education as an explicit resistance to prevailing narratives of Black inferiority, thereby creating an avenue to gain respectability (Blair, 2009). She explained,

They knew that character traits were important to White employers and, given the economic needs of their students, they did not hesitate to emphasize the development of these traits at their schools. At the same time, they never allowed themselves to be defined by Whites. (p. 574)

As evidence of the diversity of thought within the African American community, this approach did not go unchallenged by other members of Black society who derided their efforts as assimilationist actions that underscored White supremacy. The debate over whether engaging in activities that appear to pacify the oppressor but result in some modicum of political, financial, and social security are acts of resistance or assimilation is longstanding within African American communities. And, scholars who have studied these women leaders’ lives in-depth maintain, as Blair does, that “these women believed in the power of education to help African Americans rise above the degradation that shaped so much of their history” (p. 582).

Research about Black women principals is also contextualized within periods of segregation post-*Brown*, as it took decades for states to comply with the *Brown* decision: school principals during segregation such as Ethel T. Overby who emphasized high educational standards and sought to close the achievement gap (Randolph & Sanders, 2011), or the experiences of Velma Dolphin Ashley who was appointed

the first Black female superintendent of an all-Black district in Oklahoma in 1976 (Revere, 1989).

Loder (2005a, b) explored how race, gender, and generational status informed Black women principals' leadership experiences. Her findings also provide evidence that neither Black principals nor Black women principals should be viewed as a monolithic or homogeneous group. Her analysis of an intergenerational sample of African American principals in Chicago revealed how generational status informed differences between how the principals portrayed their journey to the principalship (2005b). The African American women principals born before the Civil Rights movement entered education because it was one of few professional opportunities. They were aware of institutional racism and sexism, and committed to education as a spiritual calling on their lives. In contrast, African American women principals born after the civil rights-era had more access to a variety of professional options and viewed themselves as more individualistic, rather than part of a collective culture. Loder (2005a) analyzed a subset of those principals who were born in the same generation prior to the Civil Rights movement and started teaching in the 1960s. She found that those principals, who "came of age professionally" (p. 306) during the Civil Rights movement revealed that their response to school reform in the 1980s resulted in "governance reforms that restructured long-standing authority relationships between African American principals and parents" (p. 316). This awareness transformed how they viewed themselves as mothers and carers. Loder's analysis of these generational differences led her to ponder:

What might these divergent reflections on the salience of race and gender in the professional realm reveal about contemporary African-American women principals' capacity to carry forth the longstanding tradition of activism in African-American education? Do younger generations of African-American women principals view it as their obligation to use their professional status and capital to "uplift the race" as has been widely documented among their predecessors? (p. 261)

These questions remind us of the complexity of analyzing historical and contemporary African American school leadership. Further, should one answer the second question negatively, questions remain about how to educate African American current and aspiring school leaders about the importance of the activist tradition.

Some research exists that explores Black women principals' and aspiring principals' experiences and perceptions in regarding the principalship. Allen et al. (1995) found that mentors and sponsors for Black women play a key role in their professional success, including motivation and maintaining high expectations. Pollard (1997) and Aaron (2019) found that Black women principals' race and gender informed their view of their professional role and mission regarding their students. As knowledge about the experiences of Black female superintendents is sparse (Alston, 2000), more understanding about their leadership styles, perhaps through the conceptual lens of the tempered radical/servant leadership, is warranted (Alston, 2005).

Johnson's (2006) examination of the leadership practices of Gertrude Ayer, the first Black woman principal in Harlem, contributed to "a historical continuum of

African American women's educational practice" (p. 21) which again, was steeped in a commitment to school, community, and public scholarship that criticized race, gender, and class oppression. Black administrators challenged injustices in schools and society. Over a 40-year career starting in the 1930s, Ayer was a public intellectual who published widely about race, gender, and class, championed innovative curriculum, and led workshops and taught classes about race, gender, class, and labor. Ayer's commitment to the education of her community, which was majority Black exemplifies resistance against racism because in the 1930s, "Harlem public schools, in particular, provided stark evidence of the effects of years of underfunding and neglect by the central school bureaucracy" (p. 23). Effectively, by investing in her community and creating educational spaces that provided rich educational opportunities for students otherwise underserved, Ayer resisted the narrative that the Black community of Harlem deserved and should expect less for themselves because of their race and class. Further, Johnson asserted that during Ayer's "tenure as a school leader, militant social activism was viewed as a community responsibility by many of Harlem's movers and shakers" (p. 31).

---

### **Race, Gender, and Urbanicity**

As stated earlier, these categories are neither distinct or mutually exclusive. Scholars have explored Black female principals at the crossroads of race, gender, and urbanicity (Bloom & Erlandson, 2003; Case, 1997; Dillard, 1995). Case (1997) explored the concept of othermothering, a concept where Black women, known as "othermothers within the community exhibit a sense of responsibility to the offspring of other mothers" (p. 26), which results in assistance to biological mothers in the raising of their children with the community. One of the two participants in Case's (1997) study was a Black female principal in an urban elementary school. The principal exhibited othermothering as she explained school expectations to parents and students, compassionately processed student discipline issues, and protected school grounds; thereby "[g]aining the respect of blood mothers" (p. 32). Bloom & Erlandson (2003) examined three Black women principals of urban schools through the metaphor of visibility and invisibility to reveal the factors that informed their leadership vision and how they engaged in leadership practices. As with extant leadership, the researchers found that the principals' memories of the rich Black culture and community created a strong cultural identity formation, which developed an appreciation of their collective cultural history and collective consciousness for engaging with the Black community as school leaders. Attention has been paid to Black administrators in suburban settings where the majority of the educators and students are White.

Madsen and Mabokela's (2002) interviews of four African American assistant principals, three men and one woman, yielded evidence that the assistant principals developed a color-conscious leadership and they experienced challenges as they navigated intergroup conflict, such as incompatible diversity goals and power dynamics in their interactions with stakeholders.

---

## Conclusions and Reflections

hooks (1992) summarized how affirming practices of African American administrators that disavow oppressive practices and narratives are forms of resistance:

Collectively, black people and our allies in struggle are empowered when we practice self-love as a revolutionary intervention that undermines practices of domination. Loving blackness as political resistance transforms our ways of looking and being, and thus creates the conditions necessary for us to move against the forces of domination and death and reclaim black life. (p. 20)

In sum, the actions of Black administrators that provided access to education, community resources, and a counternarrative of Black equality to negate messages of Black inferiority were counterhegemonic. It is a legacy worth remembering as many of the same tactics and messages that align to deny quality education to Black people continue in similar and different forms today.

Franklin (1990) urged contemporary African American educators to continue the legacy of community uplift, while cautioning against what he interpreted as a disavowal of this dual commitment during the latter half of the twentieth century:

During the 1980s as numerous interest groups raised their voices in support of the campaigns to improve the public educational conditions for a "nation at risk," noteworthy from the chorus of proponents for change was the collective voice of African American educators. . . This is unfortunate, for the historical record is clear. Throughout the 19<sup>th</sup> and first half of the 20<sup>th</sup> centuries, African American educators and administrators not only held themselves accountable for what took place within their educational institutions, but they also moved out into the community to provide leadership for organizations and movements aimed at the social, economic, and political advancement of the entire African American population. These educators knew that their progress and advancement as educators and administrators was tied to the overall progress of African Americans a group. (pp. 59–60)

The wide scope of possible research topics about African American principals and their experiences means that undoubtedly, there are many more questions to explore through a range of methodologies and theoretical/conceptual lenses. At the same time, it is important that scholars continue to examine the nuances and within-group differences of Black administrators, and continue to examine other identities to understand how those who identify as "Black" as one aspect of their identity experience the principalship, as well as challenges and resistance narratives. Otherwise, without a keen eye to detail and nuance, it may be too easy to homogenize experiences or create erroneous narratives of a monolithic experience of all Black administrators, and romanticize resistance efforts.

## Abstract

Public schools across the country are becoming increasingly more diverse, particularly with respect to culture, race, and ethnicity. Given the perpetual gaps (e.g., achievement, discipline, referrals to exceptional children’s programs, etc.),

the need for researched-based strategies aimed at leveling the playing field for historically marginalized populations is compelling. Much of the extant literature on school reform and school improvement focuses on the role of the teacher in stemming the tide. More contemporary research, however, reveals that school leaders in general and principals in particular also have a significant impact. In that regard, culturally responsive leadership has emerged as a research-based approach to support students of color.

**Field of Memory**

**Evolution of Deficit Thinking.** As early as the 1600s and grounded in long-standing racial beliefs about people of color, deficit thinking arose from moral, political, pseudoscientific, and racist debates (Foley, 1991). These discourses centered on the premise that people of color were either biologically or culturally inferior to Whites.

Rooted in the study of human beings, their culture, behavior, and beliefs, anthropologists took the approach of understanding the different aspects of the human experience. In the early 1900s, Darwinian Genetic Deficit Theory and concepts of evolution found genetic differentiations of animal species based upon geographical or environmental adaptation. Genetic Deficit Theorists quickly expanded this idea to include social and cultural systems of people (Davidson, 1992). From this research, anthropologists ascribed to three main theoretical frameworks: Cultural Deficit Theory, Cultural Difference Theory, and Cultural Ecological Theory. Each of these theories was formed in response to certain historical realities or educational dilemmas. For the purposes of this chapter, Cultural Deficit Theory will be utilized to frame the discussion of culturally responsive leadership.

In the 1960s, Cultural Deficit Theorists such as Hess, Shipman, Engelmann, Bereiter, and Deutsch began to gain more credence over the Genetic Theorists. Their studies specifically focused on the premise of “nurture” versus “nature.” Most cultural deficit studies portrayed the child’s social, cultural, or economic environment as “depraved and deprived” of the elements necessary to “achieve the behavior rules (role requirements)” for academic success (Hess & Shipman, 1965). Bereiter and Engelmann (1966) further emphasized that “cultural deprivation” theories purported that social and emotional deficiencies affected student performance within the academic system. Until dealt with, these differences would make it “impossible for” culturally deprived students “to progress in academic areas” (p. 41).

Ultimately, Cultural Deficit Theorists viewed cultures and environments other than European American as inferior. Middle-class expectations and values

promulgated in educational systems highlighted perceived deficiencies inherent in minoritized children. The realization that teachers were also failing to effectively teach minoritized children was rarely broached, and blame remained conveniently elsewhere. Cultural Deficit Theorists asserted that deficiencies in the home environment result in shortcomings in skills, knowledge, and behaviors that contribute to poor school performance. According to Cultural Deficit Theory, some students perform poorly in school due to the linguistic, social, and cultural nature of the home environment that does not adequately prepare them for academic pursuits. While the assumptions and biases posited by Cultural Deficit Theorists are now veiled in more modern descriptive nomenclature – such as at-risk – the undertones and cultural inferiority continue to be echoed.

**From Deficit to At-Risk.** For the past 38 years, describing vulnerable young people as “at-risk” became ubiquitous in schools, colleges, and universities in the United States (McKenzie, 2019). The at-risk label which was widely disseminated in the 1980s has also been utilized to describe students or groups of students who are considered to have a higher probability of failing academically or dropping out of school (Strauss, 2019).

Circumstances that could jeopardize school completion include homelessness, incarceration, teenage pregnancy, serious health issues, domestic violence, and transiency (as in the case of migrant-worker families). Other factors may include learning disabilities, low test scores, disciplinary problems, grade retentions, or other learning-related factors that could adversely affect educational performance and attainment for some students. While educators utilize the term at-risk to refer to general populations or large categories of students, it is often applied without regard for the stigmatizing effect on students.

When educators highlight intrinsic student deficits and interpret cultural and racial difference as a deficit, students of color become vulnerable to disparate treatment in schools. The deficit model is based on the normative development of students whose homes and communities have prepared them for schooling long before they enter school (Harry & Klingner, 2007). Educators often struggle to view student difficulties as “human variation rather than pathology” (Reid & Valle, 2004, p. 473). If children – specifically minoritized students – are to develop the skills for success in life, thinking must move beyond the deficit model towards culturally responsive pedagogy and leadership.

### **Field of Presence**

Today’s principals are expected to be culturally responsive leaders and to develop and successfully implement evidence-based solutions aimed at improving outcomes for all of their students. School reform and school improvement literature has historically emphasized teacher impact and instructional approaches for strengthening outcomes for traditionally marginalized students (Bond, 2017; Gay, 2002; Ladson-Billings, 1995). However, school leaders, particularly principals, also play a critically important role in improving outcomes for vulnerable students (Darling-Hammond, LaPointe, Meyerson, Orr, & Cohen, 2007; Fraise & Brooks, 2015; Minkos et al., 2017). According to Horner and Jordan (2020), “The accountability

and education reform era among other factors changed the role and expectations for principals over the last two decades from that of a manager to an instructional leader and school cultural broker. Principals became the centerpiece of effective schools” (p. 3). Culturally responsive school leaders critically self-reflect on leadership behaviors, develop culturally responsive teachers, promote culturally responsive inclusive school environments, and engage students and parents in culturally appropriate ways (Khalifa, Gooden, & Davis, 2016). The Field of Concomitance underscores historical connections to philosophy and education.

### **Field of Concomitance**

Socrates, one of the Greek progenitors of philosophy, vigorously challenged commonly accepted knowledge. Centuries later, others, namely, Kant, Locke, and Hume, created a contemporary view of philosophy heralded as a critique of knowledge. In keeping, Foucault’s “critical philosophy” questions truth, particularly truth grounded in Science, and instead exalts the notion of contingent historical forces as a critique of historical reason (Gutting & Oksala, 2019).

Critical Pedagogy and Philosophy of Education both stem from ruminations that originated from Socrates and his protégé, Plato. Both philosophers purported that dialogue for human interaction and for education was essential (Guilherme, 2017).

Critical pedagogies insist that, as a consequence of mainstream technocratic models of public education, the larger historical, ideological, economic, and cultural conditions out of which today’s social and institutional crises have grown, generally go unquestioned. It is precisely this lack of inquiry, analysis, and agency that a critical philosophy of learning hopes to reverse (Leistyna, 2002, pp. 14–15).

Critical theory, a precursor to critical pedagogy, stemmed from the development of the human emancipation project at the Frankfurt School in Germany in the 1920s. “Critical theorists want to determine the oppressive features of society; once they are understood the intent is to develop the conditions under which those who are oppressed might be able to liberate themselves” (p. 4). Further, critical theorists suggest that “all knowledge is socially and historically determined and they reject the positivist notion of knowledge and science. . . Logical positivism asserted that only scientific knowledge, verifiable in principle, was true knowledge” (Tierney, 1993, p. 5).

Derived from critical theory and critical pedagogy, critical multiculturalism encourages rethinking paradigms and processes and promotes teaching for educational and social equity and change. Critical multicultural theorists espouse that individual critical consciousness about class, race, gender, racial identity, and beliefs are influenced by perspectives, ideologies, and practices from the Dominant European American culture in the United States (Ukpokodu, 2003).

Banks (1993b) views the primary goal of multicultural education as transforming schools so that “all students will acquire the knowledge, attitudes, and skills needed to function in an ethnically and racially diverse nation and world” (p. 27). Sonia Nieto (2000) adds: multicultural education is a process of comprehensive school

reform and basic education for all students. It challenges and rejects racism and other forms of discrimination in schools and society and accepts and affirms the pluralism (ethnic, racial, linguistic, religious, economic, and gender, among others) that students, their communities, and teachers reflect. Multicultural education permeates the schools' curriculum and instructional strategies, as well as the interactions among teachers, students, and families, and the very way that schools conceptualize the nature of teaching and learning.

Culturally responsive pedagogy was deeply influenced by multicultural education. In addition to Describing Gay's, 2010 work, Harmon states "Three ideologies emerged, including teaching racially different students differently, using insights into ethnic or cultural pluralism to improve all educational decision-making, and teaching content about ethnic groups to all students. These ideologies provided the foundation for culturally responsive pedagogy" (2012, p. 17). From culturally responsive pedagogy, scholars culled a theory later conceived as culturally responsive leadership. Culturally responsive school leaders "nurture and maintain high-quality teaching, and foster an inclusive community that builds on teacher, student and family assets" (Schlanger, 2018, p. 1). A critical assumption advanced in this chapter is that leadership affects student learning and culture is inextricably connected to learning.

### **Critical Assumptions**

Principals influence the school environment, teachers' learning, instruction, student success through relationship building with students and families, and ultimately student achievement (Khalifa et al., 2016).

Additionally, culture plays a critical role in learning. Learning for children of color is optimized when culturally responsive pedagogy is employed. Culturally responsive pedagogy consists of critically analyzing instruction through the lens of race, ethnicity, and culture (Howard, 2003). Culturally responsive pedagogy recognizes the importance of including students' cultural references in all aspects of learning.

### **Discontinuities and Ruptures**

A fundamental shift that profoundly impacted culturally responsive pedagogy and culturally responsive leadership was the movement away from problematizing students of color with labels like at risk, culturally deprived and cultural deficit to problematizing the environments in which students of color are educated. Attention turned to policies, practices, and personnel. Wherein students of color and families of color had largely been blamed for underachievement and a lack of success in schools, critical theorists argued that the lack of cultural synchronization between teachers and students had created a negative impact on student achievement (Irvine & Armento, 2001). A clarion call was issued for culturally responsive leaders to enact policies and practices geared towards improving learning environments for marginalized students and to transform teaching through the introduction of culturally responsive pedagogy. To illustrate how culturally responsive leadership is actualized and thereby influences the school environment for students of color, the following narrative of Principal Dolores Ollie is presented here.

More than two decades ago, Principal Dolores Ollie's historical narrative of culturally responsive leadership became an inspiration for a career in the principalship and ultimately higher education for one of the authors of this chapter.

---

## Introduction

Dolores Ollie is fondly remembered as the Principal of Harriet Tubman Elementary School in Newark, New Jersey. Ms. Ollie was a teacher at Harriet Tubman Elementary School for 28 years before becoming the school's principal. A New Jersey state report explains that Ms. Ollie's successful approach includes "strong educational programs, inspired leadership and active parental support."

Ms. Ollie has created a full-service school that includes Saturday parenting classes, breakfast, and an afterschool program that ends at 5:30 pm, and she regularly writes grants to support needs for her school that the district cannot provide. Under Ms. Ollie's leadership and with a no excuses approach, Tubman Elementary 3rd graders scored 11–28 points higher on Math and Reading assessments than other district 3rd graders. Sixth graders scored 88% in Reading and 100% in Math on state standardized assessments, outperforming other district 6th graders that scored 28% and 27%, respectively. To their testament, Tubman Elementary students attend prestigious private and public high schools and universities. Her graduates have attended Yale, Colgate, and M.I.T. Tubman Elementary School also regularly ranks as one of the district's highest performing elementary schools. In fact, more than two decades ago under her leadership, even though the majority of her students are low income, Harriet Tubman Elementary School was recognized as the best school in New Jersey (Kaplan, 1996; Strum, 1993).

Ms. Ollie describes her work as an adventure and states that it is her job to keep teachers stimulated and renewed. Ms. Ollie's teachers report that they are treated like professionals, student expectations are high, and risk-taking is encouraged. Ms. Ollie has developed a culture of success by implementing effective structures that include teacher assistants in every classroom and an emphasis on Science, Music, and Art. Student accountability is prioritized and Parent involvement is remarkable. Seventy-five percent of Harriet Tubman Elementary parents attend parent meetings, and students who misbehave or do not complete homework receive a home visit. Ultimately Ms. Ollie sees her role at Harriet Tubman Elementary School as cultivating student leadership (Kaplan, 1996; Strum, 1993). Ms. Ollie's culturally responsive leadership was evident through her own ability to critically self-reflect on her leadership of Harriet Tubman Elementary School, her teachers' development of a stringent culturally responsive academic environment, and her highly engaged parent community.

Not only did Ms. Ollie utilize culturally responsive leadership practices, she also embodied theories of successful school leadership. Well-regarded leadership theories like Leithwood, Sun, and Schumacker (2020) Four Leadership Paths Framework illustrate the connection between successful school leadership and student learning,

termed here academic success. Leithwood asserts that school leadership indirectly influences student learning. In describing the Four Paths Leadership Framework, he further asserts that school leadership includes an emotions path which consists of how feelings and dispositions and the affective state of staff members impacts their work. The Framework also includes a rational path depicted by teachers' skills and knowledge about pedagogy and teaching practices, and an organizational path that includes structures and communication among stakeholders. The fourth part of the framework consists of a family path that includes variables that determine family expectations such as the family's access to social capital and school communication to families about expectations. With the Four Paths Leadership Framework, Leithwood claims if leaders address how feelings and dispositions impact teacher work, foster pedagogical knowledge and skills, examine organizational structure, and improve family communication, principals can improve the leadership of their schools by focusing intently on specific variables in each of the Four Paths.

Successful leadership practices which emanate from leadership theories cannot alone, however, elucidate how academic success occurs for students of color (Khalifa et al., 2016). Leadership that is culturally responsive is an essential component of successful school leadership. Further successful leaders understand that culture is intrinsic to the performance of minoritized students who are disciplined disproportionately and whose intelligence is often derided. Race, ethnicity, and culture are believed to significantly impact academic performance (Aceves & Orosco, 2014). Darling-Hammond (2010) also advances the argument that culturally responsive leadership improves student performance in schools. This chapter will focus on the emergence of discourse that promotes culturally responsive leadership and the role of culture.

## **Emergence of Discourse that Promotes Culturally Responsive Leadership**

Perry, Steele, and Hilliard (2003) asserted that from slavery to the Civil Rights era, African Americans had a rich tradition of pursuing education as an act of freedom and resistance. In pre-Civil Rights segregated schools across America, academic achievement was an aspiration. Many post-Civil Rights integrated schools have stymied these aspirations by adopting the views of mainstream American society that promoted messages of Black cultural and intellectual inferiority.

The clamor that began in the 1960s and 1970s for separate ethnic content evolved into a signal in the 1980s and 1990s for integrated ethnic content that was part of the core curriculum (Banks, 1993a). Though primarily touted to focus on curricula changes, multicultural education was initially conceived to focus more broadly on institutional changes that include curriculum but also include teaching practices.

Banks (1993b) states that the five dimensions of multicultural education include (1) content integration, (2) the knowledge construction process, (3) prejudice reduction, (4) empowering school culture and structure, and (5) equity pedagogy.

Content integration consists of the utilization of examples and data pertinent to diverse cultural groups to describe concepts, principles, theories, or generalizations. Knowledge construction is the process that behavioral, natural, and social scientists utilize to explore knowledge development in their respective disciplines. In addition, implicit biases, perspectives, and cultural assumptions are considered as they relate to knowledge development. Prejudice reduction examines the racial attitudes of children and practices that can impact children's attitudes and increase democratic racial attitudes. Empowering school culture and structure includes "restructuring the culture and organization of the school so that students from diverse racial, ethnic, and social-class groups will experience educational equality and cultural empowerment" (Cummins, 1986). Banks asserts that often school reform is not successful because the "roles, norms, and ethos of the school do not change in ways that make the institutionalization of the reforms possible" (Banks, 1993a, p. 33).

Equity pedagogy emphasizes pedagogies that improve academic achievement for students of color. In the 1960s, cultural deprivation became the paradigm that dominated education theory in explaining how schools could assist impoverished, underachieving students. It purported the deficits of poor children and the homes that they were raised in inhibited academic attainment. Absent was any discussion surrounding how systems had exacerbated poor academic performance. Cultural deprivation theory problematized poor children and their families. In the 1970s, cultural difference theory which assailed cultural conflicts in schools as the real obstacle to minority achievement surfaced in contrast to cultural deprivation theory that blamed the families of color for their children's lack of academic success.

Cultural difference theorists asserted that rich cultures of students of color were largely ignored in schools across the United States. Rather the cultures promoted in schools were in opposition to the cultures of students of color (Banks, 1993a). Cultural deprivation reemerged in the 1980s but with a new descriptor termed, at-risk as was mentioned above.

The term at-risk and the standards movement both gained prominence in the 1980s following the 1983 release of the report of *A Nation at Risk* published by the National Commission of Excellence in Education. The report described the United States as an economically and socially endangered society and highlighted the importance of preparing public school children to compete in a global market. Following this report, several well-read and widely adopted critiques of multicultural education were launched by Bloom, Ravitch, and Schlesinger who purported that multicultural education lacked rigor and instead incorporated self-esteem in lieu of targeting demanding work and countervailing viewpoints. In addition, with significant influence from the Business Roundtable, States across the country created standards and mandated tests to assess the implementation of those standards (Sleeter, 2004).

As discourse related to culture and achievement progressed, a new paradigm dominated the discourse that focused on changing the manner in which teachers educated students of color. The importance of not only reeducating teachers but reimagining ways to better prepare students for lives in a multiethnic, racially diverse society became paramount.

## Culturally Relevant Pedagogy

More than 25 years ago, Ladson-Billings' (1994) provocative work, *Dreamkeepers*, popularized the concept of culturally relevant pedagogy which informed Gay's (2000) landmark work on Culturally Responsive Teaching.

In her Treatise on effective teachers of African American students, Ladson-Billings centered teaching practices rather than curriculum. Her own work was informed by Ellen Leggett and Harvard Professor Courtney Cazden and Leggett (1981) work on culturally responsive education. Ladson-Billings defines culturally relevant pedagogy as "a pedagogy that empowers students intellectually, socially, emotionally, and politically by using cultural referents to impart knowledge, skills and attitudes" (Ladson-Billings, 2009, pp. 17–18). In her vision of a culturally relevant school, Ladson-Billings describes a school that provides educational self-determination, honors, and respects students' home culture, helps African American students understand the world as it is, and equips them to change it for the better. Educational self-determination refers to parental requests for specific educational needs for their child(ren)'s education and the school's willingness to address those needs. By honoring and respecting a student's culture, schools accurately and fairly portray African Americans in the curriculum. Helping African American students to understand the world as it is and equip them to change it for the better consists of teachers, parents, and community members explaining instances of racial discrimination and equipping students with the knowledge, skills, and attitudes needed to respond effectively to oppression.

---

## Culturally Responsive Teaching

Gay (2010) introduces four components of culturally responsive teaching that she describes as caring, communication, curriculum, and instruction. Teachers that care about their students, not only care about their academic achievement, but they also care about their students' emotional well-being. "Mr. Monroe, M.Ed., Social Studies teacher, 17 years teaching experience described his own learning experience as impersonal, so he has created the antithesis in his classroom. He communicates caring for his students by providing them with individual attention, building relationships with students, responding to student questions, and meeting students before school, at lunch and after school. Mr. Monroe also connects with students by being transparent with them and acknowledging the days that are harder emotionally for students than others" (McLaughlin, 2020, pp. 63–66). Caring about academic achievement includes a relentless pursuit until mastery is obtained and encouraging students to believe that they can succeed in learning tasks (Gay, 2010).

Given that communication is a vital aspect of conveying and acquiring knowledge, classroom communication should include making sure that all students are called on and participate in the classroom discourse. Additionally communication

should include patiently providing careful explanations of classroom material in clear language that students understand (McLaughlin, 2020). Smith (1971) states that “teaching is, above all, a linguistic activity and language is at the very heart of teaching” (p. 24).

Whether making assignments, giving directions, explaining events, interpreting words and expressions, proving propositions, justifying decisions and actions, making promises, dispersing praise and criticism, or assessing capability, teachers must use language. And the quality of the performance of these tasks is a direct reflection of how well they can communicate with their students. . . These effects of communication skills are especially significant to improving the performance of underachieving ethnically different students (Gay, 2010, p. 79).

Curriculum content is another fundamental component of culturally responsive teaching that impacts academic performance. Classroom teachers’ overreliance on textbooks, however, means that textbooks should be reviewed for inclusion of accurate, authentic, significant, ethnically diverse content as teachers are determining which curricula material to utilize. Gay (2010) adds that curriculum should include relevant, accessible knowledge that is connected to students’ lives. Mass media should also be utilized as a source of culturally responsive curriculum content while also including debunking myths, biases, and inaccurate and stereotypical portrayals through contemporary representation.

For instruction in culturally responsive classrooms, part of the focus should be obtaining cultural congruence in teaching and learning and determining how ethnically diverse students learn, organize, and master knowledge and make connections to prior learning. Although teachers should also be familiar with their students’ learning styles, students of color are not a monolithic group so universal strategies should not be applied. Additionally, Gay (2010) mentions cooperative learning and study groups, active learning, multisensory, participatory, emotionally engaging, and visual and physical stimulation as effective instructional strategies, particularly for African American students. Dramatic performance, music, and movement are also effective instructional strategies for improving academic achievement for students of color.

In keeping with Ladson-Billings’ notion of utilizing cultural referents, Gay asserts that culturally responsive teachers utilize prior experiences and frames of references. Both emphasize teaching from cultural strengths rather than operating from a deficit model wherein children of color are blamed for their own underperformance. By “filtering curriculum content and teaching strategies through their cultural frames of reference, culturally responsive teaching makes the content more personally meaningful and easier to master” (Gay, 2010). Ladson-Billings and Gay ultimately engendered a body of research aptly termed culturally responsive leadership. Eighteen years ago, Davis (2002) addressed the importance of culturally responsive leadership in the twenty-first century. Though not entirely interchangeable, culturally relevant leadership and culturally responsive leadership will be introduced here.

## **Culturally Responsive Leadership**

In their description of culturally responsive leaders, Khalifa et al. (2016) assert that culturally responsive school leaders make the entire school responsive to the academic needs of students of color. As has been mentioned, culturally responsive leadership behaviors are described as (a) critical self-awareness, (b) culturally responsive curricula and teacher preparation, (c) culturally responsive and inclusive school environments, and (d) engaging students and parents in community contexts (Khalifa et al., 2016).

### **Critical Self-Awareness**

Having self-knowledge as a person, as an educator, and as a leader is a fundamental component of developing a disposition towards effective, results-oriented leadership. Additionally by reflecting on their own cultural foundations, school leaders are better able to address the challenges and barriers faced by traditionally marginalized students. Self-awareness informs leaders' beliefs and values and ultimately shapes their awareness of inequity, race, culture, ethnicity, class, and language.

### **Culturally Responsive Curricula and Teacher Preparation**

Teacher preparation programs have generally fallen short in their efforts to prepare educators to address gaps in classroom achievement and teach in culturally diverse settings, producing scores of teachers who are ill-equipped to meet the challenges of the work they are hired to do. Thus, Khalifa et al. (2016) state that culturally responsive school leaders who are committed to "ensuring that teachers are and remain culturally responsive" (p. 1281) also provide adequate professional development while directly confronting deficit thinking and disrupting the status quo. When teachers are unable or unwilling to build their capacity, it is the principal's responsibility to help them explore other options. Culturally responsive school leaders also examine hiring practices and prioritize efforts to recruit, retain culturally responsive teachers, and acquire culturally responsive resources.

### **Culturally Responsive and Inclusive School Environments**

Principals who are intentional in their work to ensure that school spaces promote inclusivity also cultivate positive climates wherein diversity is respected. Failing to do so (whether directly or indirectly, intentional or unintentional) creates isolation and exclusion for some students. Khalifa (2018) calls for a reframing of sorts. He asserts, "...the principal and other administrators are not only the best positioned,

but [are] also most responsible for ensuring that both school policy and practice are (non-exclusionary (i.e., anti-oppressive) for minoritized students” (p. 86). For example, students of color are often suspended from school at disproportionate rates, particularly when zero-tolerance policies are applied. The same is true when infractions allow for discretionary consequences. Khalifa points to aggressive behavior as one such example. Minority students are more likely to be seen as dangerous by their teachers and other educators when compared to their White peers. Systematic analysis of discipline and performance data, coaching for teachers, and an emphasis on restorative practices are all within the principal’s purview and could decrease the potential for exclusionary practices.

## Engaging Students and Parents in Community Contexts

Numerous scholars have acknowledged the role that family and community engagement play in improving student outcomes (Henderson, Mapp, Johnson, & Davis, 2007; Sheldon & Epstein, 2005; Yamauchi, Ponte, Ratliffe, & Traynor, 2017). It is therefore incumbent upon principals to forge and sustain meaningful partnerships with students, families, and communities in authentic, and culturally appropriate ways. Table 1 juxtaposes pertinent culturally responsive leadership practices with what are portrayed as historical leadership practices.

While the emergence of a discourse that promotes culturally responsive leadership has been outlined along with the aforementioned culturally responsive leadership practices, culture which is essential for understanding culturally responsive leadership has not been explicitly addressed.

---

## Explaining Culture

Amidst the many disparate portrayals of culture, Foucault (2001) depicts culture through the lens of philosophy as “a hierarchical organization of values, accessible to everybody, but at the same time the occasion of a mechanism of selection and exclusion” (p. 173). Alternately Engelke (2018) asserts that culture, a hotly contested term among anthropologists, is “a way of seeing things, a way of thinking. . .a point of view. Culture is a way of making sense” (p. 27). Engelke further acknowledges the pertinency of what Franz Boas describes as *Kulturbrille*, the “cultural glasses we all wear” (p. 31). The cultural glasses help to create meaning. Boas would say that people don’t just see the world; they see the world precisely, not just as a young woman from the United States but as a young, African American female school leader from North Carolina. Gay (2018) added, even without being consciously aware of it, culture determines thinking, beliefs, and behavior that affects how teachers teach and how students learn. A reality for some teachers is the adjustment to expectations to integrate various student cultures as part of instruction while they do not consider themselves to have a culture. School

**Table 1** Culturally responsive leadership practices and historical leadership practices

Culturally responsive leadership tenets	Culturally responsive leadership practices	Historical leadership practices
Critically self-reflects	Continuous learning of cultural knowledge, challenges hegemonic epistemologies, self-reflects about biases and professional practices	Normalizes biases and colorblind thinking
Develops culturally responsive teachers	Promotes pluralism, provides culturally responsive professional development for teachers and others, reforms curriculum to become more culturally responsive. Recruits and retains culturally responsive teachers who address gaps in achievement	Adheres to monoculturalism, builds teacher capacity with professional development but marginalizes the role of culture, race, and ethnicity, cultural diversity not considered when recruiting
Promotes culturally responsive/inclusive school environment	As needed, challenges exclusionary policies, teachers, and behaviors, confronts intolerance, demonstrates acceptance, uses school data to discover and track disparities in academic and discipline trends, modeling culturally responsive leadership practices for staff in building interactions	Social closed-mindedness, shaming, dominant discourse centers cultural disadvantage, cultural deficit models, and promotes equality versus equity
Engages students and parents in community contexts school	Develops positive, trusting relationships within the community, listens, embraces, validates, and promotes individual and collective voices, empowers stakeholders in culturally appropriate ways	Isolation, rigid, rote tightly controlled opportunities within to meet parents, parents only contacted about children’s negative progress, spurious community events

Khalifa et al. (2016), Khalifa (2018)

leaders are inexorably affected by culture as well. Foster and Tillman (2009) state that race and culture are not just relevant but integral to effective leadership.

## Conclusions and Reflections

More than 30 years ago, Vygotsky (1978) asserted that “culture plays a critical role in learning.” By centering the culture of students of color, classroom teachers can improve the academic achievement of their culturally diverse students and create caring classroom spaces where rigorous curriculum, diverse instructional strategies and racially divergent communication styles are welcomed. In these classrooms, teachers reject historically held beliefs about cultural deprivation, cultural deficit, and at-risk behaviors and instead adopt Gay’s (2010) culturally responsive pedagogy that includes a focus on caring, communication, curriculum, and instruction. In

public school settings with increasingly diverse populations, culturally responsive pedagogy is pertinent for teachers whose charge is to effectively educate students who may not share their cultural backgrounds.

Amidst the immense popularity of multicultural education, culturally relevant teaching, and culturally responsive pedagogy as strategies for effectively educating marginalized students, culturally responsive leadership emerged. Culturally responsive school leaders increase understanding, civility, and adequate support for a range of diverse students (Bakken & Smith, 2011; Murkuria & Obiakor, 2006; Vilorio, 2019). In Khalifa's (2018) discussion of four key tenets of culturally responsive leadership, he espouses that successful leadership practices alone cannot adequately address the needs of marginalized students. In addition to effective leadership frameworks like Leithwood et al. (2020) Four Leadership Paths, culturally responsive leadership should also be adopted. The tenets of culturally responsive leadership include advocating for marginalized students and their families and improving outcomes for students of color. By embracing the tenets of culturally responsive leadership, school leaders gain a critical understanding of self and others and become aware of how race, ethnicity, culture, values, beliefs, and dispositions impact their practice. The tenets also highlight culturally responsive curricula and teacher preparation for student success and emphasize professional development that addresses inequities, biases, and culturally responsive teaching and hiring practices. Leaders can adopt deliberate practices for hiring diverse faculty that may include recruiting at Historically Black Colleges and Universities, Hispanic Serving Institutions (HSIs), Black Sororities and Fraternities or sponsoring an Educators of Color Networking Night (McLaughlin, 2020). The tenets of culturally responsive leadership also address culturally responsive and inclusive school environments, school processes and procedures for equity and cultural relevance, academic success and student well-being, and the discipline trends of marginalized students. Lastly culturally responsive leadership tenets support engaging students and families in community contexts in culturally appropriate ways. Practices could include conducting parent meetings in community settings, in multiple languages, and at times that are convenient for working parents. Culturally responsive leadership engenders self-reflective leaders who affirm culture and foster an academically rigorous, culturally coherent, equitable school environment in which students and families feel safe enough to be themselves.

### Abstract

This chapter explores the rich history of Islamic education, administration, and leadership, as well as many of the disruptions in this tradition due to historical periods of colonization and the current globalization colonization of education internationally and how this has affected Muslim countries. Important also to the Islamic tradition in particular is the erroneous and damaging negative stereotyping and Islamophobia that have been applied to Islam and Muslims as a whole, including the exclusion of their intellectual heritage. The chapter first examines these problems, then provides an overview of the actual values and principles of its educational, administrative, and leadership tradition historically including its social justice tradition as it applies in organizations and in education. This is followed by an overview of new work that has been done internationally in reconstructing an Islamic tradition and practice for modernizing Muslim countries and communities. Finally, the chapter identifies many dimensions and topics that require further development in Islamic educational administration generally and its adaptations in a highly diverse number of countries in the Islamic world.

**The Field of Memory**

There are at least three major phases in the field of memory for Islamic education and its administration and leadership. First is the early Islamic period from the seventh to the thirteenth centuries in which Islam began and formed state, cultural, and educational traditions. It is this period in which the "Golden Age" of Islamic scholarship was conducted in all disciplines and applied fields from which the European renaissance and part of the enlightenment formed as this scholarship was transferred, including the development of scientific and social science and humanities research approaches and methods, the formation of universities, and Islamic educational theory and philosophy, a heritage that most Westerners have forgotten or deny despite a very large body of literature in English on this topic. The next phase was a colonization of most Muslim countries and communities by Western states that disrupted societal traditions and imposed foreign educational systems on many colonized states. The third phase in the contemporary history period is a complex dynamic of decolonization in the twentieth century, with a mixture of achieving independent statehood and development, while also coming under the colonizing forces of globalization with some reclaiming of Islamic principles and traditions of knowledge, administration, and leadership although educational systems are heavily influenced by foreign systems.

**The Field of Presence**

During the twentieth and twenty-first centuries, there has been some reconstruction of Islamic traditions and practices in education, administration, management, governance, and leadership to variable degrees across Muslim countries, but many Muslim states have also had authoritarian regimes, wars, invasions, and other forms of destabilizations that have prevented development and implementation, along with the current globalization period that has exported predominantly Anglo-American theories and models in the field, often to the detriment of local societies, cultures, religions, and languages as education has been treated as a commodity that is also expected by many to serve as international standards. However, there are many areas of research on the Islamic tradition that have been developed producing for the contemporary world Islamic models of administrative, governance, and leadership practices reflecting Islamic values, social justice, and principles of practice and put into practice, along with a number of countries establishing constitutions and legal systems based on the Qur'an and Sunnah.

**The Field of Concomitance**

A number of disciplines contribute to an Islamic educational administration and leadership. Several primary disciplines contribute theories and models such as

political science in its study of Islamic political theory, state structures, and political values of social justice and a global/international. Sociology and psychology also have produced not only more accurate and comprehensive coverage of the developments in the Islamic medieval tradition during which many theories, models, and research practices formed but also have broadened their scope to represent the diversity of knowledge and practices from many non-Western countries. There is also a large body of literature on Islamic business and management in management studies, and in Islamic public administration upon which Islamic finance has developed and arbitration and mediation systems, both recognized internationally. These include philosophies of education, decision-making models, human resource systems, ethics of leadership, work ethic, financial management, arbitration and mediation, and social justice, as well as policy planning, implementation, and evaluation models. In addition, there have been large bodies of literature developing in the last few decades on the primary texts of the Qur'an and Sunnah, histories of various successful and well-functioning Islamic states and empires in history when advanced administrative systems were formed, intellectual and scholarly institutions formed, the formation of the first degree-granting university, research traditions, and the important mirrors of princes' tradition of writing throughout Islamic history. There has also been a very large body of literature on women in the Qur'an and Sunnah and in various periods of Islamic history in which women had leading roles in all sectors, in contrast with the negative stereotyping of Islam's treatment of women and inauthentic treatment of women due to political and cultural factors in otherwise Muslim states. There has also been a literature on research methods appropriate for an Islamic context forming, in part built upon the centuries of research methods that formed during the Islamic intellectual "Golden Age," which also laid much of the foundation for Western research during the Renaissance and Enlightenment.

### **Discontinuities and Ruptures**

There have been a number of disruptions, quite often caused by colonization up to the twentieth century or rapid decolonization in the rise of authoritarian regimes that deviate significantly from Islamic principles and values. Initially the disruptions formed during European colonization of the Middle East and North Africa, and in parts of East Asia where social institutions were reshaped and educational systems remodeled on various European systems. In addition, the politicization of Islam in the last few decades has given rise to negative stereotyping and Islamophobia, which are grounded in deviations and violations of Islamic principles by extremists and autocratic rulers. To a large extent, this has led to an exclusion of Islamic curricular content in Western countries since the faculty have not studied Islam and assume that the negative stereotyping and Islamophobia accurately represent it. Finally, the globalization form of colonization through borrowing of Western administration, management, leadership, and education, along with US or UK accreditation criteria often used, has colonized the field to varying degrees across the Middle East and North Africa. Many faculty from these countries also do their doctoral degrees abroad, often only being education in Western literature, which they then return with to their own countries maintaining the values, theories, and models they studied

abroad. There are also Western consultants who work in Muslim countries on contract-designing organizations, policies, and education, but who tend to replicate the structures and practices from their home countries.

### **Critical Assumptions**

There are a number of critical assumptions necessary for this topic, given the politicized environment internationally, including errant ideas in universities. First, negative stereotypes and Islamophobia need to be exposed and disposed of, placing actual texts and history into curricular context, following guidelines that not only many Middle East scholars, but also Western scholars, who have studied the field at an academic level, have produced. Second, the actual history of Islamic societies and education needs to be recognized in various disciplines and fields, including those in education which often are simply excluded. One of the reasons for this is to recognize the enormous contribution the Islamic world made during the medieval period and later in all disciplines, applied fields, research methods, and technologies during the European late medieval period, the renaissance, and into the Enlightenment, the subject now of a large body of literature and many documentaries readily available. This recognition of higher education and research developments provided a foundation for Western scholarship not only in terms of the theories and philosophies of various fields, but also in the construction of the social institutions, such as the university itself grounded in the earlier universities in the Islamic world such as the first degree granting university in the world, Karueein University established in now Fez, Morocco, in the mid-ninth century.

There is continued development in scholarship and practice in Muslim countries that contribute to disciplines and applied fields that also need to be included. To some extent, these are part of the internationalization of disciplines and fields as well as cross-cultural literature; however, Islamic contextualized scholarship has also contributed to the mainstream body of knowledge. Respecting and including diversity also requires working against neoliberal globalization in order to preserve the integrity of other cultures and societies, while also taking into account Indigenous and many postcolonial critiques that have arisen. To some extent, this requires the adoption of the multiple modernities' sociological perspective that has also been adopted outside of sociology to some degree that recognizes that countries can pursue their own form or model of modernization without having to replicate a Western model, and to create a form that preserves their society, culture, religions, and languages.

---

## **Introduction**

The history of Islamic administration and leadership for education, like that of many educational systems in the world, is embedded in the structures of government, its public administration, social institutions, cultural norms including that of religion or belief system, and in historical traditions of society. This embeddedness, as Foucault (1980) points out in his many writings on the relationship between power and

knowledge construction, is also a consequence of who has the power to determine what knowledge is, and the structures created to build and enforce their interests. It also contains the many forces and factors in the formation, technologies, or historical constitution of the self (Foucault, 1988) affecting identity, values, thought, and action, in the educational context, curriculum and pedagogy, roles, dominations, and discourses. Islamic educational administration in broad strokes has a tortured history in the last few centuries, colonized and disrupted, subjected to “orientalism” (Said, 1978), regaining some measure of autonomy and rebuilding through early twentieth-century state liberations, and then overtaken by international politics, extremism among a small minority, and now the “softer” form of colonization through globalized education.

In order to appreciate the characteristics of Islamic, and other non-Western, educational administration traditions, one has to use a sufficient contextualized model that takes into account the self, identity, and role of the individual and important character virtues, the interactional styles used in the society, the values, culture and religion that shape society, what form social institutions take, and relationships regionally and internationally. An added dimension that has to be included is the historical – what forces and factors have shaped the society and culture as they are in the contemporary period. One model that has combined most of these is Côté and Levine’s (2002) psycho-social model that also incorporates culture and covers micro-, meso-, and macrosocial structures. It is a model that is transcultural and can therefore be easily modified or adapted to particular countries.

Prior to the politicization of Islam that can be dated generally at the hostage taking in the American Embassy in Tehran, Islamic studies was generally treated similarly to any other tradition in history, political science, sociology, psychology, and international relations. With the further politicization through the rise of Al Qaeda and other extremist “Muslim” groups, there was a considerable increase in negative stereotyping and Islamophobia predominantly in Western countries that affected politics, the media, education, and international relations, affecting not only Muslim countries internationally but also minority Muslim populations in many non-Muslim countries. This has also increased through greater Internet use and the ubiquity of social media (Bhatia et al., 2018; Morey et al., 2019). There is also a misrepresentation and misunderstanding of women in Islam, one dimension of negative stereotyping and Islamophobia, but countered now by a large body of literature that has arisen internationally in the last twenty years in English addressing how women are viewed in Islam, the rights they are supposed to have, and the critically important roles they played throughout Islamic history in all societal sectors (see Joseph and Slyomovics, 2001; Haeri, 2020; Samier and ElKaleh, 2021). Engaging in Islamic studies, of particularly the contemporary period, involves examining political analysis, security, surveillance and intelligence studies, and related topics in various fields even if one is focused on educational topics such as Croft’s (2012) *Securitising Islam*. There are many issues in education in Western countries involving foreign Muslim students, members of Muslim minority communities, and the Muslim community in general such as a lack of representing Islamic tradition and values in the curriculum, pedagogical and supervision issues,

marginalization, problems for Muslim scholars, and general negative stereotyping (Mac an Ghail & Haywood, 2017).

This chapter is structured in the following sections: an identification of the problems for Islamic educational administration in the historical phases of marginalization, negation, negative stereotyping, and Islamophobia. The second section provides an overview of the early and established Islamic societies, their intellectual traditions, and formation into an educational sector that heavily influenced later Western developments through the transmission of this knowledge from the medieval through to the modern period. The following section identifies many Islamic theories and models of administration and leadership that are critical for educational systems, as Islamic knowledge has been reconstructed for the contemporary age, followed by work that still needs to be done in this process, and conclusions and reflections.

---

## The Problems

Many topics and approaches in educational administration and leadership do not need the section here; however, because of current negative stereotyping and Islamophobia, and the histories of many Muslim countries under foreign occupation and administration, these issues need to be addressed here. The problems exist on many levels, also contemporary negative stereotyping, Islamophobia, in many fields the skipping of the medieval intellectual traditions in texts, and acknowledgment of the relationship. Islamic knowledge traditions also are addressed in the general postcolonial literature with authors like Freire (1985), whose work applies in principle to other regions of the world, but the first major author to address negative stereotyping of the Muslim world was Edward Said (e.g., 1978, 1994), who through several publications addressed misrepresentation of Arabs and Muslims as uncivilized, uneducated, etc. More recently, rising populism in many countries promotes hostility and marginalization if not deportation for many minority groups (Kaltwasser et al., 2017), as well as the devastation of many Muslim countries through political destabilization and fragmentation, war, and invasion (Samier, 2021). An important dimension of these problems lies also in the many implicit, covert, and unconscious racist effects in education as in other societal sectors, due to many causal factors, including an ethnocentric assumption of superiority and high levels of ignorance making educational communities vulnerable to negative stereotyping and Islamophobia, even if not consciously intended, discussed in more detail below.

The effects of colonization into the twentieth century cause many levels and layers of institutional disruption, cultural and religious fracturing, and “subaltern” identities and roles (e.g., Spivak, 1988). Most importantly, it caused what Ali and Al-Shakhis (1989) term a “disengagement” from Islamic values that are critical to being Muslim and creating successful Muslim communities. Their study identified several ways in which this occurred in the world of work not only in historical colonization periods but also in the cultural and educational colonization under

globalization: avoiding responsibility and risk; preferring a stable life to rewarding, challenging work; being highly concerned with job security; exhibiting a reluctance to delegate authority; believing that centralization builds respect giving priority to friendships and personal consideration over organizational goals and performance; and displaying a higher commitment than Westerners to principles, but not carrying this out in practice. Many other authors have examined the disruption of colonization periods in the Middle East that create gaps between Islamic beliefs and values and work life and which have included the imposition of secularity (Metcalf & Murfin, 2011), restructured along colonizer lines such as Beekun and Badawi (2005) on increased bribery and corruption, Abdalla and Al-Homoud (2001) on injustice, corruption, abuse of power, and over-centralization, and Ali and Al-Shakhis' study (1989), in which Saudi and Iraqi managers scored higher in work ethics than Western managers although they were less effective indicating that their Islamic beliefs may not be reflected in their work practices, or may not be able to, if the organization is structured and functions along Western lines. Similar results were found by Jreisat (2009) in his work on public administration in Arab states.

The negative stereotyping of Islam and Muslims, often in the form of Islamophobia, has taken many forms in society and has many causal factors (Massoumi et al., 2017). Initially, this began with some intensity during colonial periods in the Middle East, but in the contemporary world it has been contributed to with radical politics, extremists (both of whom do not follow fundamental principles of tolerance, avoiding any form of extremism, the inviolability of non-combatants, the humanistic principles of the tradition, etc.). There have been strong discursive formations of myths, false assumptions, stereotyping, and exclusions. One form is the golemization or rewriting of history in the West to exclude the vast amount of scholarship that transferred into Europe from the medieval through to the enlightenment, still evident through shared humanisms. One author in particular received international attention for a few years after the 9/11 attack in New York: Huntington (2003), through his *Clash of Civilizations* (and an earlier article version). Many authors have disposed of this mythology and false history that was politically motivated, like Achcar (2002), whose *Clash of Barbarisms* demonstrates that it is the extremisms in both that are in opposition.

In contrast with inclusive, humanistic, and multicultural models of the positive attributes of culturally diverse groups (Barinaga, 2007), Islamophobia accepts the opposite or denies the existence of the elements of this approach in which diversity is viewed as social, cultural, and intellectual capital (drawing on Bourdieu, 1977) as a discursive resource that provides human growth and development and acts as a source of creativity. The effect of Islamophobia in higher education has been examined by a number of authors such as Ahmadi and Cole (2020), who examine how it becomes institutionalized in policies, and is reflected in social interaction, curriculum, and pedagogy, often propelled by "fake news," now a common feature of populist politics in many Western states, enforced through surveillance violating privacy and other rights at times reaching criminalization levels, and practiced through marginalization.

One more recent development, in analyzing discriminatory thinking and behavior, is the critique of unconscious racism that may apply more often in organizations like schools and universities, accompanied by many forms of defense mechanisms used to justify it such as denial, rationalization, projection, etc. Fakhry Davids (2011) proposes a psychoanalytic theory of how discrimination forms in the mind, and evolves into patterns of behavior in the individual and groups and then into institutionalized forms, many of which the participants are not consciously aware of.

## The Islamic Intellectual and Valuational Foundation

It is important to note that the Islamic tradition of administration and leadership also drew on prior states and empires in the region, and on intellectual traditions that formed prior to the Islamic period. Administrative regimes in the Middle East and North Africa drew upon a very long history of administrative systems, leadership roles and practices, and legal codes that extend back to at least 3000 BCE, first extensively documented in the first city in Mesopotamia, Uruk, where thousands of tablets have been recovered that document the sophistication and complexity of public bureaucracy in Uruk. Its characteristics consist of the following: an impersonal administration organized into central agencies with a functional work structure, regulatory practices, and accountabilities so exact and complex they created the need for administration training in specialized schools for bureaucrats; a hierarchy of four ranks; a mass public production of some goods; a coordinated economic exchange with accounting using a coding system and stamp seals for transportation and storage records; a comprehensive system of receipts, tallies, allocations of goods and rations, allocations of responsibility to offices, projections of yields and expenditure of labor, setting fixed prices and using contracts; maintaining records of waste in metal production; and a system of public buildings for religious, defense, and economic and administrative activity. The empires of Akkad, the Babylonians, Hittites, Assyrians, and many others built upon this foundation, creating a body of knowledge and practice that subsequent civilizations used (Liverani, 2006; Nissen, 1988).

The history of the Islamic classical golden age of scholarship from the eighth to the thirteenth centuries (CE) contributed heavily to the development of all disciplines, including a strong humanistic tradition focused on rights and social justice (Goodman, 2003; Boisard, 2007), later further developed in Europe during the late medieval period, the Renaissance (e.g., Makdisi, 1990; Al-Khalili, 2010), and the European Enlightenment including educational thought, educational organizations (including some of the earliest universities) (Makdisi, 1981), and literature on education itself, which by the ninth century had developed into a distinctive and large body of literature – the *adab al-‘ālim wa-l-muta‘allim* literature – as formal education systems were established (Günther, 2016). Many Muslim scholars helped shape the Western tradition in all fields, sometimes used so heavily that they were assigned Latin or Greek names, such as Averroes (Ibn Rushd) and Avicenna (Ibn Sina) (Saliba, 2007). One scholar who has been receiving attention in history and

sociology is Ibn Khaldun from the fourteenth century for his scholarship on analyzing the rise or fall of societies (Irwin, 2018), to a large extent preceding Max Weber's world historical sociology by several hundred years, a context in which the educational sector is formed including its governance and administration.

The educated and cultured world of the higher echelons of Islamic empires and their senior administration who were required to have an advanced education are referred to by Goodman (2003) as a "courtly humanism" where not only knowledge and skills of commerce, administration, and war were valued, but also a higher education and patronage of scholars, artists, and philosophers. This produced a systematization of theoretical and applied knowledge in all disciplines, in an intellectual world heavily humanistic in character (Kraemer, 1984; Ljamai, 2015). Senior officials, or *wazirs*, at this time commonly practiced scholarship while serving in the administration and often founded and supported the establishment of schools and research (Black, 2011). Islam requires one to seek and acquire knowledge, even from distant lands, and a life-long pursuit of learning was viewed as the highest type of profession. Within this context, *adab* was understood to be a culture of courtesy and urbanity, in which the secular values drawn from a broad and international range of literature from the classical Greek, Persian, Arab, Byzantine, Indian and Chinese art, and Jewish and Syriac literature were combined with Islamic law and faith into a highly cosmopolitan synthesis that was highly humanistic in character, particularly in ethical values and views. In addition, many scholars at that time also incorporated the Bedouin virtues of generosity, graciousness, and eloquence (Peters, 1973), creating a historical continuity with preurban periods in Arab history.

One example, particularly appropriate for educational studies, is the educational scholarship of Ibn Miskawayh, illustrative of these principles in his engagement with ideas from both the Greek and the Islamic traditions, common to major scholars of this period (Adamson, 2005), particularly the works of Plato, Aristotle, and Bryson. As Omar (2017) explains, Baghdad was one of the most important centers of learning in Miskawayh's time where extensive scholarship was conducted on Greek and Islamic thought where a large number of scholars worked. These cross-fertilizations of knowledge were similar to that of today, reflected in the multi-religious and multicultural groups of scholars with whom he studied, typical of this open and tolerant period of Islamic history during which time Christian and Jewish scholars worked with Muslim scholars and often wrote in the lingua franca of the period, Arabic (Adamson, 2016). Omar, (2015) describes how Miskawayh's medieval Islamic Baghdad received Westerners who came to pursue academic activities in the same way that Muslims in the Middle East currently travel to the West for the same purposes.

What is important is that these generations of scholars were also "men of action," involved in various affairs of state, who sometimes suffered the reversal of fortune and experienced risk, providing a context important in understanding and interpreting many Islamic scholars not only of the Golden Age, but also in later historical periods, and whose work still serves as principles in contemporary Islamic societies and academia. It is this combination that gives the Islamic humanist tradition of the time a validity that is both theoretical and applied, in other words a

form of praxis comprised of higher-order ideals and the practicality and tensions of life at the highest level of the state. They served as senior officials in state and empire offices, bringing professional experience and knowledge to their scholarship. One example of this is one of the major educational scholars, Aḥmad bin Miskawayh (932–1030 CE), a Persian philosopher and historian from the Islamic humanist tradition (al-Din, 1994) who was a senior official in the Buyid tenth to eleventh-century empire ruling over the area that is now Iraq and Iran. He made significant contributions to Islamic thought, philosophy, and ethics and became an influence on many later scholars like al-Ghazālī (932–1030 CE) (Goodman, 2003), known for his system of ethics informed by governmental experience and intellectual study (Leaman, 2001). As an official, he worked in the chancery of the Buwayhid ruler, familiarizing himself with practical aspects of working with political authority in governing and administering society, which granted him professional knowledge and skills. This he balanced with scholarly work mastering theoretical aspects of knowledge (Goodman, 2003). These are reflected in his view on their being two types of knowledge: knowledge power that moves us toward scholarly knowledge and sciences; and acting power that attracts us toward organizing in a practical manner. Like many other important Islamic scholars in this period, he followed Aristotelian principles, in this case the distinction between theoretical and practical reason and knowledge and the requirement for both, since theoretical knowledge of the good does not necessarily mean that it is carried out in practice (Adamson, 2005).

Miskawayh is most important for education through his text, *The Refinement of Character (Tahdhīb al-akhlāq)* (1968), that focuses on the philosophy of ethics and on practical wisdom as a main objective of education applying not only to curriculum and pedagogy for the moral values and character virtues for students, but also are principles expected to be observed in teachers and school principals and in their role-modeling responsibilities. This work not only applies broadly to both the educational system as well as professional communities and organizations like government, but also has a strong tolerance for others built in which makes it suitable for contemporary multicultural settings. His ethics was forged out of many influences, such as scholars oriented toward virtue ethics focused on character within its social and cultural context (Goodman, 2003). The ethics of character, then, in *The Refinement of Character*, is not intended for opportunistic value in cultivating useful relationships, not only in the pragmatic sense of fulfilling one's professional duties, but also in developing a moral character that can also express itself in the highest ideals of government and public service through friendship, piety, cooperation, and the perfection of our identity as human beings (Goodman, 2003).

Islamic administration and leadership developed to a very high level – both in practice and theory – in the Abbasid Caliphate, once Baghdad was established as a new capital with a court that patronized intellectual and technological development. It adopted administrative expertise and personnel from other empire in the region such as the Sassanian with bureaucratic specialized structures and a centralized administration, functionally organized into departments (*diwans*) consisting of the treasury, chancellery, an intelligence bureau, in part to monitor government officials to ensure accountability, and a court of appeal. Due to a fundamental Islamic

principle of tolerance, the civil service included thousands of non-Arab, non-Muslim professionalized administrative staff (Kennedy, 2005; Samier, 2017). What is important to note in this history is the increasing responsibility of the public administration for educational and research organizations being established, with heavy involvement from the senior civil service.

The top level of civil servants, the viziers (*wazir*) came from specialized status group families with advanced education, experience, and their own power bases (or networks in current usage). Islamic states and empires depended heavily on the attributes and decisions of a vizier since they carried out senior administrative roles such as handling correspondence, managing financial affairs, carrying out audits, inspections, and supervision of administrative aspects of the military (Lambton, 1968). In addition to their administrative roles, many viziers were also scholars, and some maintain very large research libraries of their own. The most important literature they produced is often referred to as the “mirrors of princes” texts, in addition to scholars, that identifies the responsibilities, competencies, and character traits not only of administrators, but also of those in political ruling positions involving leadership and governance, as well as identifying in some detail ethical norms and actions that one should never commit involving others, essentially regarded as forms of corruption (Boroujerdi, 2013).

There is an important educational feature in the formation of a strong and highly competent civil service – the emphasis on character development and the importance of role modeling and mentoring in Islamic traditions. Figures, beginning with the Prophet Muhammad through the Sunnah as the embodiment of compassion, wisdom, and social justice, are used in daily life (Hawwa, 1988) as a measure in reflection on one’s conduct and a guide to thought and action not only from the Prophet Muhammad (PBUH) but also from other figures in the Islamic tradition who exemplified the virtues (Salahi, 2013) whose qualities exemplify kindness, empathy, forgiveness, the use of consultation, and informed decision-making. It is the quality of knowledge, character, principles, and skills the viziers had that provided the driving force behind the sophisticated and successful Islamic states established during the first six centuries of Islam (Ali & Al-Owaihan, 2008). Jabnoun (2008) identifies a number of other qualities necessary to informing modern Islamic administration and leadership in the tradition for role modeling and mentoring purposes: courage, generosity, perseverance, having vision, being responsible and hardworking, cultivating strong communication skills, being aware of one’s limitations and those of others, and adapting to new conditions while remaining loyal and true to fundamental principles (similar to Kantian principles of ethics). These are also characteristics expected in teachers, faculty, staff, and administrators in educational organizations since they serve also as role models and at times mentors for students and each other (Samier & EIKaleh, 2019).

Just as in many other world regions, the Islamic world also produced a large body of literature often referred to as “mirrors of princes” (and sometimes as “arts of war”), intended to provide leadership and administrative guidance for rulers and senior officials, applying also to the educational sector, grounded in beliefs, values, jurisdictional characteristics, and culture (Boroujerdi, 2013). The earliest document

that is regarded not only as one of the main pillars of Islamic religious literature, but also as a guide to good administration and leadership, is the Sunnah of the Prophet Muhammad (see Adair, 2010; Salahi, 2013). In subsequent empires, rulers and viziers wrote many texts of values and guidance such as al-Marwardi, one of the most respected judges and administrators of the Abbasid period, who wrote a comprehensive text on the principles and values of Islamic governance grounded in the core texts of Islam as they could be interpreted and applied to a very large-scale population and empire, called *The Laws of Islamic Governance*. Al-Mulk is another notable vizier who wrote an influential text, *The Book of Government or Rules for Kings*, and Ibn Zafar al-Siqilli's *The Just Prince* identifying foundational principles that are still relevant, applying equally to educational administration as it does to the rest of the public sector. Many of the important scholars of the "Golden Age" contributed authoritative texts on administration and leadership, such as Al-Ghazali's (1964) *Book of Counsel for Kings* covering administrative ethics and Al-Farabi's (1985) *On the Perfect State*, that build upon Aristotelian and other classical Greek political philosophy and ethics typical of the period used to interpret and apply Islamic values and principles.

---

## Modern Islamic Educational Administration and Leadership

Exploration of the Islamic administrative and leadership tradition for modern application began by the mid-twentieth century with books even in English, covering foundational principles and values, structures and roles, and applications to various country contexts (e.g., Imamuddin, 1984; Al-Buraey, 1985; Asad, 1999; Ali, 2005; Jabnoun, 2008), as well as foundational fields that inform administration such as legal frameworks (e.g., Hallaq, 2005) and leadership in organizations (e.g., Beekun & Badawi, 1999), all of which apply to the educational sector in providing laws, government agencies and policies, and frameworks for schools and universities. The sources drawn upon for this literature is considerable, but begins with the foundational values and principles in the Qur'an and Sunnah as the central authoritative texts for Islam. Following this in terms of authoritative interpretation and application is the Rashidun period, the period in which early successors to the Prophet Muhammad lead early Islamic society, setting up the structures and systems of administration built on Islamic principles. It is also during this period that the foundation was laid for scholarly and reliable studies of principles for application, through the Hadith and Tafsir that continued to be developed throughout the next several centuries, accompanied by the mirrors of princes, and works in ethics, rulership, administration, finance, legal texts and systems, and education that define Islamic identities, roles, and sociocultural and political structures. These also draw upon history and historiography and other disciplines that formed, as well as a number of legal traditions, the shari'ah (a much maligned body of knowledge through Islamophobia), that still provide the foundation for laws in Muslim states. Knowledge in these categories does not remain static – it continues to evolve through scholarship and sociopolitical practice.

There are significant features of Islamic administration, reflective of values, family, and often tribal structures and culture in Muslim communities that make its administration of education distinctively different from the many Anglo-American theories and models that make contrary assumptions. Fox, Mourtada-Sabbah and al-Mutawa (2006) conducted a comparative values study of the US and Arabian Gulf states that indicate very clearly many of the sociocultural differences that need to be reflected in educational administration in the region. Where US society prominently values secularity, materialism, and individualistic values and the achievement of individual success, efficiency, and free enterprise capitalism, the Gulf prioritizes values that reflect the dignity and honor of family and religion providing meaning and morality, loyalty to family and friends, social interaction characterized by hospitality, generosity, sharing, justice, patience, honesty and mercy, compassion for the downtrodden in society, and an orientation that aims for a balance of individual and community responsibility. Central to this value system is a respect for and pride in heritage and tradition. In this regard, education is not just formal schooling but has strong informal and nonformal dimensions, diffusing administrative and leadership responsibilities to the family and community; in other words, in Weberian (1968) terms it is a combination of the legal-rational or bureaucratic, and the traditional.

A number of dimensions of administration and leadership have been developed in contemporary contexts for Islamic countries and communities. All of these also apply to the educational field, since they tend to focus on the underlying values, principles, character traits, etc. that apply not only across the public sector, but also in many management contexts that would apply to international and private educational organizations operating more on management principles than those of public sector administration. From an Islamic perspective, fundamental principles and values apply everywhere at all times, in part because in Islam there is no distinction between sacred and secular – all educational activity by participants, whether student, faculty, or staff, is considered to be a form of worship.

The Islamic administrative and leadership tradition is heavily influenced by the humanistic tradition that establishes a number of sociopolitical and cultural values that should be achieved and maintained: social order for societal stability; principles of justice, fairness, equity, and tolerance; the betterment of people's health, welfare, and personal development; the development of faiths, that is, belief systems that encompass a wholistic vision, in contrast with those with monodimensional aims like the material reductionism of neoliberalism; and sociopolitical accountability (al-Qudsy, 2007). This entails drawing upon humanistic traditions in disciplines such as psychology, sociology, and political science, and using research methods that are sufficiently qualitative to examine meaning and interpretations. From this perspective, the study of character and personality is critical in educational administration and leadership, encompassing not only qualities identified above, but also restraint and good manners in public, approaching one's work through brotherhood and the assumption of the equality of mankind, and carrying out one's responsibilities and social interaction with benevolence and the growth of others, not only students, but also staff and colleagues (Kalantari, 1998).

The theories and models for educational administrative practice are also conditioned by the Islamic social justice tradition, embedded at the core of the Qur'an and Sunnah, a topic of some interest in the last few years with a growing body of literature in English on the core precepts of the tradition and how they are interpreted and applied in various contexts (e.g., Qutb, 2000; Harvey, 2017; Rosen, 2018). Not only it is a major aim of education to produce people with a strong sense of social justice and the formation of personality and character qualities in their growth as human beings, but also the educational organization itself professionally is to function on these principles. Several authors have applied fundamental Islamic concepts of social justice to administrative and leadership practice in a number of organizational contexts including that of education (e.g., Hourani, 1985; Gulen & Ceylan, 2001; Hashmi, 2002; Kamali, 2002; Syed & Ali, 2010; Samier, 2016), applying equally to women (Samier, 2015; Samier & ElKaleh, 2021). These include using the principles of fairness, equity, and equality in protecting diversity and in governing one's duties and responsibilities, aiming for the collective good and in protecting the weak in society in one's social relationships, contributing to harmony and balance in society, advancing consultation in governance, and benefiting society with beneficial, transparent, and meaningful activity. Islam also takes a global perspective, which aims toward cultural coexistence and international cooperation, aided by a traditional conflict resolution, arbitration, mediation, and reconciliation process that originates in its early history (Samier, 2018). Importantly (and contrary to many negative stereotypes), one also must use reason as part of one's ethical decision-making, a point stressed in the Qur'an and Sunnah.

An important and often overlooked feature of Islam is a strong work ethic, which Aldulaimi (2016) has summarized in a model of ethics, other values, and practice-based principles. Moral principles include honesty, truthfulness, and adherence to human rights and humanistic values that are aimed at achieving justice, safety, and the dignity of others. Work-based principles include cooperation and using consultation with others knowledgeable and qualified to advise, responsibility, viewing one's work as a virtue and personal fulfillment, being obedient to legitimate authority, and following discipline principles. The work ethic also stresses self-control (rather than submitting to anger or other damaging emotions) aiming for excellence in one's work and efficiencies.

These values are reflected in Islamic conceptions of leadership, consisting of both servant and guardian dimensions and governed by tolerance, compassion, patience, empathy, honesty, justice, kindness, and consultation or *shura* (ElKaleh & Samier, 2013). Othman, Hamzah, and Ridzuan (2018) have proposed an Islamic leadership model for use in diverse contexts that stresses these values and ethical principles toward maintaining others' human dignity and welfare by identifying how these must take place in the context of administrative and leadership roles in all sorts of organization including educational ones. Saleh (2002) also developed a model for educational administration that is built upon these principles and values in the role, and in one's interpersonal relations. In effect, this tradition has clearly and in detail with applied practices defined what it means to be a professional in education as in other sectors, principles, and practices that have been appearing for a number of

years in educational administration literature (e.g., Shah, 2016; Samier & ElKaleh, 2019).

There are other aspects or dimensions of administrative practice that have been developed for Muslim contexts, all of which are applicable to educational organizations. Othman (2008) has proposed a modern Islamic decision-making model, drawing on the conventional Western models of identifying problems and decision criteria, with a development, analysis, and selection of alternatives, and the implementation and evaluation of that chosen. What distinguishes an Islamic model is the stronger introduction of seeking consultation (shura) required in Islam and the framework governed by Islamic values discussed above. Alkahtani (2014) and Branine and Pollard (2010) have described Islamic principles of human resource management that also infuse the process with the values and aims of administration described above with an emphasis on social justice and moral values, lifelong learning, and the benefit to and well-being of society. Another important dimension is that of policy studies, that Ahmad (2008) has proposed, focused mainly on the values that should inform the process. Samier (2020) has identified a number of criteria that need to be introduced into policy studies overall that would reflect Muslim values and principles, in order to reshape the field to better fit the contextual factors of Muslim states, including differences in the policy process, analysis of policy actors and instruments, and various changes in the critical and analytic approaches to policy studies.

---

## Conclusion and Reflections

There is still much work to be done in the field of Islamic educational administration and leadership. Much of the literature in the general administration, management, and leadership fields has still not been applied in education. There also is a great deal of work that needs to be done in applying these values and principles to the different cultural and jurisdictional characteristics across Muslim countries, which vary considerably in these respects. One of the greatest barriers to overcome is the effect of globalized educational administration and leadership in which developing educational systems in many countries have been dominated by Anglo-American theories and models, which a number of authors have demonstrated and which have a negative impact on culture, in part inappropriate or offensive content, and the omission of relevant material in curriculum and pedagogy as well as policy and practices (e.g., Donn & Al Manthri, 2013). In addition, Hourani, Diallo, and Said (2011) have reported on how expatriate teachers and professors either unwilling to change or avoiding change, use educational philosophies and traditions at odds with the local Muslim communities and which do not fulfill legal and policy requirements or present the rich intellectual tradition of the region to peoples for whom this is critically valuable heritage and a source of identity. Many others also have identified both the sociocultural damage of a foreign and colonizing curriculum, as well as the need to (re-)construct a field that meets the societal and individual needs of Muslim countries and communities (Shah & Baporikar, 2011; Samier, 2019).

There are a number of areas that need to be developed and challenges to overcome in order to construct a full and accurate Islamic educational administration and leadership that represents the needs and diversities of Muslim countries and communities. The two major challenges are to fully represent the diversity of systems internationally, essentially running contrary to globalization and false assumptions about the universality of some Western systems and knowledge and assumptions about their superiority, effectively excluding other knowledges and referred to as “epistemicide” by Hall and Tandon (2017). Another is to confront and overcome the negative stereotyping, false assumptions, and Islamophobia that consciously or unconsciously dominate attitudes and perspectives on Muslim traditions, including how many of these practices are encountered by Muslim foreign graduate students who come to Western countries for their degrees, and often return home with little knowledge other than that of the country they studied in, which compromises their effectiveness in their home countries. These issues are also social justice issues and compromise academic freedom. One form this takes in relation to Islamic values is the contradiction between the primary values of cooperation and working for the well-being of community and society in Islam and many Western practices that promote self-interest through extreme individualism, as well as contractions in terms of the sacred and the secular, and a humanistic conception of human beings that is wholistic against a materialistic, commodified, and instrumental approach (Ali, 1990), which Branine and Pollard (2010) refer to as a “mismatch between global integration and local responsiveness because of an excess forward diffusion of Western management and business practices” (p. 712).

This necessitates a change in curriculum in many graduate programs. The field needs to not only internationalize much more, along the lines that psychology, sociology, management, and leadership have been doing, but it also needs to cover topics historically as well as in contemporary forms to understand which are enduring traditions. An additional restriction is the overfocus on schools when in fact what happens in schools is a function of the context and contextual forces that they are embedded in a sector in societies and in the society as a whole, and often influenced directly and indirectly by external forces. This means that other educational organizations need to be studied, research institutes and foundations, various interest groups, and government at administrative and political levels. It is much easier to understand how a particular educational organization functions and what causes it to be the way it is if the system that produces the causes is examined affecting identities, roles, values, styles of social interaction, and strategic forces. It is only in this way that national and community identities can be examined in educational environments and what may be damaging to them. This also means working against the leadership fad – far too much of roles of responsibility involve many administrative and managerial activities within regulated guidelines, including the constitutional and legal frameworks, which for Muslim countries differ in significant ways from those Western countries dominating the field.

One final reflection is that the field, in its research and teaching, needs to understand that all world traditions have contributed knowledge, and that knowledge transfer does not only work in one direction. Nor is Western knowledge superior to

the knowledge of other societies and communities. The first step perhaps is to acknowledge the actual history that exists – the “West” advanced during the late Medieval, through the Renaissance and Enlightenment by inheriting knowledge, scholarly practices, research methods, and institutional structures from many other parts of the world, including the Islamic world. The second step is to acknowledge that now, in the contemporary world, value and solutions may exist elsewhere.

## Abstract

Educational issues of Indigenous peoples cannot be said to revolve around a single concept, but indigeneity is a provocative lens for calling attention to European origins of sovereignty. Colonization, a pivotal concept, permeates educational studies and, in recent times, educational leadership. Decolonization and other Indigenous concepts like self-determination, sovereignty, and futurity target the continuing plight of Indigenous peoples in global cultures. Past, present, and future snapshots are provided of grave global educational matters concerning the USA, Canada, and Australia. Within the context of cultural genocide, such issues include colonial policy, compulsory boarding schools, educational disparity, and racism. Conveying the call for “unsettling” colonial ideologies, policies, and settlements with deliberate intent to assert

freedom and self-determination, activists forge pathways for educating Indigenous and non-Indigenous students alike. Implications for educational leadership and administration are decolonizing colonial settler mindsets and opposing White hegemony and its normalization at the expense of Indigenous engagement, empowerment, and sovereignty. All education stakeholders are called upon to play a vital role in promoting Indigenous justice on behalf of tribal rights and the well-being of every Indigenous child for a more inclusive, better tomorrow.

**Introduction****The Field of Memory**

Control of governing and power are retained by nation-states, in keeping with the European origins of sovereignty. National sovereignty encompasses ownership over Indigenous land agreements corresponding with nation-states' interest. Colonial and settler conceptions of Indigenous peoples and communities are fundamentally racist, influencing policies, practices, administrations, and curricula. Government declarations of national sovereignty over land and resources historically belonging to Indigenous peoples occur worldwide. Denial of reparations for damages incurred to peoples exiled from Indigenous home/lands. Governments' refusal to recognize Indigenous sovereignty (self-determination). Rejection of alternative histories rooted in Aboriginal knowledges and the marginalization of Indigenous narratives; colonizing education, pedagogy, and curriculum and the subsuming of Indigenous worldviews (e.g., holism and interconnectedness) to settler worldviews; decades of government-sponsored assimilation of Indigenous peoples through compulsory schools used as a tool, like the appropriation of land, to eliminate traditional languages and cultures. Nation-states' policies and programs designed to eradicate and/or subjugate Indigenous communities and way of life. Racism against Indigenous peoples was/is sanctioned, internationally.

**The Field of Presence**

*Indigenous* is used as an identifier for peoples who are Indigenous to any place, and *indigeneity* signals a process. A political concept, indigeneity targets genocidal displacement from colonial imposition and violent disruption of Indigenous

life and Aboriginal ancestry. Tribal councils of different nations assert inherent land rights and claims to land, although land title when bestowed is not equated with ownership. Indigeneity's critical consciousness is directed at patriarchal systems of settler nations, including colonial schooling and its mechanisms of mind control. Indigeneity asserts freedom and self-determination for the longest continuous cultural history of any group with living descendants whose stories and, with increasing reliability, ancient DNA link them to their ancestors. Indigenous justice advances the right to self-governance and control over one's ancestral habitats, education, and life-ways, extending to discourses on, and representations of, Indigenous histories and stories. Educational assimilation's imposed schooling lacks cultural responsiveness and homogenizes student populations (e.g., high-stakes standardized testing). Perpetuations of the White–Indigenous binary exaggerate racial and cultural differences, and produce opportunity, educational, and income gaps. Damage and resiliency reverberate in survivors' accounts.

### **The Field of Concomitance**

Indigenous issues permeate the social sciences and arts (e.g., Indigenous studies, cultural studies, teacher education, and educational leadership) and pull from history, sociology, ethnography, etc. In critical discourses, *indigeneity* is juxtaposed with the settler concept (also colonial settler) and (national) sovereignty. Coexisting with indigeneity are concepts of self-determination (exercising tribal rights), also known as Indigenous sovereignty (self-governance). Indigenous justice, referring to inherent and civil rights, is addressed in multiple discourses and by advocacy and world organizations. Social justice and multiculturalism canons could further indigeneity's claims to tribal rights but often fall short. Allyship misses recognition of Indigenous rights over stolen territories and natural resources, thereby reducing Aboriginal claims to a race issue on par with other minorities' plights. Other races' experience of racism and colonization is not tangled in settler colonization, the act of forcible removal from one's land, lifestyle (e.g., fishing), and ancestral ways of knowing.

### **Discontinuities and Ruptures**

Indigeneity's rejection is of systemwide patriarchal entitlement mentality and entrenched practices of settler colonialism. Social movements and educational discourses' unintended consequences of rupturing indigeneity when at odds with its political and educational aims. Social justice and multiculturalism canons generally overlook Indigenous-specific issues, tribal (in)justice, and Aboriginal peoples' global fight against banishment, persecution, and assimilation. Decolonization, the fight for justice, calls for decolonizing/ indigenizing mainstream education, pedagogy, programs, curriculum, etc. From an Indigenous perspective, settler power enables appropriation of Indigenous frameworks and languages appearing in educational discourses, including pedagogical research. A trend in literature, this produces

discontinuity in campaigns to further Indigenous aims. Indigenous storytelling ruptures colonialism and disrupts the minoritization of communities, propelling continuity with Aboriginal knowledges and lifestyle. Discontinuities arise out of government-sponsored assimilation, enforced schooling, subpar education, land appropriation, and more.

### **Critical Assumptions**

Settler discourses, nation-states, and systems manifest colonial power. *Colonial settler* describes White settlers and governments, institutions, populations, and body politic. Colonizing settler populations and structures are complicit in removing Indigenous tribes from their ancestral territories and isolating them, commonly in toxic environmental and industrial spaces. Entire Indigenous communities across nations have been reduced to poverty, unemployment and underemployment, subpar and deficit-based education, poor health and health care, water and land pollution, and other threats. Colonial powers steal vast territories from Indigenous tribes, disrupting identities and destroying the very fabric of communities. Indigenous treatments of educational issues interrogate colonial-settler mindsets of domination and entitlement, putting justice and the public good to the test.

Snapshots of the past, present, and future are provided that convey educational issues of Indigenous peoples. At best, this account offers a partial view of history, culture, and society, and, at the same time, specific details shed light on particular times and patterns.

---

### **Snapshot of the Past**

Genocidal violence was committed against Indigenous groups in the Americas, Africa, Australia, and Asia by European imperialists who established colonies “formed from stolen land” (Smith, 2016). According to Lemkin, a twentieth-century attorney credited with articulating the concept of *genocide*, colonization is “intrinsically genocidal”: first, Indigenous communities’ way of life is destroyed, and then colonial settlers impose their lifestyle. They accomplish this by clearing territories of the inhabitants for purposes of colonial settlements and resource extraction, or through conscripting Indigenous peoples as laborers in colonial projects (as cited in Forge, 2013).

A complexity of justice, land is native life and native life is land; thus, the banishment and exploitation that disrupt tribes perpetuates *cultural genocide*, which is mirrored in ecosystems that suffer “a slow industrial genocide” (Huseman & Short, 2012, p. 216; also, Iseke-Barnes, 2008; Mullen, 2020a, b; Truth and Reconciliation Commission of Canada [TRC], 2012). In the living past (the present), challenges to exploitation and racist policies and practices contest ongoing cultural genocide. The historic seizure of native lands and resources is mirrored in today’s destruction of tribal communities and even lives in the USA, Canada, Australia, and other nations (Coulthard, 2014; Tuck & Yang, 2012).

Tribal injustices in education today are rooted in colonial legacy, with marginality and mortality going hand-in-glove. A particularly egregious form was “boarding school policies directed at Indigenous peoples globally [that] have infringed upon [their] right to self-determination” (Smith, 2009, p. 48). Comparative study of Indigenous boarding schools and Indigenous peoples confirmed that forcible colonial schools were “exceedingly brutal places where children were physically, sexually, and emotionally abused” and sometimes even died; beyond “cultural alienation” was “loss of language, disruptions in family and social structures, and increased community dysfunction” (Smith, 2009, p. 48). Snapshots follow of what transpired in three countries’ colonial campaign of schooling and assimilation of Indigenous groups.

### **United States: Forcible Colonial Schooling**

In the USA between 1878 and 1918, an off-reservation Indian school system was established by Carlisle Indian School founder Brigadier General Richard Pratt (1840–1924), whose “rationale was ‘Kill the Indian in order to save the man’” and whose motive was to engineer America’s great social experiment (Smith, 2009, p. 5). Grant’s Peace Policy of 1869–1870 formalized “the boarding school system” and turned it over to “Christian denominations” for administration (Smith, 2009). Forcing “thousands of Native children” to attend Native American boarding schools (also known as Indian Residential Schools) removed children from their families and placed them into foster care by the state. Indoctrinated with Christianity and “White cultural values,” their education was in reality training the children “to be assimilated into the bottom of the socio-economic ladder” and prepared for “manual labor” and “domestic work”; females were socialized to “lose” their leadership place “in Native communities” (Smith, 2009, pp. 5–6). Starving and imprisoned, the children had to ensure “efficiencies” involving dreaded tasks, such as in “steam-filled laundries” (Dejong, 2007, p. 261). Government-sponsored assimilation of Indigenous peoples occurred in approximately 357 Native American boarding schools, often church-run:

For decades, the US took thousands of Native American children and enrolled them in off-reservation boarding schools. Students were systematically stripped of their languages, customs, and culture. And even though there were accounts of neglect, abuse, and death at these schools, they became a blueprint for how the US government could forcibly assimilate native people into white America (Chakraborty, 2019).

Genocide, even cultural genocide, is increasingly recognized in relation to the global phenomenon associated with this period (e.g., Smith, 2006; Witte & Mero, 2008). It was a matter of economics that cultural genocide was chosen over physical genocide – the latter would cost more (it was reasoned that it was much cheaper to school a native child than kill an Indian; Smith, 2009). Cultural genocide had many

other effects: dissolving Indigenous ties by breaking up families, countering the active resistance of victimized Indigenous communities, indoctrinating stolen children as a strategy for eliminating the “Indian” in them, and disbanding native cultural practices and languages (Chakraborty, 2019; Child, 2000).

Mounting evidence has been cited for the makings of cultural genocide initiated with Pratt’s influential campaign. His paternalistic paradigm and aggressive lobbying enlisted military and political leaders in the “educational subjugation of all tribes” (Witte & Mero, 2008, p. 208). Pratt was convinced “that Indian children were the key to controlling the permanent future of Indian relations and to making a so-called primitive people ‘productive’ [during America’s] Industrial Revolution” (Witte & Mero, p. 208); this logic sustained Native American children’s exposure to “deadly contagious diseases” (p. 257).

The perfect storm arose from mandatory confinement to boarding schools. The 1928 Meriam Report (government research commissioned by what came to be known as the Brookings Institution) confirmed that infectious disease was often widespread at the schools due to malnutrition, overcrowding, poor sanitary conditions, and weakening from manual work programs (cited in Dejong, 2007). Native American students’ death rates were six and a half times higher than other ethnic groups (Witte & Mero, 2008).

Epidemics hit dozens of schools. Trachoma and tuberculosis were especially deadly, with misery also imploding from measles and pneumonia. Many died while in custody at Indian Schools, isolated from their homelands. The great influenza pandemic of 1918–1919 hit the Native American population “hard” (Brady & Bahr, 2014; Child, 2000). “Thousands of children died in these schools” due to poor health conditions, abuse, nutrition, and medical neglect, including suicide (Smith, 2009, p. 7). With some boarding schools, “death and disease were simultaneous” (Dejong, 2007, p. 261). The brutal history of the USA in mandating “racially-based separation of children from their parents is still a problem” (Little, 2018) and thus cannot be sealed off in memory or history books.

What was deemed the “‘Indian problem’ of sufficient magnitude to warrant a federal system of education to solve” (Dejong, 2007, p. 257) became “The Problem of Indian Administration” with the 1928 Meriam Report. It confirmed that “federal policies had been a disaster and this failure was nowhere greater than in the field of education” (Witte & Mero, 2008, p. 258). Following the Meriam Report, tribes initiated Indian education reform to overcome the disasters of federal policies, seizing upon “a worldview that acknowledges the inherent rights of Native people to lay claim to their tribal and personal histories” (Native American Rights Fund, 2019, p. 17).

Survivors of the US boarding school era “were marked by trauma,” as are successive generations that must live with this and ongoing trauma from “racially-biased perception[s] of Native families, of Native homes, and of Native mothers” that manifest as “racially-based separation of children from their parent” through “child welfare services” and “significant educational inequities between native and non-Native students” (Little, 2018).

## Canada: Forcible Colonial Schooling

Canada's system of forcible colonial schooling was "inspired" by its neighbor to the North. A government official advocated for Canada to "adopt a similar system to that of the United States' founded upon Pratt" and his ideals (Smith, 2009, p. 7). The Canadian system responded with government-sanctioned assimilationist agendas aimed at obliterating Indigenous persons. From 1879 to 1996, the Canadian Indian residential school system enrolled 86,000 Indigenous children (Coulthard, 2014; McGregor, 2018).

Canadian residential school policy legitimated 86,000 Indigenous children being extracted from their families and placed in nationwide residential schools. In 1883, Hector Langevin, Public Works Minister of Canada, declared, "In order to educate the children properly, we must separate them from their families. Some people may say that this is hard but if we want to civilize them we must do that" (as cited in TRC, 2012). The Canadian government funded the systemic racist initiative, which Christian churches administered. A motive was displacement of Indigenous peoples and appropriation of their lands, thereby disposing of the "Indian problem," which played out in "Aboriginal policies" (TRC, 2015).

In Canada, abuse was reported as high as 100% in "some schools," and the "death rate" was "24% among children in schools, and 42% included children who had died after being sent home when they became critically ill" (Smith, 2009, p. 8). Thus, the government's mandatory relocation of Indigenous children resulted in 1 in 25 dying, with 6,000 deaths (TRC, 2012). The program's goal was to "erase and replace" native culture and destroy Indigenous life (Coulthard, 2014). This history is alive for traumatized survivors and in the "ongoing conditions of colonialism in Canada" that call for "apology, compensation, healing, and reconciliation" (Henderson & Wakeham, 2009, pp. 5–6, 8).

In 2007, the Indian Residential Schools Settlement Agreement (IRSSA) was the Government of Canada's recognition that the nation was still enduring its residential school legacy. It also served as a public apology "to former boarding-school students and [payment of] reparations to survivors" (Sinclair, Littlechild, & Wilson, 2015). The class action suit financially compensated former residential students for damages incurred. (While money was distributed and survivors' recovery assisted, former students were mistreated.)

Established in 2008 by the IRSSA, the TRC of Canada (since defunct) set forth to ensure that the residential school legacy would be remembered; through this commission, survivors' stories were aired. As explained by Sinclair et al. (2015), the TRC found that residential schooling's continuation "is reflected in the significant disparities in education, income, and health between Aboriginal people and other Canadians [that] condemn many Aboriginal people to shorter, poorer, and more troubled lives"; also confirmed was that "intense racism" and "systemic discrimination" are realities today and that the "beliefs and attitudes" justifying residential schooling "[still] animate official Aboriginal policy." Colonization has not been left behind, as evidenced in and beyond educational inequalities.

Also in 2008, on behalf of the Canadian federal government, former Prime Minister Stephen Harper issued an apology that served as recognition that the nation was still enduring its residential school legacy. Additionally, New Democratic Party leader Jack Layton made a plea for Canadians to help:

reverse the horrific and shameful statistics afflicting Aboriginal populations, now: the high rates of poverty, suicide, the poor or having no education, overcrowding, crumbling housing, and unsafe drinking water. Let us make sure that all survivors of the residential schools receive the recognition and compensation that is due to them (as cited in TRC, 2012)

## **Australia: Forcible Colonial Schooling**

From the beginning of European occupation in Australia, under the umbrella of paternal safeguarding, Aboriginal children were forcibly removed from their homes (Moses, 2012). Australian native children were isolated and coerced into Christianity in keeping with the “civilization project” (Smith, 2009). They were placed in reserves, training institutes, or non-Indigenous homes, targeted as “cheap labor,” and resocialized around White’s peoples’ beliefs so that at age 14 they could serve colonial settlers away from the settlements and missions (Smith, 2009). Indigenous children’s lives were completely controlled, and they were prohibited from attending state schools.

Stolen Generations, a particular event, refers to the human rights violations of Australian Aboriginals set in motion by the Aborigines Protection Board. In New South Wales, starting in 1905 and into the 1970s, at least 100,000 Aboriginal children were abducted under the policy of “protection” – placed into compulsory residential schools, many were sexually and physically abused, some never seeing their families again (Smith, 2009).

A gross violation, this action was precipitated by state violence against Indigenous communities and so-called half-caste children (with a European father and an Indian mother) (Smith, 2009). Children of mixed descent were specific targets for removal because it was believed that those “with lighter skin color could be more easily assimilated” into White society, whereas “‘full-blood’ Aboriginal people were thought to be a dying race”; in fact, the goal of policy administrators was to eradicate the “Aborigines in Australia” whom they labeled “blacks” (Smith, 2009, p. 13). Policymakers’ colonial ideologies favoring assimilationist education and Aboriginal dislocation of children were extensive. From 1910 to 1970, “between 1 in 3 to 1 in 10 Indigenous children were removed from their families. By the mid-1930s, more than half of ‘half-caste’ children in the Northern Territory were housed in institutions administered by the state” (Smith, 2009, p. 11; also, Manne, 2012).

Once again, Christian churches assumed control over “educating” abducted Aboriginal children. Australian governmental policies, practices, and patterns were similar to the American and Canadian reforms. Throughout Australia in the 1940s, about “50 missions” transmitted education “focused on Christianization and manual labor rather than preparation for higher education” (Smith, 2009, p. 15). Death abuse was rampant:

Conditions were deplorable in these missions and settlements with death rates often exceeding birthrates. Disease, malnutrition, and sexual violence were commonplace. Children were often forced to work in white homes where they were routinely sexually abused. In Victoria, between 1881–1925, one third of Indigenous children died (Smith, 2009, p. 15).

And, like North America, Indigenous education for Aboriginal children was entrenched in training and gender divisions. Aboriginal children taken from their homes were less likely (than those not removed) to attain “post-secondary education”; and twice as likely to “[be] convicted of an offence [and] report [using] illicit substances” (Smith, 2009, p. 15). Consistent with this pattern, a 1994 survey of Indigenous groups “found that removal did not increase the likelihood that Aboriginal children would have higher incomes, be employed, or attain higher levels of education” (as cited in Smith, 2009, p. 15).

Professors at Australian universities described this time in Australian history as profoundly genocidal in which “frontier violence” and stolen Indigenous children were sanctioned (see Moses, 2012). Gradually, educational change has been initiated: “In the 1970s, an era of reform began in Indigenous education that stressed self-determination”; attempts were made to create culturally relevant curricula and bilingual education programs, as well as to engage local native communities in education (Smith, 2009, p. 15).

The memory of the Australian boarding school era lives on, with multiplying effects in the face of other genocidal treatment (Moses, 2012). Stolen Generations may refer to those who were abducted, those who were affected by the loss, and those who will always feel this tragedy. Modern-day settler and Aboriginal perceptions likely differ: in 2019, Stolen Generations was described by a White Australian dean/historian as a tragic historical event. When an Aboriginal Australian academic/leader described the same event, he conveyed how the loss of stolen children terribly affected communities and *continues* to be felt today – etched in *all* Indigenous struggles and collective memory, a “forever tragedy” that has no temporal bounds (see Mullen, 2020a).

Another powerful example of continuing settler genocide centers on Australia’s constitution and refusal to grant human rights protection. The Australian constitution, operative in 1901, was imbued with colonial ideology. In 2020, it still carried remnants of that colonizing dogma. Withholding equal rights and respect to Indigenous Australians, and even declaring that they should not be counted in the census, the constitution still contained “provisions authorizing discrimination on grounds of race” owing to “Australia’s continuing colonial status” and actions taken “to preserve a white Australia” (Saunders, 2011).

---

## Snapshot of the Present

Colonization continues nationally and globally, with Indigenous resistance long asserted around decolonization and self-determination (Mullen, 2019). As medical researchers confirmed, colonization is a medical and health issue, leaving “a legacy

of excess mortality, morbidity, and trauma that parallels the economic devastation and cultural loss of land alienation”; the World Health Organization also “recognizes European colonization as [an] underlying determinant of Indigenous health” (Freemantle et al., 2015, p. 644). Hence, colonization is a significant risk factor for the overall population. Underlying characteristics of society past and present (e.g., racism and racial discrimination) ultimately shape health.

Native American vulnerability to COVID-19 is aggravated because this population is “at a higher risk of chronic conditions” (e.g., diabetes and tuberculosis) and health-care systems are both ill-equipped and under-resourced (Eschner, 2020). Implications for Indigenous communities around the globe are that pandemics will afflict them in unprecedented and dangerous ways.

Indigenous cultures have developed in relationship to settler societies wherein either/ or binaries (e.g., savage/civilized) stigmatize them (Woolford & Benvenuto, 2015). Shedding colonization will require “unsettling” settler conceptions of reconciliation and finding a language that transcends identity constraints and binary constructions. Dynamics of domination and subjugation fuel racial politics, whereas reconciliation ignites understanding as well as conflict. Reimagining social relations through reconciliation of settler and Indigenous perspectives is “always beginning” in the present (Hargreaves & Jefferess, 2015). Learning to think and act, lead, and teach has grave implications for Indigenous education.

Besides sanctioned criminal behavior in the form of colonization, another lesson draws upon land. The stewardship of land is rooted in the politics of indigeneity. Without honoring Aboriginal claims to land and historic agreements, colonial states assimilate Aboriginal peoples and replace Indigenous education. In First Nations’ learning, education is embedded within a holistic life system. (*First Nations* as a term is applicable only to Canada and its largest tribe that, as reported in a 2019 Canadian household survey, represented 60.8% of the total Aboriginal population [2.6% of the country’s total population]; cited in Mullen, 2020a). Traditionally, education, like “spiritual life,” was part of “a coherent, interconnected world”; children learned from their elders, who were “keepers and transmitters” of knowledge, as well as from “living and learning” (TRC, 2012, p. 8).

To move global societies from history to legacy to reconciliation, “constructive action” would need to be deployed in education and broader systems – culture, language, health, child welfare, justice, and economics (Sinclair et al., 2015). Disrupting colonialism and resolving its negative impact on Indigenous education cannot happen in isolation, for the problem affects all Aboriginal life systems (McGregor, 2018). According to TRC Chair Justice Murray Sinclair, the non-native Canadian public must be educated differently about Indigenous peoples. To become accountable to settler impact, educational institutions would need to take responsibility for colonialism and racism in society, and for healing and transformation. Justice Sinclair’s statements resonate with the academic literature cited.

To progress with reconciliation in education, conventional structures of power would be decolonized, including (educational) research practices and methodologies (McGregor, 2018). Colonial institutions would relinquish power, privilege, and/or land, essentially political and financial capital signifying stolen land and oppressed

lives. And settlers would understand that “critical consciousness (of colonization)” cannot be the sole aim, thereby relieving settlers of “feelings of guilt or responsibility” (Tuck & Yang, 2012, p. 10).

A manipulation of settler colonialism and White supremacy today is to make genocide seem like a historical artifact. Smith (2016) asked, if the USA – and we can add other colonized nations – “is fundamentally constituted through the genocide of Native peoples, why are Native peoples not central to the development of American society?” Responding, Smith answered that “native genocide is relegated to the past so that settler colonialism today can be presumed [normal and devoid of genocide].” As a consequence, resistance to colonialism necessitates being bound to it and its genocidal manifestations and repercussions (Coulthard, 2014). Acts of resistance defy the original violence – theft of Indigenous land and labor – and the systemic project of dehumanizing lives. Severe repercussions for Indigenous generations replay the land appropriation and violence that depleted ancestors’ assets, robbing them of their way of life. Like a tree without roots, Indigenous persons cannot live outside their homelands (Gaztambide-Fernández, 2012).

In the present, the concept of indigeneity – the political necessity of a revolutionizing impulse – builds in political and cultural studies discourses. Revolutionary imaginations build solidarity among tribes. This decolonization project resists the organized, systemic scheme (i.e., the colonization project) through which disenfranchised communities are occupied, alienated, and destroyed and the young are inducted into colonial schooling (Fredericks, Maynor, White, English, & Ehrich, 2014).

The decolonization project advocates for a comprehensive plan in service of the rights, sovereignty, self-determination, and humanity of tribes for a brighter future. Supporters of Indigenous justice advance the right to govern ancestral habitats and life and to influence education without the interference of dominating settler nations. Tribes expect a strong collective voice from their members on behalf of reforms to systems, policies, and so forth (Coulthard, 2014; McCarty, 2018; Smith, 2016).

A global campaign, the decolonization project as taken up in radical Indigenous sources targets genocidal control of historic Indigenous land to be placed under tribal governance and includes recognition, restoration, and reparation. Contesting a “politics of recognition,” Coulthard (2014) questioned whether much can come from efforts that depend on Aboriginal cooperation with colonial powers. Return of stolen homeland and/or reparations and official recognition of self-determination drive the decolonization project (Mullen, 2019; Woolford & Benvenuto, 2015).

Settler political leaders’ long-awaited apologies for genocidal acts make history when announced. The US Congress passed a bill in 2009 constituting the federal government’s official apology to “all Native Peoples on behalf of the United States” via a joint resolution, which began: “To acknowledge a long history of official depredations and ill-conceived policies by the Federal Government regarding Indian tribes and offer an apology to all Native Peoples on behalf of the United States” (U.S. Government, 2009, p. 1). A decade later, California’s governor joined the slim ranks of global apologists. In response, a call to action for recognition and compensation could be heard from tribal spokespersons: “We’re still fighting for

recognition, the protection of our sacred places, [and] visibility.” “An apology is great, but what does it look like in terms of moving into action?” Also, “This is all stolen land. We are landless Indians,” and “The only compensation for land is land” (Levin, 2019).

Public education, a microcosm of systemic disorders, needs radical attention, transformation, and healing. Educational trends still indicate disparity for Indigenous students (Gordon & White, 2014; United Nations [UN], 2017), including:

1. An ongoing ethnic gap in educational levels (Indigenous school enrollments, school performance, and literacy levels are all low while attrition is high)
2. Substandard academic achievements compared with other ethnic groups (e.g., “In 2014, the high school graduation rate for Native American students was 67%, the lowest among the [American] racial and ethnic groups measured” [Little, 2018])
3. A discrepancy in educational attainment due to ethnicity, parental education, low socioeconomic status, and geography
4. An increase in Aboriginal persons without a high school diploma

A calamity of colonialism is the failure to equitably serve Indigenous students (Castagno & Brayboy, 2008; Gordon & White, 2014; Hare & Pidgeon, 2011). Low academic attainment continues for Native American students (Faircloth & Tippeconnic, 2015). High-stakes testing in North America has neither improved Indigenous academic achievement nor bolstered students’ cultural knowledge, identity, capital, and opportunities (McCarty, 2018).

“Low income” and “disadvantaged” within schools, Aboriginal youth struggle to gain postsecondary education in different countries (Hart & Kempf, 2018). Hence, tribes/bands face compounding barriers to accessing and certainly completing secondary and postsecondary education. Besides low self-confidence, obstacles include poor academic preparation, scarce financial resources, absence of educated role models, and campus racism. Systemically, education, “child welfare, health, and justice systems have failed Aboriginal peoples profoundly” (McGregor, 2018, p. 813).

Colonial schooling structures and practices embed a “colonizing legacy” (Khalifa, Khalil, Marsh, & Halloran, 2019). Concerning Indigenous communities, widespread exclusionary and inappropriate schooling is still common, attrition remains high at the secondary level, and severe penalties are experienced globally. Approximately 70% of Canada’s First Nations students drop out of high school, and disproportionate failure and dropouts are reflected in Canadian prison systems (UN, 2010).

Indigenous activism combats unequal and dangerous uses of power. In empowered households, children attend culturally responsive schools that build their knowledge and skills and prepare them for careers and life (Castagno & Brayboy, 2008). They are not deprived of their culture and identities. Mick Dodson of Australia, former Aboriginal Social Justice Commissioner, equated “social justice” with food, clean water, and sanitation; education that prepares the young for employment and respects their “cultural inheritance”; and with prospects and a discrimination-free existence (as cited in Fredericks et al., 2014).

Thus, impoverished education is not the only threat to indigeneity – it is entangled in other threats that compound negative effects for low-socioeconomic Indigenous persons. Undisputedly, youth have the right to live out Dodson’s scenario. Quite possibly, this stance constitutes the moral spine of Indigenous-based writing in education (Aitken & Radford, 2018; Iseke-Barnes, 2008) and leadership (Faircloth & Tippeconnic, 2015; Fredericks et al., 2014; Keddie & Niesche, 2012; Khalifa et al., 2019; Mullen, 2019, 2020a, b; Preston, Claypool, Rowluck, & Green, 2017; Robinson, White, & Robinson, 2019).

Educational leadership researchers Keddie and Niesche (2012) reported disturbing findings associated with a White principal’s governance of a rural Australian Indigenous school. The leader’s relationship with “indigeneity” was found to be culturally lacking and her worldview irreconcilable with Indigenous life. Outcomes indicate that this leader’s behaviors were normalizing White hegemony at the expense of Indigenous engagement, empowerment, and sovereignty. Tribes felt segregated and alienated. The colonial leader’s moral compass was lacking.

Offering juxtaposition and hope, Indigenous language immersion schools report success with Aboriginal students (Reyhner, 2017). Nine principals in Canada revealed their support for Aboriginal students’ school experiences and “relationships” while learning in “culturally relevant” ways (Preston et al., 2017). In another Canadian study, five First Nations female principals enabled cultural renewal in Nova Scotia, Canada (Robinson et al., 2019). These studies validated the importance of Indigenous justice at the level of leadership for shaping an inclusive culture. They are an indication of the importance of justice for Indigenous peoples in education, leadership, and scholarship.

Protest of educational discrimination, rejection of colonial legacy, and calls for collective responsibility are premises in the literature. The UN (2010, 2017) addressed anyone who might react negatively to all such assertions, such as by countering that discrimination against Indigenous peoples is an exaggeration or that colonial legacy is a transgression of the past that does not reflect the present (and, by way of implication, Indigenous assertions of human rights). Education is a fundamental human right, yet North America’s record of justice on behalf of its Indigenous peoples is appalling. Aboriginal individuals living in rich countries are among the poorest of citizens.

---

## Snapshot of the Future

Futurity is a powerful Indigenous concept in Indigenous literature (Mullen, 2020a). Seeking power over destiny conjures a notion of the future consciously activated in the present. The future is, importantly, acted upon in the present through “calculation, imagination, and performance” (Tuck & Gaztambide-Fernández, 2013, p. 80). While settler futurity seeks to completely eradicate “the original inhabitants of contested land,” Indigenous futurity “does not foreclose the inhabitation of

Indigenous land by non-Indigenous peoples, but does foreclose settler colonialism and settler epistemologies” (p. 80).

The hope is that education can break the cycle of colonialism and generate values critical to cultural and planetary sustainability. A lesson learned from studies of Aboriginal students’ educational experiences is that they are similar around the globe. Scholars from various nations contributed insights into “leadership in Indigenous education” with accounts of “culturally inappropriate education and poor academic outcomes for Indigenous students”; Faircloth and Tippeconnic III (2013) signaled that much work lies ahead for stakeholders in “mobiliz[ing] to effectively change the educational system” so that “the cultural and linguistic diversity of Indigenous students [can be embraced]” (pp. 484–485).

Despite differences, on a global scale, rights of “equality” and “self-determination” are universally violated. Aboriginal peoples should have the same right to education as everyone else, free of discrimination, and educational experiences that reflect their culture and respect their sovereignty (Castagno & Brayboy, 2008). However, importantly, the “education sector not only mirrors and condenses the history of abuse and discrimination suffered by Indigenous peoples, but is also a locus of the continuing struggle for equality and respect for their rights” (UN, 2017). Thus, racial differences in educational outcomes are stark, worldwide: “A significant disparity continues to occur in academic achievement and attainment between Indigenous youth and their non-Indigenous counterparts” (Hare & Pidgeon, 2011, p. 94; also, Faircloth & Tippeconnic III, 2013). To advance in the twenty-first century, rights-oriented approaches in education would need to support Indigenous cultures and societal progress. Instead, for the most part, educational opportunities exclude Indigenous groups. Migrant peoples and descendants, historical tribes, and urban Indians all experience great obstacles to educational success (UN, 2017).

Global nations carry the sting of tragic human rights abuses (Coulthard, 2014). Self-determination fuels visions of Indigenous education in which colonial structures of injustice are systemically unsettled and teachers and learners are empowered. As such, tribal governance in the educational domain not only advocates the inclusion of Aboriginal worldviews, knowledges, and values but also advances the decolonization project and politics that uphold tribal nations’ human rights and legitimate claims (e.g., Fredericks et al., 2014). As statistics, studies, and testimonials continue to indicate, conventional education has not worked for Aboriginal students – in fact, they show significant gaps in achievement (Faircloth & Tippeconnic III, 2013; Gordon & White, 2014). Culturally devoid of Indigenous ways of understanding the world and worsened by racism (Hare & Pidgeon, 2011), traditional public schooling remains a European settlement with “walls” – schooling occurs as compartmentalized subjects (e.g., mathematics) that are standardized, tested, and alienated from the teachings of elders and village life.

Viable educational alternatives are needed in the twenty-first century that are securely embedded within Indigenous ideals and goals. To help education stakeholders of all racial backgrounds and identities engage in self-determination processes embedded in Indigenous justice – and institutions and Indigenous students

develop some understanding of each other – Brayboy’s (2005) TribalCrit theory advances tenets. Among them, colonization is endemic to society; US policies toward Indigenous peoples are rooted in imperialism, White supremacy, and a desire for material gain; Indigenous peoples have a desire to obtain and forge tribal sovereignty, autonomy, self-determination, and self-identification; and tribal visions for the future are central to understanding Indigenous peoples’ realities, but they also illustrate differences and adaptability among groups.

Seeking to benefit Indigenous education, Aboriginal advocacy groups continue to call on federal governments. Educational discrepancies between Indigenous and non-Indigenous races, worldwide, need resolution, and federal funding gaps must be closed for students being educated on and off reserves (e.g., TRC, 2015). Research on educational trends and inequalities in Indigenous outcomes within different countries confirms these gaps, underscoring how Indigenous children and youth are in jeopardy educationally and relative to employment and life prospects (e.g., Gordon & White, 2014; Mullen, 2020a).

In response, with reference to Canada, the Canadian TRC (2015) prompted “new Aboriginal education legislation” so that financial capital adhering to treaty-supported principles will be channeled in needed areas. Such principles include “providing funding to close attainment gaps and improve Aboriginal educational success; setting expectations for curricula that are ‘culturally appropriate’; protecting native languages and the teaching of them; and enabling Aboriginal accountability through control over, and parental participation in, children’s education” (p. 2).

All such legacy-building expectations of the tribal commission include post-secondary institutions and their role in educating future teachers. Preservice students, as recommended by the TRC of Canada (2015), should be learning about Indigenous knowledges and teaching methods they can implement in their own classrooms. Gradually, teacher educators in Canada, the USA, and Australia have been experimenting with this course of action. Published outcomes (e.g., Aitken & Radford, 2018) indicate a change in outlook by most colonial–settler student participants in preservice teacher preparation courses targeted for critical consciousness-raising. However, Madden (2015) found that Aboriginal pedagogies tended not to focus on “decolonial goals.” By implication, decolonization and Indigenous futurity have not served as frameworks for engaging majoritarian students’ critical thinking about Indigenous education within the North American context. Regarding the three countries considered herein, a comparative literature-based study of preservice teacher education outcomes (conducted in Australia) found that “distinct models [are] operating in Canada, the USA, and Australia in relation to preservice teacher education as it pertains to Indigenous education”: Whereas “in Canada and the USA the approach to preservice teaching is through a social inclusion and community partnership model,” in “Australia the preoccupation is with teaching Indigenous studies to preservice teachers” (Moreton-Robinson, Singh, Kolopenuk, & Robinson, 2012, p. 4).

Barriers to the assertion of indigeneity in global societies more generally include place-bound disruption, poverty, environmental and educational crises,

contaminated water, displacement and homelessness, deprivation, familial abuse, and inadequate funding and compensation from governments (Fredericks et al., 2014; Mullen, 2020a, b; TRC, 2012). On the question of futurity, reconciliation among global citizens depends on the restoration and vitality of Indigenous education, as well as educators' unprecedented support.

Academics' worldwide call for collective and global responsibility targets (a) increasing tribal empowerment through Indigenous sovereignty and futurity; (b) reducing inequality in education, employment, health/medical, and other outcomes for families; (c) developing effective models of partnership and engagement with Indigenous communities; and (d) expanding understanding of structural inequities and associated responsibilities for prospective majoritarian teachers and leaders. Studies relevant to policies and practices that foster awareness are needed in these interrelated areas. Potent interventions in North America advance critical consciousness-raising (Aitken & Radford, 2018) and "culturally responsive schooling" (Castagno & Brayboy, 2008) and "culturally responsive teaching" (Gay, 2018).

Critical and collective consciousness-raising is a strategy used to promote awareness about the world's Indigenous peoples, who remain the most marginalized groups in education and society (UN, 2010, 2017). Studies have identified such decolonizing actions as fundamentally changing racist policies and practices, understanding the value of land in Indigenous knowledge systems, and returning stolen land and resources to tribal nations (Coulthard, 2014; Tuck & Yang, 2012).

Action is called for beyond awareness. As an example, culturally responsive education has been expressed through bilingual and multilingual programs. Fostering "bi-/multicultural" literacy enables Indigenous students to develop capabilities for navigating home, school, work, and global cultures. This facility is considered vital in today's world for Indigenous student engagement, retention, and success (Castagno & Brayboy, 2008; Gay, 2018).

Schooling occurs on tribal home/lands, so it stands to reason that respect and reconciliation for Aboriginal peoples would follow. Colonization of Indigenous communities is ubiquitous and remains a critical world problem. Colonial legacy is everyone's challenge to overcome. Supporting Indigenous rights, knowledges, liberties, and humanity could transform mainstream education and unify causes. Indigenous futurity should not have to be pitted against settler futurity – futurity is about remaking the world as a whole.

---

## Conclusion and Reflections

While educational issues of Indigenous peoples do not revolve around a single concept, indigeneity calls critical attention to European origins of sovereignty. Indigeneity, decolonization, and other Indigenous concepts (e.g., self-determination, sovereignty, and futurity) target the continuing plight of Indigenous peoples in global cultures. The past, present, and future snapshots conveyed grave educational

matters for the USA, Canada, and Australia. Governmental educational/industrial policy, compulsory boarding/ residential schooling, educational disparity, and systemic racism illustrate cultural genocide.

All three of these nations' federal governments have issued formal apologies to the living descendants of original inhabitants. However, genocidal effects on the world's Indigenous peoples are a crisis of global proportions, with great losses of cultural diversity. Poverty, low academic achievement, poor health, and other barriers that prevail for Indigenous communities inhibit the development of sustainable cultures.

On many measures (e.g., educational outcomes, political participation, and economic status), Indigenous peoples are particularly vulnerable as a minoritized group. Bleak international outcomes confirm ongoing educational, occupational, income, and health disparities for this diverse racial group that endures systemic discrimination. Schools assimilate Indigenous children and cultivate colonial settlers. An implication is that settlers from a young age are "programmed" to not even notice colonizing dynamics of socialization and disavow the impact, allowing neo-colonization to flourish.

Cycles of deprivation are worldwide. Despite national differences, on a global scale rights of equality and self-determination are universally violated. Educational disadvantage for Aboriginal peoples manifests in health care, ecosystems, and economics. Colonial education "feeds" on tribal injustice, including miseducation. Reforms are needed for restoring inherent rights and defeating systemic racism. Inciting objection, colonizing elements persist within new policy, curricula, and programming that misrepresent Indigenous paradigms, knowledges, and contributions. Hence, generalizing about Indigenous peoples is problematic, as is failing to probe or "call out" the settler mentality that permeates education and leadership. All such ailments of colonialism jeopardize progress and advancement. The fullest expressions of humanity in schooling contexts depend upon dismantling racist educational systems and completely transforming them, as opposed to diversity and inclusion "add-ons." Decolonizing education can help to ensure inclusion and equity for tribes.

Educational stakeholders are called upon to mindfully approach Aboriginal attainment, employment, and quality of life, and to monitor assimilation, discrimination, and exclusion. Finding constructive ways to integrate the decolonizing ethic is a grand challenge for democratic societies. With high-stakes testing, displacement, racism, poverty, and other human rights violations impacting Indigenous communities, educational disciplines can contribute much more to the conversation.

Indigenous persons must be self-determining in education if they are to survive as distinct peoples, and the full decolonization of Indigenous education must be supported if conditions of humanity are to fundamentally change. A global movement has erupted, changing pockets of policy, curriculum, teaching, and research. Through agency and solidarity in public life and, gradually, education, Indigenous justice is a mounting paradigmatic force. Actionable steps include educating for a just world through critical consciousness-raising and collective responsible action, such as by campaigning for fair and responsible legislation; making Indigenous (in)

justice visible by recognizing the unique circumstances surrounding the colonization of this race (i.e., land dispossession); and “decolonizing” settler mindsets, in addition to laws, policies, programs, and curricula.

Finally, implications for educational leadership and administration are decolonizing settler mindsets and opposing White hegemony and its normalization at the expense of Indigenous engagement, empowerment, and sovereignty. All stakeholders in education are called upon to promote Indigenous justice on behalf of tribal rights and the well-being of every Indigenous child for a more inclusive, better tomorrow. Needed are educational worlds in which tribes, unfettered by colonialism, live out the fullness of their lives – futurity’s essence.

## Abstract

Public schools emerged as monocultural organizations aiming to assimilate the cultural diversity in a society in agreement with ideals like citizenship. These schools were usually deemed as the implementers of the nation-building programs in which certain values were encouraged while others were repressed. On the other hand, nation building programs have not (yet) “managed to” eliminate existing social diversity and create monocultural societies. Moreover, accelerating international migration movements have increased social diversity to the point transcending already weakened assimilation capacities of schools. These developments have given rise to the notion of multicultural schools since the last decades of the twentieth century. However, the vast majority of such/these schools

have not yet achieved necessary transformations to be a multicultural school. Institutional structures of most schools still reflect the ideal of cultural assimilation, which turns educational leadership in multicultural schools into a complicated task involving facing with policy, cultural, curricular, administrative, and operational challenges. Despite these challenges, no comprehensive leadership practice or strategy has yet to be fully developed. Current suggestions either rely on social transformations in an uncertain future or have the risk of causing even more prejudice between social groups. Furthermore, the fact that schools are embedded in highly institutionalized environments requires educational leaders to secure the support of institutional and political figures to achieve the necessary transformations.

**Keywords**

Multiculturalism · Diversity · Prejudice · Multicultural schools · Educational leadership

**The Field of Memory**

The emergence of education systems and public schools in the nineteenth century largely reflects the idea of bringing together students from different cultures, religions, ethnicities, and social classes around common values. Public schools have often been regarded as the implementing actors of the nation-building experiments and as monocultural organizations executing cultural assimilation programs where certain values are promoted while others are suppressed.

**The Field of Presence**

Monocultural schools for cultural assimilation have weakened especially towards the end of the twentieth century and begun to decline since then as a result of social diversity. Social groups, such as socioeconomic classes, ethnic minorities, racial groups, immigrants, LGBTIQ+ individuals, and belief groups have largely preserved their existence during nation-building experiments in the world and have created their very own subcultures, leading to a diversity that overcomes the cultural assimilation capacities of schools. Alongside this, the upward trend of international migration as well as the influx of refugees in recent years have increased the pressure of acknowledging diversity on schools and consequently secured the position of multiculturalism within schools.

**The Field of Concomitance**

The term multiculturalism refers to the political accommodation of minority cultures by states and/or majority groups which are mostly defined based on racial and ethnic origin, but can also be elucidated through some rather controversial cases according to categories, such as nationality, aboriginality, or religion. The ideal of citizenship, which was at the center of nation-building experiments of the past, aimed to warrant the adoption of the idea (1) of equality through cultural assimilation. However, social

movements, such as black, feminist, and gay pride, have challenged this idea and upheld the fact that social groups could preserve their differences without having to adapt to dominant cultural norms. In other words, colorblind and culture-neutral concepts, such as equality and citizenship, have been criticized for confining socio-economic, ethnic, sexual, religious, and ethnic subcultures in private spaces (Modood, 2007).

### **Discontinuities and Ruptures**

Due to enhanced social diversity and accelerating migration movements, multicultural societies that transcend the cultural assimilation capacities of schools have emerged. This has led to the advent of the notion of the multicultural school and the introduction of multiculturalism into the macro-institutional structures of schools in a fair number of Western societies in the form of government policies and legislation. However, the majority of schools failed to change, and as social diversity has increased, prejudice and discrimination have become more frequently observed and experienced phenomena within schools.

### **Critical Assumptions**

The education of distinctive groups of students from divergent cultural and minority ethnic classes continues to be on political, social, and educational agendas of the world. Depending on this situation, leadership for multicultural schools in broad strokes faces policy-bound, cultural, curricular, administrative, and operational challenges. That being said, frequently recommended leadership strategies to achieve these goals mainly target social transformations in the distant future; or, although they suggest making transformations within the school, they miss the *know-how*, namely, they fail to provide any knowledge on how and through which stages they will be made. Nevertheless, it is still possible to encounter examples of successful leadership particularly in cases where the support of both school-site stakeholders and institutional and political figures is provided.

---

## **Introduction**

The rise of public schools and education systems largely reflects the idea of bringing together students from different cultures, religions, ethnicity, and social classes around common values. Apparently, in a good number of regions of the world, from the late nineteenth and early twentieth centuries, political control over schools was established through secularization, the establishment of education systems, and public funding. Since then the task assigned to schools has generally been to train the manpower needed for the dominant political thought and assuring labor for the existing economy. In this respect, schools have been assigned major roles related to citizenship, and values other than the commonly embraced values have been either ignored or suppressed. Attempts of a social group to bring their unique values, practices, or beliefs into the school environment have often met strong opposition of other groups (Ansell & Lindvall, 2013). For example, at the Testimony of the US

House of Representatives in 1980, Rabbi Daniel Polish objected to the introduction of public prayers in public schools upon demands of some Protestant parents, arguing that it would compromise the sense of community in the school and cause unnecessary schism. As can be seen from this example, especially public schools were seen as the implementing actors of the nation-building experiments and were designed as monocultural environments in which some values were promoted while others were silenced (Meyer, 2006).

In addition, for social groups that strictly resist secular education in public schools, the option of subsidizing private faith schools has emerged. For instance, Catholic or Jewish schools have survived in many secular Western societies. Likewise, missionary schools and religious minority schools have held their places in the vast majority of Islamic countries (Donovan, 2019; Fraser, 1999). But be that as it may there have always been conflicts pertaining to curricula of these schools between the standardization influences of secular education systems and the specific demands of the religious group(s) the school serves. Curricula are largely similar to those of secular public schools though. Yet, it is possible to speak of the dominance of a certain religious group in these schools, particularly through a hidden curriculum. In this context, the most criticized issue about these schools is that they do not leave enough space to critical thinking required by democracy as they are prone to promoting unconditional commitment to a certain belief. Ironically, these schools, which came up due to the need for multiculturalism, turned out to be monocultural environments in which specified values are promoted whereas others are repressed (Feinberg, 2006).

The unifying effect of public schools, which limited social diversity because of their attributed nation-building mission, has been diluted in particular since the end of the twentieth century and started to decline in the face of the overwhelming power of diversity. The *imago* of monocultural school, which was established with the aim to alleviate social contradictions, has come to an end as the subject of these contradictions. As the social and cultural diversity escalated, the number of groups that meant to be the target audience of the schools increased howbeit the number of common educational ideals appealing to everyone decreased. Social groups, such as socioeconomic classes, ethnic minorities, racial groups, immigrants, LGBTIQ+ (lesbian, gay, bisexual, transgender, intersex, queer/questioning, asexual) individuals, and belief groups, have largely preserved their existence during the nation-building experiments and formed their own subcultures, leading to a diversity that exceeds schools' assimilation capacities (Dimmock & Walker, 2005).

It is known that the efforts to assimilate diversity have often reinforced prejudices and deepened social contradictions (Maxwell, 2014; Palardy, 2013). To that end, the differences between socioeconomic groups among schools and within schools are almost taken for granted. Equality of opportunity has turned into a myth rather than a universal principle that guides students' lives (Palardy, 2013). Similarly, immigrants, ethnic and racial minorities' facing more prejudice and discrimination in schools than in their neighborhoods is a frequently observed fact (e.g., Burgess, Wilson, & Lupton, 2005). LGBTIQ+ students constitute a less fortunate group; because they

are more likely to encounter stronger prejudice and discrimination both at schools and in their neighborhoods than other micro-social groups (Dessel, 2010). Furthermore, in Muslim countries like Turkey where patriarchy and masculinity are among core elements of national identity, homosexual students are mostly regarded as a “threat” to the society and school communities by several groups (Bakacak & Öktem, 2014). The phenomenon of international migration, which has been witnessed worldwide in a mounting manner in recent years, has led schools to face a pressure of diversity beyond their already weakened cultural assimilation capacities. This has made multiculturalism an inevitable trend bringing about a rising tide for public schools (Dimmock & Walker, 2005).

The place of religion and belief groups in schools has been the subject of a heated debate since the establishment of the institution of public schooling. As a matter of fact, debates on religion in social life have generally been carried to schools. Whether faith schools and religious classes lead to social cohesion or to intergroup stereotyping and prejudice has remained a focus of conflicting discourses. However, faith schools have also had their share of diversity pressures, since it is possible to encounter students from different faiths or of no faith even in Catholic schools (Hemming, 2011).

The erosion of the cultural assimilation capacities of schools in the face of social and cultural diversity has forced them to welcome social reality. Notably since the end of the twentieth century, the ideal of cultural assimilation has left its place to the conception of multiculturalism (Meyer, 2006). Nevertheless, in multicultural schools, negative effects of intergroup contacts, such as prejudice and discrimination, can frequently be observed. The most important agenda topics of educational leaders in multicultural schools are then usually the strategies to be followed against such negativities (Dimmock & Walker, 2005). The following sections intend to elaborate on the said discussions by portraying the salient characteristics of multicultural schools and examining the challenges that leaders can face with and the leadership practices that can be resorted to in such environments.

---

## Multicultural Schools

Multiculturalism is a term originated from the discipline of sociology. In its simplest term, it bespeaks the political accommodation of minorities. Should multiculturalism turn into a governmental policy, it could have educational consequences, as its primary goals have often been the schooling of children of minorities, the regulation of curriculum content in accordance with the needs of these groups, and those of in-school rules of conduct in conformity with varying beliefs and cultures (Modood, 2007). Thence, in multicultural schools, equal learning opportunities are provided to all students regardless of their socioeconomic status, ethnic and racial characteristics, gender, sexual orientation, or beliefs. This hints at the reorganization of the educational content, knowledge production processes, pedagogical approaches, in-school relations, school culture, and structure; a series of reflections of shifted mindset as well as praxis triggered

by multiculturalism. That is, multiculturalism actually mirrors an ideal for schools (Banks, 2016; Bennett, 2001). Thereupon it has been underpinned in the macro-institutional environment of schools through egalitarian governmental policies, immigrant policies, and legal regulations in many Western societies encouraging schools to change in this direction (Ham, Song, & Yang, 2020).

However, despite the fact that the conception of multicultural school has become a *point à l'ordre du jour* for nearly 30 years and multiculturalism has infiltrated the macro-institutional environment of schools in many countries, to date schools constituting a quorum have not succeeded in achieving this ideal. The existing institutional structures of the aforementioned schools still echo the ideal of cultural assimilation (Banks, 2016). Due to several school-specific factors, viz., curriculum, teacher qualifications, cocurricular and extracurricular activities, as well as school culture and environment, Whites compared to other races, citizens to immigrants, rich to poor (Warikoo & Carter, 2009), heterosexual students to LGBTIQ+ students (Kosciw, Palmer, Kull, & Greytak, 2013) hitherto have relatively higher academic achievement. To be specific, diversity has seemingly forced schools towards multiculturalism, but as interaction between social groups has increased, so has stereotyping and prejudice which makes it difficult for schools to attune and acclimatize themselves resulting in discrimination among students (Thijs & Verkuyten, 2014).

Stereotyping and prejudice are dissimilar but closely related, if not intertwined, constructs. Stereotyping is a set of knowledge structures that function as mental pictures about a group. Stereotypes represent features that are unique to a whole group or members of that group, which differentiate them from other groups. In short, the term concerns the features, the exemplars that come to mind first when you think about a group. Although it is possible to come across positive examples, stereotyping often has negative connotations. The simplification caused by stereotyping leads to ignoring important details, such as historical realities, individual resumes, and collective responsibility. For this reason, stereotypes are said to reflect inaccurate, negative, overly general, and unfair perceptions (Stangor, 2016). Looking from an educational perspective, stereotypes can indeed shape teachers and students both positively and negatively. To illustrate, teachers often view Asian students as diligent and intelligent, but introverted. African students might be stereotyped as friendly and athletic but disobedient and aggressive. Whites, on the other hand, can be stereotyped as friendly, intelligent, and diligent, but materialistic (Chang & Demyan, 2007). At this point, the fact that they are not stereotyped as intelligent puts extra pressure on African students in academic matters. Similar pressures caused by stereotyping are also encountered in issues related to gender, sexual orientation, socioeconomic status, and immigrant students (Wright & Taylor, 2007).

Undoubtedly, the most negative result of stereotyping is prejudice. Prejudice alludes to socially shared judgments and assessments about a group, and emotions they give rise to. Because of its emotional aspect, prejudice can be seen as a negative attitude towards a group or a member of that group. Prejudice is a social category; it leads to the depersonalization of individuals, that is to say, to seeing them not as

individuals with distinctive qualities but as representatives of a social category (Stangor, 2016; Wright & Taylor, 2007). As an illustration, teachers who state “terrorists come from one religion but it’s a very small group. . .” during a lesson about 9/11 attacks, while trying to be fair in their own way, disclose their prejudice against students belonging to that religion (Sullivan, 2018). In a similar vein, individuals, based on the stereotype that “immigrant families are not interested in their children’s school life,” explain their prejudice when “blaming” immigrant students for schools’ declining SAT scores and education quality (Fennelly, 2008).

Legal regulations and governmental policies for the institutionalization of multiculturalism should not be expected to easily change the rooted mental models of school-site stakeholders that lead to stereotyping and prejudice. The realization of the multicultural school ideal in the face of increasing diversity pressures is largely possible through leadership practices. However, leadership for multicultural schools involves struggling with a number of challenges without the guidance of any proven strategy or style (Gardiner & Enomoto, 2006).

---

## Leadership for Multicultural Schools

The stereotyping, prejudice, and discrimination tendencies in the local community can easily permeate the inner environment of a school. Depending on the intensity of these tendencies, the type and frequency of leadership practices in multicultural schools may vary. Leading in a multicultural school is a challenging task involving dealing with multilayered issues. It is viable to enlist the challenges that leaders face with while struggling to arrive at the ideal of a multicultural school as: (1) policy challenges, (2) challenges related to cultural diversity, (3) curricular challenges, (4) administrative challenges, and (5) operational challenges. Furthermore, the touchstone shared gives an idea about the challenges that educational leaders encounter while transforming their schools and the leadership practices that can be employed against these challenges. It is also noteworthy to state that oftentimes these challenges are interwoven (Banks et al., 2001; Bennett, 2001).

## Policy Challenges

With the rise of multicultural education, the focus of policy-making has been on the success of all learners including students of racial and ethnic minorities and of low socioeconomic groups, not only those with high competency, and on the closing of the achievement gaps between these groups. In that, policy documents regarding multicultural education usually involve the realization of the vision of educational equity and assign responsibilities to various public institutions, such as schools, school districts, and state as well as national level agencies (Singh & Taylor, 2007). To illustrate, legal regulations like No Child Left Behind Act establish a legal basis for policies aiming at enhancing proficiency levels of all students to meet pre-determined criteria, and distribute tasks and responsibilities among governmental

agencies at various levels to realize policy goals. It can be argued that ensuring equitable opportunities lie at the core of policy-making in multicultural education (Grant & Sleeter, 2007). Concordantly, multicultural schools are built to fulfill schools' roles in realizing the vision of educational equity. Equity indeed is the provision of equal opportunities for students to reach their full potential (Bennett, 2001). It includes creating an awareness of students, who are more disadvantaged than others, compensating for past misfortunes, inadequacies, disabilities, and deprivations, and establishing schools and education systems that will ensure all have access to high levels of academic achievement and a similar type of healthy lifestyle (Simon, Małgorzata, & Beatriz, 2007).

Educational equity vision has come to the fore because of the heavy social and financial costs of educational failures in the long run. Although there has been a great expansion in the number of students, educators, and institutions in all education levels from basic education to higher education around the world, the dropout rates of students of racial and ethnic minorities and of low socioeconomic groups and marginal students are higher than the mainstream groups. Additionally, even if the number of years they spend at school is the same as the majority students, these students' basic skills, such as reading, writing, and problem-solving, are generally at a lower level. Poor basic skills mean less chances of getting a job, more health problems, higher likelihood to commit crimes, and a shorter life expectancy (Demirel & Kurt, 2021; Lochner, 2004). Another disturbing fact is that despite the increase in the number of students, this situation has not increased social mobility, on the contrary, increased economic inequality. To put it in another way, even an egalitarian scenario, in which all individuals receive the same education at the same time and acquire the same advanced skills, does not always guarantee equitable results. The time and effort that individuals from marginalized groups must spend to "compensate for" the disadvantages they inherit from their families cause them to reach lower living standards than their peers. Accordingly, irrespective of the cause, inequity is among the reasons why stereotyping, prejudice and discrimination continue through generations (Autor, 2014; Öçal & Cicek, 2021).

Although equity is occasionally associated with the ideal of a socialist society or individualistic and radical liberal transformations, it actually indicates the need for a democratic society supported by a robust welfare state. Social inequity is the result of the massive historical and socioeconomic problems and injustices, solutions of which necessitate the intervention of large governmental agencies and non-governmental organizations, and the allocation of immense financial resources. Put it differently, inequity can be deemed as the indicator of the failures of welfare states and democratic societies (Offe, 2006). To give an example, inequity issues are relatively less common in Nordic countries where welfare states are still highly redistributive (Kääriäinen & Lehtonen, 2006; Öztürk & Tataroğlu, 2017). At this point, promising that all individuals, including those from marginalized groups, can be adapted to the society and economy as largely free from the negative effects of the inequity issues solely via education and thence inequity problems can easily be solved by multicultural schools can be regarded as a fallacy. This is because schools

have a slight effect on improving actual conditions of parents and repairing socio-economic injustices they inherited from the past, and cannot undo differences in students' social capital (Esping-Andersen, 2006).

Along with this, schools are not independent institutions developing and applying their own policies but, instead, are one of the implementers of the equity-oriented welfare programs and policies administered and funded by large governmental agencies. For instance, The Equity and Excellence Commission in the USA has distributed roles within a spectrum from teachers to the federal government in the equity issues. Remarkably the states and the federal government were assigned tasks on topics, such as goal and standard setting, funding, and political and legislative actions. In other words, educational leaders usually take action against inequity issues by following certain rules, codes and standards to realize specific goals all of which are predetermined by other organizations. This should not mean that there is no room for equity-oriented leadership practices at the school level; because it is primarily the mission of school leadership to "agitate" the school environment and change the mental models of school-site stakeholders (USDE, 2013). To achieve the vision of equity, making school-specific action plans in line with ideals, such as cultural pluralism, social justice, and affirmations of culture in teaching and learning, instead of one-size-fits-all leadership strategies, promise more effective results (Bennett, 2001; English, 2020).

## **Challenges Related to Cultural Diversity**

Educational leaders generally perceive their schools as amicable and inclusive multicultural organizations valuing every student's cultural heritage and neutralizing their social and physical disadvantages. However, studies on stereotyping, prejudice, and discrimination in educational organizations have indicated that cultural conflicts and distinctions become more salient as cultural diversity in a school increases. The fact that schools are the places mostly dominated by the culture of the majority group gives rise to stereotyping and prejudice particularly against culturally different minority students during intercultural contacts. To illustrate, educators and parents tend to distance themselves from members of the minority groups, such as Black and Hispanic students, due to cultural differences. Factors such as language, group identifications, and socioeconomic status serve as bases of cultural conflicts and distinctions by creating achievement gaps and communication barriers. Expressly, bringing students from different cultural groups together in a school does not ensure intercultural contacts to produce positive results and attain policy goals regarding multicultural education (Cooper, 2009). To do so, firstly leaders need to figure out how to bring students from different cultural groups together without quitting their cultures, and secondly they need to find ways to compensate the effects of past misfortunes and unjust treatments on student learning. Briefly, taking steps towards cultural pluralism and social justice ideals can help leaders to alleviate the negative effects of cultural conflicts and distinctions on intergroup contacts (Bennett, 2001).

At this point, Bennett (2001) identified the ideal of cultural pluralism as one of the prerequisites of transforming multicultural schools in compliance with the equity vision and establishing constructive intergroup contacts. The vast majority of contemporary states emphasize the definition of citizenship built around a dominant culture. Therefore, fulfilling cultural pluralism is among the primary goals of multicultural school leadership. In societies dominated by a single culture, the preservation of the subcultures and their integration into society can be realized by cultural pluralism. The nomenclature of cultural pluralism was born into a world where newly arrived immigrants were expected to choose between adapting to the dominant culture by giving up their own languages and cultures or being discriminated and otherized (Bennett, 2001). Strictly speaking, cultural pluralism has manifested itself as an option developed for minorities in a multi-ethnic society, apart from cultural assimilation and discrimination. Hence, the former definitions of cultural pluralism resonate the ethnic perspective. By way of illustration, as part of the initial attempts to expound cultural pluralism, Kallen (1957) considered pluralism as the perpetuation of the cultural heritage of each ethnic group and, in this regard, the acceptance of their values and identities by the dominant culture.

Later, Kallen (1957) expanded this definition to include race, belief, gender, sexual orientation, and socioeconomic status groups. It can be underscored that equality lies behind cultural pluralism. Nonetheless, equality does not imply the adjectives similar or identical; it is the equivalence of unequals or the equality of dissimilars. The right of individuals and social groups to preserve their differences is indispensable and they cannot be punished for their inborn and/or developed differences. Cultural pluralism envisages giving equal status to each subculture, which is of great importance to get to positive results arising out of the interaction between cultural groups. As it can be understood from the definitions, cultural pluralism denotes a prescriptive approach rather than a descriptive term that portrays the current situation. To rephrase it, cultural pluralism necessitates an intense, democratic form of idealism and a high level of commitment (Bennett, 2001; Kallen, 1957).

However, the kind of equality envisaged by cultural pluralism may not completely eliminate the effects of the factors that cause inequality. Minority cultures are generally composed of lower socioeconomic groups. Moreover, the mechanisms of knowledge production and dissemination in a society are mostly shaped according to demands and needs of the majority group. Therefore, the fact that they have equal status does not mean that different groups are truly equal. Economic and cultural disadvantages inherited from the past can lead to the continuation of discrimination between groups that have been given equal status and opportunities. To put it concisely, formal equality status without alleviating social injustices risks masking existing discriminations (Miller, 1987).

This is evidently valid for the following situation, where Card and Rothstein (2007) argue that in integrated schools consisting of different socioeconomic and racial groups, White students with higher socioeconomic status incline to enroll in higher level advanced courses more than the other groups. Besides, the SAT scores

of the students coming from the neighborhoods of lower socioeconomic groups are lower than the other students (Card & Rothstein, 2007). Similarly, in Turkey, where millions of Syrian and Afghan immigrants have been continuously accommodated, immigrant students usually have lower levels of academic achievement than Turkish students even though they take courses in the same classroom being exposed to the same curricula (Karsli-Calamak & Kilinc, 2021). It is understood that benefiting from equal opportunities with equal status cannot eliminate the disadvantages of students stemming from their family background. In this instance, the ideal of social justice appears to be necessary to mitigate the effects of prejudice and discrimination in multicultural schools. In the past, due to the extreme tensions and inequalities caused by class society, the redistribution of capital and property was the subject of the ideal of social justice. Today, the goal of improving the human rights and lives of groups that have been discriminated against and marginalized due to a bunch of factors, i.e., gender, sexual orientation, age, socioeconomic status, and ethnicity, is at the center of the ideal of social justice (Barry, 2005).

As a result, the ideals of cultural pluralism and social justice serve as guiding principles for educational leaders rather than being a set of leadership strategies to be employed in certain school situations to lessen conflicts and distinctions. Furthermore, it is not possible to entirely isolate schools from intercultural tensions in and of the society. Also cultural interactions at schools are highly likely to catalyze stereotyping, prejudice, and discrimination as individuals are not always willing to change their existing positions against others and change their habitualized actions easily when they construct a collective identity against another group (Hogg, Van Knippenberg, & Rast, 2012). What is worse, the resources of schools are usually too limited to make significant improvements in students' social lives and the actions of school leaders are strictly constrained by highly institutionalized environments of schools. In addition to that, "fancy" leadership styles with romantic and stylish names that give great roles to educators are not magic wands. Cultural pluralism and social justice are ideals that can be attested at the end of a long and difficult journey entailing shared and distributed leadership practices with the active participation of all stakeholders (English, 2020; Fraise & Brooks, 2015).

## **Curricular Challenges**

Ideals of cultural pluralism and social justice are the main pillars of the societal structures of multicultural schools to create constructive intergroup contacts, but multiculturalism is not merely about intergroup interactions. Curricular activities, which comprise the technical and pedagogical core of schools, are also among the main elements of multiculturalism. Culture guides the actions of individuals through shared beliefs, values, worldviews, and norms of behavior. In the past, attempts to use schools as a means of cultural assimilation during colonialism had led to the disruption of minorities' social reproduction and the pathologizing of minority parents. This in turn have triggered intergenerational traumas and deepened the

antagonism between minority and majority groups. Individuals, whose ancestors experienced such traumatic schooling experiences in the past, are likely to have a feeling of injustice and resist engaging in constructive interactions with majority group members (Maxwell, 2014). It is, therefore, possible but not wise to teach in multicultural communities without considering the cultures and cultural backgrounds of individuals (Banks et al., 2001). Alongside this, curriculum in multicultural schools is generally transformational and action-focused since curricular activities are the parts of struggles to enhance equality between the cultures of social groups and rectify outcomes of past unjust treatments. This at times necessitates the parental participation to provide cultural context for classroom activities. Teaching methods and techniques are personalized and participatory; and teaching materials are developed to include perspectives of all groups in the school on teaching content. In other words, curricular activities must be designed in a way to improve intercultural understandings and communication skills of teachers and students, and to decrease the effects of stereotyping and prejudice against minority groups (Banks, 2001).

The need to design curriculum activities in agreement with multicultural societies has also led to culturally responsive teaching. Culturally responsive teaching affirms that cultural diversity is influential in individual learning experiences and organizing teaching activities and in-school relations accordingly. Culturally responsive teaching is quite a broad field. It calls for taking action(s) in line with the knowledge of different cultures in the development of curricula, the use of instructional methods and strategies, the selection of instructional materials, and the conduct of relations with students. Additionally, struggling with stereotyping, prejudice, and injustices that prevent multiculturalism and transforming the school community in harmony with the ideals of cultural pluralism and social justice are among the objectives of culturally responsive teaching (Gay, 2013).

Culturally responsive teaching usually has positive effects on academic achievement and student engagement. On the other hand, designing curricular activities in keeping with multiculturalism is a challenging process that compels shared leadership practices and must be carried out delicately (Khalifa, Gooden, & Davis, 2016). In this process, past interracial and intercultural tensions may resurface or new prejudices may engender. While individuals with more intercultural interaction experiences can adapt to this process more easily, those with limited and negative past experiences may not want to give up their prejudices. For example, a Black student who encounters Whites only in governmental agencies or through criminal justice system may resist to course activities about the place of Whites in anti-racist movements. Or, students may find it difficult to grasp the long, difficult, and complex nature of equal rights and freedom struggles. In similar fashion, in schools where students and teachers predominantly belong to a certain group, school-site stakeholders may be reluctant to adopt curricular changes. In parallel, teachers may have limited opportunities to determine curriculum content and select course materials. In some cases, administrators and teachers may have to obtain cultural information by contacting families directly (Epstein, Mayorga, & Nelson, 2011). The most challenging obstacle is that educators mostly do not believe in the idea of

multicultural school and are unprepared for the curriculum changes demanded by the social diversity. The prevalence of educators prefer to emphasize similarities not differences, unity rather than division, and the security provided by stability instead of the uncertainty that change can cause (English, 2020; Gay, 2013).

These examples demonstrate that designing curricular activities in commensurating with multicultural education impels serious preparation and mental shifts for and of administrators, teachers, students, and families. School transformations can be accelerated by school leaders' critical self-reflection on stereotyping and prejudice, their empowering and inspiring teachers to be culturally responsive, their changing curricula, as well as altering the school environment and climate, and last but not the least through their establishing close contacts with indigenous communities. In order for these actions to have long-lasting results in schools and to persuade school-site stakeholders to actively participate in these efforts, they may need to be supported by legislative regulation changes and state or national level governmental policies (Khalifa et al., 2016).

## **Administrative Challenges**

The implementation of policies regarding multicultural education, the resolution of cultural conflicts caused by social diversity, and the designation of curricular activities in the spirit of multicultural education are predominantly administrative tasks calling for transforming schools' organizational structures and daily routines. To rephrase it, the notion of multicultural school can be realized through comprehensive and effective administrative interventions in the first place (Banks, 2001). First off, multicultural schools need to employ culturally and ethnically diverse teachers who are capable of surpassing lingual and cultural barriers caused by social diversity and of implementing curricular activities involving multicultural elements. In this direction, continuous professional development programs are necessary to improve cross-cultural teaching skills of these teachers consistent with constantly changing student profile and curricular activities (Kaye, 2006). Besides, highly individualized classroom activities entail the development or the procurement of curricular materials specific to each school or classroom, which can be accomplished through close and continuous collaboration between administrators, teachers, and parents. Further, not only teachers but also administrative staff in multicultural schools is expected to have a competency to overcome lingual and cultural barriers and a capacity to deal with the increasing workload as they need to repeat the same task in different languages while, at the same time, meeting the standards set by local and national authorities. Most importantly, all these administrative interventions cannot be undertaken without the allocation of adequate financial resources (Knight, Izquierdo, & DeMatthews, 2016).

All the administrative interventions required to build multicultural schools pose significant challenges for educational leaders. Finding highly qualified, committed, and experienced teachers and administrative staff who can meet the requirements of multicultural education is one of the reasons of discontent for educational

leaders (Greenlee & Brown, 2009). This is because adjusting curricular activities through individualized teaching methods and pacing lessons in compliance with learning needs of students from diverse groups in the same classroom are huge concerns for teachers. Furthermore, on most occasions, they have difficulties in ensuring equality among in-classroom groups and applying social justice interventions for disadvantaged individuals due to time constraints (Hamm, 2015). Consequently, preparing existing teachers and administrative staff for multicultural education through professional development programs is a frequently used method, yet it is mostly constrained by inadequate resources. Even educational leaders usually have to reallocate existing financial resources without creating additional expenditures to implement professional development programs and procure curricular materials. In other words, it can be argued that the vast majority of schools lack adequate resources to meet the requirements of multicultural education, making school leaders financially and administratively dependent on local or national authorities in achieving necessary transformations (Knight et al., 2016; USDE, 2013).

At this point, it can be asserted that the most significant challenge in transforming the school community is institutional constraints on in-school activities. Schools are embedded in bureaucratic hierarchies, which implies that in-school structures, rules, and procedures are largely directed by legal regulations and demands of the governmental agencies. Put differently, the implementation of interventions to build multicultural schools and the allocation of necessary resources usually impel securing the support of political and institutional actors (Theoharis, 2007). For instance, in cases where interventions, such as changing the existing curriculum, hiring bilingual teachers and administrative staff, implementing professional development programs, and increasing the number of advanced courses, are supported by political figures and institutional actors, they are likely to reach relatively more successful results. While political figures can initiate legislative actions for legal amendments, institutional agents, like local districts, governmental bodies, and state authorities, can change regulations and directives regarding school activities and finance administrative interventions (Fusarelli, 2002). In addition, the political and institutional support can also ensure the persistence of the effects of these interventions irrespective of the changes in staffing (Pettigrew & Tropp, 2006).

## **Operational Challenges**

School leadership in multicultural schools needs to seek answers to questions such as: “How can I establish a culturally plural school community and school conditions appropriate for constructive intergroup contacts?” and “What kind of interventions should I apply to neutralize the negative effects of past misfortunes and unjust treatments on student learning?” Some may argue that challenges posed by policy, intercultural, curricular, and administrative issues leave a small room for the operationalization of leadership and complicate the application of interventions.

However, transformations in schools required by the multicultural education can be achieved by the leadership distributed among all school stakeholders. For instance, creating a fruitful in-classroom climate through constructive and inclusive interactions for positive curricular outcomes demands teachers and parents to assume leadership roles (Bennett, 2001; Gay, 2013). Similarly, a supportive school community for egalitarian intergroup contacts among majority and minority students can be established by the participation of school administrators, teachers, and parents. Further, the reparation of past misfortunes and unjust treatments drives educational leaders to extend their spheres of influence out of the schools to invite the support of institutional and political figures (Khalifa et al., 2016).

It can be argued that educational leaders must first take steps towards building a culturally plural school community in order to promote appropriate conditions for constructive egalitarian intergroup contacts. Moreover, culturally plural school communities can also facilitate school leaders' receiving the support of school stakeholders while taking actions in favor of culturally different individuals (Opatow, 2012; Pettigrew & Tropp, 2006). On this occasion, intergroup contact theory can be used to analyze the patterns and consequences of interaction between cultural groups in schools and the interventions that can be employed by educational leaders. This theory is based on the assumption that intergroup contacts under appropriate conditions reduce stereotyping and prejudice between cultural groups. This means, a properly managed contact can reduce intergroup stereotyping and prejudice problems in schools and lead to positive results. Equal status, common goals, intergroup cooperation, and institutional support are among the necessary conditions for the intergroup contact to yield positive results. Equal status here signifies different groups' taking part in the interaction as equal parties (Pettigrew & Tropp, 2013).

Ensuring intergroup equality can be deemed as the most basic duty of educational leaders for interactions without equality often give rise to hostility, even with the support of institutional actors, such as district administrations and local or national education authorities. The other condition within this frame of reference is that the interacting groups should have common goals. Gathering students from different groups to solve a problem or overcome a challenging task can let them put their differences of opinion aside and focus on common goals (Pettigrew & Tropp, 2013). It is a requirement of intergroup cooperation that these students need to have an equal status and work to reach common goals without competing. At this point, teachers may also need to assume leadership roles and encourage students. That said, it is unlikely that such activities will become permanent in schools without an institutional support. As a formal educational leader, the level of influence of the school principal may not be enough to create and institutionalize the necessary conditions to verify positive results in schools. Thus, the support of school district administrations, local or national education authorities through legal regulations and policies can facilitate the engagement of school-site stakeholders in such activities (Pettigrew & Tropp, 2006).

The assumptions of intergroup contact theory have been largely confirmed by studies conducted in schools. To give an instance, in a study conducted with Palestinian and Jewish-Israeli students, it was discovered that the tendency of

cooperation and positive feelings between the two groups strengthened when the necessary conditions were met despite the deep hatred among students (Goldenberg et al., 2017). Likewise, a structured intergroup contact provided under appropriate conditions in classroom teaching activities has been found to reduce stereotyping and prejudice among students (Pettigrew & Tropp, 2013). The issue that complicates the work of educational leaders in this regard is the possibility of different leader prototypes of each group. Generally, social groups tend to choose individuals similar to themselves as leaders. If an education leader is seen as “one of them” instead of “one of us,” their impact may be limited. Owing to that, the implementation of leadership practices without threatening the identities of the groups in the school and without showing a special affinity to any group can increase the probability of the success of educational leaders (Kershaw, Rast, Hogg, & van Knippenberg, 2021).

However, egalitarian interactions achieved through the application of the assumptions of the intergroup contact theory are not anywhere near as effective in serving as social justice interventions since granting equal status to groups with unequal ability and social capital levels and socioeconomic status in benefiting equal opportunities does not guarantee to get equal educational outcomes for all students. This implies that educational leaders must employ social justice interventions in favor of culturally different individuals to compensate injustices they inherited from past (Berkovich, 2014). Taking a critical stance, it can be pinpointed that schools have contributed to the reproduction of social power relations throughout history. Today, the elements that cause social injustice are mostly due to nonschool factors and historical unjust treatments. This has led to academic discussions about social justice interventions in schools concentrating on abstract concepts or ambiguous goals. Intervention recommendations, such as including the ideal of social justice in teacher training programs, redesigning school leader preparation programs based on the concepts of multiculturalism, social justice, and critical thinking, discussing power and oppression structures in society, believing in the ideal of social justice, creating democratic and critical communities, and bringing the ideal of social justice into daily activities, are undoubtedly crucial for shaping attitudes of administrators and teachers and are essential constituents of multiculturalism (Hyttén & Bettez, 2011). In the long run, such interventions may have the potential to transform schools into autonomous “safe-heavens” isolated from power relations in society or to stimulate social transformations. Having said that, relying on bright, uncertain, and radical changes in the distant future to solve problems inherited from the past and constantly keeping it on the agenda might lessen the threats to the identities of marginalized groups rather than contributing to the improvement of their actual conditions. To be more specific, it can assuage the social injustice perceptions of these people without actually helping them at all (Dubé-Simard, 1983).

Correspondingly, the bureaucratic hierarchies in which schools are embedded limit the social justice interventions of school leaders mostly to the school environment (Ayyıldız & Baltacı, 2020; Theoharis, 2007). Several scholars (e.g., Theoharis, 2007; Wang, 2018; Furman, 2012) stated that school leaders usually implement interventions, such as focusing on increasing the academic achievement of marginalized students, the creation of heterogeneous classes by eliminating exclusive

programs like ability-based courses and pull-out models of special education, boosting the number and facilitating the access to educational opportunities for all students such as advanced courses, improving staff qualifications through social justice-oriented seminars, strengthening school cultures, motivating the establishment of positive communication and relationships (Theoharis, 2007; Wang, 2018). However, it is often unclear how these leadership strategies close the academic gap between marginalized students and other students. Furthermore, these strategies typically do not offer any guidance about how to overcome legal barriers particularly in services provided to students in special education although such services are generally regulated by rigid legal rules. While the unstructured interaction of different groups risks deepening of the existing prejudices (Goldenberg et al., 2017), it is usually not clearly specified how this problem is to be overcome. Even though students with higher socioeconomic status generally tend to enroll more in advanced courses, it remains ambiguous how other groups are encouraged in this manner (Card & Rothstein, 2007). It is often not explained how the enhancement of staff qualifications and positive communication foster changes in the actual conditions of marginalized students through what mechanisms either (Dubé-Simard, 1983). It is possible to utter that these strategies are equality-oriented but unstructured instructional efforts instead of being social justice-oriented practices. Conceptualizing leadership on social justice and prescribing certain strategies and interventions are undoubtedly well-intentioned efforts, but unstructured intergroup contacts risk inadvertently increasing prejudice and discrimination (DeMatthews & Izquierdo, 2016). This situation also shows that the ideal of social justice cannot be separated from cultural pluralism (Bennett, 2001).

There is a broad literature on social justice interventions. Social justice interventions often call for the recognition of marginalized individuals or groups and the preparation of action plans appropriate to their circumstances. Thence, there must firstly be awareness about social injustice. Awareness that a marginalized individual or group is more socially and culturally different than others enables individuals, social groups, institutions, and governments to take actions. These actions should be taken as soon as injustice is noticed, because justice delayed is justice denied (Opatow, 2012). Notwithstanding, there may be groups that feel threatened by social justice interventions in favor of an individual or group (Kershaw et al., 2021). For example, Asian families, who feared losing their advantageous position, reacted against a proposal to enroll more Black and Hispanic students to top high schools in New York (Shapiro, 2020). Thusly, arranging social justice interventions in a way that does not threaten their identities and rights can facilitate the persuasion of these groups to support interventions in support of culturally different individuals. What is more, using nonviolent actions in the struggle against injustices may precipitate the support of other groups. Cultural pluralism can create favorable conditions in which these interventions can be made without deepening the existing conflicts and divisions. Finally, a strong institutional support is needed for the persistence and sustainability of the effects of these interventions and the reparation of losses caused by previous discriminations (Opatow, 2012). This support can be in the forms of teacher union actions, regulation changes, and political and legislative actions. For

instance, in schools in a region where Mexican families make up the majority of the population, it was necessary for school leaders to get the support of district administrators and political figures to switch to dual language education, which consisted of the teaching of the same curricula in both English and Spanish in the same classrooms (DeMatthews & Izquierdo, 2016).

In sum, it can be stated that there is yet no proven leadership practices or styles to build culturally plural school communities fully free from the effects of the social injustices. Establishing constructive egalitarian interactions and neutralizing past injustices in schools can be achieved through a leadership that should be undertaken delicately by all school stakeholders. The fact that such a highly elaborated and complicated task requires the collaboration of a number of individuals during a relatively long period and carries the risk of causing more prejudice and discrimination turns leadership in multicultural schools into a challenging operation. For this reason, making action plans for each school by analyzing the tense and harmonious relations between social groups can help leaders determine appropriate leadership practices and decrease the risks posed by the complexity of the operation and the unpredictability of the intergroup contacts. Furthermore, administrative restrictions imposed on schools require getting the support of institutional actors nearly in every action towards establishing multicultural schools (Hogg et al., 2012; Opotow, 2012).

---

## Conclusions and Reflections

Especially since the 1990s, the idea that schools, teachers, and educational leaders should be sensitive to increasing social diversity is widely accepted among policymakers and educators around the globe. Ideals, such as educational equity, cultural pluralism, social justice, and cultural responsiveness, are increasingly spreading and finding more and more responses in society. Nevertheless policy-bound, cultural, curricular, administrative, and operational challenges generally slow down the efforts to transform school communities. In policy documents, schools are usually regarded as one of the implementers without goal and standard setting authority, which makes them followers of superior organizations in multiculturalism issues. Furthermore, the settlement of cultural conflicts and distinctions involves acting in keeping with guiding idealistic principles, such as cultural pluralism and social justice, rather than proven leadership strategies or roadmaps. In curricular issues, the tendency of school administrators and teachers to emphasize unity and integrity may cause them to resist changes in the direction of multiculturalism. Hiring skillful teachers, developing and procuring school specific curricular materials, and making necessary transformations within limits set by legal regulations without creating additional expenditures turn administrative work into a bureaucratic mess. What is worse, comprehensive leadership practices and strategies to be applied to achieve multicultural schools have yet to be fully developed. Current recommendations oftentimes rely on social transformations in an uncertain future. Leadership strategies recommended to be implemented at school sites have the risk of causing more prejudice between students and teachers because they are not elaborated

sufficiently to manage intergroup interactions. Also, the institutional environment that schools are embedded in usually limits the multiculturalism-oriented transformational leadership practicum of school leaders. All these obstacles indicate that educational leadership for multicultural schools not only should aim to transform the mental models of school-site stakeholders, but also invited the support of institutional and political figures.

It is anticipated that social diversity will be in the pipeline even more in the future, which means that schools, curricula, and relationships between school-site stakeholders will turn into arenas of sociocultural conflicts. With this in mind, it can be argued that stereotyping, prejudice, and discrimination will remain to be issues to deal with for school leaders. As can be discerned from the discussions in the bulk of literature, the multicultural school is a “project” that can be implemented with broad social consensus and strong political and institutional support, as well as via transforming the mental models of school-site stakeholders. Henceforward, it is possible to italicize that educational leadership studies on multiculturalism will continue to focus on major issues, such as policy, cultural, curricular, administrative, and operational matters, that pose challenges to the establishment of multicultural schools and the practice of leadership in socially diverse school communities.

## Abstract

Curricula and educational practices in schools largely define the collective understanding of what society has deemed relevant, accurate, and valued. From the earliest days of colonial contact, the narrative of the presence and role of Indigenous peoples has been offered from a primarily Eurocentric perspective. This process has become normalized and ingrained in the educational system and

dictated stereotypes and biases about Indigenous nations and peoples. This process continues to do harm to Indigenous as well as non-Native learners. While this state of affairs has been clearly documented, and the harm is ongoing and pervasive, there are practices and policies that have been successful in mitigating these deleterious effects. Within a framework of conceptual change, educational leaders are called upon to help all stakeholders recognize more culturally appropriate and accurate representations of Indigenous nations and people.

**The Field of Memory**

The representation of Indigenous nations and people has an insidious history; the echoes of which overshadow and shape our understanding of topics in education related to Indigeneity. While there is some progress in addressing overt racist representations and cultural misappropriations, the pervasiveness of those messages continues to influence biases and stereotypes. One of these messages is the false notion that there is a fundamental difference among races of people that predispose educational or career success. Aligned with this racist perspective was the misconception that there is a distinct and unitary race of people identified as “American Indian” or “Native American.” Finally, both official policies and widespread public sentiment (among the dominant white culture in particular) held that the forced assimilation of Indigenous people was not only justified but served the best interests of Indigenous people.

**The Field of Presence**

Educators and society, in general, are becoming cognizant of the reality that race is an abstract construction generated by society. In historical and contemporary society, systemic racism and American exceptionalism have promoted and sustained inequitable economic and social advantages to the dominant culture. While racism and misconceptions remain inherent in society, there is also recognition that (a) Indigenous nations are sovereign states that have self-determination in their organization and operation; (b) there is great diversity within and among the hundreds of Indigenous nations (state and federally recognized, as well as those continuing to fight for formal recognition); (c) the histories and contemporary lives of marginalized peoples are critical components to understanding the places we live and work, and (d) contemporary American education has considerable gaps in the representation of the cultures and histories related to Indigenous peoples.

### **The Field of Concomitance**

The process of transforming a systemic corpus of knowledge and beliefs as well as the structures that underlie those widespread belief systems and bodies of knowledge align with the field of conceptual change theory from educational and cognitive psychology (Chi, 2008). Conceptual change has been deeply investigated in the field for decades, with early roots in Piagetian perspectives of cognitive adaptation. Central to this line of inquiry is the recognition that naive learners build representations of the world around them, which leads to established or entrenched theories that are laden with inaccuracies. These early misconceptions provide considerable barriers to learning “accurate” representations when entering formal instructional settings because the “new” content is perpetually interpreted from the perspective of the original (or resident) theory. This leads to a series of cognitive defense strategies that inherently protect the resident theory from what is perceived to be “anomalous” information (Chinn & Brewer, 1993). Of course, not all naive learning leads to misconceptions. When a learner is first exposed to positive representations that are conceptually accurate, the “resident theory” is correct and no conceptual change is needed.

To overcome misconceptions, merely providing the “correct” information is usually ineffective, because the learner will reinterpret, discount, or explain away the new information within their existing structures (Chinn & Brewer, 1993; Sinatra & Chinn, 2012). Achieving conceptual change is most effective when learning materials illustrate the failures of the resident theory, offer new content clearly, guard against “backsliding” (reverting to pre-existing misunderstanding), and actively engage learners with an expert mentor.

Using conceptual change theory for systemic change suggests that the first step is to identify critical failures in understanding. Further, under the leadership and guidance of experts, coordinated and consistent presentation of appropriate replacement content that debunks common misconception is necessary. Functions operating at the level of an individual class, lesson, or field trip limited utility in overcoming systemic misconceptions because social awareness and curriculum standards perpetuate the common misconceptions. Finally, as with individual learners’ conceptual change, it is important to recognize there will be resistance to adjusting embedded and inherent “resident theories.”

### **Discontinuities and Ruptures**

To illustrate primary discontinuities and ruptures related to the education of and about Indigenous nations and people, a broad framework classifying eras represented by the primary interactions between Indigenous and colonizing peoples is illustrative. In the first era – before the arrival of European colonists – there were thousands of diverse and sovereign nations across the Western Hemisphere, with their own histories, identities, cultures, languages, and ways of living. Indigenous governments were built on cultural values and practices, with unique and often democratic principles. Indigenous nations engaged in trade, social relations, diplomacy, alliances, wars, and ecological stewardship since time immemorial.

The second era can be represented by the time frame from the first colonial contact with Indigenous people in North America through the foundation of the United States. That period was driven by a colonial mentality, with focus on “claiming land” within a Eurocentric orientation guided by the doctrine of discovery that was often associated with some degree of “education” connected to religious missionary (e.g., Deloria, 1988; Deloria & Wilkins, 1999). It is during this second era when colonists began to construct the false conceptualization of “Indian” as a monolithic group (or race), rather than recognizing individual sovereign nations.

The next major era – extending through the late 1800s – is characterized by formal U.S.-Indigenous policies and activities such as the Indian Removal Act (1830) and over 370 treaties negotiated with Indigenous nations and ratified by Congress. While the Removal Act is often portrayed in education as a stand-alone moment, the evidence is clear that there was a consistent goal among US government officials to deal with “the Indian problem” (Arthur, 1881). This led to a century of policies, wars, and treaties designed to remove or confine Indigenous people so Americans could occupy the Indigenous lands they found desirable. In this timeframe, educational efforts of the United States and religious organizations were primarily focused on agricultural training in the European tradition and ongoing efforts to Christianize Indigenous peoples (Trujillo & Alston, 2005). In both situations, the prevailing goal was to assimilate established Indigenous cultures and communities into the newly developing United States.

From the late 1800s forward, four eras are discernable: Allotment and Assimilation (late 1800s–1920s), the Indian New Deal (1930s–1950s), Termination (1950s–1970s), and Self-Determination (1960s–forward). During Allotment and Assimilation, the Dawes Act and vast promulgation of Indigenous boarding schools are prime examples of systemic efforts to dismantle Indigenous peoples’ cultures and nations by changing their world views, shaming them, and disrupting their relationships with one another and their homelands. The Dawes Act (1887) forced Indigenous nations to allot communal tribal lands into small parcels of acreage for ownership by individual Indigenous people. Following that phase of allotment, the federal government appropriated approximately 65% of the 138 million acres legally held by Indigenous nations in 1887 in less than 50 years (Deloria & Lytle, 1983), disbursing (usually without compensation) the land to settlers or federal entities. Further assimilation was forced upon Indigenous people through boarding schools. By 1926, approximately 83% of Native American school-age children were attending residential boarding schools (The National Native American Boarding School Healing Coalition, n.d.), with a preference for educating Indigenous children at a considerable distance from their homes to reduce “disruptions” to their training (Trujillo & Alston, 2005). Boarding schools were designed to prepare Indigenous children for life in a “civilized world” by extolling the principles (and superiority) of an American democratic vision, eliminating the use of tribal languages, and employing explicit religious training and conversion (Juneau et al., 2013; Northern Plains Reservation Aid, n.d.).

“The Indian New Deal” has been described by many as a reaction to the Meriam Report of 1928, which demonstrated the deplorable conditions that many Indigenous

nations were living in due to mismanagement of resources by the U.S. government (Deloria & Lytle, 1983). During this era, policies such as the Indian Reorganization Act of 1934 (IRA) are often represented as formal attempts to promote tribal autonomy and structure. The IRA was beneficial in some ways to Indigenous nations, providing a shift from the brutal policies of Allotment and forced assimilation. It included efforts to restore Native lands that had been lost, support for the revitalization of Native governments, and programs and projects to stimulate the economies of Native communities. However, Hopkins (2020) argues these policies essentially maintained colonial goals, reshaping or destroying tribal identities.

The Termination Era was driven by Public Law 280 (1953), which sought to terminate federal recognition and assistance to more than 100 Indigenous nations. These policies were economically disastrous for many Indigenous nations who ultimately lost millions of acres of valuable natural resource lands. Another failed program of this era encouraged Native people to relocate from rural reservations to urban areas for “better opportunities.” The policy resulted in loss of culture and connection to home communities and created a sense of alienation for many Indigenous families. In these urban settings, Indigenous people were exposed to racist views and behaviors, and the promised jobs often failed to materialize (Deloria, 2001a). As such, policies and practices through the first two-thirds of the twentieth century focused on promoting American exceptionalism, and “success” for Indigenous people often involved leaving their communities or abandoning homelands, family members, and cultures to advance their educational or career goals.

The era of self-determination for Indigenous nations and people (1960s–forward) is highlighted by the Indian Self Determination and Education Assistance Act of 1975. During this time frame, the federal government has been called upon repeatedly to affirm the sovereign rights of tribes (e.g., the Boldt Decision and Keystone Pipeline; Hopkins, 2020; Deloria, 2001a). This period also has involved the formal abandonment of the termination policy (Juneau et al., 2013) and has been accompanied by a resurgence in Indigenous communities rebuilding and reconnecting with their languages, customs, and more. In conjunction with this focus on Indigenous self-determination, the past 40 years has also been a time of growing attention to the value of recognizing Indigenous voices in the construction of the educational landscape for US curriculum standards and classroom materials.

### **Critical Assumptions**

Effectively considering limitations in educational content and considering processes that may support meaningful corrections in the field is significantly influenced by assumptions about the field and the people who are to be engaged in that process. The first assumption is that most educators do not hold *explicit* racist biases that consciously drive instructional practices *intended* to advance deficit perspectives of Indigenous nations and individuals. However, the second assumption is that people (including educators) hold implicit biases and stereotypes related to Indigenous people shaped by their own educational experiences and popular culture. Those implicit biases and stereotypes, supported by a history of explicit policies focused on

forced assimilation, have normalized standards and educational resources that perpetuate and strengthen colonial representations of Indigenous people. Furthermore, inherent preferences for a national perspective of the United States as exceptional, heroic, or morally superior to other nations produce resistance to the presentation of content that contradicts those tropes. As such, educational leaders and teachers often perpetuate false narratives due to a limited base of knowledge, flawed materials, and curriculum constriction imposed by standardized curricula and testing expectations. Finally, a key assumption is that educational leaders at local and broader levels can be instrumental in critically reviewing the standards and materials used to educate learners about Indigenous learners.

---

## Introduction

Recovering from centuries of repressing and misrepresenting Indigenous cultures in educational curricula requires systemic efforts. Building from this review of the challenges created by policies, practices, and embedded biases, this discussion focuses on articulating successful strategies that can guide leaders toward a more equitable and appropriate curricula. The path forward requires first identifying that the existing curricula have perpetuated and strengthened misconceptions and biases about Indigenous people. Next, exposing the harm upon Indigenous learners as well as non-Native learners is essential to illuminate the clear detriment that complacency will sustain. Finally, evidence of successful strategies is provided to serve as a guide to transforming the teaching and learning of Indigenous content within the frameworks of current educational practices.

---

## Curricula Based on False Narratives Perpetuate Misconceptions

An indisputable reality in education is that the standard delivery of content related to Indigenous nations and people is incomplete and flawed. In line with a conceptual change framework, effectively remediating this failure must begin by identifying the source. To that effect, while teachers curate and deliver content in classrooms, national and state curriculum standards in concert with textbooks dictate the topics that will be drawn upon by teachers. Collectively, these standards and textbooks stand as *de facto* representations of a society's declaration of truth and validity within educational disciplines (Sabzalian, Shear, & Snyder, 2021). As such, the presence of incomplete and inaccurate representations of Indigenous cultures and Native histories in curriculum standards and textbooks perpetuates reductionist and stereotyped thinking in society (Sanchez, 2007).

In contemporary educational practice, for most learners, Native nations are visible primarily through materials and standards that are limited and focus on select tribes in specific contexts that serve primarily in the role of antagonist or barrier to a settler colonization narrative (Hopkins, 2020). Sabzalian et al.'s (2021) comprehensive review of civics curriculum standards across the United States confirmed the failure

of standards to effectively address Indigenous cultures and histories. Their review demonstrated that state standards routinely ignore tribal sovereignty, fail to recognize or represent treaties and treaty rights, and portray Indigenous peoples in predominantly historical frameworks or as racial minorities in the United States (rather than as members of their recognized tribal nations). In addition to demonstrating the repeated absence of Indigenous cultures' representation in content standards, Sabzalian et al. (2021) identified that primary strategies of explicit and implicit "erasure" from state standards include: (a) standards that should incorporate Indigenous knowledge but did not (e.g., when the standard calls for examples of levels of government and failed to identify tribal governments as relevant examples), (b) restricting standards coverage to the later grades or elective courses, and (c) relabeling Indigenous tribes or nations as "groups" (delegitimizing legal and cultural standing).

Like Sabzalian, Shear, and Snyder's analysis of K-12 civics standards, Shear, Knowles, Soden, and Castro (2015) conducted a national study of K-12 U.S. history standards to better understand how Indigenous peoples and nations are included or not in the narrative of American history. Their findings demonstrated a considerable imbalance favoring historic accounts (pre-1900), with approximately 90% of content standards focused on pre-1900 representations. The disproportionate coverage was more extreme in the elementary grades (on average 20 out of 23 state standards), but middle and high school standards still averaged 80% focus on pre-1900 contexts (on average 17 of 21 state standards; Shear et al., 2015). A qualitative review of the standards across states demonstrated that a narrative of "cooperation to conflict" was common, progressing from genial cohabitation during early colonization to the era of wars and treaties in the late 1800s. Shear and colleagues also noted that the standards depersonalized the experiences of Indigenous nations by focusing on institutional aspects of topics such as removal (i.e., focus on policy or law rather than personal experiences). Finally, the standards predominantly confirmed a vision that westward expansion and dominating colonization was an inevitable outcome, in which Indigenous nations are held to a "secondary role as temporary barriers in the way of American progress." (Shear et al., 2015, p. 87)

Driven by this colonial framework for standards, the information presented in textbooks is largely inaccurate, incomplete, and results in a false representation of Indigenous nations and people. The few representations that do arise in textbook treatments generally portray singular Indigenous individuals or tribes in a historical or prehistorical context (Sanchez, 2007). These limited treatments of Indigenous cultures are incapable of exposing learners to the wide range of tribes that differ in languages, traditions, legends and stories, and relationships with their traditional lands – and how those various tribes have changed over the course of time. Moreover, when teachers and students are offered only one biased and stereotyped view, they are led to make assumptions and overgeneralizations about Indigenous nations. Those assumptions lead to a variety of misconceptions of the people described and eventually affect their understanding of how the people lived in the past and how they live in the present (National Congress of American Indians, NCAI, 2019).

These overgeneralizations and extensions can be easily seen in traditional “Thanksgiving stories” that fail to identify the Wampanoag directly, often referring instead to “Indians” or “Native Americans.” Many texts showcase artistic renderings of Indigenous culture featuring food, clothing, and shelter, predominantly portrayed in a historical context. Furthermore, limitations in textbook space and Indigenous contribution to content commonly lead to overgeneralization, which Sanchez (2007) documented extensively for 15 popular secondary level texts. Relying heavily on these materials, classroom teachers have been observed to favor lessons related to Indigenous tribes from the perspectives of focusing on the past (e.g., living in tipis, hunting buffalo, riding horses, and wearing buckskin) or assigning tasks where the students are “tourists” visiting a tribe and focus on unusual or exotic components of Indigenous cultures (Almeida, 1996).

---

## Flawed Curricula Inflicts Harm upon Learners and Society

Attentive educators readily recognize that there are inaccuracies in the information that has become the collective educational consciousness embodied in curriculum materials, state and national standards, and popular cultural representations (Sanchez, 2007; Reese, 2008). School leaders will commonly acknowledge this reality but express a limited ability to overcome the issue given the extreme range of topics related to Indigenous Cultures that have been conveyed with inaccuracies (both intentionally and unintentionally; Quigley, 2016; Sanchez, 2007). This barrier is further compounded by educational leaders’ self-identified limited expertise in knowing “what to trust.” Educational leaders also grapple with the challenge that realities of colonization and systemic cultural oppression are uncomfortable and distressing to many white Americans. Resistance to accurately educating around issues such as forced removal, allotment and termination policies, treaty violations, boarding schools, or the urban relocation efforts are counter to an American exceptionalism that is valued and promoted under the cloak of “patriotic” civic education (Sabzalian & Shear, 2018).

Awareness of inaccuracy coupled with a perceived inability to effectively remediate the flawed curriculum standards and materials has led to decades of incomplete modifications that generally exacerbate misconceptions. For instance, the removal of content that has been identified as clearly racist and inappropriate from textbooks and curricula does not correct the problem. Naturally, eliminating curricular materials that explicitly communicated negative stereotypes and biases is necessary – but when the content is merely *removed* and not *corrected*, the result is a redaction of the culture (Sanchez, 2007). The result has been a large-scale ablation of cultures from history texts (and other curricula) rather than a correction to the frames of understanding.

## Psychological Invisibility

This process has created a crisis for Indigenous nations and people that has long been overlooked – the process of invalidating the cultural identities of entire communities

of people. Fryberg and her colleagues have been raising awareness of the notion of psychological invisibility imposed upon Indigenous People by the systematic removal of their cultural presence in educational materials (Fryberg & Eason, 2017; Fryberg & Townsend, 2008; Fryberg & Stephens, 2010). As their research champions, the practice of removing the content addressing entire cultures of people conveys a message of irrelevance to that group – made all the starker and damaging when the nearest representation of Indigenous people are represented as historical artifacts. This perpetuates the myth that Indigenous nations were “frozen in time” and have not been continuously present in society (see Leavitt, Covarrubias, Perez, & Fryberg, 2015). The result of this widespread approach to curricular erasure has a negative psychological impact on Indigenous learners. In essence, the children cannot see themselves in the curriculum that is designed to “tell the story” of their country (i.e., the land currently identified collectively as the United States), creating two points of conflict. First, Indigenous children receive the message that their cultures do not belong in contemporary society or is inferior, because the standard curriculum narratives delegitimize Indigenous nations and center the settler or colonial narrative (Sabzalian, 2019). Second, Indigenous children are pushed to reconcile they exist in “two worlds” – their home culture and the school culture. As Vine Deloria and Daniel Wildcat articulate in their collection of essays on education (Deloria & Wildcat, 2001), this duality often forces Indigenous learners who wish to excel in the U.S. educational system to leave their tribal lands and traditions behind.

Learners from marginalized or minoritized cultural groups collectively face barriers in the predominantly Eurocentric curriculum. The metaphorical “mirrors and windows” approach to recognizing underrepresentation in literature and educational materials (Bishop, 1990, 1997) helps educators be more mindful of resources used in schools. Using this framework, Reese (2018) highlights the importance of Indigenous authors creating the content employed to convey stories about specific tribes to promote authenticity. Centering Indigenous voices also ensures traditions and stories are shared in ways that are consistent with the cultural values of the Indigenous nation. Overcoming this invisibility supports the goals of tribal critical race theory (Brayboy, 2005) or Indigenous critical theory (Reese, 2008), which advocate for identifying how Indigenous perspectives have been suppressed and discounted in the colonial, Eurocentric narrative.

## **False Curricula Harm Dominant Cultures**

While it is clear and irrefutable that misrepresentation of a culture in educational contexts provides a toxic message to those learners who are connected to the erased or invisible culture, this systemic oversight is also harmful to society as a whole. The first point of harm comes out of the wealth of generational tribal knowledge that is routinely overlooked or discounted as folklore and myth (Brayboy, 2006; Reese, 2018) that could support solutions to existing challenges in today’s world. As Wildcat (2001c) expressed, we can benefit from Indigenous knowledge that has

been built from “the lived experiences of peoples who have resided in places long enough to know and remember what it means to be Native to a place” (Wildcat, 2001c). Failure to incorporate perspectives in a pluralistic society is simply short-sighted and limiting.

In addition to failing to capitalize on valuable Indigenous knowledge, centering educational content, and popular media representations on a colonial or settler narrative advances and increasingly stereotypic representation of non-dominant cultures. Recent research examining non-Native U.S. residents demonstrated that roughly 75% of over 5,000 respondents could not identify a “famous living Native American” and when asked to identify a “film with a Native American character,” the responses were similarly dominated by stereotypic (and usually historical) representations of Indigenous people (Davis-Delano, Folsom, McLaurin, Eason, & Fryberg, 2021). When educational materials and leaders are silent on a topic, stereotypes portrayed in popular media and culture become the dominant and accepted representation (Leavitt et al., 2015). To illustrate the relevance of this problem in education, disconcerting inaccuracies, and stereotypic thinking was documented in a national survey of practicing teachers (Cassady, Schupman, Heath, Smith, & Yerdon, 2021). Teachers were unaware of the wide diversity in tribal nations (only 16% correctly identified the claim “there are roughly 120 federally recognized tribes” was false – a value that misses over 400 tribes). Furthermore, less than 60% of teachers believed that Indigenous cultural “mascots” were harmful to tribal children’s self-worth. Finally, teachers routinely misunderstood the concept of tribal sovereignty.

Increasingly biased views of Indigenous people lead to the perpetuation and entrenchment of a settler-colonial narrative that continues to validate views that sovereign Indigenous nations are not present in contemporary contexts and have abdicated their autonomy or agency through the processes of removal and forced assimilation (Hopkins, 2020). The result of the dominant culture’s inability to “see” Indigenous people in accurate historical and contemporary contexts is crippling and consequential, influencing “non-Native attitudes toward Native Americans, which can then affect treatment and public policies that impact Native People” (Davis-Delano et al., 2021; pg. 13). For instance, when products of an educational system are ignorant of Indigenous nations’ diversity and sovereignty, they are unprepared to effectively support the existing rights of Indigenous people as well as critically interrogate existing and forthcoming policies that disenfranchise them (Sabzalian et al., 2021).

---

## **Strategies to Recognize and Include Indigenous People in Education**

To support educators in the process of transitioning from perpetuating misconceptions, biases, and stereotyped views toward culturally responsive pedagogy, systemic efforts are needed (systemic problems require systemic solutions). To support this reformation in education, there needs to be action focused on (a) recognizing the

misconceptions that have persisted, (b) holding curricula accountable for portraying accurate core conceptions, and (c) providing supportive structures for educators (Phillips, 1983). A key feature in this process is to advance the number and quality of standards that feature Indigenous content, both as “stand-alone” topics focused on Indigenous peoples (recognized as significant by the National Congress of American Indians, 2019) and as integrated regularly into the standard educational framework (Sabzalian et al., 2021).

It would be naive to consider the process of changing statewide or national standards as a simple process. Political pressures, maintenance of status quo, defensive orientations of educators and policymakers, and curriculum crowding all serve as real and present barriers to growth (Anthony-Stevens, Jones, & Begay, 2020; Quigley, 2016). However, key features of promising systemic efforts serve as a starting point for local and national efforts to more effectively include culturally inclusive and accurate representations of Indigenous nations and people. These strategies are anticipated to assist educational leaders in promoting progressive and continued improvement in the inclusion of Indigenous voices adding to historical narratives. Acknowledging and hearing from diverse perspectives enables learners to more fully understand the complexities of history and civics which enables the learners to be more informed citizens who can contribute to a just society (Davis-Delano et al., 2021; Sabzalian et al., 2021).

## Visibility in Standards and Curriculum Development

One strong case study of a systemic approach to revising the content of educational materials and standards at a state level has been well-documented, focusing on the process of developing and delivering the Montana Indian Education for All (IEFA) program (Hopkins, 2020). As Juneau (2001) recounted, a key first step to curriculum revision was a change in the state constitution in 1972 in which the state recognized “the distinct and unique cultural heritage of the American Indians and is committed in its educational goals to the preservation of their cultural integrity.” (Montana State Constitution, Article X, Sect. 1.2). As such, Montana started by overcoming the invisibility of Indigenous nations. IEFA was enacted by state legislation in 1999, declaring that all students in public schools “learn about the distinct and unique heritage of American Indians in a culturally responsive manner” (Montana Office of Public Instruction; as cited in Hopkins, 2020, p. 7). Furthermore, a requirement of IEFA is that instructions occur across grade levels and content domains. While similar efforts in select states (e.g., Washington, Wyoming, Oregon, and Oklahoma) have been also been promising, the reality is these statewide curriculum revisions remain the minority (Shear et al., 2015).

Hopkins (2020) attributed much of the success in implementing IEFA to the explicit policy mandating the inclusion of Indigenous people as partners in designing and implementing the curriculum. This involves both engaging Indigenous people in the creation of standards as well as ensuring tribal-informed materials and resources are available for meeting those standards. In essence, a simple lesson to be learned

from IEFA's success addresses the problem identified by Deloria (2001a), who stated "the thing that has always been missing in Indian education, and is still missing today, is Indians" (p.152).

The success of IEFA has bolstered and inspired efforts to provide a national framework to help guide educators at all levels to reflect upon and improve their approach to education related to Indigenous cultures. The National Council for the Social Studies (NCSS) has provided national standards that focus not on specific events or content but address broad disciplinary skills-focused goals, with guidance toward an inquiry-based model framed around the College, Career, and Civic Life (C3) Framework (NCSS, 2017). NCSS released a policy statement in 2018 calling upon all educational leaders to recognize and correct the reality that "education often perpetuates a false understanding of history and trivializes the past and current experiences of Indigenous Peoples and Nations" (NCSS, 2018; p. 167). NCSS advocated for ensuring Indigenous nations were identified as foundational to social studies, rather than peripheral or stand-alone units. Furthermore, they recommended primary starting points for interrogating educational practice:

1. Commitment to responsible representations – recognizing the stereotypes that are replete in society and educational settings (mascots, cultural appropriation, and overgeneralization).
2. Presentation of current events and movements – illustrating the contemporary presence of Indigenous nations.
3. Explicit coverage of tribal governance and sovereignty as civics education.
4. Challenge Eurocentric stance in social studies topics (e.g., "discovery" or "Westward expansion").
5. Affirm Indigenous Knowledge in various fields as relevant and instructive.
6. Pattern curriculum reform after long-standing Indigenous advocacy efforts (such as IEFA).
7. Foster and promote relationships with Indigenous nations and communities – sensitive to the cultural protocols of the Indigenous communities. These efforts may involve connection with local tribal education departments in states with tribal presence. For those states where tribes have been removed from their traditional lands, connection with the Indigenous nation in their current space may be possible and serves as an opportunity for state and district leaders to acknowledge their organization resides on traditional homelands of a removed people (NCSS, 2018; pp 169–170).

To support the implementation of these efforts, educational leaders with Indigenous expertise at the national level such as the National Indian Education Association and the Smithsonian's National Museum of the American Indian (NMAI) have been instrumental in supporting schools in making these transitions. For example, NMAI's *Native Knowledge 360° Framework for Essential Understandings about American Indians* promotes conceptual change in understanding about Indigenous histories, cultures, and contemporary lives by inducing an ontological shift in the approach to content presentation (Chi, 2008). This is accomplished by disrupting

resident theories and engaging teachers and learners in actively reconstructing their understanding of the fundamental presence and role of Indigenous people. NK360° shifts attention toward transferable skills that promote review of disciplinary domains through a critical lens that is conscious of Indigeneity.

The NMAI Essential Understandings are organized under the ten themes of the NCSS social studies standards. As an example, one of the themes is *Power, Authority, and Governance*. The first sentence in the NMAI Essential Understanding provides a call to action for educators:

*The 21st-century classroom should include experiences that provide for the study of how American Indians create, interact with, and change structures of power, authority, and governance*

Next, the Essential Understanding invites educators to consider large conceptual ideas related to the power, authority, and governance of indigenous nations:

*American Indians devised and have always lived under a variety of complex systems of government. Tribal governments faced rapid and devastating change as a result of European colonization and the development of the United States. Tribes today still govern their own affairs and maintain a government-to-government relationship with the United States and other governments. (NMAI)*

Such concepts support an ontological shift by providing examples of broader themes, new language and perspectives, and inspiration to curriculum writers and teachers. The value of these resources is the empowerment provided to meet disciplinary best practices with quality content. For instance, using this specific Essential Understanding, and linking to Dimension Two of the C3 Framework (“evaluate social and political systems in different contexts, times, and places, that promote civic virtues and enact democratic principles”; NCSS, 2017), a specific historical focus for a lesson might address the structure of the Haudenosaunee Confederacy’s (Iroquois) Great Law of Peace as a tripartite formal democratic structure that preceded the one created in the Continental Congresses. A contemporary example might inquire into how Indigenous nations govern today and the types of issues they deal with, such as economic development, natural resource management, and criminal jurisdiction.

## **Authentic Voices and Multiple Perspectives**

A simple way teachers have been encouraged to recognize different perspectives in their coverage of the histories of indigenous cultures in the United States has been to ensure that for every story involving Indigenous peoples being encountered, colonized, or “discovered,” learners have the opportunity to consider that story from the perspective of the culture that was “facing East” in the story (Richter, 2001). That is, rather than having all texts discuss “westward expansion” (which is a narrative taking only the viewpoint of the white colonizers), learners examine the context of people

who were “already there” and their experiences with oncoming invaders. Students examining these histories should be encouraged to do more than “imagine what it would be like.” They should be provided with available resources that provide a record of the experiences of those tribal members who were living in that time and experiencing those events. Quigley (2016) illustrated this process in an account of staff development where teachers received textbook representations of boarding schools contrasted with first-person accounts of children who were forced into those settings. This demonstration of multiple perspectives illustrated the potential to interrogate the assumptions and conclusions made in the textbook account (the Indigenous children need to be socialized into the American system), as well as see the real impacts on children taken from their families (Quigley, 2016). In the absence of the Indigenous perspective, the sanitized version of boarding schools fails to recognize the false presumptions of American exceptionalism as well as the persistent and pervasive negative effects on Indigenous communities and people.

Another example of an educational experience effectively illustrating multiple perspectives is the instructional support materials provided to accompany the *Dawnland* documentary (Lesser, 2021; Mazo & Pender-Cudlip, 2018). *Dawnland* documentary the Maine Wabanaki-State Child Welfare Truth and Reconciliation Commission, revealing to viewers the often-overlooked state-sanctioned removal of children from their homes well into the latter half of the twentieth century (Lesser, 2021). To enable this deep inquiry lesson, teachers are provided with a compelling question to guide the instruction and student exploration (“What is the relationship of the taking of the land and the taking of the children?”), with supportive primary documents from history that faithfully offer points of view “from the boat” as well as “from the shore” starting from the colonial invasion of Wabanaki land and progressing into the present day, anchored by the film (Mazo & Pender-Cudlip, 2018).

## De-Mythologizing Through Inquiry

The misconceptions commonly held about Indigenous people, nations, and cultures are widespread and well documented (NCSS, 2018). As such, educational efforts can be strategic in structuring content delivery in a fashion that directly dismantles the myths and biases that are common in society (Davis-Delano et al., 2021). The general strategies known to effectively isolate and invalidate an individual’s misconceptions include (a) making known the “resident theory” that the individual maintains, (b) providing learning materials that enable the recognition of conceptual failures, (c) ensuring a superior replacement is available to supplant the misconception – ideally focused on active construction by the learner to ensure deeper understanding (Chi, 2008; Sinatra & Chinn, 2012).

The NMAI’s Native Knowledge 360° education initiative features online instructional materials for classrooms. One of the featured resources is an inquiry titled “What Does it Mean to Remove a People?” which focuses on the Indian Removal Act of 1830 (Smithsonian National Museum of the American Indian, 2018). This online inquiry addresses misconceptions and omissions commonly observed in

instruction about Indian Removal. For instance, common misconceptions include (a) the “Trail of Tears” was relocation imposed upon one tribe (the Cherokee) in the 1800s and (b) Indigenous nations were merely passive and did not engage in active agentic processes to resist removal. Furthermore, typical instruction focuses primarily on the act of removal, ignoring decades of policies, fraud, and other pressures leading to removal and disregarding the post-removal experiences of Indigenous nations after they arrived in Indian Territory.

Simply, the standard presentation is an oversimplification of the widespread and systemic removal of Indigenous peoples and the wide array of strategies employed by Indigenous nations and individuals to survive. To enable greater awareness of these complexities, the module provides the perspectives of seven different tribes who were removed from their traditional lands. The presentation engages learners in a personal inquiry process that requires active engagement with primary source historical documents, images, maps, and quotes representing both Indigenous and colonizing perspectives. These materials allow learners to recognize multiple strategies employed by the different tribes (as well as within tribes) to resist the removal efforts and colonization or adapt as a culture to survive. In addition, seeing videos of present-day descendants of the Indigenous nations who were removed from their traditional lands helps learners cast aside the “frozen in time” misconception (Shear et al., 2015) – observing that the people were removed from their lands but continue as agentic and sovereign nations.

## Teacher Professional Development and Training

When teachers are asked to comment on the barriers they observe in their ability to effectively provide culturally appropriate representations of content, they cite incomplete training and insufficient curriculum materials (Cassady et al., 2021). Teachers also report great interest in access to better materials to support their *teaching* – however most teachers unknowingly hold inaccurate and harmful beliefs or misconceptions about Indigenous People because they are *products* of the existing and flawed Eurocentric educational and societal narrative (Archibeque & Okhremtchouk, 2020; Shear et al., 2015). With those pre-existing biases, merely offering new instructional activities, standards, or content will lead to insufficient outcomes, because it is unlikely to lead to complete conceptual change for the educational leader. To promote more culturally accurate coverage in classrooms, there is a need for structured in-service professional development and pre-service teacher education that (a) engages teachers in building multiple perspective thinking, (b) promotes infusing Indigenous content in the early grades, (c) combats the misconceptions of Indigenous nations and people as historical, unidimensional, and lacking in self-determination, and (d) builds teachers’ familiarity with high-quality classroom resources (Hopkins, 2020; Sabzalian et al., 2021; Shear et al., 2015).

Hopkins voiced the importance of supporting non-Native educators in “desettling” as a core feature in professional development experiences. Desettling is a transformative process aligned with a tribal critical race consciousness that recognizes that “world

views” and inherent conceptual understandings of most non-Indigenous people are dominated and centered in a Eurocentric narrative (Brayboy, 2005). Desettling focuses on decolonizing the curriculum by recognizing that non-Native’s hold misconceptions and resident theories centered in a Eurocentric framework. Hopkins (2020) suggests that “Land Education” be employed when possible to support this process, which engages educational training in a tribal setting to promote authentic awareness of tribal cultures. This process is particularly important for those white educators who are working in schools serving Indigenous youth.

Archibeque and Okhremtchouk (2020) also explored the needs of white classroom teachers working in a school serving predominantly Indigenous students, identifying specific themes to promote readiness for non-Native teachers serving Indigenous youth. First, the teachers learned the importance of social dynamics among the members of the tribal communities. Adapting from their Eurocentric understanding of personal relationships, teachers learned that it was essential that they develop relationships not only with the children in the classroom, but also with their families and the community. This relationship-building developed trust and support and validated the educational goals promoted by the teachers. The teachers also reported on the importance of recognizing the pedagogical dynamics in the classroom (Archibeque & Okhremtchouk, 2020). Culturally responsive adaptations include greater attention to community life, tribal celebrations, and traditional values for the tribal communities. Teachers also expressed the need to reframe their views of success in their practice. Rather than being focused entirely on statewide assessments of proficiency to determine the school or child success, working in a tribal reservation setting illuminated the importance of knowing and supporting locally-valued indicators of success.

---

## Conclusion and Reflections

Systemic oppression of Indigenous peoples has been the standard protocol in a variety of forms since initial contact by European explorers. As U.S.-Indigenous interactions have transitioned over the last 250 years, we see greater attention to legal protections, awareness of sovereign rights, and clear expression of agency among Indigenous nations in political, economic, and educational arenas. While there are excellent examples of progress in addressing systems-level fallacies about Indigenous histories and cultures, most classrooms continue to operate in the fog of misconception and stereotypes. Recognizing the need for systemic conceptual change about the place of Indigeneity in standard curriculum development and delivery is the first step in addressing these biases and preparing learners to live in a truly diverse and inclusive society.

Common responses from educators whose misconceptions and biases are exposed in this conceptual change process include embarrassment over ignorance, shame in adding to the problem, and dismay over how to proceed. Cultural experts often disarm guilt and shame in these settings, pointing out that those emotional responses are appropriate – but not the primary goal, which is to promote better

outcomes. This often occurs by accepting or affirming the belief that the educator was truly unaware of the misconceptions and biases and hold no overt racist malice toward Indigenous people. However, the gracious allowance for ignorance comes with a price. Once these problems have been exposed to the educator or leader, ignorance or naivete can no longer be offered as a defense for the curriculum, standards, or practices of education that promote biases and false narratives.

As such, educational leaders are in a key position to call attention to the pervasive biases and misconceptions, build coalitions that can effectively interrogate the curricula and standards guiding practice, and promote positive change in their communities, states, and beyond. These are all systemic efforts and require in many cases considerable conflict with the status quo in education. However, as Deloria (2001a) described in his analysis of the “Perpetual Education Report,” 200 years of federal education reports have made essentially the same conclusions about the challenges facing education with Indigenous people and topics, when what is needed is an education system that recognizes the reality of Indigenous cultures. Such adaptations are not simple, but as Deloria concludes: “If traditional institutions, programs, and teaching have to be changed, so be it. After five centuries of contact, it does not seem too much to ask non-Indian educators and institutions to come to grips with the reality that is the American Indian” (Deloria, 2001a; p. 161).

## Abstract

This chapter aims to deconstruct culturally relevant leadership (CRL) and social justice leadership (SJL) frameworks in newcomers' education using the Foucauldian lens, based on extensive research on refugee and newcomers' education and its leadership. The way the Foucauldian lens on enunciative fields will be utilized in this chapter draws on the proposition of its authors that implementing social justice policies in schools and that existing educational leadership theory (mostly developed in "Western" societies) cannot simply be adopted without revisiting and contextualized into all other world societies, rather a critical form of educational leadership is needed that grounds educators' work in their cultural and social heritage and enables them to understand and carry out their responsibilities in the local educational field.

**Introduction**

Every year, people lose their lives or loved ones, and face human trafficking and other forms of violence on their way to *safer* lands, escaping from violence in their home countries. As “No one leaves home unless home is a mouth of a shark” (a quote by Warsan Shire as cited in Arar, 2020), the dynamics behind the forced refugee experience is complicated. This is a story of a former teacher who owned a language studies institute in Syria. He is now a refugee in Germany and he narrated his story:

As a former teacher, who owned a language studies institute in Syria, my children (five in number), were the best in school, despite the war. I saw that there was no chance, even for my own children. The schools ceased to operate, studies ended for my boys, who were about to take matriculation exams and complete secondary school. I decided to emigrate, I sold my house and property. I paid smugglers to bring my wife and three of my sons to the German border. Meanwhile, I and my oldest son, travelled from Syria to Turkey. We walked for days, with little food and money, very many kilometers. In Turkey, we were forced to pay smugglers to cross the border into Europe. We wandered for many days and nights in a small group... walking aimlessly without direction, the time and distance didn't really matter, we wanted sanctuary. Then we arrived in Hungary, where the Hungarian police arrested us, what didn't they do to us! We went through agony, although we had not harmed anyone, and then they sent us back to the Turkish border. Eight days later I repeated the same path and I succeeded [I don't really want to explain how] in reaching the German border. Even though they inspected us and interrogated us quite a lot, the Germans, they finally allowed us the safe haven we sought, food, a place to sleep. We were about 800 refugees who had arrived from different cities in Syria. It took me three months in the border camp until I could join my family. I have now been here in Germany for three years and they have not yet given me the status of permanent resident, we have tried hard to obtain it, but they did not recognize my resources or those of my wife, although we are both teachers. I work in a café, my wife is at home, trying to learn German. My children find it very difficult at school, the language is not easy at all. Each day that passes in our lives here is renewed survival. I won't hide the fact that there are Germans, who try to help us, like the social worker, but the laws here and the bureaucracy are very difficult. (See Arar, 2020)

This is a story that could be told by any refugee on the move because of the forced displacement and flight from home. Refugee movements fast proliferated between 2010 and 2019, following the United States' invasion of Afghanistan (2.6 million) and Iraq, the civil wars in Syria (6.3 million refugees in 2017), South Sudan (2.4 million), Somalia (0.9 million), and Yemen, and the increase of South American immigration to the United States, immigration within Asia and Asia, particularly from Myanmar (1.2 million), and significant immigration from North Africa to Europe. National policies vary toward the absorption of refugees as *forced*

*acceptance, temporary protection; controlled and selective integration; or a welcoming guest reception* (Arar, 2020), while shaping the approach of the local schools toward diversity. Understanding the refugees and newcomers' state as "exile as a modern human condition resulting from the combination of global migration, war and dispossession, statelessness, economic restructuring, and other disruptions" (Leonardo, 2020; p. 103) is important because being a refugee in an unknown place means "existing to struggle while finding a sense of humanity in the struggle to exist" (Leonardo, 2020; p. 106). Therefore, it is essential to discern refugees from other types of immigrants since they are exilic because of any kind of hardship at homeland.

The recent scene in the refugee hosting countries is complicated (Dryden-Peterson, 2017). Those who receive massive numbers of displaced people in the last 10 years encounter diversity of challenges and host states often find it difficult to cope with the inflow of large unexpected populations of migrants and to cope with their basic requirements. Their economic, health, and education systems are adversely affected by refugee influx and are likely to experience turbulence. Education systems in the host countries faced with challenges in terms of policy and practice to ensure inclusive, healthy and welcoming schooling services to the refugee minors, who arrive in traumatic states (Arar, Örücü, & Waite, 2020; Dryden-Peterson, 2017; Şirin & Şirin, 2015). Yet, education is the primary formal means to reduce uncertainty and to build better future for the vulnerable children as new comers seeking to integrate in the host society (Arar et al., 2020; Banks, 2017). Given this situation, the roles and responsibilities of school leaders are redefined in how they would address the needs of such vulnerable student communities through welcoming schooling enhancing their integration (Guo-Brennan & Guo-Brennan, 2019). Regardless of and/or despite the political context, educational leaders at school level face moral and ethical dilemmas in creating fair access to high-quality education. Thus, acting to ensure the appropriate premises and academic programs for the refugee children through constant support for healthy integration and better future bring more responsibility and demand on the part of the school leaders (Liou & Hermanns, 2017).

Moreover, refugee minors landing with high level of trauma and vulnerabilities in the host countries (Şirin & Şirin, 2015) necessitates special attention and a sensitive approach while their challenges embedded in the form of culture shock, integration, and adaptation problems create more responsibilities for the school community. Much has been said about the nature of leadership in refugee schools (Arar, 2020; Banks, 2017) and two main concepts of leadership in the literature rest upon cultural relevance (Arar, Örücü, & Ak-Küçükçayır, 2019b; Horsford, Grosland, & Gunn, 2011; Khalifa, Gooden, & Davis, 2016; Lopez, 2016) and social justice (Aronson & Laughter, 2016) to guide the school leaders and teachers to provide welcoming and inclusive education for newcomer children.

Given the above phenomena, this chapter aims to revisit and deconstruct culturally relevant leadership (CRL) and social justice leadership (SJL) frameworks for refugee and newcomer education using the Foucauldian lens based on the authors'

extensive research on educational leadership for refugees and newcomers. The way the Foucauldian lens will be utilized in this chapter draws on the proposition of its authors that implementing social justice policies in schools and that existing educational leadership theory (mostly developed in “Western” societies) cannot simply be adopted into all other world societies and context. Rather a critical and reflective form of educational leadership is needed that grounds educators’ work in their cultural and social heritage and enables them to understand and carry out their responsibilities in the local educational field (Arar, 2020; Arar, Brooks, & Bogotch, 2019), while revisiting these models and their praxis in their social and cultural context (Waite & Arar, 2020, p. 178). Indeed, the current reform and improvement initiatives emphasize the responsiveness of schools, teachers, and educational leaders to cultural, racial, gender, sexual, and religious diversity within their client, student, parent, and community populations (Blackmore, 2006, p. 181). On the contrary, in practice, this could remain as a rhetoric. This is a drive to reconsider CRL and SJL frameworks in the field of EA through Foucauldian lens.

---

### **Reframing Culturally Relevant and Socially Just Leadership for Refugees: A Foucauldian Analysis**

CRL and SJL are frequently discussed frameworks in addressing diversity (Arar, 2020; Arar et al., 2019; Khalifa, 2018; Lopez, 2016) as is the case with marginalized and vulnerable groups such as refugees and newcomers. The volatile state of war, social unrest, and natural disasters lead to the rise of refugee influx, which reify the unique position of schools being able to form conditions of equity, high academic expectations, and social in/justice in contexts where there is a demographic transformation (Arar et al., 2020; Liou & Hermanns, 2017). While such vulnerable groups rise in number and the large refugee migration into many countries has contributed to increasing multiculturalism, the mainstream literature in educational administration, management, and leadership is criticized for being hegemonic, standardized, market-driven (Blackmore, 2006) and eschewing to focus on marginal lives and their needs in schools (Arar, Örüçü, & Wilkinson, 2021). One should be cautious of the warning about the misleading cultural isomorphs forged by the Western knowledge in EA (Begley, 2000) as this section will be elaborating on the CRL and SJL in refugee education through Foucauldian concepts of power/knowledge relationships and enunciative field (Foucault, 1972).

Defining social justice (SJ) has been a controversial issue in the literature as it has been regarded as an elusive and ambiguous concept (Bogotch, 2002; Waite & Arar, 2020). Thus, cultural relevance finds itself a position within the SJ as an umbrella term (Khalifa et al., 2016). In an effort to deconstruct these two frameworks in refugee schools, the uniqueness of Foucault’s perspective (Foucault, 1972) is that he situates knowledge and identities in a historical cultural context. Thus, Foucault’s attention to history as the “archaeology” or “genealogy” of knowledge production (English, 2020; Gillies, 2013) urges to explore the continuities and discontinuities between “epistemes” (idea of what constitutes knowledge) (Armstrong, 2015). In educational

leadership, a field already with blurry boundaries (English, 2020) have “authority-figures and gatekeepers controlling the field of knowledge, as also critiqued by several researchers (Blackmore, 2006; English, 2020), including the boundary-work which decides what shall and shall not count as a valid element of it” (Armstrong, 2015; p. 5). Foucault, in this respect, asserts that knowledge is inextricably connected to power as it is both created by it and creates it simultaneously: the “regimes of truth” which operate in society could be promoted (Foucault, 2002).

In this sense, literature and ways of seeing SJ and CRL for refugees depend on the cultural hegemonic discourses in the enunciative field, where the regimes of truth is reconstructed through the gatekeepers’ knowledge and their hegemony; while gatekeepers are most frequently “White and Masculine voices” from Anglo-American cultures (Blackmore, 2006; Brown & Strega, 2005). Hence, traditional social science research has ignored and silenced the marginal experiences of the Other, using a deficit-informed approach in explicating lives and experiences of groups on the margins, while their histories, experiences, cultures, and languages have historically been devalued, misinterpreted, and tokenized in academia (Brown & Strega, 2005). Newcomers and their education as the context in this chapter bear similar features as refugees are regarded to be at “margins” as a case.

In agreement with Blackmore (2006), the absence of transformative discourse toward cultural diversity in policy and mainstream educational leadership and administration (ELA) literature is reified through the critical gaze of the “the other.” On the contrary, identity cannot be reconsidered without the influence of hegemony (Foucault, 1975) as hegemony refers to the fact that individuals can maintain their dominance over other groups of individuals in a society via coercion rather than violence (Gramsci, 1971). Hence, the awareness of the structured binary oppositions as in the form of “otherness” (Derrida, 1982) has led to the formation of this manuscript. Given that “all social justice/educational reform efforts must be deliberately and continuously reinvented and critiqued” (Bogotch, 2002, p. 15), one needs to reiterate the emphasis on the deeper cognizance of the culture in studying educational leadership, management, and administration (Bajunid, 1996). It is now agreed that Western-led educational interventions (Goh, 2009) and one-size-fits-all approach do not forge the necessary accoutrements of school leaders in non-Western contexts (Begley, 2000; Goh, 2009; Oplatka & Arar, 2016).

Drawing on the evidence that Western-centric approaches (Begley, 2000) do not “acknowledge the rich cultural traditions, theories and practices of recipient societies, and may not be appropriately scrutinized for ‘cultural fit’” (Collard, 2007, p. 740), one needs to be cautious of the adoption of Western “cultural bound” theories in the local school contexts (Goh, 2009), it is the authors’ urge to deconstruct the CRL and SJL in educational settings of marginalized refugee and newcomer pupils.

---

## Enunciative Fields in SJL and CRL Frameworks

The configuration of the enunciative fields in Foucauldian terms (Foucault, 1972) has three subfields as the field of memory, the field of presence and field of concomitance, while all accompanied by discontinuities and ruptures which form

the different viewpoints within (English, 2020). In any field or framework within, discourse simultaneously forms the objects of which it speaks, categorizing the world in a particular way through power (Foucault, 1972). Power and knowledge are mutually productive, yet power as a discourse depends on the knowledge it has constructed, and developed and promulgated, but that very knowledge is itself dependent on power relations (Niesche, 2011, p. 27).

### **The Field of Memory**

Of the enunciative fields in Foucauldian terms, the first one is the field of memory which refers to the genesis, past traces, ideas, theories, and concepts that are no longer considered valid or viable in the field. That is, *the field of memory* in ELA discourse, in a broader sense, includes the celebrated theories and epistemologies such as scientific management, human resources management, systems approach, as borrowed from the mainstream management literature, while the theory movement, positivism, and standardization measures, that is, ISLLC standards marked their hegemony in the history (Papa, 2009), produced mainly the US-based scholars through their seminal works. This is true for issues of equity, diversity, inclusion, and social justice leadership, which were heavily developed in and through Anglo-phonetic contexts and perspectives (Gümüş, Arar, & Oplatka, 2021). Yet, one can see there was no room for cultural politics, cultural sensitivity, or social justice in the archeology of EA. To better interrogate the place of social justice in the field, one needs to remember the below quote hinting at the hegemony embedded even within the intellectual terrain by Campbell (1964):

In seeking talent for the professorship. . .we should look for men who are bright, who are young, who have dealt with the major ideas of Western culture, who have exhibited some independence and creativity, and who have a commitment to education. (p. 19)

What could one expect as knowledge production considering social justice and cultural relevance in *refugee education* from this kind of a *definition of the professoriate* and which has been reaffirmed in recent analysis conducted by Gümüş et al. (2021)? If one to deconstruct this definition; apparently it is full of binaries. Recall identity/self and space are significant factors behind knowledge production in any discipline (Foucault, 2002). Therefore, there was no mention of SJ or CRL in the ELA literature until 1960s. Since the 1960s due to the abolition of school segregation in the USA, scholars have indicated the significance of being responsive to expanded meaning in terms of practice. Some researchers have developed specific models and strategies that would address high-needs students in diverse school contexts such as Culturally Relevant Pedagogy (CRP), and Culturally Relevant Teaching (CRT) (Aronson & Laughter, 2016), and a more recent outcome of these approaches is the development of CRL, as a significant component of SJL (Arar, 2020). CRL historically derives from the line of culturally relevant pedagogy (CRP) (Ladson-Billings, 1994) and its further version as culturally responsive teaching (CRT) (Gay, 2010). CRP is

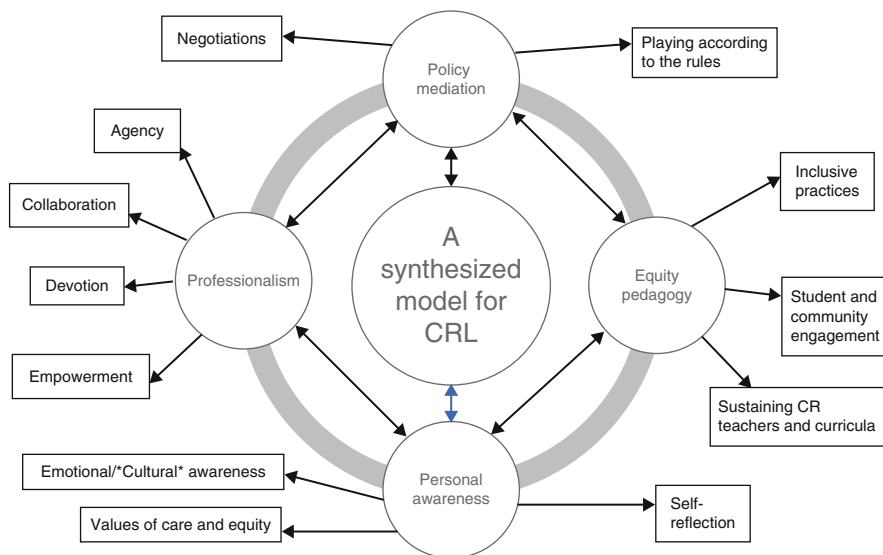

defined as a teaching approach “that empowers students intellectually, socially, emotionally, and politically using cultural referents to impart knowledge, skills, and attitudes” (Ladson-Billings, 1994, pp. 16–17). Thus, CRT is about using cultural knowledge, prior experiences, frames of reference, and performance styles of ethnically diverse students to make learning encounters more relevant and effective for them” (Gay, 2010, p. 31). These two frameworks have led to the understanding of CRL, moving the scope from teaching to school leadership praxis to the present.

### **The Field of Presence: An Attempt of A CRL Model**

The *field of presence* signifies current concepts, theories, or perspectives that are now considered to be valid and viable (Foucault, 1972). The premise that CRL and SJL align with multicultural education praxis is about providing a democratic citizenship and equitable education (Guo-Brennan & Guo-Brennan, 2019). Thus, seeking for social cohesion in the host community necessitates using knowledge about the social, cultural, and language backgrounds of refugee, undocumented, and newcomer students (Banks, 2017).

A foundational framework for SJL was provided by Fraser (2009) based on three critical concepts as redistribution, recognition, and representation. Redistribution is regarded as sense of distributive justice (relating to allocation of resources), recognition involves consideration of cultural injustices (focusing on the distribution of power) and representation identifies and relates to political injustices (recognizing the need to reflect on multiple identities) (Blackmore, 2006). Hence, English (2020) further purports six barriers to social justice implementations as follows: textual unresponsiveness to social justice issues; school leaders being agents of organizational conservatism; social science methods erasing subjectivity and diminishing moral choices; an aversion to emotionality and other nonrational factors in decision making; a troubling legacy of national leadership standards; and a field historically dominated by anti-intellectualism.

The review of different frameworks of SJ and CRL in an intertwined fashion, a synthesized model, was reached (see Arar, 2020) based on three different models (Horsford et al., 2011; Khalifa, 2018; Lopez, 2016), which could contribute to address some of the barriers stated by English (2020). Culturally relevant leadership discerns the leadership philosophies, practice derived from the concept of culture and policies that create inclusive schooling environments for students and families from ethnically and culturally diverse backgrounds (Horsford et al., 2011; Khalifa, 2018; Lopez, 2016). These three models all focus on critical reflexivity of the leaders on themselves and the contexts they work in, on creating inclusive and caring schools through teacher empowerment, community and student engagement especially when, in this context, dealing with deprived, wounded, and underprivileged refugee students suffering from economic deprivation, trauma, and loss and possibly endured harmful life experiences. Thus, school leaders need to perform collaboration and agency and mediate the policy creatively at the school level. Based on the previous research (see Arar, 2020; Arar & Örüçü, 2020; Arar et al., 2019b, 2020;

**Fig. 1** The CRL Model (Arar, 2020)

Waite & Arar, 2020) and analysis of the three models, we came up with a restructured synthesis, as in Fig. 1.

This visual deconstruction and synthesis might be useful as a framework for culturally relevant leadership based on the three aforementioned models. It has four main components such as personal awareness, inclusive pedagogy, policy mediation, and leader professionalism. *Personal awareness* is about moral values, emotional awareness of the vulnerable state of refugee students as well as their peers in the host community. Moreover, the school leaders' involvement in critical self-reflection is crucial as also suggested directly (Khalifa, 2018; Lopez, 2016) and indirectly (Horsford et al., 2011). However, the "emotional awareness" is not emphasized in the previous models, and it is essential in any effort to build a culturally relevant approach in refugee schools. Moral responsibility, emotional empathy, and cultural understanding on the part of the educators are essential especially for those working with vulnerable groups. Evidence shows that understanding the emotions and emotion management in refugees and those working with them is complex as emotions and cultural understanding has an interrelated pattern (Örüçü, 2019). *Inclusive pedagogy* is ancillary to inclusive educational implementations, engaging students and community for social cohesion and integration and promoting culturally relevant teachers and curricula for both refugees and host nations' pupils. In realizing these components, *policy mediation style* that forges negotiation with external and internal parties, taking risks while playing according to the rules (Lopez, 2016) is needed. The delicate balance is critical in the cases where policy lacks clear guidelines (Arar, Örüçü, & Ak-Küçükçayır, 2019a) or ignores the healthy

integration of the refugees (Dryden-Peterson, 2017). *Leader Professionalism* is another component (Horsford et al., 2011), which pervades agency in overcoming the prejudice to establish the necessary inclusive and cultural practices while engaging the community.

Empowerment of teachers and students at school level through professional collaborations with internal and external actors is a must to achieve culturally relevant and socially just practices in refugee schools. That said, social justice and the necessary activism are driven by “the entrenched social norms giving unique meanings to issues of justice, respect, interpersonal relations, equality and equity in education” (Oplatka & Arar, 2016, p. 366).

### **The Field of Concomitance**

A *field of concomitance*, in Foucauldian lens, refers to the “statements that concern quite different domains of objects, and belong to quite different domains of objects, and belong to quite different types of discourse, but which are active among the statements studied” (Foucault, 1972, p. 64). Herein, the interdisciplinary nature of ELA field marks itself on SJL and CRL discussions in refugee and newcomers’ education. CRL and SJL aim for a democratic citizenship, social cohesion and equitable education (Guo-Brennan & Guo-Brennan, 2019) utilizing knowledge about the social, cultural, and language backgrounds of the students.

### **Discontinuities and Ruptures**

Having focused on the premises of the frameworks, the discontinuities and ruptures as well as critical assumptions in SJL and CRL for refugee schools could be well-deconstructed in multiple ways.

First of all, the authors of this manuscript have their positionality as explained initially, where their “episteme” rests at the intersection of Western and Eastern forms of understanding through their varied backgrounds and interdisciplinary lens.

Secondly, there is no clear consensus in the literature as to what constitutes a socially in/just society (Waite & Arar, 2020). Different disciplines frame the concepts in varied ways and refame their ontoepistemologies (Brooks, Knaus, & Chang, 2015). Understanding the social phenomenon, value systems, beliefs, and culture(s) is not an easy task while the discourse in social sciences, more specifically in ELA, still lends itself to expressions such as “subaltern,” “Black,” “female,” “colonial,” and in this case “refugees,” “newcomers” even, as is the case in this chapter. On the contrary, “those in “Western” worlds, however, often expect those in and from developing worlds to conform to Western conceptions of the social, which implicitly or explicitly includes the supremacy of the Western state, empire, and imperium as argued by Waite and Arar (2020), its people, and their values (p. 182).

Thirdly, this brings the elucidation of the dominant discourse in the field. Historical and contemporary forms of subjugation and hegemony create dilemmas for the researchers and practitioners alike regarding refugee education settings. The

etymological problem here is two-folded. One is about the dominant discourse in the field. The discourse of ELA is rooted in the effective and efficient uses of power to achieve stated educational ends. Those who hold the power, the gatekeepers, or authorities form the current mainstream theoretical orientations, which emphasize achievement over understanding while failing to capture nature of human interactions and the genuine and immediate concerns of children, parents, teachers, and educational leaders themselves (Gardner-McTaggart, 2020). Furthermore, Beachum and Gullo (2019) warns the social justice advocates about the ideological trap if they think that they are the sole repositories of the appropriate knowledge and use this power to determine those who are acceptable and unacceptable. This should be eschewed in any SJ effort, particularly for the marginalized groups. The other is about the possible reproduction of “epistemic violence” to avoid while especially taking a humanitarian stance. Similarly, in an attempt to equalize discourses, one can find themselves in a situation of othering the exiles as marginals (Herising, 2005). A further warning by Herising (2005, p. 139) is paramount importance as:

We need to ensure that we do not reproduce patterns and processes of colonization or “epistemic violence” in relation to marginal knowledges. We need to be attentive to how we relate to and with communities, and to engage politics of location continuously in order to forestall the commodification or fetishizing of marginal identities, knowledges, ways of being, and communities.

In a similar vein, problematizing SJ and CRL may lead one to the danger of acting upon a system of difference although CRL and SJ scholars have positive approaches and good will toward disadvantaged groups as Schmeichel (2012) claimed such genealogy of CRL might produce one way of thinking by reliance upon difference to categorize children.

Last but not least, addressing the ontoepistemic issues discussed above, Blackmore’s (2006) critique of the fallacy of hegemonic discourses in the ELA and the overemphasis of “diversity and difference” in the organizational spaces as discursive practices, would be a food for thought for anyone exploring SJL and CRL for refugee education.

### **Critical Assumptions: Know Thyself and the Field of ELA Discourse**

The cultural context, dynamics, and the positioning of a person have received debates in the field of ELA. The ways in which education systems can develop and respond to the needs of individuals through understanding of social dynamics and notions of power structure, culture, and practice are widely questioned (Waite & Arar, 2020). In this attempt to reframe the CRL and SJL in refugee education, the positioning and ontoepistemic orientations of the authors are crucial to brief the reader. If to draw on Foucault, then it is essential that one position and know the “self” because identities are shaped by external forces and his notion of “technologies of the self” are individual practices shaping the individuals themselves in particular ways in relation to discourse (Gillies, 2013).

## **Epistemologies, Social Fabric, and Commitments**

The authors of this chapter are from entirely different backgrounds and life experience yet have a common approach and sensitivity towards the disadvantages, inequities resulting from diversity, power relations of the emporium, and intercultural meeting.

The first author belongs to the third generation of a Palestinian family that was uprooted from its native village following the war of 1948 and the foundation of Israel following cleaning and demolishing acts. Some of the family were expelled beyond the borders of the new State of Israel, some live in occupied territories of the West Bank of the Jordan, and some remain as refugees in their land, within the borders of the new state. Thus, he maintains in contact with half of his family within Israel's borders subject to a majority-minority discourse, while the other half are in occupied territory in the throes of a conflict to overthrow Israeli occupation. This reality created a childhood torn between two extremes, at the meeting point between two worlds through a military checkpost, facing questions of identity, belonging, exile, and agency. This childhood helped him to develop sensitivity to those who are weak, dispossessed, conquered, the victims of war, refugees, and others who are rejected whether through war, political conflict, or subjected to the supremacy and control of others due to their ethnicity, religion, gender, or social affiliation. His endeavor to study the issue of education for refugees and migrants stems from his own personal moral voice, and epistemology shaped largely by the above history as the phenomenon of life as a refugee has become a large part of the narrative and collective memory of the Palestinian people.

The second author comes from a middle-class Turkish family, while she spent her childhood and youth in an urban area of a big town in Turkey, which could be described as melting pot of cultures. The neighborhood consisted of different groups of immigrants. Some of them were rich Jewish and Christian minorities of Turkey, while some others were the internal migrants coming from the rural areas of Turkey and earn their bread through manual jobs on cheap labor. Experiencing the stark differences and having diversity of friends in the neighborhood and the school within, she developed an awareness of the inequities and social stratification in her early years onwards, while witnessing both very hard and very rich lives next to her. The issues in the neighborhood ranged from family violence to political/religious conflicts, from intolerable poverty of the newly arrived migrants to glittering Christmas lights and expensive lifestyle of the rich families in the same area between 1970 to 1995, which left in her the sting of inequality around her little context, which could be generalized to the globe. Moreover, her exposition to the Western writings during her studies in English language and literature, cultural studies, and educational administration and policy for the last 25 years has developed a moral voice and sensitivity toward the disadvantaged groups. The recent forced influx of Syrians into Turkey has urged her to explore the phenomenon in depth in an effort to contribute, at least a little, to the recent problems and challenges of both refugee minors and children in need.

Both authors' collective memories and experience have led to work on cultural diversity, identity, affiliation, relevance, and question the any possibility of social in/justice in educational leadership (Arar, 2020; Arar et al., 2019, 2020; Örüçü, 2019).

---

## Conclusion and Reflections

Reviewing the narrative in the opening of this chapter, there is a wide array of such refugee conditions in previous research (see Arar, 2020; Arar & Örüçü, 2020; Arar et al., 2019b, 2020; Waite & Arar, 2020). Yet, the aim was not to fetishize the refugee situation but rather to lead the readers to rethink, revisit, and re-evaluate how the social reality of this human condition is constructed, from which angles and viewpoints and from whose perspectives when the current state of forced migration is considered, especially when witnessing both the call for humanity, their reception to include welcoming, or exclusion accompanied by xenophobic public and political discourse (Arar et al., 2020).

The concept of SJ is not a new concept, as it is inherent to major religions and philosophies of the world (Oplatka & Arar, 2016). Philosophy, psychology, sociology, and environmental studies and other disciplines can all contribute to a more comprehensive, complex understanding of the relevant phenomena and the issues involved. There is no one best way to understand, capture, and represent our societies. Instead, it requires an ontoepistemological exercise (Waite & Arar, 2020) while in a post-modern view of the world, one can notice that identities become more complex, lucid, and following the people in move phenomena, there is the shift from homogenic nations to cultural liquidity and diversity (Arar & Örüçü, 2020). Along with the imperialistic efforts to establish a common sense, identity would stay in competitive stories and cultural contexts (Waite & Arar, 2020). Therefore, the subjugated level of knowledge in Foucault's genealogy terms, which is "knowledges that exist at the local and specific level which cannot be explained or understood by mainstream discourses of leadership and management," is to be carefully addressed. The power and knowledge relationship is the determinant of true or false (O'Farrell, 2005); However, there are too many gray areas regarding the policy, leadership, and praxis in refugee and newcomers' education leadership (Arar et al., 2019b) leading to stark encounters between power relations and systems structures.

This effort of building a model of CRL and interrogating refugee and newcomers' education may be a depiction of constituting the researchers as subjects (Bernauer & Mahon, 2005); yet as many researchers understand "beneath what science knows about itself is something that it doesn't know" (Foucault, 1996, p. 54).

To sum up, the cultural relevance and socially in/just praxis and theory in refugee education discursively would depend on and is reproduced by the actors, the context, the subjects/objects of the phenomenon, and more importantly under what conditions the phenomenon takes place. Even the use of the word "refugee" or "newcomers" itself is problematic as it is a form of reproducing inequity and categorizing, yet technically the aim was to address and draw the limits of the research and address these needs. What is obvious is to challenge the comfort

zones and revisit the schemata on diversity, justice/injustice, exile, and other forms of exclusion, colonialization. Conceptual frameworks and positions must be considered in peculiar contexts before *prescribing recipes* for school leaders, teachers, refugees, newcomers, and all people who are active in the contested space of the field.

**The Field of Memory**

The concept of inclusion has expanded since its earliest iterations related to mainstreaming of students with disabilities into regular schools. However, there are various competing discourses through which meaning and understandings differ. As a result, there is a need to disrupt inclusion's tendency to re/produce the otherness and reinforce the marginalization of those who are the targets of inclusion. In fact, conceptualizations of inclusion in schools are still anchored to special education and discursiveness regarding difference, separation, abnormality, and in some cases, deviance which are marked by often produce and reproduce problems of exclusion in schools and can be antithetical to its goals. Educational policy, as it is often written, presupposes that inclusion is a guarantee and thusly produces accountability for its achievement. Yet, schools historically have reified secure exclusion due to the promulgation of normalized discourses that shape and drive policy. However, we contend that the more presence of certain students or others is not necessarily to be inclusive, and inclusivity is not quite the same as "dealing with" diverse groups.

**The Field of Presence**

One could reasonably argue, however, that "[w]e are still citing inclusion as our goal; still waiting to include, yet speaking as if we are already inclusive" (Slee & Allan, 2001, p. 181). Many diversity leaders find themselves in contexts that still confound quotas, tokenism, erasure, and assimilationist practices as inclusion (Ford, Harding, & Learmouth, 2008). Such discursive practices mark individuals and groups by difference, attach them with an identity, and impose upon them a law of truth that must be recognized.

**The Field of Concomitance**

Research has not only highlighted, but demonstrated through empirical data, the efficacy of heterogenous classrooms, not just for students with special needs but for all students. Tying the notion of inclusion to special education populations is not, however, universal. Indeed, in corporate studies, inclusion has been framed more broadly to include the inclusion of a variety of different demographic groups. Inclusion is now theorized as ideas, stances, and practices that not only determine

position (inclusion/exclusion) in organizations such as schools, but also location and position (geography), participation (business), classification (economics), integration (sociology), and reconciliation (theology), to name a few. Consequently, inclusion discourse also creates opportunity and language to interrogate exclusionary practices such as discrimination, deprivation, separation, criminalization, appropriation, and territorialization as articulated in various disciplines such as law, psychology, criminal justice, gender studies, and colonial studies.

### **Discontinuities and Ruptures**

Inclusion can be operationalized in many ways, as described in the field of concomitance. One way it manifests is it in the inclusion of immigrant students into school setting in the United States. Many school communities are experiencing sudden influxes of large numbers of immigrants at one time adds a sense of urgency to the general uncertainty of how educational administrators should lead school settings to the benefit of all students. Such dynamic school contexts demand a great deal from leaders and challenge them in terms of their sources and use of knowledge. School leaders are not trained with adapting school environments to accommodate immigrant students. In addition, educational practitioners are uncertain of how to positively integrate immigrant students into the school ecology, thereby limiting students' experiences and participation in schools.

### **Critical Assumptions**

School leaders must want to address to myriad of topics that are inherent when addressing the needs of immigrant students and families. It is important for educational leaders to acknowledge that they have different lived experiences as others and not assume they understand the lived experiences of their students – this is inherent in the dignity work of school leaders. Educational leaders are faced with the important tasks of: (1) seeing and mediating the contradictions and indignities that exist in education and the larger world; (2) acting as inclusive leaders; and (3) prioritizing diversity. Those leaders who are able to do all three in their personal lives often have leadership practice characterized by deep collaboration, which is a marker of dignity.

---

## **Introduction**

Former Secretary of Education Arnie Duncan stated: “If we want to maintain the trust of parents and communities in our schools, we must start by treating our children with respect and human dignity.” Dignity is an essential human condition, defined as self-respect, a sense of pride in oneself, and being worthy of respect by others. One concern for educators is how to work with communities where children grow up, learn, and live in spaces and places where they experience multiple assaults to their sense of dignity (Witherspoon & Taylor, 2010).

This chapter focuses on dignity as an emerging leadership practice in schools, focusing most closely on how the phenomenon looks from the viewpoint of school

leaders and their leadership regarding immigrant students. Immigrant populations comprise a significant segment of the population in urban areas, and increasingly in rural areas in the United States (Zong & Batalova, 2019). However, research has highlighted the troubling trend that the longer an immigrant is within the new society, the worse their quality of life and schooling appears to be (Alegría et al., 2007). In the United States, the immigrant population is 42.1 million, with over 11 million students from these households in public schools (Camarota & Zeigler, 2015). A troubling trend is that most US policies directed at managing immigration generally focus on race and ethnicity, and these policies affect immigrants through the institutions that have an impact on their lives, such as the educational, housing, and health care systems.

Based on preliminary data explored, the idea emerged that dignity is an important part of inclusion, especially for immigrants, and the way leaders manage inclusion for immigrant students are often scaffolded by where, how, and with whom they receive information about particular groups, such as immigrant groups. However, seeing immigrant students as individuals with dignity was often informed by leaders' own information grounds (IGs) (Pettigrew, 1998, 1999, 2000). Information grounds are locations and sources where people get information formally and informally, often through interaction with the social world (Fisher & Naumer, 2006).

To date, there is no research examining the influence of IGs on educational administrators' leadership practice and as critical constructs of leadership. Research suggests that teachers and principals are unsure of how to adapt classroom and school environments to accommodate immigrant students (Bartlett & Ghoshal, 1994). In addition, studies suggest that educational practitioners are uncertain of how to positively integrate immigrant students into the school ecology, thereby limiting students' experiences and participation in school (Lee, Bryk, & Smith, 1993). Moreover, as immigration is a highly racialized notion (Umansky, Hopkins, & Dabach, 2020), it is important to understand the diverse and highly charged social contexts in which leadership is practiced by drawing from scholarship that has explored such dynamics.

This chapter focuses on the role of dignity as an essential construct of inclusive practice. Principals' schema for inclusion is greatly influenced by their IGs regarding certain groups who are traditionally excluded in schools, such as students of color and immigrants. It is important to note that information ground theory is not the only framework for examining schema and knowledges. However, the authors resonated with IG foci on social interaction, conversation, context, and the inductive analysis offered in a lot of the IG literature. Information grounds offer an opportunity to better understand how leaders' schema regarding immigrant diversity and their treatment of them are scaffolded professionally by where, how, and with whom they receive in/formal information about particular immigrant groups.

Literature suggests that principals shape the culture, conditions, and organization of schools, and these things matter to teaching quality and student learning outcomes (Brooks, Miles, & Buck, 2010). They also influence school improvement processes by promoting a shared vision, building structures and practices to support that vision, and fostering strong relationships with the local community (Scanlan & López 2012). Concomitantly, schools considered "successful" are those where leaders

champion student progress by focusing on social issues like personal, social, and economic student potentialities (Ishimaru, 2013). In summary, the construct of information grounds provides a novel viewpoint on school leadership by identifying where everyday information seeking and sharing occurs.

Formal information structures might include an individual's actions or behaviors such as actively seeking information from articles, research, etc. Informal information structures might be contextual and serendipitous – or information that might occur in everyday information flow in social settings such as barber shops and hair salons, churches, playgrounds, etc. (Pettigrew, 1998). IGs occur across all areas of life yet are brought to bear as people perform tasks in the course of personal and professional life (Fisher & Naumer, 2006). As illustrated, IGs form the basis for schema that impel leadership behaviors and practices. This is critical as organizations like schools reflect the beliefs, assumptions, expectations, norms, and values of the people working with them (Lindahl, 2011).

---

## Policy, Politics, and the Narration of Immigration

As the authors are exploring IGs, it is important to highlight the context of US policy, the political climate, and the “narration” of immigration, which all form a significant information context. Political events and discussions often serve as influential information behaviors. The context of immigration is “especially important to consider because immigration is the only component of population change over which the US Congress seeks to extend direct and complete supervision” (Espenshade & Calhoun, 1993, p. 224). In the United States, especially, immigrants carry significant emblematic weight in the narrative of America (Smith, 2003). However, policy related to immigrants is mediated by United States' fears and insecurities rather than an understanding of immigration itself (Tichenor, 2002) and thus circulating discussions that pose to be harmful IGs. Although the United States might be thought as “a nation of immigrants,” there have been dogged attempts to restrict newcomers since the founding of the colonies. In the 1800s, there was a significant increase in the numbers of immigrants coupled with an economic recession that stimulated negative perceptions of immigrants. During this time, there was also a promotion of Anglo-Saxon racial superiority (Polyzoi, 1986).

The first restrictions on US immigration were passed during the 1920s which led to the passage of the discriminatory quotas such as those in the Quota Acts of 1921 and 1924. These acts sought to reduce the number of immigrants entering the United States (Massey & Pren, 2012). The first national-level policy to consolidate immigration-related statutes was the Immigration and Nationality Act (INA) in 1952 (U.S. Citizenship and Immigration Services, 2016; 2021). In general, there was a more relaxed climate for immigration that continued throughout much of the 1950s and 1960s that was reflected in the 1965 amendments to the INA. These amendments, on their face, seemed to signal an increasing acceptance of immigrants by repealing the national origins quotas (Massey & Pren, 2012). In reality,

immigration was simply a background issues in decade focused on civil rights, the war in Vietnam, the sexual revolution, and urban riots.

Since 1965, US immigration policy has become more restrictive, with many attributing this to an increase in illegal migration from 1965 through the late 1970s (Hogan & Haltiner, 2015). The notion of “immigrant threat narratives” (Farris & Mohamed, 2018) are vitally important to understanding subsequent immigration policy responses and perhaps the dynamics of IGs. Politicians, media, and others’ portrayal of immigrants can influence negative attitudes about immigration, leading to more restrictive policy measures (Abrajano, Hajnal, & Hassell, 2017) and contributing to dangerous IGs. Negative images and narratives of immigrants disproportionately emphasize illegality or undocumented status; crime and criminality; and low-skilled professions as part of a threat narrative (Farris & Mohamed, 2018). Research demonstrates that negative portrayals of immigrants often incite perceptions of threat or crisis (Benson, 2013). In addition, immigrant threat narratives disproportionately focus on terrorism or radicalism (Stürmer, Rohmann, Froehlich, & van der Noll, 2019); border concerns (Sowards & Pineda, 2013); criminality (Stewart, Pitts, & Osborne, 2011); “job stealing” (Chomsky, 2007); and some sort of societal danger (Cisneros, 2008).

However, these negative aspects of immigration are often inconsistent with actual or immigrant demographics (Stewart, 2012). For instance, there is no evidence that immigrants increase crime in communities (Gonzalez, Collingwood, & El-Khatib, 2019), yet these false narratives profoundly impact immigrants in all areas of their lives. As another example, politicians place an overemphasis on border security, when in fact approximately one-third to a half of immigrants in the United States arrive legally (Rosenblum & Hipsman, 2016). Moreover, estimates suggest that the number of undocumented immigrants has declined since 2005 (Warren & Kerwin, 2017) signifying that false narratives serve as harmful and dangerous IGs. Over the last three decades, Congress has repeatedly debated immigration reform, and these debates have largely centered on an immigrant threat narrative. Since the events of September 11, 2001, contemporary racial and ethnic discourses define US immigrants (particularly those that are Brown) as sociopolitical “problems,” with Brown representing the de facto color most frequently associated with immigration (Rivera, 2014). In the era of the War on Terrorism, all immigrants become a proxy of “rogues and extremists” (Churchill, 2004) that places “individuals, communities, and youth consistently on the defense about their identities and beliefs” (Ali, 2014, p. 1248). Taken-for-granted understandings or “common metaphors” of immigration hold importance when examining the discursiveness of immigrant exclusion (Santa Ana, 2002). Chavez (2008) contends that by espousing these negative narratives, politicians are able to increase immigrant restriction with new policies created to address “the immigration problem” (p. 9). Schneider and Ingram (1993) contend,

[P]olicy designs reflect the social constructions of knowledge, target populations, power relationships, and institutions in the context from which they emerge and these are conveyed to citizens through the messages, interpretations, and experiences that people have with public policy . . . . Many policy designs contain the footprints of a degenerative form of

politics in which the social construction of issues and target populations are strategically manipulated for political gain. These designs separate target populations into “deserving” and “undeserving” groups, thereby legitimating the conferral of beneficial subsidies or regulations for the former and neglect or punishment for the latter. (pp. 5–6)

---

## Immigrant Students

Research has highlighted the troubling trend that the longer an immigrant is within the new society, the worse their quality of life appears to be (Coll & Marks, 2009). In the United States, the immigrant population is 42.1 million, with over 11 million students from these households in public schools (Camarota & Zeigler, 2015). Of these students, around 80% speak a language other than English at home. Because of migration, schools all over the globe are serving children of increasingly diverse origins, but not always successfully. This presents a challenge to educators and scholars to develop deeper understanding about immigration, diversity, and various other aspects of schooling.

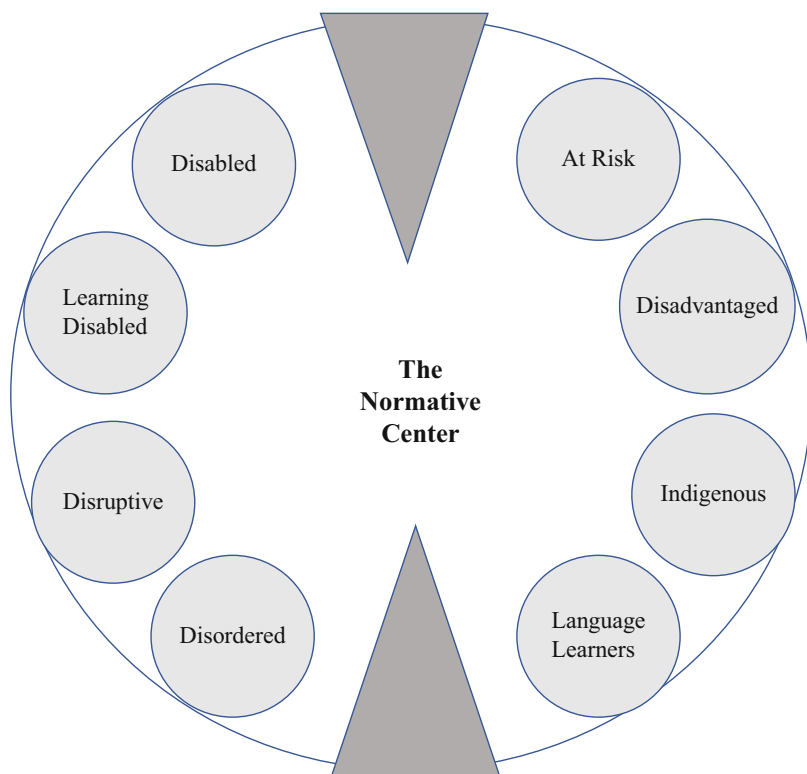

Intentional strides for inclusion are critical for immigrant students. The 1982 US Supreme Court ruling in *Plyler v. Doe* (1982) determined that every child in the United States is entitled to an education from kindergarten through high school. *Plyler* determined that undocumented persons deserve equal protection under the Fourteenth Amendment, which “extends to anyone, citizen or stranger, who is subject to laws of state and reaches into every corner of state’s territory” (pp. 210–216). In their ruling, the Court emphasized the crucial role education plays in one’s life chances, noting that the tremendous “toll of deprivation of basic education on the social, economic, intellectual, and psychological well-being of the individual, and the obstacle it poses to individual achievement” (pp. 216–224).

Immigration increases diversity in society and result in positive benefits for the receiving countries (Weber, Kronberger, & Appel, 2018). Even still, negative immigrant discourses and their outcomes extend to education as well. There is persistent achievement gap between immigrant students and their nonimmigrant peers troubles the educational system in the United States. According to the Organization for Economic Cooperation and Development (OECD, 2015), immigrant students drop out of school earlier, do not attend postsecondary institutions, and often score lower on education achievement tests. “Factors such as socio-economic status (SES), family resources, and language can only partly explain the systematic underachievement of immigrant students” (Weber et al., 2018, p. 211). Other factors such as school climate and advocacy may also contribute to certain gaps in school (Crawford & Arnold, 2016, 2017).

Students of certain immigrant groups are faced with comprehensive stereotypes of low cognitive achievement, laziness, and low performance motivation (Asbrock, 2010). Research has highlighted the importance of institutions such as schools and community agencies to the development of children in immigrant families (Orellana, Reynolds, Dorner, & Meza, 2003). The school as a proximal context plays a key role for immigrant children, because it is often a primary the first social and cultural

institution that immigrant students inhabit outside of their homes (Suarez-Orozco & Suarez-Orozco, 2015). However, immigrant students' sense of belonging to school (i.e., the degree to which students feel socially accepted); immigrants' reception (Weber et al., 2018); and increasing immigrant feelings of inclusion (Weber et al., 2018) has a positive impact on their educational success.

Over the years, research has repeatedly revealed that many educators are not well-prepared to work effectively with immigrants (Malatest & Associates, 2003) and lack the required IGs to ensure their inclusion. One of the challenges is the fear of diversity (McDonough & Hoodfar, 2005). In addition, many lack knowledge and readiness to approach cultural and religious diversity that comes with immigration (Guo, 2012). Another challenge is the "difference as deficit" perspective (Dei, 1996). This results in the compartmentalization of individuals or groups in certain categories such as those in Fig. 1. In education, this compartmentalization is populated by "so-called target groups for inclusion—disabled children, learning disabled children, disruptive or disordered children, ESL children, disadvantaged and at-risk children, and Indigenous children" (Education Queensland, 2004). In particular, these domains become normalized and serve to confirm or invalidate particular groups

**Fig. 1** Production of domains through the constitutive pressure of normative discourses. (Adapted from Graham and Slee (2008))

of students. These discourses can be drawn as two poles of division. As shown in Fig. 1, there is a normative center around which these categories of students revolve but do not meet. Students in these categories are seen as deficit or something other than normal and become in many ways excluded.

Through socialization, institutional structures, and policies, life is breathed into this figure, emphasizing difference as deficit and reinforcing exclusion. Rather than seeing difference and diversity as an opportunity to enhance learning by using the diverse strengths, experiences, knowledge, and perspectives of students and parents from various cultural groups, the ‘difference as deficit’ model sees diversity ignored, minimized, or as an obstacle to the learning process (Dei, 1996). Educators are called to empower and support students, pursue justice, encourage human dignity, honor diversity, and reduce marginalization (Hispanic Association of Colleges & Universities, n.d.).

---

## Dignity and Inclusive Leadership

Young and Arnold (2021) calls for a restructuring of educational practices to prevent marginalization, while creating school cultures based on dignity and respect. The emerging framework for inclusive leadership (Fig. 2) focuses on place, preparation, and practice as domains that help leaders cultivate an inclusive culture by clarifying what inclusive leadership means, and the practice needed to develop structures of support that foster inclusive leadership mindsets and practice. The ultimate goal is

**Fig. 2** Emerging framework for inclusive educational leadership

that this framework can be scaled beyond leadership development to larger transformative practices, policies, and activities.

Initiating increase in groups who are historically excluded in education has created challenges for educational leaders at all levels (Arnold, 2020). In terms of attempts to include everyone equitably, leaders have focused on both individuals and organizations being excluded from society because of variables such as (1) having a disability, (2) having a migrant or refugee background, or (3) people with less access to information and facilities because of where they reside (Bortini, Paci, & Rojnik, 2021). The focus for this chapter is on the role of dignity as an essential construction of inclusive practice in schools, with a specific focus from the lens of leaders advocating for immigrant students.

The definition of the term inclusive leadership and what it means to be an inclusive leader varies among scholars and practitioners because of the several ways the terms are applied (Bortini et al., 2021). Many factors should be considered for both terms, including developing inclusive culture and addressing forces that dehumanize people at all levels of educational spaces (Arnold, 2020). Additionally, there are several fundamentals that leaders must weigh as they engage the needs of students such as the political, social, and economic context in which they operate. The unique needs should also and always be considered for students who possess different (or similar) abilities from the majority, and contribute to group outcomes (Toson, 2013).

Inclusive leadership is concerned first with inclusion, then its process and result (Ryan, 2006). The phenomenon is increasingly seen as an essential part of leadership practice and for many, provides a better foundation for academics and practitioners to serve parents, students, teachers, and community members (Ryan, 2007). Promoting and developing inclusive leadership is often a challenge for educational leaders, particularly for students diverse in race, class, and disability, or anyone that are among the community of people who exist outside the traditional norm (Kugelmass, 2003). As a result, educational leaders must focus on the result of implementing inclusive leadership practices and find ways to include everyone in the governance processes and actively pursue inclusive principles (Ryan, 2007). The worth of inclusive leadership is immeasurable since it seeks to value the dignity of every individual as a result of recognizing their needs and acting accordingly, which impacts everyone in the process positively (Bortini et al., 2021). Leaders have the responsibility of acknowledging the diverse abilities of disadvantaged groups, and on a broader, organizational level, leaders can be seen as people who plant the proverbial seeds which lead to more inclusive action (Bortini et al., 2021).

In terms of the motivation for this chapter, which focuses on dignity as an emerging leadership practice and an essential construct of inclusivity, the IGs which certain groups tend to gravitate towards is significant. As stated, IGs offer an opportunity to better understand the motivation of leaders regarding the representation and treatment of immigrant students. However, and unfortunately, there is no research available which examines the influence of IGs as leadership practice or critical constructs of leadership, specifically regarding leadership inclusivity.

## Information Grounds

Coined by Fisher (writing as Pettigrew), information grounds emerged from Pettigrew's (1998, 1999, 2000) fieldwork at community health clinics. Information ground theory focuses on people's information behavior in professional and social settings, ranging from book clubs, gyms, folk festivals, and bus stops to hair salons and supermarket queues. Information grounds serve as locations where people get information formally and informally, often through interaction with others (Fisher & Naumer, 2006). Information grounds are environments created when people gather to do something not primarily about information, but information sharing occurs spontaneously and serendipitously (Pettigrew, 1999). Pettigrew's (1999) original study focused on a foot clinic. Other IGs include places of worship, cafes, and bus stops (Fisher & Naumer, 2006), and virtual environments (e.g., Talip & Yin, 2017). According to Fisher, Landry, and Naumer (2007), IGs not only refer to a concept but more broadly to a research and theories of social interaction and settings in *everyday* information behavior. Information grounds can occur anywhere at any time. "As people visit and engage in social interaction, their conversation about life in general and about specific situations leads to both formal and informal information sharing" (Counts & Fisher, 2008, p. 1). Other times information is shared incidentally, where information might be shared serendipitously or without anyone seeking or needing that information (Erdelez, 2005).

In one characterization of IGs, the concept is characterized as the people–place–information trichotomy (Fisher et al., 2007). Specifically, IGs can be thought of as a social construct rooted in an individual's combined perceptions of place, people, and information. As Fisher et al. (2007) point out, IGs may form in a wide variety of physical places and may be tied to them or move to new locations. The "people–place–information trichotomy" (Fig. 3) organizational strategy was "a first step at organizing information ground attributes for the purpose of informing system design and optimizing information ground settings" (Fisher et al., 2007).

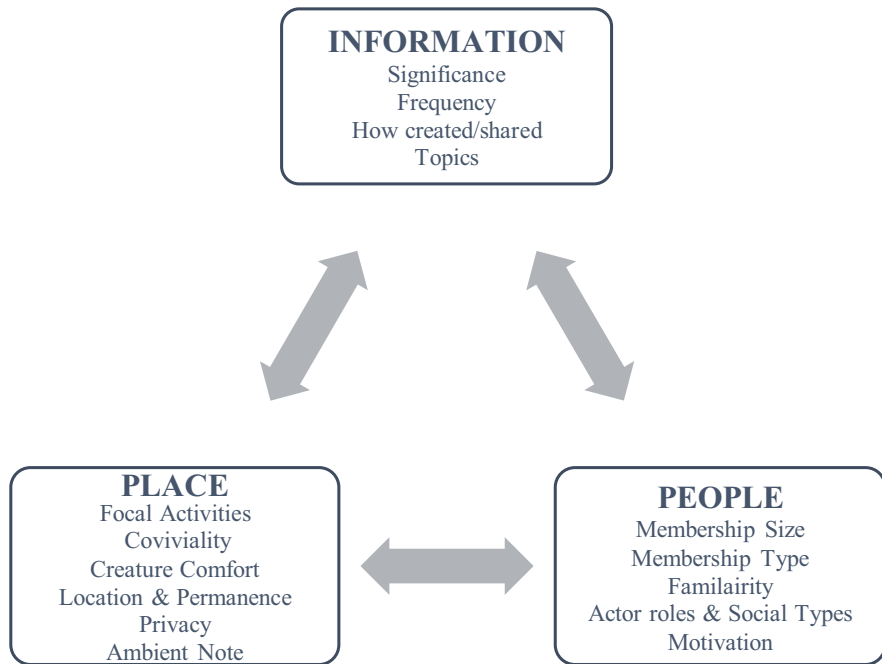

For example, in the people domain, research has found that smaller circles or groups tend to be sources of IGs. The closeness of the tie, familiarity, or intimacy tend to influence IGs. How one self-defined their or others' role and the motivation for the exchange influences IGs.

Information grounds have been elaborated in a series of field studies across varied populations, including library science (Savolainen, 2009), public health (Kelder & Lueg, 2011), medicine (Chew et al., 2019), and business (Gregor & Kalińska-Kula, 2013), and education (An, Na, Zhang, 2019; Fisher et al., 2007). Counts and Fisher (2010) suggested a set of propositions that deepen understanding of the information grounds framework (Fig. 4).

Taken together, these propositions form a grand context (Pettigrew, 1999) and concluded that "the study of information use cannot be considered in terms of an isolated individual or outside a specific . . . social context" (p. 810), and posited that "a challenge for information behavior researchers is to recognize contextual factors and understand their consequences" (p. 814).

According to Savolainen, IGs do not yet have a final definition, as it is evolving as the topic continues to be researched. Information grounds are vital as they form the

**Fig. 3** Information ground people-place-information trichotomy. (Adapted from Fisher et al., 2007)

- Proposition 1: IGs can occur anywhere, in any type of temporal setting and are predicated on the presence of individuals.
- Proposition 2: IGs serve a primary purpose other than information sharing.
- Proposition 3: IGs are attended by various groups serve different roles in information flow.
- Proposition 4: Social interaction is a primary activity of IGs
- Proposition 5: People engage in formal and informal information sharing, and information flow occurs in many directions.
- Proposition 6: People use information obtained at information grounds in alternative ways, and with various benefits along physical, social, affective, and cognitive dimensions.
- Proposition 7: Many sub-contexts exist within an IG and are based on people’s perspectives (Fisher et al., 2004, pp. 756 –757)

**Fig. 4** Information grounds propositions (Fisher et al. 2004)

framework for critical educational leadership practices that can make meaningful impact to the lives of immigrant students. Critical types of leadership include inclusive leadership, trauma leadership, and empathic leadership.

## Information Grounds, Dignity, and Immigrant Students

In this section, the preliminary findings (Arnold, Crawford-Rossi, & Brooks, [in press](#)) of a previous study are discussed according to the types of personal and professional IGs and how they relate to dignity practices and inclusion for immigrant students (Esteban-Guitart & Moll, 2014). The authors present themes and insights from the previous study to highlight how dignity intersect along axes leaders' information grounds. It is important to note that as a part of the larger study (Arnold et al., [in press](#)), the researchers conducted an analysis process that examined IGs, inclusion, and immigrant students in professional talk and text, but also *markers* or *descriptors* of these concepts. In the same way, both the markers and descriptors of dignity from that study as well as the literature are discussed. However, when the authors expanded to related words such as culture, there were 92 references. These information grounds mediate how leaders "identitize" (Esteban-Guitart & Moll, 2014) immigrant students and families as deserving dignity. In other words, school leaders adopt professional practices of in/dignity based on their information grounds. These information grounds are negotiated by various units such as skills, knowledge, and resources; actions and responses; and institutions, discourse, and narratives.

### Geographic Information Grounds

Geographic IGs are those with origins in regions, locales, etc. (Esteban-Guitart, 2012). Space and place fit significantly into discussions of immigrant reception and integration, which can be positive or negative mediators of dignity. Leader IGs may be influenced by the immigration "history" of the sending or receiving community. Schools are the first spaces where many immigrant students are likely to have constant contact with members of the receiving community. It is where students internalize the rules of engagement of their new spaces and places and discourses of reception (Kenway & Youdell, 2011). Negative events or perceptions of a "sending" country can influence how people perceive incomers from that country (Jaret, 1999). Leaders' IGs determine if they are brokers of culture and diversity in schools and the acculturative process, which is a marker of dignity.

### Practical Information Grounds

Practical funds are those that originate from knowledges or activities (Esteban-Guitart & Moll, 2014). Previous educational or professional experience with immigrant students are also sources of leaders' information grounds. For example, some immigrant students are fleeing traumatic events such as those who are refugees. However, the act of moving to another country can also be considered a trauma event (Arnold et al., [in press](#)). School leaders must acknowledge the

social and emotional needs adolescents bring with them to school, as well as the racial contexts that shape their experiences (Thompson & Schwartz, 2014). Sophia et al. (2018) found in their study that it was important for educators to move past teaching immigrant students to learn to speak English but to be conscious of the trauma the students experienced on a daily basis as well as to “grasp the role of the constrained policy context in creating crises for newcomers” (p. 13). Both formal and informal IGs provide a platform for information important to protect of immigrant students’ dignity and growth.

## Cultural Information Grounds

Cultural information grounds include information originating from symbols, tools, and categories, etc. that characterize, define, and mediate human experiences. These might include social categories such as ethnic group or religious identification. Educational leaders who prioritize diversity in their personal lives or those from their own cultural sources, often have leadership practice characterized by deep collaboration, which is a marker of dignity. Klotz (2006) found that principals who “value diversity in theory and in practice and [who assure that] teaching and learning are made relevant and meaningful to students of various cultures” (p. 11). When the cultural IGs of leaders represent immigrants as disadvantaged in education from the start, this leads negative cultural stereotypes, understandings, images that incline leaders towards indignity practice in schools (Iverson, 2007).

## Social Information Grounds

Social information grounds include significant others such as relatives, friends, or colleagues who have significant importance. For instance, family, mentors, or friends often serve as IGs. However, leaders’ social IGs often are correlated to varying levels of leaders’ empathy (Arnold et al., *in press*). Empathy is correlated to promoting inclusivity in education, particularly when it comes to being empathetic towards immigrant students. The study of Miklikowska (2018) found “programs aimed at reducing anti-immigrant attitudes in adolescence should work more closely with youth perspective taking and empathic concern” (p. 703). This signified that empathy can be correlated to being more inclusive of with immigrant statuses. Being cognizant and empathic towards the experiences of immigrant students is key. Additionally, Sophia et al. (2018) shared that sociopolitical awareness was important for educators to uphold. They indicated that this knowledge resulted in important advocacy work for immigrant students. Ultimately, educational leaders can make a vast difference in the lives of their students and their families if they utilize empathy as a form of guidance for treating them with the dignity they deserve. Holt and Marques (2012) significantly expressed that “empathy is an essential aspect of 21st century leadership and can no longer be ignored” (p. 104).

---

## Institutional Information Grounds

Institutional information grounds include structures and mechanisms that control one's behavior. These might include institutions such as policies, laws, mores, etc. Often latent structures re/produce indignity education (Frankenberg & Mani, 1993). For example, institutionalization in education often manifests in discourse surrounding detrimental standards and policy for immigrant students (Suárez-Orozco & Suárez-Orozco, 2009). Schools have “a set of linked dimensions that include structural advantage” (Frankenberg & Mani, 1993, p. 1). For instance, education policy can contribute to the active structuring of inequity as it relates to immigrant students. When leaders approach institutional IGs with a critical lens, it results in student and family advocacy, another marker of dignity, for immigrant students. Though leader practices may be unintentionally oppressive, it nevertheless perpetuated indignity (McIntosh, 2005). Leaders often still expect immigrant students to conform to attitudes, structures, and institutional practices rooted in assimilationist practice. Even when schools postulate diversity and universality, they may still produce and perpetuate indignity (Watson, 2013).

---

## Conclusions and Reflections

Discourse surrounding immigrants shows up as nationality-based policy making and policy application highlighting intersections among public policy, space, and race-based difference (Dikec, 2007). These policies materialize as difference and disparities in zoning decisions and school makeup (Holme, Diem, & Welton, 2014). For instance, the specialty schools varied in terms of who could attend them – one specialty school was located in a certain area with a large immigrant population. However, the application process for that school included a lottery system that did not privilege students living in that community.

Literature suggests that principals shape the culture, conditions, and organization of schools, and these things matter to teaching quality and student learning outcomes (Brooks et al., 2010). They also influence school processes by promoting a shared vision, building structures and practices to support that vision, and fostering strong relationships with the local community (Scanlan & López 2012). Concomitantly, schools considered “successful” are those where leaders champion student progress by focusing on social issues like personal, social, and economic student potentialities (Ishimaru, 2013).

Our chapter suggests there is a feasible pathway to uphold the desire of Former Secretary of Education Arnie Duncan in maintaining the trust of parents and communities in schools particularly when it pertains to immigrant populations. This goal can be attained by educational leaders treating immigrant students, their families, and their communities with dignity while being cognizant of impactful IGs that can play both a negative and positive influence on decisions that impact immigrant populations.

Information grounds are important to educational leaders as research indicated that educational leadership are unsure as to how to accommodate immigrant students (Bartlett and Ghoshal, 1994). Educational leaders must be intentional in expanding their IGs to create beneficial experiences for immigrant students. Likewise, educational leaders must be cautious of the credibility of IGs they obtain in regard to issues related to immigration, immigrants, and their lived experiences. IGs can be complex as information can be obtained formally and informally within the social world (Fisher & Naumer, 2006) and there is a plentiful amount of inaccurate information continuously being shared.

The political climate of the country serves as an important IG for how people feel about groups of individuals among more. Educational leaders must be knowledgeable of and see past the detrimental IGs in order to provide inclusion and safe environments for immigrant students. In other words, educational leaders must always stand on guard in regard to IGs that spread false and dangerous narratives and educate themselves with accurate and inclusive IGs.

It is important for educational leaders to acknowledge that they have different experiences as others and not assume they understand their lived experiences (Boske, Osanloo, & Newcomb, 2017) but to seek to connect and support them.

As connectedness via globalization and diversity increases, schools and other institutions are becoming incubators of internationalization. Understanding how teachers, leaders, educational entities, communities, and nations get their information and respond to diversity and immigration could shed light on these processes. Moreover, teachers and leaders of schools are faced with the important task of seeing and mediating the contradictions and indignities that exist in education and the larger world (Boske et al., 2017).

## Abstract

This chapter investigates five educational leaders who transcend national and contextual boundaries who utilize diverse ways of knowing about poverty, access, equity, the human conditions of schools, and communities across the globe. Each exemplifies the four parameters associated with Papa's concept of an educational leader without borders (ELWB). We apply these four parameters to our five exemplars, Muhammad Yunus, Paulo Friere, Tsunesaburo Makiguchi, Maria Montessori, and Fredrich Froebel, illustrating the wide- and far-reaching implications that these exemplars have had on increased access to opportunity and peace across schools and communities. Finally, we explore how these leaders influence current and future considerations of educational leadership and educational opportunity for all.

**Keywords**

Educational leadership · Educational leaders without borders · Kindergarten · Early childhood education · Poverty

**Field of Memory**

Historically, school systems and their leaders have considered economic strife and poverty from the lens of how these problems have impacted the school system. In his history of urban education, Rury (2005) traced the ways that poverty shaped early concepts of school and learning from the period prior to the American Revolution where access to education depended upon social class and gender to societal systems of the Industrial Age when schools were framed as the answer to the perceived problems of immigration, crime and poverty, and extending to contemporary times. Conventionally, for educational leaders, poverty operates as a source of accountability pressure, as a contextual factor that shaped leadership practices and decisions related to curriculum, attendance, and exclusionary practices (Tropea, 2005; Tyack, 1974), rather than a societal ill that could be ameliorated by leadership practices.

**Field of Presence**

In recent scholarship and dialogue, educational leaders are called to broaden their gaze to serve the aims of social justice and cultural responsiveness in their work. These purposes manifest for leaders in leadership practices such as building classrooms that support student identity exploration and self-regulated learning (Kaplan, Bridgell, & Garner, 2020; Schunk & DiBenedetto, 2016) and building knowledge within students using culturally responsive methods (Hammond, 2014).

**Field of Concomitance**

Moving forward, the calls for a sharper focus on anti-racist educational leadership practices will be an important part of the dialogue and scholarship associated with the field of educational leadership.

**Discontinuities and Ruptures**

School leaders' conceptualization of poverty are primarily framed through school reform efforts to reduce existing disparities in educational outcomes between students living in poverty and those who are not. Well established in research, reform, and policy discussions are considerations of the complexities of the socioeconomic and racial achievement gaps, persisting over decades (Darling-Hammond, 2001; English, 2002; Reardon, Robinson-Cimpian, & Weathers, 2015). Related to these socioeconomic gaps are engagement and attainment gaps, also related to race and socioeconomic status (Heckman & La Fontaine, 2010; Balfanz & Byrnes, 2012). With this in mind, recent work asserting the need for culturally responsive leadership practices and the rejection of narrow deficit mindsets which constrain leadership

thinking about cultural differences as a viable asset (Hammond, 2014; Kohli, Pizarro, & Nevarez, 2017).

### Critical Assumptions

There is widespread agreement among educational policymakers, practitioners, and scholars that parity, equity, and ethical decision-making are foundational ontological beliefs to the educational leader (Gross & Shapiro, 2016). Though educational leaders may not travel the globe, the ELWB exemplifies thinking and practice that transcends one educational setting or one set of contextual factors. While there are many important assumptions that are critical to a conception of equitable leadership practices and policies, two foundational assumptions speak to the desegregation of schools and the access special education students have to learning.

---

## Introduction

While educational leadership scholars have been long committed to the notions of social justice, ethics, and transformation in the work of leadership development, school, like other societal systems, remains socially constructed by those who operate in leadership roles, and therefore reflect and perpetuate the inequities of the broader context. Culturally situated and socially constructed schools are, as Papa (2016) argues, the embodiment of the values of the nation-state, and reflect and reproduce the structural inequities of its society (English, 2002; Giroux, 1981; Levinson & Holland, 1996). The practices and actions of educational leaders – the policymakers, district leaders, and school administrators – shape and define education for students across educational systems, states, and nations.

The use of exemplars in educational leadership can be a powerful tool for practitioners and scholars endeavoring to understand how to transform conventional notions of leadership, to think more broadly about their practices, and to break free from the borders confining and taking over education from achieving more equitable outcomes. Thus, the concept of an educational leader without borders (EDWB) emphasizes the idea of leaders actively breaking out of contextual constraints of their own communities and operating in a way that advances the aims of education for all. Papa (2016) identifies four assertions for what an ELWB believes and enacts in their daily practices:

The first recognition of an ELWB is to come to the realization that the goals of nation state global dominance are not always compatible with the pursuit of becoming more fully human and humane...and some problems fall between the borders of all nation states and are not solvable by any one nation state by itself...A second recognition of an ELWB is the universal element of the ethics both for the common good and by the individual on behalf of all humanity...A third parameter is an ELWB is one who not only understands but lives as a member of an ethical humane society - a community that organizes itself in accordance with democratic standards...A fourth parameter is that an ELWB is found today in what I call sustaining actions, those decisions/actions and their relationship to the power of the nation state global which may be harmful to humanity (p. 2).

This concept of educational leadership without borders applies not just to educational leaders with positional power, but to teachers and community members as well. Gross and Shapiro's (2016) notion of shared responsibility for democratic social improvement that cuts across political and cultural boundaries and is achievable through ethical and equitable leadership represents a fifth belief that is closely related to the concept of Papa's conception of ELWB. As Papa (2016) argues, equitable access to education for children remains an important area of focus for ELWB. In the next section, we provide five concise portraits of influential ELWB, describing their important contributions to transcending the prevailing thought and action of conventional educational leaders to center an array of access and equity considerations for underserved children and families.

---

## Muhammad Yunus

The experience of poverty and its associations have been conceptualized by countless influential modern thinkers across disciplines. Paulo Friere (1970), an educational theorist, critiqued a conventional model of education where pupils are vessels to be filled passively disconnected from the construction of knowledge, where students are unaware of the role of oppressors. Orwell's *The Road to Wigan Pier* (1934) explores the bleak realities of living in poverty and the constraints people experience regarding systemic economic reform. In *The History of Madness*, Foucault (1961) discusses the connections between isolation, lack of activity, and poverty. Beyond conceptualizations that shape assumptions of others in positions of influence, much of this work, and others like it, tends to be disconnected from the experience of people struggling to survive poverty.

One of the components that makes the work and thinking of Muhammad Yunus so unique is its immediacy of connection to the people that were at the center of his work. Some leaders advance ideas that are so important, so life-changing, that they transcend the boundaries that limit the thought and dialogue of multiple fields. Muhammad Yunus is one such leader. Undoubtedly, Yunus, an economist, is best known for transforming conventional business models in unprecedented and far-reaching ways. Indeed, he took on a lofty goal for an educational leader: eradicate poverty and rethink our perceptions of those living in poverty. A volume of work has been done exploring the profound ways Yunus revolutionized thinking around the economics of poverty.

Disenfranchised with conventional thinking regarding helping those living in the highest level of poverty, Yunus aimed to help the problem of widespread poverty in Bangladesh by rethinking the organizational structures that were available and applicable to those living in poverty (Yunus, 2009). Recalling a growing recognition where teaching "elegant" theories of economics to students while countless Bangladeshi people starved and suffered felt "empty," (Yunus, p. 44–45), Yunus felt called to take action to improve the economic conditions of the people. After a few false starts where Yunus attempted to use existing structures to create economic opportunity which continued to leave out the poorest, Yunus created a new concept

for money lending, known as social business, through his interactions with the Bangladeshi villagers who had virtually no access to land ownership or fair banking practices, and as a result, lacked access to education, health care, or security for their families (Yunus, 2009). Advocating with the government to create a new kind of bank, one that operated for the poor and did not require collateral, Yunus's Grameen Bank began to finance the small businesses of Bangladesh's poorest villagers. Once relegated to begging, serving as day laborers and handing over crippling percentages of profits to their landowners, Yunus's clients were finally able to save, finance their own small businesses, and begin to lift themselves out of poverty. In advancing the concepts of social business and microcredit, Yunus's model posed a new way of not only financing, but conceptualizing the initiative and entrepreneurship of some of the world's most underserved communities. Poor people are the world's greatest entrepreneurs, Yunus famously said, attributing the narrow mindsets of the people who misunderstood the aspirations, innovation, and motivation of the poorest people as the most difficult work in eradicating poverty. How leaders operating in important societal systems think about people living in or near poverty matters.

In addition to the broad strokes that Yunus painted across our collective understanding of how to think about and help people living in poverty, both on a systemic and an individual level, there are a few additional ways that Yunus conceptualized the notion of service, on the part of a teacher, to those living in poverty. Rather than operating with a conventional set of action possibilities related to how a professor or university administrator might act, Yunus broke through conventions and taught his economics students through the creation of something that did not exist before: a new banking system for the poor, predicated on a new set of assumptions. People without money are not without the drive to create, to prosper, to share responsibility. By examining and shifting these assumptions, Yunus achieved what Papa and Englis call the leveraging of "institutional force for greater equality and opportunity."

Accordingly, his work indelibly transformed a second field, that of educational leadership. Indeed, beyond business models, Yunus's work can also be looked at through the lens of transformative educational leadership. As a scholar and a teacher, Yunus uniquely focused on the people living in the worst kind of poverty, endeavoring to achieve social change across systems and national boundaries. By providing an alternate concept for addressing poverty, Yunus is not simply an innovative economist and economics educator, but also a transcendent educational leader, an exemplar of an educator embodying the inner sense of responsibility to social development on a world scale (Gross & Shapiro, 2016), working to lift some of that darkness that prevails when people do not have access to education, justice, and hope.

---

## **Paulo Freire**

Paulo Freire is one of the most prominent transformative leaders of our time. He is widely known for his critiques of society and education and his dedication to societal change.

His landmark 1968 book *Pedagogy of the Oppressed* explored the connection between education and society and is a groundbreaking work on critical pedagogy which is still relevant today. “The work of Paulo Freire has continually been associated with the themes of oppression and liberation, and his critical pedagogy is visionary in its attempt to bring about social transformation” (Jackson, 2007, p. 199). Freire envisioned the pivotal impact that teaching student to develop critical awareness of the contextual knowledge people bring to learning. Moving away from the conception of teaching and learning as a one-way deposit into an empty receptacle, Freire’s thinking led the way for conceptions of teaching for social justice and culturally responsive pedagogy.

Born in Recife, Brazil, in 1921, Freire worked to erase adult illiteracy in Brazil. His work transcended national boundaries as he fought for positive change and equality in education. “Drawing on his experiences in Latin America and elsewhere, Freire created a theory of education that is closely linked to issues of oppression and struggle, particularly within social relations that center around both ideological and material domination” (Jackson, 2007, p. 199). Breaking with convention, Freire was not content to look at education as a passive experience where the educator imparts knowledge on a student or *banks knowledge* and instead, rethought the process of education stressing the role of the learner as an active participant. Through his exploration of oppression and poverty, Freire created discourse regarding the role that education could play in the eradication of the oppression of those traditionally without access to a better quality of life outcome. Indeed, Freire saw the interconnectivity between the educational system and the perpetuation of systemic injustice.

Freire was influenced greatly by the times in which he was born. During his childhood, the Great Depression was ravaging not only America but many other nations, including Brazil. He witnessed poverty and mass illiteracy among the population. It was during these times that his exposure to a society which fostered poverty and illiteracy piqued Freire to think about the impact that an emphasis on consciousness in education could have on societal change. “Latin American societies are closed societies characterized by a rigid hierarchical social structure; by the lack of internal markets, since their economy is controlled from the outside; by the exportation of raw materials and importation of manufactured goods, without a voice in either process; by a precarious and selective educational system whose schools are an instrument of maintaining the status quo; by high percentages of illiteracy and disease” (Freire, 1998, p. 505). While it is evident that Freire felt school systems could replicate inequity, Freire embodies the fourth parameter of the ELWB in his assertion that this status quo of the nation-state was, in fact, harmful to humanity. Unlike educational leaders interested in maintaining the status quo in terms of societal systems, Freire had progressive, expansive thinking about the role education had the potential to play in social change.

While Freire started his career as a professor of history and philosophy of education at the University of Recife, his influence would span far and wide beyond his own community. After a military coup in Brazil, Freire moved to Bolivia and Chile. He lived in Chile where he held a position at Christian Democratic Agrarian

Reform Movement and the United Nations Food and Agriculture Organization and later, at the World Council of Churches in Geneva, Switzerland. He joined the Workers' Party in Sao Paulo in 1979 where he became Sao Paulo's secretary of education and started the adult literacy project (Freire Institute, 2021). It was through his travels and his views of a changing society that Freire began to write about the impact of education on society and its connection to social change. According to Maviglia (2019), "It is well known that Freire upheld a strong commitment to struggle against all forms of oppression, dehumanization, marginalization, injustice and violence." He believed that education is the fundamental instrument for building a less inhuman world. He was a staunch supporter of education as a "practice of humanization" which overcomes every form of injustice, oppression, and discrimination. He proposed "problematizing education" as a valid antidote able to show humans the path to "humanization" (p. 388). Undoubtedly, while Freire's thinking transcended his own nation's educational system, Friere's ideas transcended borders, influencing educational leaders interested in advancing education as a universal human right, rather than as a means to further the nation-state's goals and purposes (Papa, 2016).

On balance, Freire looked at the way education functioned in society with a critical eye, conceiving of groundbreaking pedagogical practices that he associated with the work of dismantling oppressive societal systems or structures. One such process, praxis, entailed such social action and reflection. A second process, conscientization, was the process of developing in students a critical awareness of social reality through action and reflection (Freire Institute, 2021). Freire knew that only through education there would be freedom from poverty and injustice illustrating the wide- and far-reaching implications he had across schools and communities. Freire maintained that reflection by the oppressed on their oppression and its causes "will come their necessary engagement in the struggle for their liberation. And in the struggle this pedagogy will be made and remade" (Jackson, 2007, p. 199). Friere's theories and writings regarding educating the illiterate, using education to alleviate poverty and oppression, still heavily influence critical pedagogy today.

---

## **Tsunesaburo Makiguchi**

While educational leaders without borders share expansive ideas and efforts that deign to solve the problems that "fall between the borders of all nation states" (Papa, 2016, p. 2), their influence may not be recognized or appreciated in their lifetimes. Goulash and Gebert attribute this widespread notion. Indeed, recent work has begun to illuminate the important influence of one such transcendent leader, Japanese teacher, principal, and scholar Tsunesaburo Makiguchi, connecting his writings to important discourse prevalent today about the goals of education (Goulah & Gebert, 2009; Gebert & Joffee, 2007).

Moving away from a deterministic notion of human decision-making, educational leader Tsunesaburo Makiguchi saw the role of human agency in creating values that would contribute to the individual and collective well-being of people

(Gebert & Joffe, 2007). Believing that a human's pursuit to create value in life was the most important purpose in life, Makiguchi, like Freire, saw the utility of the "authentic" goals naturally associated with education, as a vehicle for this universally important pursuit. By providing opportunities for students to create value, educational leaders and educators would cultivate students that would manifest harmony and happiness. Like Freire, Makiguchi conceived of a school experience where the sharing of knowledge affords more than just individual learning to its students. Rather, humanity, as a whole, could benefit from the individual students responding both aesthetically and through their senses to ideas or experiences. This process constitutes Makiguchi's conception of creating the value of beauty in humanity's pursuit of happiness (Goulah, 2009). Through the beauty that individual students create, Makiguchi asserted, the society is collectively improved through added value that can be shared and manifested continuously. For Makiguchi, like Freire and Yunus, the outputs of education could begin to be realized immediately, even in an imperfect world. Envisioning a symbiotic relationship between the individual student and the good of society, Papa (2016) notes, is a key component of leadership that transcends national borders.

Although Makiguchi had philosophical and religious differences with the political beliefs of his government, importantly, both in his teaching and leading roles, he avoided integrating his own critical beliefs regarding the state into his work with students (Goulah, 2009). While his work with Indigenous, women, and other marginalized people is well established, Makiguchi's school leadership, Goulash argues, placed value on foundational and universal concepts that could benefit them regardless of the sociopolitical context. This kind of an emphasis concerns itself with a pursuit of students becoming "more fully human and humane" (Papa, 2016, p. 2). His leadership, emphasizing the ubiquitous creation of value, cannot be contained to one set of educational systems or one specific setting. Like Freire and Yunus, Makiguchi did not limit his gaze to those with privilege, instead leading with the belief that education had value for all people, and conversely, all people had the ability to create value, beauty, and truth for all of society from the experience of education.

---

## **Fredrich Froebel**

Fredrich Froebel was a transformative leader who transcended national boundaries through his work in early childhood education. Born in Germany in 1782, Froebel was not only an educational visionary but uniquely, a social activist and feminist. "He claimed that the health and happiness of the individual, the family, and the state depended on the quality of preschool education at a time when there were virtually no public provisions for it. He invented both the concept and the word kindergarten, and he began programs of training for women" (Weston, 2000, p. 1). His influence has impacted early childhood education in an ever-changing landscape. His ideas and philosophy helped to influence leaders throughout Europe, America, and the rest of the world. The effect of poverty, the lack of opportunities for women, and the

absence of care and understanding of young children had a profound effect on his work and legacy.

During the beginning of the industrial revolution, children often went without care as women and older children worked in factories while the youngest were forced to fend for themselves. According to Weston (2000), Froebel saw the hardships of women and children and responded to societal needs. "Industrialization and economic pressures were leading to increased exploitation of child labour neither church nor state or making any educational provisions for the very young, Froebel became convinced of the need to train capable and gifted women in particular mothers" (p. 14). Froebel's belief that women should be trained as teachers was a modern and shocking idea and one that was often met with derision. "Froebel also advanced the idea of training women as teachers—and he persisted with this idea in spite of the laughter and ridicule the subject evoked when he presented it at an all-male conference in 1847" (Hewes, 1990, pp. 7–8). Undoubtedly, Froebel was a man of deeply held convictions about women as teachers. He believed that women should have training as teachers and that their involvement in early childhood would benefit society at large. By opening training centers for women he allowed opportunities for women away from the dangers and low pay of the factories that previously had been their main means of employment. "On 28 June 1840 Froebel's Universal German kindergarten was formally opened on the 400th anniversary of Gutenberg's invention of printing. It was staffed entirely by women who were not previously well represented in the teaching profession and many women were subsequently trained there as teachers of infants" (Weston, 2000, pp. 18–19).

Like Makiguchi, the development of the individual student was a primary goal for educators. According to Lascarides and Hinitz (2000), "spiritual development of man was Froebel's highest priority in education. He wanted, however, to develop it in harmony with man's physical and intellectual growth" (p. 94).

With an emphasis on the younger child, Froebel broke new ground as it related to access. According to Spodek (1988), before Froebel, "There was seldom a distinction made between programs for young children and programs for older children prior to the 19th century. Indeed, in the first part of the nineteenth century, primary schools had no particular entrance age" (p. 2). Froebel believed that in order to properly educate a youngster, the teacher must match the exact developmental stage of the child with the activities presented in the classroom. Froebel stressed the importance of sharing and community building. According to Baader (2004), "In this perspective, the kindergarten is understood as a microcosm of society, education in kindergarten as democratic" (p. 429). Froebel's dedication to the creation and care for the community was embodied in the term "kindergarten" which he created and which meant *garden of children*. "Each child was given a plot in the garden as their responsibility, as well as being expected to tend larger communal plots (Liebschner, 1991). The aim was for young children to be involved in and knowledgeable about the wider community" (Hoskins & Smedley, 2019, p. 76). Froebel's dedication to the creation and care of community reflects an educational philosophy that embodies a vision of a leader without borders as his work supports not only the individual child but the common good reflecting the emphasis for the common good for all of

humanity that Papa (2016) identifies as foundational for ELWB. His contributions have had a profound impact on the field of early childhood education over time.

Froebel's philosophy guided transformative leadership and his ideas had a huge effect on children in poverty throughout the world. According to Albisetti (2009), Froebel's work with children had a huge influence on reformers and educators in Italy, France, Switzerland, Portugal, and Belgium who wrestled with the idea of supporting children whose parents were taken from the role of caregiving by factories and poverty and not subjecting young children to long hours of rote learning and passive instruction. Ferrante Aporti, an early follower of Froebel, helped to establish some early kindergartens in Europe. "Aporti believed that children needed to start schooling earlier than age 6. Concerned with moral and physical development as well as instruction, he considered the *asilo* (nursery school) preferable to leaving children on the streets, keeping them up in the Italian equivalent of Dame schools or even leaving them in the hands of parents who could not educate them" (Albisetti, 2009, p. 162).

In the USA, visionaries such as Patty Hill Smith, the founder of the National Association of the Education of Young Children, established Froebelian kindergartens for children. Her vision of leadership demonstrated "an ethical humane community—a community which wants to know what is right and good—that organizes itself in accordance with democratic standards and ideals not only because they are good in themselves, but because they are prerequisites for the application of intelligence to inquiry" (Papa, 2016, p. 2).

Patty Hill Smith responded to childhood poverty both during the industrial revolution and the Great Depression. "She was deeply moved by the malnutrition, child labor, and high mortality rate among children living in poverty. She had developed a life-long commitment to democratic ideals and the importance of self-determination in activity—especially in childhood—as a means of empowering individuals" (Liebovich, 2020, March). The influence of Froebel, his kindergartens, and his response to childhood poverty was evident in Smith's establishment of kindergartens in the poorest areas of New York.

Smith-Rosenberg (1985) wrote, "Revolutionaries are rarely trained for their roles. They come forward to answer unexpected challenges, at times when old paradigms prove obsolete and new visions are required" (p. 11). The leaders in the field of early childhood education have reacted to certain societal shifts that are relevant to understand ways in which early childhood leaders have expanded their roles as school leaders and their own philosophy of early childhood education. These leaders are shaped by the field of memory, as they look to past models of the education of young children and have reshaped thoughts of how to educate young children as they responded to challenges and societal shifts that have arisen over time. By the time of his death in 1852, his influence and dedication to the community served "to revolutionize how educators activate their passions, serve humanity through schools and inspire the children in our care to find happiness and fulfillment in their lives" (Papa, 2016, p. 32). The ideas presented by Froebel were molded and shaped to help create structures that supported young children and their families over a long period of time and circumstances. Froebel's influence helped educators to look at young

children not merely as “younger students” but as unique and deserving of an approach that centered on development, community, and play. He moved education from simple rote learning and drills to one that endeavored to develop the whole person both morally and creatively. His dedication to creating access for children in poverty and the elevation of women as teachers was pivotal in the world of early childhood and the larger society and still has influence to this day.

---

## **Maria Montessori**

Early childhood education has seen many transitive leaders whose work impacts the lives of women and children who are living in poverty. According to a 2020 report by the World Bank,

Although children make up around a third of the global population, around half of the extreme poor are children...The youngest children are the worst off - nearly 20 percent of all children below the age of 5 in the developing world live in extremely poor households. (World Bank, 2020)

It is well established that poverty disproportionately affects young children. It is this injustice that historically captures the attention of leaders and transforms them from educational leaders into social reformists and revolutionaries. This is the case with Maria Montessori whose revolutionary views helped to shape the lives of women and young children in both Italy and worldwide, expanding.

Born in Rome in 1870, Montessori broke with gender norms by studying engineering and mathematics and later attended medical school, graduating with honors. Once she completed her training, she dedicated her work to disabled children and their families. According to Papa (2016), the first recognition of an educational leader without borders is to come to the realization that the goals of nation-state global dominance are, at times, incompatible with what is ethical and equitable. Gunderman (2020) wrote, “In 1906, Montessori gave up a university chair position to organize the education of low-income children in Rome. Known as Casa dei Bambini (‘Children’s House’), it was here that Montessori began to develop and apply her educational principles” (p. 327). As such, Montessori operated as an educational leader without borders, sharing a vision of education as a liberating force for peace which stayed consistent even though her beliefs often put her at risk, and her path to that vision evolving over time.

While Montessori’s experiences with children in poverty led her to develop her theories regarding early childhood education, her theories had utility for the Fascist party. It was during this time that the Italian dictator Benito Mussolini became enamored with Montessori’s methods of increasing childhood literacy. According to Montessori and Gutek (2004), “Mussolini, of course, was not interested in the freedom of the child to learn but was attracted to a method that instilled discipline and order and in which children learned to read and write at age four” (p. 44). This interest by the government resulted in Montessori being awarded a government post

developing programs related to early childhood education. As such, Montessori's methods were embraced by the Fascist party, but their ideologies were constantly at odds. Whereas Mussolini wanted to use education as a means of control (Ascoli, 1937), Montessori believed that education could help achieve world peace (Baligadoo, 2014).

Importantly, Montessori went as far as to defy the Fascist regime by refusing to allow Fascist propaganda a place in her schools. This division caused Montessori to lose the backing of the government and put her life in danger. Gunderman (2020) explained what happened to her this way:

But beginning around 1930 she fell out of favor, in part because she refused to allow her schools to participate in pledges and songs designed to promote the ruling party's political objectives. Moreover, Montessori was an indefatigable proponent of education as a means of securing peace, which brought her into conflict with Mussolini's militaristic plans. By 1936, the government had terminated its Montessori-inspired educational programs throughout the country (p. 327).

This conflict with the Fascists led to Montessori's dismissal and the need for her to eventually flee Europe in fear of her life. In keeping with the deep commitment that ELWB exemplifies to the universal ethic, Montessori went to India where she continued her work fighting child poverty. Baligadoo (2014) wrote: "Maria Montessori's determined effort to bring peace through education should not be underestimated. She considered education as the best means for achieving peace" (p. 428). Nominated for the Nobel Peace Prize in 1949, 1950, and 1951 (Baligadoo, 2014), Montessori's vision, like Froebel's, would transcend national and political borders to influence global efforts to educate the world's youngest and arguably, some of the world's most vulnerable students. Moreover, Montessori's conception of education as a tool of peace and her dedication to education worldwide as a weapon against childhood poverty makes her a leader operating beyond political and ideological borders. Her work in education, framed by her aim to build peace in communities, exemplifies Papa's definition as someone who works "to create a more socially just world society" (p. 5).

---

## Conclusions and Reflections

Yunus once described the experience of poverty as the absence of all human rights (Yunus, 2009). This same indictment could include the absence of peace and a feeling of value, as well. For poverty to sustain, the systems in place must support and reproduce the conditions necessary for communities of people to remain in poverty, cut off from their rights as human beings, equitable access to education, and a quality of life required to lift themselves out of poverty. With an awareness of what types of leadership and work might help the underserved, the exemplars of Freire, Froebel, Makiguchi, Montessori, and Yunus each provide insight into the progressive thinking endemic to educational leadership without borders. Indeed, each

significantly advanced the conventional thinking about what educational leadership could accomplish, framed by their ontological beliefs about the importance of equity and access in education, and supported by their expansive thinking on what might be attainable through educational processes, reconceived. Although the discourse of improving equity and access for underserved students and communities in educational leadership is prevalent in the field, making systemic changes in the domain of educational leadership beyond small-scale changes has proven complex and difficult to achieve (English, 2020). Importantly, these leaders each contributed a fresh perspective on how best to serve the underserved in ways that remain challenging and relevant past their particular time frames and beyond their original settings. Certainly, these leaders, philosophers, and thinkers have transcended national borders to continue to challenge today's educational leaders, across nations and systems, to serve all of humanity, in their dialogue, practice, and leadership.

## Abstract

The search for science and scientific understanding in educational administration and leadership has been shaped to varying degrees by differing views of science. Three such views have had some influence in the field. Positivism, as a form of strict foundationalism, has been perhaps the least influential. It purports to justify a theory of educational administration by deriving it from a secure set of alleged knowledge foundations. The weaknesses in this view are well known, with its influence nowadays confined mainly to accounting for operational definitions and a quest for empirical foundations. Logical empiricism, a modest form of foundationalism, has been of most influence. Expressed most clearly in the Theory Movement of the

1950s, and later through its application in social systems theory, it sought to justify theories of administration by empirical testability. Observation statements are derived from the theory and are then tested against actual observations. Justification is a matter of securing many confirmations and no disconfirmations.

Both positivism, in this sense, and logical empiricism were primarily employed in a project to build scientific theories of educational administration. Because they placed a premium on law-like generalizations, a form of systems theory such as could be applied to organizations, came to dominate the field, at least until the 1980s, despite known weaknesses in logical empiricism as an account of science.

It was systems theory itself that emerged as problematic. As key features of systems emphasized stability and return to equilibrium, the model proved to be unsatisfactory in accounting for change, especially large-scale systems change as occurred with neoliberal reforms of schooling in the direction of school-based management.

Theories of change, especially those for systemic change within whole jurisdictions, favored leadership as the primary explanatory source in accounting for school reform, and furthermore, for implementing it. As a result, by the 2000s, the role of science had narrowed from providing constraints on theories of organizations, to providing the conditions for evidence-based research into leadership. Logical empiricism as a theory of science had become the epistemological basis for a scientific research methodology in leadership studies.

Known weaknesses in logical empiricism have led to so-called post-positivist accounts of science. An important one of these uses science itself to account for the nature, acquisition, and justification of knowledge. This scientific naturalism favors a coherentist view of justification that can then be used to shape both the content and structure of theories of educational administration, leadership, and how they are related.

### Keywords

Positivism · Logical empiricism · Naturalistic coherentism · Subjectivism · Critical theory · Humanism · Postmodernism · Causation · Statistical regularity · Pattern · Randomness · Effect size · Correlation · Best fit · Empirical adequacy · Systems theory · Testability · Confirmation bias · Distributed cognitive system · Context

### The Field of Memory

Former key ideas, notably those associated with building a science of administration as envisaged by the researchers of the Theory movement of the 1950s adopted positivism of the 1920s, now linked to the Vienna Circle, and subsequent developments from the 1940s more accurately labeled as logical positivism. Under the influence of logical positivism, administrative theories were construed as hypothetico-deductive structures from which could be derived observation

statements that could then be tested in experimental or natural settings. To meet the requirements of science, these theories were held to be versions of systems theory.

### **The Field of Presence**

Because of problems with logical empiricism as an account of science, an important development in the field, commencing in the 1970s, was to move away from the entire enterprise of science. Instead, many alternative paradigms came to compete with science. Voice was given to subjectivist views, those based on administrative values as central, Critical Theory, and a version of postmodernism that challenged the whole matter of an account of epistemic justification that relied on observation and testability. Traditional science of administration still flourished, but alongside these other competing views.

### **The Field of Concomitance**

The outside influences on the search for science and scientific standing have come from philosophy, particularly philosophy of science, and from critics whose ideas are based in Weberian social science and its method of understanding, political philosophy and theories of human emancipation, the philosophy of social science, and research methodologies associated with these different influences.

### **Discontinuities and Ruptures**

Most of the field's discontinuities and ruptures have centered first on disputed over the nature of science, and second over whether science, however it is conceived, could function as an adequate basis for educational administration or the justification of accounts of leadership and its effects within organizations. These ruptures may be described, at the most general level, as different paradigms, where in Kuhnian terms, their merits are claimed to be defensible within the terms of each paradigm. This results in the formation of distinct theoretical silos. An alternative to this, naturalistic coherentism, challenges the entire basis for paradigms theory. It argues that if paradigms were truly incommensurable, a paradigm would not be learnable by an occupant of a different paradigm.

### **Critical Assumptions**

The key assumptions of this chapter are that a persuasive account of the nature of science can be argued in relation to rival views, and that this comes with a preferred methodology for justifying claims about organizations and about leadership. However, this requires that the task of justification always be relative to context. In social science research, the difference between controlled and uncontrolled variables is blurred, and that such a science looks for patterns. Since leadership occurs within particular organizational contexts, a feature of the blurring contributes to a more distributed view of leadership. This is more so where the basic tasks of organizations involve characteristic epistemic tasks such as decision-making or problem solving. Leading in organizations can then be construed within the framework of social epistemology. The result is a view of leadership as occurring within a distributed cognitive system that admits of scientific and mathematical modeling.

## Introduction

The quest for a science of educational management and leadership has been shaped by two significant forces. The first concerns views about the nature of science. The second concerns the scope and role of science in building theories in these fields. Ideas about the nature of science have come largely from philosophy, particularly from understandings of positivism and logical empiricism, two distinct notions that are sometimes run together in the educational literature.

Historically, the widest scope for a science of educational administration was proposed in the 1950s, an approach that was called the “Theory Movement.” This was an attempt to develop a systematic account of management theory that conformed to the philosophical canons of logical empiricism. Its central model was systems theory, as it was thought to meet the required philosophical strictures (Culbertson, 1981).

Understanding educational organizations as systems dominated the scene until the mid-1970s when it came under criticism from two sources. The first was a developing skepticism concluding that a traditional science of educational administration was fundamentally inadequate. Arguments for these inadequacies came mainly from the kind of philosophical objections that gave rise to the claim that there were many different paradigms for conceiving management theory, not just one so-called scientific conception.

The second source of objection to systems theory came from a challenge to some of its fundamental assumptions, particularly the notion that systems return to equilibrium. This assumption made systems theory an ill-suited framework for understanding educational change, notably the widespread shift to school-based management that gained momentum across multiple jurisdictions beginning in the 1980s.

The principal force for driving educational system and individual school change was theorized to be leadership. The leadership theories that developed out of this policy trend instantiated a more restricted role for science. There was no demand for a science of leadership as a constraint on theorizing leadership. Rather the dominant role of science shifted to providing justification for claims about leadership. The philosophical ideas of positivism or logical empiricism found a home in research methodology with concomitant support for quantitative research methods. So, too, followed the belief that research methods partitioned into paradigms with some failing to be scientific.

While most objections to a quest for science in educational management and leadership are based on objections to positivist and logical empiricist accounts of science, these philosophical doctrines have been seriously challenged as accounts of the nature of science. It is argued here that the prospects for science in leadership and management are best defended within the framework of a post-positivist (and post-logical empiricist) account of science, one that sees evidence as being more than a narrow view of empirical evidence and sees theorizing not as a quest for law-like generalizations, but rather as a way of expressing patterns in leadership and management phenomena.

As these ideas about science emerged and influenced the field over time, the discussion that follows will as much as possible be chronological.

## Epistemology and Terminology

The role of empirical evidence has always been central to accounts of science, particularly over the question of what counts as justifying a scientific theory. The branch of philosophy that deals with this issue is epistemology, or theory of knowledge. In educational administration, views about a science of administration can be refined and distinguished by attending to their underlying epistemologies. There are, however, both in philosophy and in administration, a number of divergent and sometime conflicting uses of such terms as positivism, logical positivism, empiricism, logical empiricism, science, and scientism. Some of these differences are about how to specify the meaning of terms or even claims. Others, to be focused on here, are to do with justification.

Concerning justification, it is useful to distinguish three main varieties: positivism, logical empiricism, and coherentism. The first two are forms of foundationalism. With strict foundationalism, justification proceeds from observational evidence to theory. Classical empiricism treated observational evidence as sensory experience. However, if theories are formulated symbolically, as sets of interrelated sentences, then sensory experience must also be expressed symbolically as inferential relations, such as logical deduction or induction, are between sentences. In the positivism of the Vienna Circle, the most influential form of positivism, the basic epistemic foundation was protocol sentences. These are first person, present tense, reports of sensory experience, such as “I see a red patch” (Laydman, 2002, p. 152). Justification consists of showing inferential relations between protocol sentences, which form the foundations of knowledge, and all other knowledge claims.

There are many problems with this form of positivism, but two are central to its demise. The first points to the fact that protocol sentences do not actually tell us anything about the world beyond the inner workings of the perceiver’s mind. That is, first person reports of sensory experience are no more than reports about the contents of the mind, not reports of the external world. This is the problem of solipsism. Getting from protocol sentences to justified claims about the world requires a lot of inferential machinery, perhaps in the form of a theory of perception that locates the world as the cause of sensory experience. Unfortunately, the required theory of perception is itself not a sensory experience and so its role in justifying an external world begs the question.

Even if the problem of solipsism could be solved, singular observation reports will not yield what is most characteristic of good science, namely law-like generalizations. This is because of the problem of induction. A finite number of singular observation reports does not permit an inference to a generalization. One cannot go from “all observed ravens are black” to the conclusion “all ravens are black.” Such are the woes of positivism’s strict foundationalism where one is justifying claims by way of inference from a subset of foundational claims.

There are many other uses of the term “positivism” in social science literature, but these are often used simply to refer to science as though it is, by definition, positivist. Traditional versions of critical theory in educational administration make this conflation. The term “scientism” is also used as a pejorative in this and other traditions (Foster, 1986).

Logical empiricism attempts to bypass some of these problems by adopting a modest form of foundationalism, one that sees the inferential status of observation reports as being concerned with confirmation or disconfirmation. Instead of attempting to deduce theories from observations, logical empiricism deduces observation sentences from theories. If the deduced observations are in fact observed, the theory is confirmed, and if not, the theory is disconfirmed (Evers & Lakomski, 1991; Hoy & Miskel, 2013, pp. 1–8). A theory is said to be justified if it builds up many confirmations and no disconfirmations.

Although logical empiricism was initially developed as an account of scientific knowledge, one of its founders, Herbert Feigl, sought to extend its applicability to social science (Feigl, 1953). And it was this view of science that was adopted by the leading figures of the Theory Movement, and later theorists in educational administration. As Griffiths (1959, p. 28) remarks, “Halpin suggests that we accept Feigl’s use of ‘theory’ as the standard and that researchers and theoreticians restrict the use of the word as does Feigl. We agree that this is a needed step.” The needed step continued even into the 1980s and beyond: “Some agreement is apparent in the field of educational administration that the definition of theory produced by Herbert Feigl is an adequate starting point” (Hoy & Miskel, 1987, p. 2). The key point here is that “theory” in this context means “scientific theory.”

So, what does a logical empiricist account of educational administration look like? It is useful to begin with what scientific theories in the field are supposed to do. Four main functions were proposed (Griffiths, 1959). The first was to guide practicing administrators, something that other approaches aspired to but, according to critics, only achieved if at all, in an anecdotal way. The second was to guide the collection of facts, or data, about administration. The third was to promote the development of more theory, and the fourth was to explain and describe the nature of administration.

In order to achieve these goals of theory, logical empiricism imposed four major constraints on the content and structure of theories, as well as their development: (1) theory was a hypothetico-deductive structure; (2) justification for every claim in the theory was by empirical testability, that is by observations that either confirmed or disconfirmed claims; (3) operational definitions of all theoretical terms was required for specifying meaning; (4) as a corollary of these constraints, ethics was to be excluded from administrative theory (Evers, 2003).

Theory conceived as a hypothetico-deductive structure implies that a theory consists of layers of claims, from the most general to those that are particular, linked by deduction. This is Feigl’s “wedding cake” model. At the top are the universal generalizations of physics. Lower down are to be found theories in the middle range dealing with a more context-specific domains of phenomena such as societies or organizations. And further down are the specificities of contingent

initial conditions that help describe states of affairs. A hypothetico-deductive scientific administrative theory would then consist of domain-specific generalizations concerning organizations, or administrative functioning, statements of particulars for specific organizations, and deductions from the theory as to how the organization will behave.

Justification is then a matter of checking deduced observations with actual observations, particularly when it comes to a theory's hypothesized generalizations. The empirical justification of the theory depends on building up many matches between deductions and observations, or confirmations, while discovering either no disconfirmations or only those that can be explained by special circumstances that lie outside the assumed conditions of the theory's context of applicability. Examples of generalized hypotheses would be "The stronger the collective teacher efficacy of a school, the higher the level of mathematics in the school," or "The greater the external pressure from the community on their schools, the higher the level of academic achievement" (Hoy & Miskel, 2001, p. 6).

Notice that these hypotheses contain a number of theoretical expressions, for example: "collective teacher efficacy," "external pressure from the community," and "academic achievement." Logical empiricism requires that these be given precise empirical definitions. This is achieved by the use of operational definitions, notably those that specify empirical measurement procedures for each expression. Although this is a feature of logical empiricism's empirical theory of meaning, its importance for justification lies in the fact that the language describing observations must match the language in a theory's hypotheses for there to be a logical relation between the two that is required for testability.

Finally, the reason that ethics is excluded in this kind of science of administration is because of a purported distinction between facts and values. Science is about facts, how they are described, predicted, and explained. They admit of justification by observation, and the theoretical terms that may figure in their description are said to be definable by operational definitions. Ethics, on the other hand, does not admit of any of this, and so has no place in a scientific theory. Since something must drive the quest for good theory, the issue is faced by separating means from ends. The virtues of description, prediction, and explanation are to do with means. The question of what ought to be done, or how it should be done, are the province of ends, or goals, and where ethics enters the picture. The usual way in which logical empiricism gets to evaluating goals is by appealing to the concept of preference. Preferences can be measured, and if they are complete with regard to a set of options, and they are transitive, then a utility function can be constructed for an individual. And if rationality is identified as maximizing expected utility then we get a rational choice of goals. The disconnect with ethics comes when a person's preferences can be decidedly unethical. A weaker version of ethics claims that it is just an affective response to facts.

All four of these central features of logical empiricism have been criticized in the educational administration and leadership literature. Some have claimed that there is no such thing as a science of educational administration and leadership, while others have argued that there is such a thing but that it requires a more philosophically

sophisticated account of the nature of science. Both these alternatives will be discussed later where a coherentist account of a scientific theory will be given and an application to the field sketched.

---

## Systems Theory

The administrative theory of choice for the founders of the 1950s Theory Movement was systems theory. Schools were theorized to be systems, possessing a number of common properties. Of more importance for a middle range theory operating in a sea of organizational contingencies were the common properties providing a basis for law-like generalizations. To see how these are possible, consider the case of a simple heating system. It is comprised of a heater and a thermostat that contains a thermometer and a device for setting a temperature goal. The desired temperature is set and the heater begins to operate until the area to be heated reaches the target temperature, whereupon the heater switches off until the temperature falls below what is set. Once in operation, the system is self-regulating and maintains stability. Because this is a basic design principal for a heating system, we can predict its operation regardless of the physical details of the component parts or most details concerning the area of operation. The heater provides the heat, the thermostat provides the system goal, and the thermometer provides the epistemological feedback on goal attainment. This is a single loop system. Others can be made with more complex feedback loops.

Consider a school introducing a new policy on what school uniform should be worn by students. The policy requires all students wear the uniform, and staff measure compliance and provide incentives for the policy to be followed. After the school's best efforts, compliance tops out at 95% with recognition that more extravagant resourcing would be required to reach 100%. A second feedback loop is required to review the system's original goal of full compliance and reset the goal. Scaling this up to a view of the school as a social system results in an extremely complex set of nested feedback loops, measurement techniques, and mechanisms for setting and making adjustments to goals (Hoy & Miskel, 2013, pp. 1–38). Nevertheless, the systems theory model still provides some basis for abstracting from this detail to characterize key design features. These include systems being comprised of interrelated parts, that they are best conceived holistically, that they are stable possessing a capacity to return to equilibrium after being disturbed, that they are self-regulating, that they are defined by their inputs and outputs and the processes of transformation that lie between, and that they contain multiple interacting subsystems. Even the difference between closed and open systems is sometimes characterized by reference to physical theory: closed systems move from order to disorder in conformity to the second law of thermodynamics while open systems can extract energy from the environment to maintain order (Evers and Lakomski, 1991, pp. 60–75).

Theorizing at this level of abstraction allowed accounts of organizations more closely to fit the requirements of logical empiricism. For example, drawing on

Lewin's (1936) formalism, defining system behavior with precision was attempted in the following way: "Behaviour (B) in the system is explained in terms of the interaction between role (R), defined by expectations, and personality (P), the internal need structure of an individual; that is,  $B = f(R*P)$ " (Hoy & Miskel, 1987, p 62). This hints at the possibility of building mathematically precise sets of relations among measured operationally defined variables. Moreover, the model's requirement that organizations return to equilibrium seemed to be unassailable, allowing of course for exceptions that occurred outside operating parameters. And the presence of feedback among interrelated parts also seems obvious. Yet, the model, as an instantiation of logical empiricist theory, ran into some serious difficulties.

---

## From Systems Theory to Leadership

Leaving aside, for the moment, the question of whether logical empiricism is an adequate account of the nature of science, systems theory as a model of how organizations operate has its own flaws. For example, by treating the tendency to return to equilibrium, or stability, as a fundamental feature, explanation slides into functionalism which places weak constraints on causal explanation within organizations. This occurs because once stability is seen as the central empirical constraint on explanation, it can fail to rule out multiple possible causes of that stability. Indeed, if return to equilibrium is, by definition, a feature of organizations, then the feature becomes a tautology. However, the real difficulty with this feature of the systems model is that it makes the possibility for explaining change problematic.

Perhaps the biggest change to affect education at the jurisdictional level was the push for neoliberal reforms during the 1980s and beyond (Starr, 2019). This policy emphasis included such features as school decentralization, school autonomy coupled with centralized accountability, schools as participants in a market, and parent choice based on school performance. The transition of state education systems to a form of school-based management was not something that suited characterization in terms of traditional systems theory. As Caldwell & Spinks, (1992, pp. 49–50) argued "a powerful capacity for transformational leadership is required for the successful transition to a system of self-managing schools." Transformational leadership is here understood as instantiating the "four I's" of idealized influence, inspirational motivation, or charisma, intellectual stimulation, and individual consideration (Burns, 1978; Bass & Steidlmeier, 1999). The shift to understanding organizational performance and change in terms of leadership had become so prevalent that by 2004 the journal *Educational Management and Administration* had decided to add "Leadership" to the title, to become *Educational Management Administration and Leadership*. In explaining the change, the journal's editor noted that there were various reasons but that since the late 1990s, "leadership had been in the ascendancy" (Bush, 2004, p. 7).

## Against any Science of Administration

Over the same period of time that systems theory was coming under attack as a model of organizational functioning, attacks were also being mounted against the logical empiricist theory of science, at least to the extent that it could form the basis for any attempt at a science of administration. One line of criticism was directed at purported claims of objectivity. Observations, the source of scientific objectivity, were always interpreted, usually with the aid of theories. That is, observations are theory-laden. This compromises the independence of observation as a source for confirming or disconfirming theories since theories are presumed to be less epistemically secure than observations. The blurring of the theory/observation distinction was thought to undermine scientific objectivity. Greenfield (1975) raised this, and a more substantive issue. Following Weber (1947) he claimed that science was the wrong model for doing social science. Whereas science sees research as aiming for “experimental or quasi-experimental validation of theory,” social science should be concerned with “the search for meaningful relationships and the discovery of their consequences for action” (Greenfield, 1975, p. 7). Natural science looks for causes of phenomena, preferably finding law-like regularities. But when it comes to the study of organizations, which are comprised of people, the focus should be on people’s reasons, on why they choose to act the way they do in the contexts in which they act. It is reasons, not causes, that are central to the study of administration, resulting in a logical empiricist view of science being totally inappropriate for educational administration.

Hodgkinson, a contemporary of Greenfield’s, reached a similar conclusion about the inappropriateness of a science of administration but from a different set of considerations. Hodgkinson (1978, pp. 62–63) accepted logical empiricism’s claim that facts and values were entirely distinct. He also accepted that scientific theories were about facts, about how the world is, its regularities and its anomalies, not about values, how the world ought to be. He endorsed Hume’s claim that one cannot derive an “ought” from an “is” and he accepted Moore’s (1903) argument that any attempt to define moral values in terms of natural properties committed the naturalistic fallacy and was invalid (Evers & Lakomski, 1991, pp. 98–111). On the other hand, administration, especially when it comes to decision-making, is fundamentally steeped in considerations of moral values. Decision-makers cannot avoid navigating choices between moral versus immoral means for achieving moral versus immoral goals. But if administration intrinsically involves values, and if science is intrinsically incapable of considering values, then administration cannot be construed as a science. Rather, it is best construed as a humanism (Hodgkinson, 1991).

Another set of arguments against the possibility of a science of administration during this period came from those Critical Theorists who were influenced by Habermas’s *Knowledge and human interests* (1972). The central argument of the book is essentially of the form of a Kantian transcendental deduction that examines what must be presupposed for something to be the case (Power, 1993). In this case, the question is “what are the conditions for knowledge to be possible?”. The answer from the deduction is that three sorts of human cognitive interests need to be met.

One is knowledge of how to manipulate things in the world, what may be regarded as scientific knowledge. Second is knowledge of how to communicate, or hermeneutical knowledge. The third is knowledge of the conditions for human freedom, or emancipatory knowledge. The implication for a science of educational administration is that such a science is concerned with only one type of knowledge, and when applied to organizations, involves the manipulation and control of people (Foster, 1986). In the literature, this view of science is usually termed “positivist” and often “scientific” but it is more correctly classified as logical empiricism. Lakomski (1987) offers systematic objections to this approach.

During this period of challenges to traditional science of educational administration, a more radical critique emerged, one that seemed to challenge not just the possibility of a science of administration but the possibility of justified knowledge at all. Postmodernism, at least in the form in which it influenced educational administration (Littrell & Foster, 1995; Maxcy, 1993, 2001) offered a perspective that owed much to Rorty’s (1979) *Philosophy and the Mirror of Nature*. Rorty’s pragmatist postmodernism propounded three central doctrines. The first was anti-foundationalism, namely that knowledge has no foundations. The second, echoed in the title of his 1979 book, is anti-representationalism, namely that our theories are not representations of the world (or aspects of it). Finally, he was anti-essentialist, denying that objects must have certain properties to be the objects that they are.

Attacks on science, objectivity, and the relevance of empirical evidence in relation to the central purposes of education such as the promotion of student learning, successful school administration, and the practice of good educational leadership produced their own backlash in the form of evidence-based research.

---

## Science, Evidence-Based Research, and Leadership

With the demise of systems theory and the rise of leadership as the central explanatory resource in accounting for organizational functioning, appeals to science took on a new role. Neoliberal emphasis on performativity in a pseudo-market of educational provision, coupled with leadership’s explanatory focus, created a demand for evidence on how school leadership might promote the performance of school organizations, especially the major educational outcome of student learning. Commenting on changes to the US government’s funding of educational research, Lather (2004, p. 759) observed that “the ‘evidence-based’ or ‘accountability’ movement includes governmental incursion into legislating scientific method in the realm of educational research.” The US National Research Council’s Committee on Scientific Principles for Education also noted that skepticism about educational research “led to proposed legislation that defines what constitutes rigorous scientific methods for conducting educational research” (Shavelson & Towne, 2002, p. 1). The Committee’s response was to identify six “scientific principles” that are needed for rigorous scientific research in education. The principles partly reflect logical empiricist epistemology: The vital importance of empirical adequacy and its determination through testing of

hypotheses via confirmation and disconfirmation links to an overarching theory or conceptual framework, an emphasis on replication and generalization, and a quest for causes of phenomena (Shavelson & Towne, 2002, pp. 3–4). However, they also allow for different methods of research determined by their appropriateness to the research questions to be investigated.

Generally speaking, the most influential so-called scientific research on leadership and student learning has come from quantitative studies, in particular meta-analyses that aggregate multiple studies in a form that produces effect sizes. This section offers a close examination of logical empiricist features of evidence that figure in the justification of claims concerning how leadership promotes student learning outcomes, with a particular focus on quantitative research methods. Of special concern is the relationship between research questions, empirical evidence and the nature of epistemic justification. It will be argued that scientific educational research requires more than logical empiricist standards of justification. The additional requirements are located in a form of coherentist justification.

## Effect Size Evidence

An effect size is a measure, in standard deviations, of the change that can occur in a variable as a result of a treatment, or a practice. In a research design that compares an experimental group to a control group, the effect size measures the degree to which the experiment makes a difference compared with the control group. The simplest formula gives this as the difference between the groups' means divided by the average of the groups' standard deviations. An effect size of 1.0 can mean that the experimental group performs at one standard deviation above the control group. While the above formulation of effect size is in terms of experimental research designs, ex post facto (after the fact) research, that is, research that looks at the statistical structure of ongoing or former practices, with a quest for determining correlations among variables, can also be converted mathematically to evidence of effect sizes.

Quantitative research on leadership typically does not admit of experiments. Most of it reports ex post facto studies (Egalite & Kisda, 2016; Leithwood et al., 2004; Robinson et al., 2008; Witziers et al., 2003). By far the largest study ever conducted on the effect size of factors that contribute to student learning is Hattie (2008). (See also Hattie, 2012; Hattie et al., 2015.) In *Visible Learning* (2008) Hattie produced effect sizes for 138 possible factors influencing student learning, based on 800 meta-analyses of over 50,000 research studies involving a total of over 200 million students. The average effect size for factors was 0.40. The advice from these analyses was that schools wishing to improve student learning should adopt factors that have the highest effect sizes. Those factors below 0.40 should be avoided. A 2018 update to the list of factors lists effect sizes for 252 factors drawn from 1400 meta-analyses of over 80,000 research studies involving over 300 million students (Hattie, 2018). The effect size for “principal/school leaders” is 0.32, although there has been some meta-analytic research on a small number of studies that suggests the

effect size for instructional leadership is higher than that of transformational leadership (Robinson et al., 2008).

Although this, and other, effect size findings seem to be rigorously scientific, they depend on a number of assumptions. The first is that findings from the two main research designs, experimental and ex post facto, can be placed on the same scale. This is questionable. Consider the example of finding the effect size of carbon dioxide (CO<sub>2</sub>) on plant growth. An ex post facto design would measure the variability of plant growth against the variability of possibly relevant factors such as multiple soil nutrients, presence of water, sunlight, temperature and climate, altitude, and CO<sub>2</sub> in the atmosphere. However, because there is little variability in the proportion of CO<sub>2</sub> in the atmosphere, the effect size of CO<sub>2</sub> on plant growth would be negligible. On the other hand, with an experimental design, we can haul the plants into the lab and turn up the CO<sub>2</sub>, thus producing a considerable effect size. Research design thus can have a considerable effect on effect size. A lot of factors that have the largest effect sizes, notably those to do with teaching methods, lend themselves to a preponderance of experimental studies, whereas those to do with leadership are mostly ex post facto.

In determining the most appropriate inference from these studies on leadership, we need to do some social science. We need to know whether, as in the case of CO<sub>2</sub>, there is something in the social world of schooling that limits variability. The obvious answer lies in the constitutive and regulative rules that define schooling as a social institution (Searle, 1995). Within the jurisdictions in which much research on leadership is conducted, one does not gain appointment to a leadership position, especially the principalship, without meeting defined appointment conditions usually defined at the jurisdictional level. These are the constitutive rules that define what it is to be a principal. Moreover, once appointed, the role comes with performance standards, the regulative rules that govern principal performance in the job. The aim of these rules is to both limit variability in performance outcomes across the jurisdiction, and to ensure high levels of required outcomes. To the extent that these two sets of rules achieve their goals, a low effect size for principal leadership on student learning outcomes can be compatible with the high performance of principals in achieving these good learning outcomes. Sorting out the truth or falsehood of this inference requires a lot more social science than just the evidence of effect size results from aggregating research studies into multiple meta-analyses.

## **Evidence from Experimental Research Designs**

In medical research, the gold standard is the double-blind controlled experiment. This is one where neither the participants nor the researchers know who is receiving the treatment (the experimental group) and who is getting the placebo (the control group). Despite the possibility of confounding placebo effects, the important methodological distinction to note is that between the epistemic conditions of good research and the causal conditions of good research. However artificial the epistemic conditions between an experimental setup versus those of its real-world application,

what matters are the conditions for the causal efficacy of a treatment. Receiving a vaccine in a clinical trial and receiving it when distributed within the general population should not make a causal difference. In social science experiments, it needs to be argued that the epistemic conditions for good scientific inference do not create a divergence in the causal conditions for efficacy. The issue is whether a pedagogy that has a large effect size in a controlled pedagogical environment has the same efficacy in a relatively uncontrolled natural school and classroom setting. Whatever the result of the experiment, more social science is required to make the inference go through for its wider causal application beyond the epistemic context of research. The messiness of the social world can compromise the validity of inferences from controlled experiments to the contexts of application. Logical empiricist canons of scientific rigor are not suitable for dealing with this issue (Walker & Evers, 1986).

### **Evidence from Ex Post Facto Research Designs**

These designs typically collect data on postulated variables after the fact and analyze statistical relations among them. In the case of structural equation modeling, the statistical structure of the data is usually given in terms of correlation coefficients among pairs of variables, with the total structure expressed as a pattern of multiply linked pairs. The links can be expressed mainly in the form of linear equations. The normative value of these studies lies in the inferences they purport to sustain for good leadership (and other) practices that lie outside the contexts from which data on high performing or improving schools are drawn (Day et al., 2016).

Using these studies to support interventions raises the matter of whether evidence for a statistical structure can function as evidence for a causal structure. The usual test of this is that causal claims support counterfactuals while merely statistical ones do not. For example, the perfect correlation between lightning and thunder is causal because, contrary to fact, if there was no lightning there would be no thunder. On the other hand, if there is a perfect correlation between two people leaving for work at the same time, this may just be a coincidence if one stays at home and the other goes to work. The link may simply be unrelated workplaces having identical starting times.

There are two issues here. The first is that the principle on which successful cases are selected rules out by definition counterfactual cases, namely those for which a normative argument for an intervention could be mounted. Evidence from successful schools is meant to be applied to unsuccessful schools. This means that we do not know if what is revealed by the statistics will support counterfactual cases. The second is that even if the statistics capture the causal structure of the successful schools, a case needs to be made for whether the factors for success can be applied to the counterfactual intervention schools (Meehl, 1970). The causal structure of intervention schools may prohibit an intervention that will yield the expected outcomes.

Solving the application problem requires a different kind of social science approach. It requires an epistemically progressive goal-driven process that begins

with the causal features of the particular intervention school. It starts from where the school is, identifies problems that have normative purchase, proposes tentative theories that are assumed to be those most likely to work in that context, implements them, in the process discovering the extent to which they work, or not, and if problems persist, continue the process, treating problem-solving as a trajectory undertaken within that context and through time. However, this is not a logical empiricist methodology. It is broadly Popperian coupled with the use of coherence criteria for adjusting tentative theories in light of implementation feedback (Popper, 1959, 1979; Chitpin & Evers, 2019; Evers, 2015).

## Fitting Data to Curves

Attempts to describe, explain, and predict phenomena in a scientific way often involve trying to do causal modeling by fitting data to curves, either single curves, or multiple curves in the case of a complex set of phenomena. Curve fitting is one key aspect of demonstrating that data are patterned. (Factor analysis is another.) Suppose we have a set of, say, 1000 points, each described by an  $x$  and  $y$  coordinate:  $(x_1, y_1), (x_2, y_2), \dots (x_{1000}, y_{1000})$ . Let us call the 1000 ordered pairs of coordinates a bit map of the data. Then according to the Kolmogorov/Chaitin definition of “pattern,” these data are patterned, as opposed to random, if there exists a description of these data that uses fewer bits than the bit map (Chaitin, 1975; Haig & Evers, 2016). For example, if all the points lie on a straight line  $-y = mx + b$ , then they are highly patterned because they can be extremely compressed into an expression containing very few bits. The line enjoys the virtues of both goodness of fit and high compression of data.

These two virtues raise an issue fundamental to logical empiricism, namely, what counts as empirical adequacy (Bhaktavatsalam & Cartwright, 2017). At first sight, empirical adequacy looks like a condition that is met if all the data points satisfy a theory, or in this case, lie on a curve. That all the points might lie on a straight line is, of course, an idealization in social science research. The notion of “best fit” is more modest. The standard account of “best fit” is that it satisfies a “least squares” criterion. This is a requirement, for a straight line, that the sum of the squares of the perpendicular distances of points to a proposed line be a minimum. For nonlinear curves, the requirement is that the distances to be squared and summed are the perpendicular distances from points to tangents to the curve. This method was first invented by Gauss, although at the time priority of discovery was disputed, and was used by him, in 1801, to calculate the orbit of the asteroid Ceres. Gauss’s first estimate of the orbit was based on just three out of 22 observations, from the astronomer Piazzi, and was then later refined so as to best fit all 22 observations. (There are many online sources for his methods. A brief, accessible classical account is in Bell, 1937, pp. 240–242.)

One feature of obtaining a best fit by the least squares method is that the result is not unique. An arbitrarily large number of curves can satisfy this condition. Gauss did not try fitting to a straight line because he already knew from Newtonian

mechanics that the curve would be an ellipse. This means that an epistemology for determining a best fit should include the requirement to cohere with what best current theory prescribes. Since the formula for an ellipse contains more bits than one for a line, the coherence constraint can override the quest for compression. A good example of this tension is the case of belief/desire theory, or folk psychology, to explain human behavior. The theory vastly abstracts away from all the physical details of human behavior while successfully predicting a huge range of social behaviors. We know this cannot be the full explanatory story because, if so, it would create the “miraculous coincidence” problem (Cussins, 1992). Going to a shop to buy a pizza explained in folk-theoretic terms amounts to the rational coordination of beliefs and desires, in this case believing that the pizza can be bought in a shop and desiring to buy a pizza. That cannot be the whole story however, since a lot of coordinated physical activity is also required to get someone to the shop to buy the pizza. If the explanatory resources of folk theory are independent from those of human physiology, it would be a miraculous coincidence for the body to be doing exactly what is required by a rational coordination of those particular beliefs and desires, namely going to the shop to buy a pizza. In this way a scientific case might be made for preferring cognitive neuroscience to folk psychology despite the loss of the folk-theoretic compression algorithm. Explanatory comprehensiveness thus becomes another epistemic virtue in determining goodness of fit or how adequacy is to be understood when to come to empirical adequacy.

Despite these considerations, the virtues of compression, or what can appear as simplicity, are important. A useful way of noting the utility of a straight line that compresses data, even if no point actually falls on the line, is by the correlation coefficient. If the correlation is high, then the line is useful in predicting, within a range, the likelihood of the next point falling near the line. If least squares goodness of fit is better for, say, a parabola, and we have good theoretical reasons for considering it, then it may be preferred on epistemological grounds. But it is possible to construct a complex curve by Fourier analysis that concatenates multiple sine curves so that the curve passes through every point. Though possible, to do so creates a representation that contains as many bits as the bit map of the data it is representing. The result is that the probability of where the next point will land is random. The formula is functioning like a look-up table that does not include an entry for “next point.” Determining the most suitable trade-off between “best fit” and “data compression” exceeds the epistemic resources of logical empiricism.

Coherence epistemologists sometimes say that theory choice requires more than empirical adequacy. It requires so-called super-empirical criteria such as simplicity, comprehensiveness, and consistency. A scientific, or naturalistic coherentism, also requires coherence with natural science, including a scientific account of the acquisition and dynamics of knowledge, including scientific theory (Churchland, 1985; Quine & Ullian, 1978). The argument above goes further in maintaining that any epistemically useful account of the concept of empirical adequacy itself requires appeal to these further super-empirical epistemic virtues. A scientific evidence-based view of research in educational administration and leadership

will need to appeal to these broader coherentist criteria of evidence for epistemic credibility (Haig & Evers, 2016).

---

## **Toward a Coherentist Science of Educational Administration and Leadership**

It is not possible to offer one particular scientific theory of educational administration or of leadership because the appropriateness of a theory is sensitive to the conditions under which it is to be applied. What sort of leadership is appropriate for one school may not be appropriate for another. As organizations, there may exist similarly important differences that compromise the feasibility of one appropriate account of organizations. Of overriding importance is the relevance of context (Evers & Lakomski, 2022; Lakomski & Evers, 2020). In building a good bridge, for example, the properties of the materials remain relatively invariant across different contexts of application. In building a good school, the features of good leadership are not invariant across different school contexts. This compromises the achievement of generalizations in leadership studies, or at least limits their possibility to contexts whose similarity is circumscribed by jurisdictional constitutive and regulative rules, by social and physical conditions, and by cognitive functioning. Rules, resources, and cultures can create divergent contexts. In fact, even the logical possibility of defining a class of similar objects, or states of affairs, depends on the existence of a prior theory that weights some features of these objects or states of affairs as more important than others. Without this prior weighting any two objects will have as many properties in common as they have differences. (This is known as the “Theorem of the Ugly Duckling” and was first formally proved by Watanabe (1969, pp. 362–377) with an earlier, informal demonstration given by Popper (1959, pp. 420–425).)

In view of these limitations, an initial choice of a theory of leadership, or a theory to guide a course of action, is fallible and needs to be improved by adjustments to both its circumstances of application and of implementation. Through a process of successive implementations and error corrections within a context, the theory is improved by a coherentist epistemic process that requires the theory’s development to be constrained by empirical adequacy that includes coherence with natural science, consistency, comprehensiveness, and simplicity. This epistemically progressive process of theory building usually takes the form of a trajectory, through time, of a sequence of problems, trial theories, and attempted solutions. The theories are scientific in the modest sense that they cohere with natural science, and the process of theory building is scientific in the sense that it mirrors much theory building in natural science (Chitpin & Evers, 2012, 2019; Evers, 2015). It is a process that places an emphasis on error correction being driven by falsifying evidence and theory adjustments being driven by coherence considerations (Hawking, 1988, p. 11.). A combination of theory-ladenness of observations, underdetermination of theories by evidence, and the complexity of theory testing, implies a holism in which epistemically progressive theory building

is best done by a scientifically naturalistic coherentism. And the “best theories” that emerge are always relative to context.

Just as the complexity of social systems blurs the distinction between controlled and uncontrolled variables, so the context in which leadership theories are developed blurs the distinction between leader and organization. This is because theory development requires testing through implementation, and implementation in organizational contexts is mostly done by many hands. Theory building in organizational contexts instantiates a social epistemology. This broadening of the epistemic unit for building successful problem-solving theories robs leader-centric accounts of organizational functioning of their default explanatory status (Evers and Lakomski, 2013; Lakomski & Evers, 2017; Evers, 2015).

To see this, consider some modeling of the social epistemology of decision-making under varying epistemic conditions. We begin with a social network of variously connected individuals where the evidence for possible courses of action is ambiguous. Define leadership in terms of the relative strength of a leader’s influence on the course of action that other members of the network have a role in deciding. Under these conditions, strong leadership is an advantage where it is important for the group to make a decision quickly. The downside is that given this influence in the face of ambiguous evidence that could lead to a bad decision, strong leadership strengthens confirmation bias, making it difficult for the bad decision to be easily revised. In the modeling literature this is known as the “royal family effect” (Zollman, 2007). On the other hand, if there is less leadership, more time is required for a decision to be made, but there is less confirmation bias and a bad decision can more easily be corrected (Hutchins, 1995, pp. 260–261).

When it comes to leadership under these conditions there is no default option (Lakomski, 2005). There are just degrees of ambiguity in all evidence as well as of the differing conditions under which speed of decision-making can be traded off against the need to reduce confirmation bias. These conditions lead to different preferred approaches to leadership all contextualized by the nature and purposes of an organization. Inasmuch as decision-making, problem solving, and leadership are interlocked, a good science of organizations will therefore owe much to a rigorous account of organizations as distributed cognitive systems. It thus re-creates the promise of a more general account of organizations to replace earlier attempts employing logical empiricist versions of systems theory. And a scientific account of leadership will reflect coherentist methods of justification from data as contextualized in an organization analyzed as a distributed cognitive system.

---

## Conclusions and Reflections

The search for a science of educational administration and leadership has been shaped by different accounts of the nature of science and scientific method. Given that the content and structure of theories of administration and leadership are substantially shaped by these accounts, the quest has mattered. Traditional accounts of positivism have had little influence historically, despite the common practice of

conflating positivism with science. Logical empiricism has had the most influence, though has transitioned from being a failed account of organizations as social systems, to a more influential account of evidence-based research about leadership. The weaknesses of logical empiricism are more technical but nevertheless real, contributing much to the weaknesses of leadership studies because of the causal and methodological importance of context. A more recent naturalistic coherentist account of science has attempted to remedy some of these weaknesses (Evers and Lakomski, 2022). So too does recent work on relational accounts of organizations and leadership (Eacott, 2018) and critical perspectives on positivist and logical positivist accounts of science in education (Courtney et al., 2020).

## Abstract

Statistical analysis plays a key role in many fields within education and the social sciences. Because of its importance, most doctoral students in these fields take multiple statistics courses, which typically focus on the topics of hypothesis testing, relational modeling, and description of data. While these tools are quite useful in many situations, they also have limitations that make them less than optimal for many research situations. The goal of this chapter is to provide brief introductions to alternative statistical methods that researchers may find useful for situations in which standard methods are not particularly appropriate. These methods include approaches for delving more deeply into the nature of relationships among variables by investigating possible nonlinearities and interactions, opportunities to investigate causal links in observational studies, the incorporation of prior information into data analysis, and accounting for clustering of subjects into groups such as classrooms and schools. This chapter does not provide an in depth discussion of these models, but it is hoped that interested readers will find it a useful starting point from which they can learn more about the application of these methods.

**The Field of Memory**

The term *statistics* was created by Lambert Adolphe Jacques Quetelet (1796–1874) “who organized the first International Statistical Congress (1831) [and] conducted statistical researches on the development of the physical and intellectual qualities of man, formulating a theory of the ‘average man’ as a basic type” (Merriam-Webster, 1983, p. 826).

Prior to 1900 the basic statistical concepts commonly used today were formulated such as the use and reference to the normal curve, the use of percentile norms, correlation, regression, chi-square, reliability, and factor analysis. One of the most common forms of research, still in wide use today, was the use of surveys. The founder of comparative education, Marc Antoine Jullien de Paris designed the first survey of national systems of education in 1817 (De Landsheere, 1988).

In the early 1900s surveys became the method of choice to critique school systems for their lack of efficiency following Tayloristic *scientific management* precepts. Tatsuoka and Silver (1988) aver that “Quantitative methods were introduced to the field of educational administration in the early years of this century, with the advent of the school survey” (p. 677). Callahan (1962) has indicated that, “In the years between 1911 and 1925 hundreds of surveys of schools were made—so many, in fact, that it seems there was hardly a state or school system in America which was not surveyed” (p. 112). Universities sometimes set up special units within schools of education to conduct such surveys. But over time surveys fell out of favor as did the infatuation with *scientific management*.

**The Field of Presence**

The application of measurement in education “has been practiced for more than a millennium in China and for centuries elsewhere” (Keats, 1988, p. 253). However, it was not until the early twentieth century that researchers became fully aware of measurement methods (Keats, 1988).

In contemporary times Tatsuoka and Silver (1988) label the period 1950 to the early 1970s as “the heyday” of quantitative research. Studies in this time frame were overwhelmingly statistical (Chapman, Sackney, & Aspin, 1999). Tatsuoka and Silver (1988) classified four basic types of methods for treating quantitative data. They were (1) *survey-descriptive methods*; (2) *analysis of variance methods*; (3) *correlational methods*, and; (4) *casual methods*. In *survey-descriptive methods* the data “are reported in terms of central tendencies, frequency distributions, and simple tests of differences between groups” (Chapman et al., 1999, p. 91). In *analysis of variance methods* the data are reported as comparisons of differences between groups. In *correlational methods* data are reported as a comparison of relationships. Tatsuoka and Silver (1988) note that a related correlational technique is that of factor analysis

“which uses a correlation matrix as its starting point, over half of all studies in educational administration are correlation based” (p. 689). Finally, in *casual methods* the data are revealed in regression and path analyses as well as true experimentation designed to indicate cause and effect.

In 2010, English and Papa examined the abstracts of 1, 027 doctoral dissertations completed in educational leadership between 2006–2008 as listed in ProQuest. 33% were classified as quantitative, 53% as qualitative and 12% as mixed methods. The remaining were classified as “other”. The number of Ph.Ds was 476 and Ed.Ds 551. When the type of institution awarding those degrees was calibrated, it was determined that over 60% of them were earned at either a R1 (very high research activity) or R2 (high research activity) universities. A troubling statistic was that slightly less than 20% were awarded by on-line for profit non-traditional universities many with a dubious record for quality and rigor. Five criteria were recommended to judge the adequacy of dissertation research: (1) explicit theoretical grounding, (2) differentiated concepts and terms; (3) advances the content and boundaries of the field; (4) rigorous methods; (5) strong implications for improving practice.

### **The Field of Concomitance**

The modern concept of science in educational research originated in experimental psychology. De Landsheere (1988) explains that contemporary research practices did not originate in the social sciences but rather, the natural sciences. He indicates that it was Darwin in his *Origin of Species* (1859) who connected research on humans “with physics, biology, zoology, and geography” (p. 10). The approach was clearly interdisciplinary. In 1869 Sir Francis Galton (1822–1911) wrote among other things *Hereditary Genius* and “applied statistics in the study of human phenomena and began work on the concepts of standardization, correlation, and operational definition” (De Landsheere, 1988, p. 10). Galton is also credited with the creation of percentile norms and in “1875 he drew the first regression line, and developed the concept of correlation in 1877” (De Landsheere, 1988, p. 12).

Later experimental psychology was the field from which experimental pedagogy sprang “in German physics laboratories by scholars with a strong philosophical background” (De Landsheere, 1988, p. 10). Among the most influential was Wilhem Wundt (1832–1920) who established the first psychological laboratory premised on the principle that psychology must be centered on experience. Many rising American academics studied in German universities at this time and Wundt’s ideas were widely disseminated, among them Raymond Cattell and G. Stanley Hall.

So the wellsprings of quantitative research in educational administration began in psychology, later shifting to pedagogical psychology before there was even a recognized field. Many of the concepts derived from these early years remain highly influential in present times.

### **Discontinuities and Ruptures**

Early use of quantitative approaches in educational administration were tied to a larger effort to produce a science of administration in what came to be called “the

theory movement” in the field (Fusarelli, 2006). This effort “was founded on an intellectual paradigm borrowed from social psychology, management, and the behavioral sciences and emphasized empiricism, predictability and scientific certainty” (Fusarelli, 2006, p. 1016).

According to Chapman et al. (1999) the challenge to this perspective and the rise of what has been identified as “interpretivist accounts of phenomena” occurred in educational administration in the 1970s and 1980s. The flashpoint rupture was a paper given by T.B. Greenfield, a Canadian scholar, who presented a paper in Bristol, England, in 1974 at the Third International Intervisitation Programme. Greenfield challenged the prevailing paradigmatic view of the field which was then anchored in positivistic science. Greenfield himself had been a “true believer” in that perspective. His Ph.D. dissertation was entitled, “System Analyses in Education: A Factor Analysis and Analysis of Variance of Pupil Achievement” (Barlosky, 2006, p. 439). In his seminal paper Greenfield did not repudiate the statistics he used, but rather the framework in which they had been applied. The dominant belief at the time, encapsulated in the theory movement, was that a science of administration was both desirable and possible. Such a science would be “objective, quantitative, and value free” (Greenfield, 1993, p. 145).

Greenfield (1993) eventually came to reject the entire project to create such a science arguing that, “A science of administration limited by the assumptions of positivism can produce experts in technique, not experts in value” (p. 147). He later lamented, “We should ask ourselves why a flawed science persists. Why a science that does not work is still hailed as science” (p. 251). The reason he averred was that this view of science promised a world which was largely conflict free and cheerful. One result was that the use of quantitative methods, so much a part of the theory movement, was diminished and even eclipsed by the expanded application of qualitative approaches. Only now has that position for expanding the use of quantitative methods once again become ascendent. Some of these approaches are described in this chapter.

### **Critical Assumptions**

Kaplan (1988) defines measurement as “the mapping of numbers to a set of elements in such a way that certain operations on the numbers yields results which consistently correspond to certain relations among the elements” (p. 90). Then he goes on to indicate that, “The conditions specifying the mapping define a scale; applications of the scale produce measures which correspond to magnitudes. Just what logical operations on the numbers can be performed to yield empirical correspondence depends on the scale” (p. 90).

This harmony is assumed to be the case in the statistical procedures described in this chapter. It is further assumed that, “there exists a mind independent reality ‘out there’ that is, to some extent, knowable” (Husen, 1988, p. 30). By using disciplined procedures around such concepts as “internal and external validity, reliability, and objectivity—the quantitative researcher increases the likelihood of discovering something important about that reality” (Husen, 1988, p. 30).

However, it is not assumed that the application of statistical procedures and processes are in situ “neutral” or value free. Statistical methods exist in a context of values, sometimes contradictory and contestable and open to a number of different interpretations depending on the situation. While reality is discernable it is not necessarily unequivocal, unitary or unidimensional.

---

## Introduction

The field of statistics is at once central to educational research and at the same time ancillary to the training of many researchers in the field. Individuals receiving doctoral training in education are typically required to take multiple statistics courses, and often conduct dissertation research using statistical methods for data analysis. The statistics courses that doctoral students take as part of their programs generally focus on traditional methods of hypothesis testing and estimation of linear models. More specifically, students learn how to use software packages such as SPSS, SAS, Minitab, Stata, or R, in order to obtain descriptive statistics, compare group means using analysis of variance (ANOVA), and fit linear models to data in order to gain insights into relationships among variables (correlation, regression). In some cases, researchers with a particular interest in statistical analyses and quantitative methods may also learn about more complex modeling approaches such as multivariate ANOVA (MANOVA), discriminant analysis, factor analysis, and structural equation modeling.

Despite their popularity and utility in many situations, there are cases where the approaches that are taught in a traditional statistics sequence are either not appropriate for addressing the research questions of interest, or not applicable because the assumptions underlying them are not met. The purpose of this chapter is to describe from a largely conceptual point of view, statistical methods that may be more appropriate in some situations than are the approaches that most non-statisticians learn. These techniques provide leadership researchers with a set of tools that can be used to address a wide array of questions that are not amenable to standard statistical methods. This chapter does not present an exhaustive description of the methods described herein, but rather is intended to provide the reader with an introduction to techniques that may serve useful for specific research problems. The interested reader is referred to the references for a more detailed description of how the methods can be applied in practice.

## Traditional Hypothesis Testing Methods

Researchers frequently are interested in testing specific hypotheses about a population of interest using a sample drawn from that population. As an example, an educational psychologist may wish to know whether a new method of teaching mathematics is more effective than the traditional approach. In order to address this question, they

could randomly sample 30 students, half of whom would then be randomly assigned to the new instruction condition, with the other half being randomly assigned to the traditional method of teaching. At the conclusion of the instruction, she would then administer a math exam to all of the students. In order to answer her research question regarding which instructional method is most effective, the researcher would compare the mean scores from students assigned to each of the conditions using some form of a hypothesis test, such as a  $t$ -test. In statistical hypothesis testing, research questions are framed in the form of null and alternative hypotheses. The null hypothesis is what will actually be tested, and in the current example would be that there is not a difference in the groups' mean math test scores. The alternative hypothesis in this example would simply be that there is a difference in the means. The null ( $H_0$ ) and alternative ( $H_A$ ) hypotheses are formally expressed as:

$$H_0 : \mu_1 = \mu_2$$

$$H_A : \mu_1 \neq \mu_2$$

Here,  $\mu_1$  is the population mean for the first treatment, and  $\mu_2$  is the population mean for the second treatment. So, when the hypotheses are tested, questions about the population are being answered. In practice, however, sample data are used in order to test these hypotheses because the entire population of interest cannot be accessed.

There is one additional issue that should be addressed when thinking about hypothesis testing. Specifically, the alternative hypotheses about the population means can be directional or non-directional. In the previous example, the alternative hypothesis was non-directional, meaning that it did not state ahead of time which group was expected to have the higher mean. Rather, the alternative simply stated that the means would differ from one another. Alternatively, if the mean math test score of the group receiving the new teaching method ( $\mu_1$ ) was expected to be higher than mean score for the individuals receiving the traditional instruction. In that case, the null and alternative hypotheses would be:

$$H_0 : \mu_1 \leq \mu_2$$

$$H_1 : \mu_1 > \mu_2.$$

Regardless of the directionality of the hypotheses, the test will be about the likelihood of the null hypothesis holding true. In the current example, testing of the null hypothesis can be done using a  $t$ -test or analysis of variance (ANOVA), both of which are commonly used methods in education and the social sciences. The details of these methods is beyond the scope of this chapter, but the interested reader is encouraged to examine Thompson (2006) or Warner (2008). Regardless of the statistical method used, if there is sufficient evidence to reject the null hypothesis it can be concluded that it is likely to be false, and that the alternative is likely to be true. On the other hand, if there is not sufficient evidence to reject the null, it can be concluded that it is definitively true, but rather simply conclude that there is not sufficient evidence to be rejected based upon the sample data.

## Effect Sizes

A weakness of using only a hypothesis testing approach to understanding the nature of population parameters, such as mean differences, is that it does not provide information regarding the magnitude of the effects under study. For example, if the results of a *t*-test are statistically significant for our math achievement example, it could be concluded that there was likely to be a difference in the population means of the treatment and control groups. However, this result does not reveal the actual magnitude of this difference. It is certainly possible to examine the means to get a sense of the magnitude of the difference descriptively. But using this approach, there is unlikely to be a sense for what constitutes a large or a small difference. To address this question regarding the actual magnitude of the statistical result, effect size statistics can be used. There are a number of effect size statistics that can be used with the selection of the appropriate one being dependent on the nature of the research problem at hand. Three of these will be reviewed in this chapter.

Perhaps the most common effect size measure used in practice is Cohen's *d*, which is used to characterize the difference between two means and is calculated as:

$$d = \frac{\bar{x}_1 - \bar{x}_2}{s_p}$$

where

$\bar{x}_1$  = Sample mean for group 1

$\bar{x}_2$  = Sample mean for group 2

$s_p$  = Pooled standard deviation for both groups

Cohen's *d* represents the difference between the groups' means on the measured variable expressed in terms of the number of standard deviations. The mean math score for the treatment group in our example was 9.75, whereas the mean for the control group was 3.44. The pooled standard deviation was 3.70. Using these values, the value of *d* is

$$d = \frac{9.75 - 3.44}{3.7} = 1.71.$$

This would be interpreted as meaning that the treatment group mean was 1.71 standard deviations greater than that of the control group.

In terms of characterizing a *d* value as small, medium, or large, the suggested guidelines appearing in Cohen (1988) can be used:

Small:	0.2–0.5
Medium:	0.5–0.8
Large:	0.8+

An alternative approach for characterizing *d* values is to compare them with those reported in the literature. Thus, if a review of the literature reveals that typical treatment effects result in *d* of 1.2 or less, then it could be concluded that the

treatment instruction is very effective. Conversely, if this other work reveals  $d$  values in the 2–3 range, then it could be concluded that the treatment is somewhat less effective than is typical.

When there is interest in examining relationships between two variables, either correlation or regression can be used. The correlation coefficient ( $r$ ) reflects the strength and direction of the relationship between two variables and ranges between  $-1$  and  $1$ , with a value of  $0$  indicating that the two variables are unrelated to one another. In contrast, Pearson's  $r$  of  $1$  or  $-1$  indicates the variables are perfectly related to one another. Correlation coefficients that are closer to the extremes indicate a relatively stronger relationship between the two variables, as compared to relationships for which the value is closer to  $0$ . It is important to keep in mind that a correlation value that might be considered large in one context might be seen as relatively small in another. Cohen (1988) developed some very general guidelines for interpreting the magnitude of correlation coefficients that are helpful in practice. Cohen (1988) suggested that  $r$  between  $0.1$  and  $0.3$  indicate a weak relationship between the variables, whereas a value between  $0.3$  and  $0.5$  indicate a moderate relationship, and values in excess of  $0.5$  indicate a strong relationship. As with Cohen's  $d$ , these are really just rules of thumb, and should be used only as general guidelines for understanding the correlation values.

Regression is another statistical methodology for exploring relationships between variables. It is very similar in many ways to correlation. However, with regression, one of the variables must be denoted as the dependent or outcome variable ( $y$ ), and the other as the independent variable ( $x$ ). As with correlation, regression can be used to estimate the strength and direction of the relationship between two variables. In the population, the linear regression model relating  $x$  and  $y$  is written as

$$y_i = \beta_0 + \beta_1 x_i + \varepsilon_i$$

where

$y_i$  = Value of the dependent variable for subject  $i$

$x_i$  = Value of the independent variable for subject  $i$

$\beta_0$  = Intercept

$\beta_1$  = Slope relating the independent variable to the dependent variable

$\varepsilon_i$  = Random error for subject  $i$ .

The slope reflects the amount of change in  $y$  that is associated with a 1 unit change in  $x$ . The intercept tells us what the value of  $y$  will be when  $x$  is  $0$ .

In addition to estimating the nature of the relationship between two variables through the slope, it is also possible to measure the amount of variability in the dependent variable that can be directly attributed to the independent variable. The statistic that is typically used to express this quantity is the squared multiple correlation, or  $R^2$  value.  $R^2$  ranges between  $0$  and  $1$ , with larger values indicating a greater proportion of the variance in  $y$  being explained by  $x$ . It is one way to express the effect size for a regression model, with larger values representing a larger effect. Unlike with  $d$  and  $r$ , there are not readily agreed upon guidelines for what constitutes small, medium, and large values of  $R^2$ .

**Table 1** LDA weights for variables differentiating students who have been suspended and those who have not

Measure	LDA weight
Days absent	0.67
Days tardy	0.35
Grade point average	0.14
Discipline referrals	0.89

## Data Mining and Machine Learning

### Linear Discriminant Analysis

Linear Discriminant Analysis (LDA) is a very widely used and effective technique for understanding the differences between two or more groups on a set of predictor variables (Huberty & Olejnik, 2006). In this context, we have groups of individuals on whom we have collected data for several variables. LDA then finds a weight for each of these predictor variables so that the linear combination of them maximally separates the groups from one another. Variables with larger such weights are more important in terms of differentiating the groups from one another.

As an example, a researcher has collected a variety of measures for individuals who have been suspended from school and those who have not. We are interested in the extent to which each of these measures can differentiate between students who have been suspended and those who haven't been. Table 1 displays these variables along with the weights obtained from LDA.

These results suggest that the most important variable in terms of predicting whether a student will be suspended from school is the number of discipline referrals, whereas the GPA was the weakest predictor of suspension.

### Generalized Additive Models

Many statistical methods, such as LDA and regression, are limited to addressing situations in which the relationship between the independent and dependent variables is linear in nature, unless the researcher explicitly includes nonlinear terms in the form of interactions or squared main effects. Obviously, when the relationship between one or more predictors and the group is not linear in nature, this model will be of limited utility (Wood, 2006). An alternative approach that is available to researchers working in such conditions is the Generalized Additive Model (GAM), which relates the outcome variable with one or more independent variables using nonlinear equations, and does so automatically (Hastie & Tibshirani, 1990).

There are a number of nonlinear functions that can be used in order to estimate the nonlinear relationship between the independent and dependent variables. GAMs are particularly useful in situations where the researcher believes that  $x$  and  $y$  are related to one another in a way that regression cannot adequately capture. For example, consider the case in which prior work has demonstrated that the development of reading skills in children is nonlinear with respect to age, such that between years 5 and 6 the ability to read increases very quickly, but that between years 6 and 8 this increase in skill slows. Therefore, if we want to estimate the nature of this relationship, standard linear regression will not accurately capture this change in the

**Fig. 1** GAM for relationship between community median income and the rate of dog adoptions

developmental trajectory. However, GAM will automatically identify this nonlinear pattern, and is thus a better choice than regression in this case. This introduction to GAMs was intended to be brief. The interested reader is referred to any of several excellent sources that describe GAM in more detail, including Wood (2006), Hastie, Tibshirani, and Friedman (2009), and Hastie and Tibshirani (1990).

In the following example, the relationship between the median income in towns is related to the number of adoptions from dogs at a local animal shelter. This relationship was modeled using a GAM, and the relationship was found to be clearly nonlinear. From Fig. 1, it can be seen that as the median income rose so did the number of dog adoptions. However, at a community median of approximately \$55,000 there is a decline in the dog adoption rate. However, there is an increase in the adoption rate for the wealthiest communities. Note that the y-axis is on a standardized scale and does not represent the raw data values.

### Classification and Regression Trees

A potential drawback of GAM is that while it does not restrict the relationships between predictors and response to be linear, it does not automatically include

interactions among the independent variables. Indeed, popular statistical techniques such as regression do not accommodate interactions either, unless researchers explicitly include them. One set of methods for regression and classification that does not require the researcher to prespecify anything about the nature of the model, except the predictor variables are those based on recursive partitioning. One of the earliest such method to be described in the literature is classification and regression trees (CART), which were first outlined in detail by Breiman, Friedman, Olshen, and Stone (1984). CART is a nonparametric method (not assuming any particular form of the relationship linking predictors and the outcome variable) that arrives at predicted group membership given a set of predictors by iteratively dividing individual members of the sample into ever more homogeneous groups, or nodes, based on values of the predictor variables.

Essentially, CART builds a decision tree for predicting the dependent variable  $y$  using a set of independent variables  $x$ . This model starts by placing all subjects into a single group, called a node. It then searches the set of predictor variables to find the value of one of those by which it can divide the individuals and create two new nodes that are as homogeneous as possible with respect to the dependent variable. Once this optimal split in the initial, or root node is found and the individuals are moved into one of the two resulting daughter nodes, the predictors are once again searched for the optimal split by which the observations can be further divided into ever more homogeneous groups, again with respect to the dependent variable. This process continues until further division does not yield decreases in within node heterogeneity (i.e., the dependent variable variance cannot be made smaller), at which point the tree stops growing. At the conclusion of the tree growing process, the final or terminal nodes are then categorized as belonging to the group which has the largest value of  $p_{mk}$  therein. New cases can then be introduced to the tree in order to obtain a group classification. Their predicted group is equal to the plurality group for the terminal node into which they are placed based on the predictor splits identified by CART.

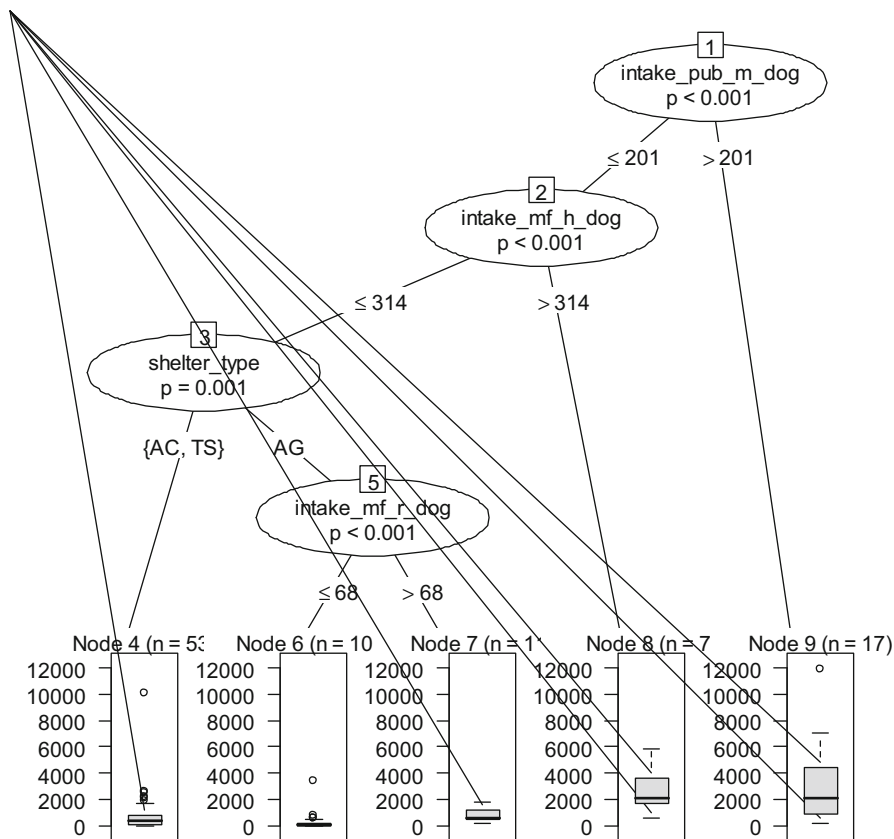

The dog adoption data can be used to demonstrate the utility of CART. In this case, what is desired is to predict the number of dog adoptions using a variety of independent variables. The resulting tree appears below (Fig. 2).

It can be seen that the important variables for determining the number of dog adoptions were the intake rate of dogs in public shelters, the intake rate of healthy dogs, the type of shelter, and the number of dogs returned to the shelter. It can also be seen that the larger number of dog adoptions appear on the right side of the graph (i.e., the boxplots in the rectangles at the bottom show this higher rate). Thus, more dog adoptions were associated with shelters that had larger number of dog intakes and larger numbers of healthy dog intakes. In contrast, the lowest rates were associated with higher numbers of returned dogs.

### Random Forests

A major weakness of CART that has been identified in the literature is the potential instability of trees across samples from the same population, due to its sensitivity (Breiman, 2001). At the same time, research has also shown that an individual

**Fig. 2** CART results for number of dog adoptions

CART tree does produce unbiased predictions, so that averaged over a number of individual trees, the resulting predictions for an individual should be quite accurate (Bauer & Kohavi, 1999). Given this fact, researchers have developed alternative methods for developing predictive models based upon CART. One of the more popular of these is Random Forests (RF; Breiman, 2001), which relies on a technique known as bootstrap resampling to overcome the problems associated with a single CART analysis. Specifically, both methods select a large (e.g., 1000) number of individuals from the original sample and apply CART to each of these. These bootstrap samples can either be drawn with replacement (i.e., an individual can be selected multiple times) and be the same size as the original or without replacement and represent subsets of the original sample. The results of these trees are then averaged together in order to obtain both variable importance information and to predict an individual's value on the dependent variable. RF also randomly samples the independent variables as well, thereby using a subset for building each tree. Thus, for each RF tree  $B$  bootstrap samples of subjects and predictor variables

are used. Because the trees used by RF are diverse than those produced by CART, it can be shown that its averaged results are also less sensitive to sample specific variation and thus potentially more generalizable than are the CART results (Breiman, 2001). In addition RF provides more information than CART regarding the true importance of individual predictors.

## Neural Networks

The data mining method to be discussed in this chapter is Neural Networks (NNETs; e.g., Marshall & English, 2000; Garson, 1998). NNETs identify predictive relationships between the dependent variable and one or more predictors using a search algorithm that includes multiple subsets of the weighted predictor variables and their interactions. Typically, a large number of such competing variable subsets are compared with one another by the computer algorithm based on some measure of model fit. In addition, so as to reduce the likelihood of finding locally optimal results that will not generalize beyond the training sample, random changes to the variable subsets, not based on model fit, are also made. Most frequently the measure of model fit used to decide on the final coefficients for the main effects and interactions is a form of the familiar least squares criteria, i.e., the best fitting model is one that minimizes the difference between the observed and predicted outcome values. This method of ascertaining fit in NNET is known as back-propagation, where the difference between actual and predicted outputs is used to adjust the weight values.

There are a number of NNET models available for use, with perhaps the most common of these being the feed-forward back propagation network with one hidden layer (Garson, 1998). This particular NNET uses the least squares minimization method described above in order to obtain weights for the inputs, which are the predictor variables. This model includes what is known as a hidden layer, which is very much analogous to one or more interactions in the more familiar regression context (Garson, 1998). It should be noted, however, that nodes in this hidden layer can be much more complicated than the interactions one might see in a standard linear model, involving complex combinations of the weighted predictor variables (Schumacher, Robner, & Vach, 1996). Finally, the inputs and hidden layers are used in conjunction with the weights in order to obtain the predicted outputs, which, in this case is group membership, leading to the use of the logistic form of the model.

A potential strength of NNET models is that they can identify complex interactions among the predictor variables in the hidden layer that other methods will ignore (Marshall & English, 2000). Indeed, NNETs not only search for optimal weights for the main effects just as happens with standard regression, but they also examine various combinations of the predictors beyond the simple interactions typical in the regression context, which most of the other methods included in this study do not do. Therefore, whereas in regression it is common to express the interaction of two predictors simply as their product, or to square or cube a single predictor variable if its relationship with the response is believed to be non-linear, a NNET will create hidden nodes as weighted products of potentially several variables, some of which are also raised squared or cubed, for example. This construction allows the hidden

nodes to be influenced by the predictors in varying degrees. If, for example, two variables interact and none of the others play a role, then the hidden layer would be represented by large weights for each of the two and near 0 weights for the others. On the other hand, a hidden layer could be thought of as the combination of several of the predictors with some contributing slightly more and thus having slightly larger weight values. As was true for CART and RF, NNETs are particularly useful for identifying interactions without the researcher having to prespecify them.

## **Bayesian Statistical Analysis**

Bayesian statistics marks a major departure from the standard framework that underlies much statistical analysis, and certainly the standard courses that graduate students in leadership are likely to take. This standard approach to thinking about statistics, which is called the frequentist paradigm, is based upon a basic assumption about the nature of the variables of interest. Specifically, in frequentist statistics, it is assumed that for a variable of interest there is a static population mean and variance. For example, if the interest is in estimating the impact of a new method of teaching reading, students could be randomly assigned to classrooms in which the new instructional method is used, and an equal number assigned to classrooms in which the traditional approach to reading instruction is used. After an appropriate amount of time, reading tests are given to all of the students, and the effectiveness of the new instruction method vis-à-vis the traditional approach is estimated as the difference in the mean scores for the two groups. The actual interest is in the difference of mean reading scores for all students in the population of interest (e.g., all students in the district). It should be noted that in nearly all real world cases, the population of interest is a theoretical construct and cannot actually be measured in any realistic way. As was discussed earlier in this chapter, inferences can be made about the population using the sample and statistical tools such as ANOVA.

Perhaps the most fundamental assumption underlying the frequentist framework described above is that, although it can't actually be measured, there is a population mean difference between the treatment and control groups. This single number is known as the population parameter, and is estimated by the sample mean difference. An alternative way to view this problem is by conceiving of the parameter of interest as a distribution of values, rather than as a single number. This distribution is made up of two distinct pieces of information: (1) the data that we collect from our sample and (2) prior beliefs about the likely effectiveness of the new method for teaching reading. These beliefs are referred to as the prior distribution for the parameter of interest, and is combined statistically with information from the data itself to create the distribution for the parameter of interest (e.g., the difference in reading score means between the treatment and control groups), which is referred to as the posterior distribution.

There are two primary practical differences between the frequentist and Bayesian approaches to statistical estimation. First, Bayesian modeling relies on both the data and prior information (usually referred to as priors) that the researcher brings to the

problem. In contrast, frequentist estimation only uses the data. The incorporation of priors allows the researcher to acknowledge prior research directly into the analysis process, and thereby potentially provide a more accurate estimate of the parameter space of interest. In addition to the possibility of including information from previous research into the analyses themselves, Bayesian modeling has also been shown to be particularly useful with small samples and/or complicated statistical models due to the incorporation of the prior information (Kaplan, 2016).

In the context of Bayesian estimation, the model parameters are estimated using a technique known as Markov Chain Monte Carlo (MCMC). The technical details of this methodology will not be reviewed here, but the interested reader is encouraged to learn more in the many good technical references that are available (Kaplan, 2016; Kruschke, 2015; McElreath, 2016). However, it is worth understanding the basic concepts that underlie MCMC, as they are what make the Bayesian estimation approach so flexible and powerful. Essentially, with MCMC the computer uses the observed data and the priors to estimate a distribution of the parameter of interest. This process involves of joining the prior distribution with the data using a simple computer algorithm known as a sampling procedure. One of the more popular of these, the Metropolis Hasting algorithm works as follows:

1. An initial value is randomly generated from a proposed distribution, such as the standard normal.
2. The value from step 1 is assigned a probability of acceptance, given the prior distribution assigned by the researcher and the values of the observed data.
3. The probability of acceptance for the candidate value is then compared to a random number between 0 and 1.
4. If the probability from step 2 is greater than the value from step 3, then the candidate is accepted into the posterior distribution, otherwise it is discarded and a new candidate value is drawn.
5. Steps 2 and 3 are repeated a very large number (e.g., 100,000) of times.
6. The posterior distribution is created from the retained values obtained from step 4.

The posterior distribution generated in step 6 serves as the final estimate for the parameter of interest (e.g., achievement test score for a population of students). If a single number is desired to estimate the variable of interest, the mean or median of the posterior can be used. Finally, an important point to note here is that this sampling procedure ensures that a poor initial selection of the prior distribution will almost certainly be overcome so that the final posterior distribution accurately represents the actual population of interest (Kaplan, 2016).

As an example, take the case where a researcher would like to use a Bayesian approach to estimate the proportion of students in a school who would receive a passing score on the advanced placement mathematics test. Based on prior years, the school leader believes that approximately 35% of the students should receive a passing score, and in the best year 53% of the students received a passing score on the exam. In the current year, 32 students took the test and 18 (55%) received passing scores. Thus, the performance was somewhat better than was the case in previous

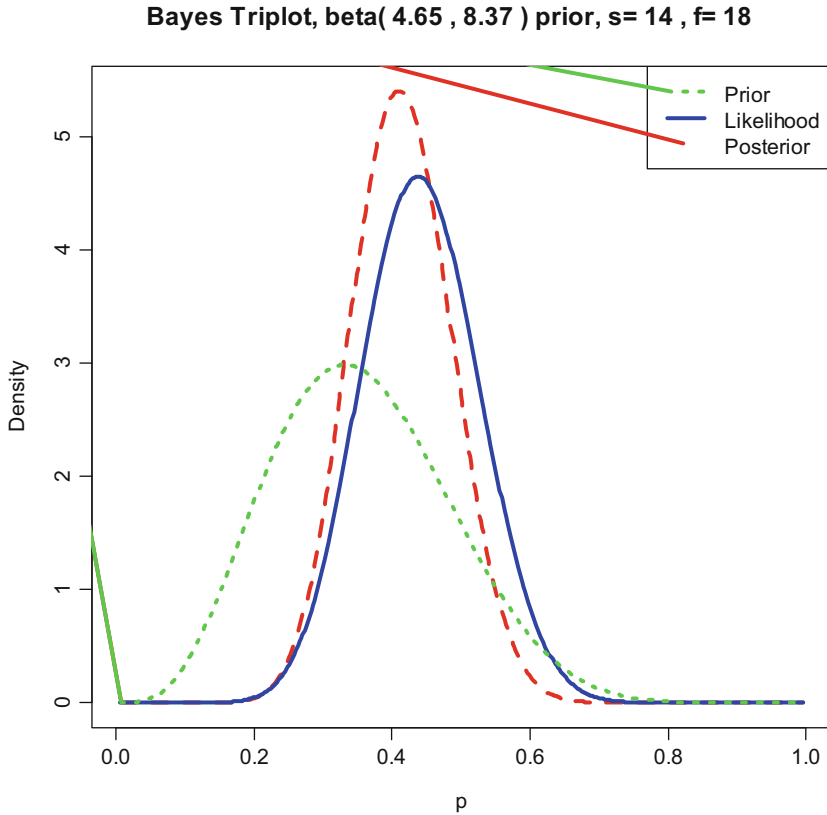

years. In the Bayesian context, an estimate of the proportion of individuals passing the test as a distribution is used rather than a single number. The prior distribution is employed which is based on the results from previous years, and then combine it with the data in order to obtain the posterior distribution. The distributions for the prior, the data, and posterior all appear in Fig. 3 below.

It can be seen that the prior distribution is centered on approximately 0.35, which is based on prior results for the school. The data (likelihood) are centered on 0.55 reflecting performance for the current year. Finally, the posterior is centered on approximately 0.50. The posterior incorporates both the prior information as well as the data itself. If the interest is in evaluating the performance of the school's AP math instruction, then the Bayesian posterior may be a more accurate measure because it incorporates not only the single sample from this year, but also information from previous years. Thus, a single anomalous result will not serve to bias the estimate of program effectiveness as much as would be the case if we use only a single year's data.

## Causal Inference

Frequently, when researchers compare group means on some variable, their questions are implicitly causal in nature. For example, a program evaluator comparing the mean math achievement scores between a group of students taught using a new method of instruction versus those taught using the standard approach. The underlying question in this problem is, does the new method *cause* higher math achievement when compared to the traditional instruction approach? Traditionally, in order for researchers to make any such causal statements they must first randomly assign individuals to the two conditions prior to the beginning of instruction. The fact of this random assignment renders group membership ignorable with respect to any factors other than the teaching method. In other words, if students are assigned randomly to the treatment condition, we are breaking any relationships between membership in the group and all other variables that might impact math achievement test scores (e.g., age, family income, inherent math aptitude). Because these bonds have been broken through random assignment, any differences in the mean achievement scores between the groups can be inferred to be caused by the method of instruction.

Although in many situations researchers would like to make causal statements but they cannot randomly assign subjects to the groups. For example, if intact classrooms are used in the math instruction evaluation study, group membership is not ignorable, meaning that variables other than instructional method that might influence math achievement performance are not controlled for. Therefore, if there are group differences in the mean math test scores, it cannot be concluded that this difference is due only to the intervention status. Thus, if a standard hypothesis testing method is used to compare the groups' means and differences are found, the evaluator can only conclude that the intervention *may* have some relationship with the group difference, but not that it is the only (or primary) cause of the difference.

**Fig. 3** Distributions for the prior, the data, and the posterior for proportion of examinees receiving passing scores on the AP mathematics exam

Because random group assignment is often quite difficult to accomplish in practice, statisticians have worked to develop methods that allow for causal statements to be made using observational data. Perhaps the most famous of these was articulated by Rubin (Rubin, 2005; Sekhon, 2008) who developed a paradigm for causality around the notion of counterfactual claims. Referring back to the math achievement example, imagine that each child could be assigned to both treatments simultaneously. Of course, in reality that can't be done, but it can be imagined as possible. Now consider a single student named Kelly. Kelly's achievement test score in the treatment conditions can be denoted as  $y_{iT}$  and their score in the control condition can be denoted as  $y_{iC}$ . The treatment effect can be calculated as  $\tau_i = y_{iT} - y_{iC}$ . If  $\tau_i < 0$  then it can be concluded that receiving the new form of instruction results in lower math achievement, whereas if  $\tau_i > 0$  then it is known that the new method yields higher math achievement. Finally, if  $\tau_i = 0$  then it can be concluded that the method of instruction doesn't have any impact on math achievement.

Of course, in reality Kelly can't be in both treatment conditions, so it can't be calculated  $\tau_i$  directly. In the case, where random assignments are used for treatments, it can be estimated  $\tau$  because the process of randomization has rendered all variables unimportant with respect to group mean achievement differences other than the method of instruction. But in observational studies, which are very common, an alternative to random assignment is needed. Rubin (1974) posited that if one could account for the impact of these other variables on group membership, then one could estimate  $\tau$  using an observational study design. In other words, Rubin proposed that statistical methods be used to remove all of the variability in group membership that is associated with external variables that are not of interest. Accounting for these variables is not a simple matter, of course. Not only is there a need to develop an appropriate statistical model to account for the variance in group membership, but there is a need to also identify all of the relevant variables. Indeed, this latter issue is probably the most difficult part of applying together Rubin's causal model.

In actuality, Rubin's approach to causal modeling is simply an exercise in matching individuals in the groups using a potentially large set of variables. There are a number of ways in which this matching can be done, but all have in common the use of a set of variables that are believed are important with respect to the treatment effects of interest. In the current example, the goal is to identify individuals in the treatment and control groups who have very similar values on a set of variables that are believed to be likely to be associated with performance on the achievement test. One of the most popular approaches that researchers use for the purposes of matching participants in the groups is called propensity score matching.

In order to illustrate how propensity score matching is used in practice, assume that there are only three control variables that are associated with scores on the math achievement test, and that each of them is accessible for all of the students in our treatment and control classrooms. The variables are family income, score on a mathematics aptitude measure, and age. Propensity score matching involves the use of a type of regression where the dependent variable has only two categories (e.g., treatment or control) and independent variables can be related to the probability of being in one or the other of these. Once the statistical model is estimated for the data, an estimated probability of each person can be obtained of each person being in the treatment condition based on the set of independent variables (income, math aptitude, age). Once this probability is obtained, which is known as the propensity score, individuals can then be matched in the treatment and control groups. It is known that individuals with exactly the same propensity score have the same values on the set of variables used in the logistic regression. There are a number of ways to actually do the matching and these are beyond the purview of our discussion here. Suffice it to say that all of these methods serve to identify one or more individuals in the control group who have very similar propensity scores to each member of the treatment group. If any treatment group members do not have a match in the control group, they are removed from further analysis. After the matching is completed, a standard approach for comparing the treatment and control group means (e.g., ANOVA) is used, accounting for the matching.

## Multilevel Modeling

Standard statistical models such as regression or ANOVA rest on a variety of assumptions, with one common one across them being the assumption of independently distributed error terms for the individual observations within the sample. This assumption essentially means that there are no relationships among individuals in the sample for the dependent variable, *once the independent variables in the analysis are accounted for*. In many research scenarios, the sampling scheme can lead to correlated responses on the outcome among individuals. For example, a researcher interested in the impact of a new teaching method on student achievement might randomly select schools for placement in either a treatment or control group. If school A is placed into the treatment condition, all students within the school will also be in the treatment condition – this is a cluster randomized design, in that the clusters and not the individuals are assigned to a specific group. Furthermore, it would be reasonable to assume that the school itself, above and beyond the treatment condition, would have an impact on the performance of the students. This impact would manifest itself as correlations in achievement test scores among individuals attending that school. Thus, if a regression model is used to assess the relationship between achievement test scores and treatment condition with such cluster sampled data, there would likely be a violation of the assumption of independent errors because a factor beyond treatment condition (in this case the school) would have an additional impact on the outcome variable.

The data structure described above is referred to as nested, meaning that individual data points at one level (e.g., student) appear in only one level of a higher level variable such as school. Thus, students are nested within school. Such designs can be contrasted with a crossed data structure whereby individuals at the first level appear in multiple levels of the second variable. In our example, students might be crossed with after school organizations if they are allowed to participate in more than one. For example, a given student might be on the basketball team as well as in the band. In the case where data are nested, the appropriate approach involves multilevel models in which students (level-1) are explicitly nested within schools (level-2). An excellent reference on this topic is Bickel (2007).

In cases where individuals are clustered or nested within a higher level unit (e.g., classrooms, schools, school districts), it is possible to estimate the correlation among individual's scores within the cluster/nested structure using the intraclass correlation (denoted  $\rho_I$  in the population). The  $\rho_I$  is a measure of the proportion of variation in the outcome variable that occurs between groups versus the total variation present and ranges from 0 (no variance between clusters) to 1 (variance between clusters but no within cluster variance).  $\rho_I$  can also be conceptualized as the correlation for the dependent measure for two individuals randomly selected from the same cluster. It can be expressed as

$$\rho_I = \frac{\tau^2}{\tau^2 + \sigma^2}$$

where

$\tau^2$  = Population variance between clusters

$\sigma^2$  = Population variance within clusters

Higher values of  $\rho_I$  indicate that a greater share of the total variation in the outcome measure is associated with cluster membership; i.e., there is a relatively strong relationship among the scores for two individuals from the same cluster. Another way to frame this issue is that individuals within the same cluster (e.g., school) are more alike on the measured variable than they are like those in other clusters.

When researchers apply standard statistical methods to multilevel data, such as regression, the assumption of independent errors is violated. For example, if there are achievement test scores from a sample of students who attend several different schools, it would be reasonable to believe that those attending the same school will have scores that are more highly correlated with one another than they are with scores from students attending other schools. This within-school correlation would be due, for example, to having a common set of teachers, a common teaching curriculum, coming from a common community, a single set of administrative policies, among numerous other reasons. The within school correlation will in turn result in an inappropriate estimate of the of the standard errors for the model parameters, which in turn will lead to errors of statistical inference, such as  $p$ -values smaller than they really should be and the resulting rejection of null effects above the stated Type I error rate, regarding the parameters. If the standard error is underestimated, this will lead to an overestimation of the test statistic, and therefore statistical significance for the parameter in cases where it should not be; i.e., a Type I error at a higher rate than specified). Indeed, the underestimation of the standard error will occur unless  $\tau^2$  is equal to 0.

In addition to the underestimation of the standard error, another problem with ignoring the multilevel structure of data is that important relationships may be missed involving each level in the data. Recall that in the example, there are two levels of sampling: students (level 1) are nested in schools (level 2). Specifically, by *not* including information about the school, for example, we may well miss important variables at the school level that help to explain performance at the examinee level. Therefore, beyond the known problem with misestimating standard errors, an incorrect model is proffered for understanding the outcome variable of interest. In the context of multilevel models, inclusion of variables at each level is relatively simple, as are interactions among variables at different levels. This greater model complexity in turn may lead to greater understanding of the phenomenon under study.

---

## Conclusions and Reflections

The purpose of this chapter was to discuss an array of statistical methods that serve as alternatives for researchers when more standard methods are not appropriate given the data at hand and research questions of interest. Methods that are particularly useful for situations in which standard approaches may not be optimal

were reviewed. Effect sizes are a necessary accompaniment to any hypothesis testing results because they reflect the magnitude of the statistical effect, above and beyond the simple question of statistical significance. A variety of statistical models that collectively fall under the heading of data mining were examined. These approaches are particularly useful for researchers who are interested in delving deeper into their data than is possible with linear models such as regression. Such models can automatically identify nonlinear relationships (GAM) and/or interactions among the independent variables (CART, RF, NNET). Thus, if it is possible that interactions are present, or the researcher would like to investigate whether they exist, these models may be most appropriate. Bayes estimation, which stands as an alternative to the standard frequentist approach, was presented. The Bayesian paradigm is particularly useful when the researcher wants to incorporate prior information about the problem at hand. In addition, Bayesian methods are particularly useful when samples are small. The discussion then turned to causal modeling when random assignment is not possible. The chapter concluded with a review of multilevel modeling, which is important to use when data are clustered together, such as students in classrooms or schools.

The goal of this chapter was to introduce readers to the plethora of alternatives available for data analysis. It is hoped that they will use this work as a platform off which they can jump into more in depth works for each of these. The reference list contains a number of excellent resources for the interested reader. There are many useful and powerful statistical tools available to researchers, and modern computer technology allows for relatively easy application of them.. Their use will allow researchers to more deeply interrogate their data and thereby gain greater insights into the topics of their investigations.

## Abstract

The idea that teaching practices should at least, be informed by evidence, continues to capture the imagination of many politicians and policy makers. Most recently, in Australia, the report – *Through Growth to Achievement (Gonski 2.0)* – recommends the formation of a National Evidence and Research Institute.

Despite the body of work that has raised questions about the feasibility of the idea of evidence-based practice in education (Biesta, *Studies in Philosophy and Education* 29:491–503, 2010b), there is growing acceptance of the discourse of neoliberalism making further in-roads into the classroom as well as narrowing what is viewed as “good” educational research. This chapter argues for a strengthening of the case for teacher judgment and the role that research can play for professional action in the ambiguous circumstances of teaching. Research can only indicate what *has* worked, not what *will* work, which means that the outcomes of research cannot be translated instrumentally into rules for action. Teachers can build an investigative stance to teaching, which involves reflecting on, and theorizing what is happening in their classrooms, schools, and neighborhoods. It takes up the question of local differences as well as a realistic approach to what constitutes actual school improvement.

Evidence-based practice · Teacher professionalism · Judgment · Engineering model

**The Field of Memory**

Image of teacher professionalism was of teachers possessing a high degree of autonomy justified by their expertise. Nature of professional judgment is moral rather than technical. This does not imply that professional judgment might not be *informed* by the outcomes of educational research. Teacher judgment favors contingency, openness, and relationship. Pedagogical relationships are reciprocal in some way. They are also ethical. The situated nature of the teacher’s ethical responsibility cannot be resolved in terms of rational analysis.

**The Field of Presence**

Diminishment of the value of teacher professional judgment in the dominant discourses concerning teacher quality. The current age of compliance, “being good” as a teacher is evidenced by engagement with dominant conceptions of the “good teacher” described through standards and evidence-based practice. Advocacy for evidence-based practice is a wish for certainty and predictability, measuring educational outcomes with scripted causes, which can be implemented without question, as “best” practice or “what works.” Based on idea that teaching ought to be based on research evidence. The engineering model of the practice-research connection assumes that the transition from research findings to policy or practice is a straight-forward process.

**The Field of Concomitance**

Background of evidence-based practice is the improvement of “diagnosis, inference, treatment” based on a medical evidence model. Also described as Engineering

model. Proponents of evidence-based practice highlight the need, in education, for a progressively generated knowledge base similar to fields such as medicine, agriculture, transportation, and technology.

### **Discontinuities and Ruptures**

Through the 1980s and 1990s criticisms of the lack of a research base for teaching was used to strengthen the idea that the medical model of “evidence-based” interventions could be transferred to education to give “certainty” about student learning. A significant debate critical of evidence-based practice arose in the UK but receded in the dominance of neoliberal performativity. While the use of “evidence-based” or “research-based” practice in conjunction with education was relatively new around 2000, “the idea that teaching ought to be based on research evidence has a long history” (Hammersley, 2002, p. 14). Australia took up the “evidence-based” push in relation to the establishment of the Australian Curriculum and Teacher *Standards* from 2011 enmeshed in a policy suite for the next 8 years. COVID-19 has brought a changed emphasis on the capacity of teachers to adapt to circumstances using their judgment potentially rupturing the “evidence-based” discourse since March 2020.

### **Critical Assumptions**

Purposes of medical evidence and educational judgment are different. Arguing that the nature of professional judgment in educational practice, is moral rather than technical, does not imply that professional judgment in education might not be *informed* by the outcomes of educational research, but contextual judgment needs to occur. For Dewey “intelligent action . . . [with] the intervention of thinking or reflection” (p. 395) involves “the dramatic rehearsal (in imagination) of various competing possible lines of action” (Dewey, 1922, p. 132). What *informs* intelligent action is not knowledge gained about the world but about the relationships between our actions and their consequences *in this particular situation*.

---

## **Introduction**

Through the 1980s and 1990s criticisms of the lack of a research base for teaching was used to strengthen the idea that the medical model of “evidence-based” interventions could be transferred to education to give “certainty” about student learning. The chapter identifies the present situation in Australia with a policy suite and the Gonski Review supporting the claim for evidence-based practice and a research-based for teaching. The connection with previous calls for evidence-based practice and the idea of a research-based profession in Britain is discussed. The chapter shows how the evidence-based practice is connected to the “effective teacher” paradigm and suggests an alternative for teacher professionalism which takes into account current COVID-19 potential ruptures to dominant discourses.

## Background

During the 1970s, the prevailing image of teacher professionalism was of teachers possessing a high degree of autonomy justified by their expertise. Policies developed since then have reconstructed what it means to be a teacher and the nature of teacher professionalism. The overall result has been a diminishment of the value of teacher professional judgment in the dominant discourses concerning teacher quality (Groundwater-Smith & Mockler, 2010). In the current age of compliance, “being good” as a teacher is evidenced by a “willingness to adopt and interact with” (p. 12) dominant conceptions of the “good teacher” described through standards and evidence-based practice.

The idea of evidence-based practice for the teaching profession has been a part of education policy discourses and debates since the 1990s in many parts of the world; however, in the last decade, in Australia, there has been a tightening policy convergence of *Teacher Standards* (AITSL, 2011b), Australian Curriculum and government reports focused on improving teacher quality. This is thought to be a key strategy for improving student results on international tests. In July 2020, a National Evidence Institute was established in Australia (funded by \$50 million over 4 years from the Australian Government and States and Territories). This was a key recommendation of the Gonski 2.0 review (Gonski et al., 2018), in the identification of a structure to support “evidence-based” teaching. The Federal Education Minister claims that the “institute will research and collate effective teaching and learning practices and share them with teachers, principals and educators to help drive further improvements in Australia’s education system” (Ballantyne, 2018a).

In 2020, as a result of the COVID-19 global pandemic, schools in various parts of Australia have been shut-down for periods of time, with teaching moved to distance learning, or in some cases, hybrids of face to face and online. This has brought a resurgence of faith in teacher professionalism and a broader understanding of what teachers do as a result of significant numbers of parents who were either working from home or undergoing changed work arrangements, involved in home schooling. The current times have created the circumstances for possible ruptures and discontinuities within the current push for evidence-based practice.

---

## Gonski Review in Australia

In July 2017, the Australian Government established the Review to Achieve Educational Excellence in Australian Schools (the Gonski Review). The final report, *Through Growth to Achievement: Report of the Review to Achieve Educational Excellence in Australian Schools*, was released in March 2018 and recommends evidence-based practice in schools and a National Research Institute to bring about a “return to being one of the top education systems in the world” (Gonski et al., 2018, p. viii). In the Australian Association for Research in Education (AARE) blog *EduResearch Matters*, Rowe and Gale (2018, p. 4, emphasis added) argued that

Australia is “already producing world-class independent educational research,” but they agreed with the Review that *the real problem* is how to “encourage the uptake of educational research in our schools and universities [through ensuring that research] . . . is *readily translatable to classroom practise* (sic) for time-poor teachers.”

According to the Public Education Foundation (Hetherington, 2018), student performance in the OECD’s Program for International Student Assessment (PISA), in Australia, has declined by 21.3 points for students in the bottom 10% between 2009 and 2015. They also claim that inequality and the decline in educational performance in Australian education has cost \$118 bn (Ballantyne, 2018b). The Gonski Review argues that the current decline in student outcomes in International tests is “compounded by a lack of research-based evidence on what works best in education, [and] the *absence of classroom applications readily available for use by teachers*” (p. ix, emphasis added). Gonski et al., (2018) argue that currently “no national body is expressly charged by governments with the task of *delivering into teachers’ hands* the practical results of this evidence and research” (p. 104, emphasis added). The suggested work of the National Evidence Institute is referred to as a “‘bottom-up’ evaluation of effective education policies, programs and teaching practices” primarily for translating research evidence “*into practical advice* for teachers, school leaders and decision makers” (p. 103).

A report commissioned by the review called *Promoting evidence uptake in schools: A review of the key features of research and evidence institutions* (Clinton, Aston, & Quach, 2018) developed what they called a “rapid synthesis of existing evidence” which drew upon findings from Australia, the USA, the UK, and the EU in the areas of education, health promotion, public health, mental health, and tourism to make claims about *evidence informed practice in education*.

Most included studies were in the public health sector, focussing on sanitation and hygiene, preventive health interventions and disease prevalence monitoring and the development of practice and policy guidelines to support healthy lifestyles. About *a quarter of included studies were based in education* . . . Most studies were conducted in the USA, with *15% based in Australia* . . . (Clinton et al., 2018, pp. 4–5, emphasis added)

The authors acknowledge that evidence in education, is limited and that the “evidence that exists has stemmed from improved outcomes in clinical medicine” (pp. 1–2). The authors also argue that *evidence-based* practice may be better described in settings that are social and less structured like education, as *evidence-informed* practice, which values to a greater extent, the role of professional judgment and values. Clinton et al. (2018) argue that *evidence-informed* practice involves the process of synthesizing, combining and applying evidence to “guide decisions and practice in a way that also incorporates their professional judgement and expertise” (p. 1). Unfortunately, the inclusion of professional judgment is limited to the initial discussion and does not really feature as a key aspect of the *Evidence into Action* model developed in the report. Overall, they acknowledge the “paucity of literature documenting the efficacy of evidence-informed practice in education” (p. 35) with 75% of the included research in the fields of health promotion, public health, mental health and tourism instead of education. The Gonski et

al. report (2018) itself, does not reflect the uncertainty in relation to “evidence” and continues to use *evidence-based practice* as the dominant term.

## Certainty and Predictability Rather than Uncertainty

The Gonski review (2018) claims that its two key purposes were to “recommend ways that Australia could improve student outcomes, *return to being one of the top education systems in the world*, and ensure that school systems and schools *truly prepare Australia’s young people for an ever-changing world*” (p. viii, emphasis added). At the heart of the report is a discourse of standardized testing for measuring schooling success and a strengthened demand for linear models of “managed” learning, where teachers have what amounts to *evidence-based scripts*. Reid (2018, p. 65) argues that “the desire to reaffirm a controlled, rationalist, linear and managerial approach to education policy and practice can only compound the complexity and ambiguity that educators face.”

At a time when . . . humans are facing significant challenges and exponential change, the dominant official educational response has been to resort to the safety of standardised testing, education markets, league tables and scripted teaching . . . At the heart of this regime of certainty is an obsession with data, often manifested and justified under the banner of evidence-based policy. (Reid, 2018, pp. 8–9)

There is a history to the call for evidence-based practice, which is revisited here to highlight the similarities and differences with what is currently suggested.

---

## History of the Call for Evidence-Based Practice 1995–2010 in the UK

Educational research has been criticized by both governments and practitioners alike for not providing “an unequivocal ‘answer’ to pressing practical concerns” (Rogers, 2003, p. 65). In the UK, a position about evidence-based practice for a *research-based teaching profession* was promulgated in a lecture to the Teacher Training Agency by David Hargreaves (1996). This was, at the time, a proposition that “[t]eaching is not at present a research-based profession” because it does not have a “research base” (p. 1). When Hargreaves (1996) first used *evidence based practice* in relation to “education” (Hammersley, 2002, p. 14) there was significant advocacy in Britain (Davies, 1999; Hargreaves, 1996, 1997, 1999, 2001a, 2001b) for more research focused on the classroom and a simplistic view of how educational research might influence teaching. The argument was that quality educational research would provide the best available evidence for teachers to “change their practice from x to y” (Hargreaves, 1996, p. 5), by modelling the research process on that of medicine. Hargreaves (1996, 1997, 1999) suggested that if research was indeed valuable, it would, in itself, be sufficient to demonstrate “conclusively that if teachers change

their practice from x to y there will be a significant and enduring improvement in teaching and learning” and also convince “teachers of the benefits of, and means to, chang[e] from x to y” (p. 5). A range of debates followed (Davies, 1999; Edwards, 2000; Hammersley, 2000, 2002; Hargreaves, 1997; Marston & Watts, 2008; Rogers, 2003; Slavin, 2008b).

While the use of “evidence-based” or “research-based” practice in conjunction with education, was relatively new around 2000, “the idea that teaching ought to be based on research evidence has a long history” (Hammersley, 2002, p. 14). Hargreaves (1996) argued that if there was a substantial body of research which was “disseminated and acted on by teachers, [it] would yield huge benefits in the quality of teaching and learning” (p. 5).

Hargreaves adopts a narrowly instrumental view of practical relevance: that research should be able to tell practitioners, which is the best technique for dealing with a particular kind of problem. In this respect, though his analogy is with medicine, he seems to be committed to the “engineering model” of the relationship between research and practice. This portrays research as directed towards finding or evaluating solutions to technical problems. [There is] the question of whether educational research can supply the sort of knowledge assumed by the engineering model . . . there is also the issue of whether the problems that teachers face are of a kind that is open to solution by research; in other words, whether they are technical in character. (Hammersley, 2002, p. 22)

The engineering model of the practice-research connection assumes that the transition from research findings to policy or practice is a straightforward process. The purpose of research in this model “is to tell us what works and why and what is likely to be most effective” (Rogers, 2003, p. 72). As Hodgkinson (2000) points out, what is demanded here is unmistakably a positivist conception of research which claims to enable prediction and control, increase certainty and avoid risk (p. 3). The implication that “valued” research evidence can be accumulated into a knowledge base, can be disseminated, is implementable, and can be transferred *into practice* is unquestioned.

In Hargreaves’ (1996) lecture, there is a strong claim for “a radical change both in the kind of research that is done and the way in which it is organised” (p. 1). At the time, Hargreaves (1996) blamed researchers rather than teachers for the lack of connection of research to practice. He argued that “current educational research is neither sufficiently cumulative nor sufficiently relevant to practical concerns for it to make the contribution required of it” (Hammersley, 2002, p. 15). It is interesting that at the time, Hargreaves (1996) also proposes the establishment of a National Educational Research Forum, which would sponsor research, so that it is cumulative and relevant to practice.

In the period since the debates in Britain about evidence-based practice, in Australia, there has been a steady growth in the number of government policies and reports which assume, and build on the idea of evidence-based practice. The next section includes a brief overview of the policy context in Australia which is critical to understanding how the recent Gonski review (2018) positions itself as a document of consensus and certainty.

---

## Policy Context in Australia

Since 2011, Australian schooling has seen the development of an interlinked suite of policies and standards published by the Australian Institute for Teaching and School Leadership (AITSL, 2011a, 2011b, 2012a, 2012b, 2015, 2018) which include the *Australian Professional Standards for Teachers* (AITSL, 2011b) and the *Professional Standard for Leaders* (later updated to include leadership profiles) (AITSL, 2011a). The process has also included the Australian Curriculum released by Australian Curriculum, Assessment and Reporting Authority (ACARA) in 2010, all of which has provided a series of linked discourses about the importance of teacher quality, “evidence” and leadership. Throughout the period, there were dominant narratives reinforced through each project and document:

Evidence shows that *quality teaching can overcome location* and other disadvantages and is the single greatest in-school influence on student engagement and achievement. (Council of Australian Governments, 2008, emphasis added)

The link of decontextualized “teacher quality” to improvement in student achievement was central to the establishment of the *Standards*. In the early years of this century, there was a repeated claim about national and international evidence that a teacher’s effectiveness has a powerful impact on students (Hattie, 2003), with broad consensus for teacher quality as the single most important in-school factor influencing student achievement (Organisation for Economic Co-operation and Development (OECD), 2005). The link between teacher quality or effectiveness and student achievement is not questioned and in fact underpins, throughout the next decade, the suite of government policies. It is no surprise that in 2016, the *National Education Evidence Base Report* (Productivity Commission, 2016) identifies that Australia needs to improve “the use of data and evidence to identify, and then apply, the most effective programs, policies and education practices” through creating an evidence-based approach to education policy and teaching practices and turning best practice into *common practice*, once again, decontextualized.

---

## Teacher Professionalism

Policies developed in the last two decades in the UK, USA and Australia have reconstructed what it means to be a teacher and the nature of teacher professionalism. The overall result has been interventions in the detailed processes of how to teach, as a form of “managed” professionalism (Furlong, 2005, p. 130) resulting in a diminishment of the value of teacher professional judgment in the dominant discourses concerning teacher quality (Groundwater-Smith & Mockler, 2010, p. 9) which is in inverse proportion to the rise in valuing of standardized testing and the “codification and quantification of teachers’ knowledge and practice via professional standards” (p. 9). Groundwater-Smith and Mockler (2010) argue that the call for “evidence-based” practice is “predicated on a positivistic understanding of ‘evidence’ as

leading to scientific certainty in relation to ‘what works’” (p. 27). The discourse of “what works” has been criticized (Atkinson, 2000; Edwards, 2000; Hammersley, 1997) for limiting possibilities in understanding education and for failing to capture the complexity of the educational field.

There are different conceptions of teacher professionalism, but the “effective teacher” is implicit in policy and government calls for evidence-based practice. In 2010, a literature review on teacher education in the twenty-first century was commissioned by the Scottish Government (Menter, Hulme, Elliot, & Jon, 2010). What emerged from the review, were differing conceptions of teacher professionalism underlying policy and research literature. These were summarized in four influential “paradigms” of teacher professionalism: the *effective* teacher, the *reflective* teacher, the *enquiring* teacher, and the *transformative* teacher (Menter et al., 2010, pp. 21–24).

### **The Effective Teacher: Standards and Competences**

The paradigm of the *effective* teacher has emerged as dominant in official government discourses across the developed world over the last 30 years. It is embedded in accountability and performativity and closely aligned to the view that teachers need to “prepare pupils to take their part in making their respective nations’ economies a success (e.g., DfEE, 1998)” (Menter et al., 2010, p. 21).

### **The Reflective Teacher**

The paradigm of the *reflective* teacher has philosophical roots in the work of John Dewey and underpins the development of action research/practitioner research or inquiry linked with professional development through practice. It particularly demands that teachers pay attention to the learning needs of their students and perhaps challenge what is taken for granted. Furlong, Barton, Miles, Whiting, and Whitty (2000) found that “about 70% of teacher education programmes led from universities and colleges were informed by some version of ‘reflective teaching’” (Menter et al., 2010, p. 23).

### **The Enquiring Teacher**

The origins of the notion of “teacher as researcher” goes beyond reflection to the nature of inquiry and is usually associated with the work of Lawrence Stenhouse (1975), who argued that teachers should take a research approach to their work. The paradigm of the *enquiring* teacher encourages teachers to undertake “systematic enquiry in their own classrooms, develop their practice and share their insights with other professionals” (Menter et al., 2010, p. 23).

## The Transformative Teacher

The paradigm of *transformative* teacher builds on the *reflective* teacher and the *enquiring* teacher, bringing an “activist” dimension (Sachs, 2000, 2003). The activist dimension identifies the teacher’s role as contributing to social change and preparing students to contribute to change in society, rather than just transmitting knowledge and preparing students for work in an existing world.

## The Dominance of the Effective Teacher

The paradigm of the *effective* teacher has come to be most dominant in the last decade, “where teaching is largely defined in terms of a range of technical skills” (Menter et al., 2010, p. 24). In current times, teachers need to “produce students who perform highly on international rankings in PISA (and TIMSS, PIRLS, etc.) in a context of increased neoliberal governance led by “big data” and policy as numbers (Grek, 2009). When students perform at levels below national aspirations, it is their teachers who are deemed to be at fault” (Gale & Parker, 2017, p. 521) and “ineffective.” Gale and Parker (2017) argue that there is an *underpinning logic*, driven by assumptions about underperforming students, a cause-effect relationship between student and teacher “performance,” and a sense of crisis about the quality of teachers. “This logic is particularly evident in nations such as Australia and the UK, with increasing emphasis on professional standards, measures of competency and teacher effectiveness” (Gale & Parker, 2017, p. 521). The presumed linear, causal link between teacher and student “performance” draws “a ‘straight line’ between teacher practice and student outcomes, ‘controlling’ for and ultimately dismissive of other possible influences” (Skourdoumbis & Gale, 2013, p. 892). A reductive element of the narrative is what is implied by evidence-based practice – that good teaching in one school is also good teaching in another, which strips teaching of social context (Skourdoumbis & Gale, 2013). Context is forgotten in “the rush to attribute student achievement solely to what teachers do” (Mills & Gale, 2010, p. 30). Gale and Parker (2017) comment about the striking similarity of this discourse across nations. Within the framework of performativity, teachers are represented and encouraged to think about themselves as individuals who must improve their productivity, through “evidence-based pedagogical approaches” (TEMAG, 2014, pp. xiv, 10), and “up-to-date, evidence-based teaching practices” (TEMAG, 2014, p. 15). The *effective* teacher paradigm (Menter et al., 2010) underpins various government documents, which potentially “privileges performativity and ‘practical’ knowledge over theoretical, pedagogical and subject knowledge” (McNamara & Murray, 2013, p. 22).

---

## Double Transformation

Historically, the push for evidence-based practice in education, partially came as a result of critical reports about educational research in Britain (DfEE, 1998). The key criticisms were that research did not provide educational professionals with clear

guidance for their work, that “it was fragmented, non-cumulative and methodologically flawed, and that it often was tendentious and politically motivated” (Pring, 2000, p. 1).

On the one hand it was argued that educational research should not be left to educational researchers, but should be subject to centralized agenda setting, both with respect to its contents and its methods, so that it can become *more practically relevant*. On the other hand, it was suggested that *educational practice should not be left to the opinions of educators*, but that their work should be based on research evidence. The call for a *double transformation* of both educational research and educational practice lies at the very heart of the idea of evidence-based education (Davies, 1999, p. 109, emphasis added).

The idea that research in education should be able to tell us “what works” was already articulated in the 1980s. The assumption of a causal link between experimental research about “what works” and improved student achievement remains dominant (Slavin, 2002, 2004, 2008a, 2008b, 2008c) since then. Proponents of evidence-based practice highlight the need, in education, for a progressively generated knowledge base which “has characterized . . . fields such as medicine, agriculture, transportation, and technology” (Slavin, 2002, p. 16). The key change required to do this is proposed to be a more rigorous approach to evaluating research evidence, particularly the randomized controlled trial which can establish “beyond reasonable doubt the effectiveness (or lack thereof) of treatments intended for applied use” (Slavin, 2002, p. 16). Opponents of the idea of evidence-based education have raised many questions about the appropriateness of the evidence-based approach for the field of education. Some have questioned the homology between education and medicine (Davies, 1999; Pirrie, 2001; Simons, Kushner, Jones, & James, 2003). Others have questioned the positivistic assumptions and have criticized the narrow conception of research entailed in evidence-based practice (Atkinson, 2000; Berliner, 2002; Elliott, 2001; Erickson & Gutierrez, 2002; St Pierre, 2002). Still others have criticized the managerial agenda of evidence-based education and its linear, top-down approach to educational improvement (Davies, 2003; Hammersley, 2000; Ridgway, Zawojewski, & Hoover, 2000), and the lack of an acknowledgment of the crucial role of values in educational research and practice (Davies, 1999; Elliott, 2001; Hammersley, 2000).

---

## Critique of Evidence-Based Practice

Biesta (2014) argues that the idea of evidence-based practice favors a technocratic model in “which it is assumed that the only relevant research questions are questions about the effectiveness of educational means and techniques” (Biesta, 2010a, p. 392). As a result, it limits the conception of teacher professionalism and judgment, making it difficult for “educational practitioners to make such judgments in a way that is sensitive to and relevant for their own contextualized settings” (p. 392). Biesta (2014) critiques the extent to which, the practice of education can be compared to the practice of medicine; how research informs professional practice; and the role of research that is implied in the idea of evidence-based practice.

## Comparison to Medicine

The spread of evidence-based practice from medicine to most other health fields, has also been advocated and adopted in fields such as social work, probation, human resource management and education. There is a question about whether evidence-based practice can be applied to education because it brings the view of professional practice (Elliott, 2001; Hammersley, 2001) as *intervention*, and asks from research that it provides evidence about the *effectiveness of interventions*. Evidence-based practice relies upon a causal model of professional action (Sanderson, 2003) – the idea that professionals administer a treatment, they intervene in a particular situation – in order to bring about certain effects. Evidence-based practice assumes that the ends of professional action are given, and that the only relevant (professional and research) questions to be asked are about the most effective and efficient ways of achieving those ends. In this respect, evidence-based practice entails a technical model of professional action.

## Professional Judgment and Practical Epistemology

Concluding that the nature of professional judgment in educational practice, is moral rather than technical, does not imply that professional judgment in education might not be *informed* by the outcomes of educational research. The question is about how the *informing* process works. For Dewey, knowing is not about a world “out there,” but concerns the relationship between our actions and their consequences (Biesta, 2004). “Using” knowledge can be seen as “the ability to intelligently plan and direct our actions” (Biesta, 2014, p. 395). For Dewey “intelligent action . . . [with] the intervention of thinking or reflection” (p. 395) involves “the dramatic rehearsal (in imagination) of various competing possible lines of action” (Dewey, 1922, p. 132). What informs intelligent action is not knowledge gained about the world but about the relationships between our actions and their consequences *in this particular situation*. Research provides us with information about *possible relationships between actions and consequences*. Biesta (2014) argues that research can only indicate what *has* worked, *not what works* or *will* work, which means that the outcomes of research cannot be simply *translated* into rules for action.

## The Practical Roles of Educational Research

Research can also inform practice “by providing different interpretations, different ways of understanding and imagining social reality” (p. 396). Research can help educational practitioners to see and imagine their practice differently. The idea of evidence-based practice focuses on the production of means for *given* ends and reduces research questions “to the pragmatics of technical efficiency and effectiveness” (Evans & Benefield, 2001, p. 539). If practice is conceived as “context-free technical problem solving,” the emphasis is placed on reducing *uncertainty* through evidence. On the other hand, if practice is conceived as “context-dependent practical action,” the emphasis is placed on dealing with *ambiguity* as well as uncertainty

through communicative processes of dialogue, argumentation and social learning. The nature of teaching is best understood as a practical, ethical, and relational activity, dependent on judgment, rather than as just a technical activity.

---

## Possibilities of Research-Informed Practice

Research undertaken beyond school settings can facilitate *informed* discussions between teachers and researchers which “become both ‘research-informed’ and ‘research informing’” (p. 716). Lingard and Renshaw (2010, p. 27) argue for teachers having a “researchly” disposition which fosters “genuinely inclusive . . . truly educative – stances among teachers, and their students” and therefore uses a broad “ecumenical definition of education research” (Hardy, 2010, p. 716). Imagining the *research-informing* process as *joint work* (Little, 1990) enables us to understand that a space in which *research-informing* processes occur is a collegiate and collective space. This has been evident recently in school shutdowns and the move to distance learning or in some cases hybrid learning with face to face and distance as a result of COVID-19. The key aspect of making that possible was teachers working to support and share with each other (Norman, 2020).

teachers . . . have become even better at their craft thanks to the strength of their professional communities and their school’s meaningful approach to professional learning. (Norman, 2020)

---

## Conclusion and Reflections

The idea that teaching practices should at least, be informed by evidence, continues to capture the imagination of many politicians and policy makers. Most recently, in Australia, the report – *Through Growth to Achievement (Gonski 2.0)* – recommends the formation of a National Evidence and Research Institute. Such a body is to be “charged by governments with the task of delivering into teachers’ hands the practical results of this evidence and research . . . in an accessible format that can be readily translated into classroom use” (Gonski et al., 2018, pp. 104–105). Despite the growing body of work that has raised questions about the feasibility of the idea of evidence-based practice in education (Biesta, 2010b), there is growing acceptance of the discourse of neoliberalism making further in-roads into the classroom as well as narrowing what is viewed as “good” educational research.

The call for evidence-based practice in teaching is not new. The 2018 reinvention of this call in Australia also includes the call for a double transformation which makes educational research both more “practically relevant” and focused on government agendas. However, reports of growing inequality in education (Hetherington, 2018) and the impact of COVID-19 on teachers (Norman, 2020) has strengthened the case for teacher judgment in context and the role that research can play for professional action in the ambiguous circumstances of teaching. Research can only indicate what *has* worked, not what will work, which means that the outcomes of research cannot be translated instrumentally into rules for action. Teachers can build an investigative

stance to teaching which takes up the question of local differences as well as a realistic approach to what constitutes actual student learning and school improvement. Such a stance is essentially a collective activity. Given that in recent COVID-19 times, we have seen the inventiveness, judgment, and collective support of teachers dominant at a time when the ability of any system to describe “what works” is impossible. We have possible ruptures in the operation of the National Evidence Institute from 2021 as it may never have been imagined because the general public has a much greater idea of the messiness and responsiveness needed in teaching through personal experiences in COVID-19 times.

## Abstract

Given the established importance of leadership to effective and successful schools, this chapter explores the identification, preparation, and development of future school leaders. The chapter explores the strengths and weaknesses of preparation programs and outlines current policy and practice. Comprehensive programs that provide traditional and alternative career pathways, which can identify potential leaders early, provide a range of authentic activities that can

help assess their capabilities and support their development, and prepare them for the role is now the conventional wisdom. The chapter also highlights the problematic nature of the identification of effective leaders and how they are selected to the job. It draws on research from a range of jurisdictions around the world.

---

**Keywords**

Leadership preparation · Leadership development · Succession planning · Identifying leaders · Leadership standards · Leadership capabilities · Measuring leadership performance · Recruiting and acquiring talent

**The Field of Memory**

The current focus on identifying and developing leaders is a refutation of the early focus on leaders as being born and not made. Within the last 100 years we have seen a shift from leadership as an endowed quality, through the democratization of leadership by the identification of traits of leaders across different sectors and industries, a focus on what effective leaders did (the behavioral movement) and how this was impacted by context (situational and contingency leadership views). In the 1960s and 1970s contingency theory and situational leadership were mainstream. What leaders did, and in what circumstances, determined leadership effectiveness. This was then replaced by more specific industry-related views. In education, the three dominant views of leadership over the past few decades have been instructional, transformational, and distributed leadership. These views have a strong leadership development focus – an individual can learn to become an effective leader.

**The Field of Presence**

Identifying, developing, and selecting school leaders at various levels in educational systems and schools are the focus of many jurisdictions across the world. This is because of evidence that leadership matters in building organizational capacity and improving student and school outcomes.

Who the aspiring leaders are and how they are identified varies significantly across jurisdictions but formal and informal preparation and leadership development programs are common across the spectrum. Some programs are attached to licensure and certification of principals, as is the case in North America, but this is not common across the world. While there has been criticism of preparation programs, the knowledge about quality, comprehensive programs is evolving and they are increasingly being shown to be effective in preparing leaders for the principalship.

**The Field of Concomitance**

Personnel management and human resource management provide frameworks for management of people at work. They include policies governing the organization, workplace planning, recruitment, selection, placement training and development, performance management, working conditions, and termination. Other human

resource terms used include people management, employee management, and management of human capital. The objective of human resource management is to make the most effective and best possible use of people within the accepted social, economic, and ethical frameworks and standards of the culture. Strategic human resource management (SHRM) integrates these areas, rather than treating them as separate functions. SHRM considers the importance of the environment and context in shaping an organization's human resource strategy. Another important contribution is "talent management," again derived from the business world. Talent management is now accepted as a mantra in both for profit and not-for-profit organizations around the world. It is defined as the acquisition, development, and retention of talent. Educational leadership has tentatively adopted both strategic human resource management and talent management to influence policy and practice.

### **Discontinuities and Ruptures**

The role of school leader has changed and is viewed as being more complex. Leadership theory has progressed and continues to evolve as we attempt to understand leadership in context. Identifying and selecting leaders based on potential is a discontinuity compared with selection based on performance.

### **Critical Assumptions**

The assumption is that effective leaders can be identified, developed, selected, and retained. Preparation programs will continue to improve and impact positively on leader performance.

---

## **Introduction**

Famous individuals who we labeled "leaders," have been identified throughout history as people with certain characteristics that distinguish them, and they were known for their great accomplishments. They were the rulers, kings, emperors, commanders, or heroes. They were mainly born and not made. Some of the ancient heroes were mythical in the sense they descended from the Gods (Fry, 2018). Many were heroic because they won battles against the odds (e.g., Alexander the Great). The word *leader* comes from the Old English word "laedan" or "to go before as a guide." and was first used in England in the fourteenth century to describe a person in charge. The term became more common in the nineteenth century (MacMillan Dictionary blog). Until the beginning of the twentieth century, leaders were more likely to come from aristocracy or inherit their positions. The Great Man Theory that was based on heroic leadership persisted into the twentieth century. Biographies of great men were used to teach leadership as a subject. The Trait Theory superseded the Great Man Theory (Stogdill, 1948). While largely discredited by academics since the 1940s, the Trait Theory persisted (Stogdill, 1974; Zaccaro, 2007). While individual traits can't be applied to predict an effective leader, Zaccaro, Kemp, and Bader (2004) argued that effectiveness can emerge because of a combination of traits. Today, most educational jurisdictions have adopted a more systematic approach to identifying, developing, and

appointing school leaders based on a range of capabilities, personal dispositions, training, and experience, although research shows there is still need for improvement.

---

## Effective Leadership

In the field of educational administration, the effective leader label applies to leaders at various levels in the school and/or educational system. We can include teachers, those in middle level positions like department or year level heads, assistant principals, principals, superintendents, those in district or system roles, and chairpersons on educational boards and councils. These leaders can have very different roles and expectations depending on their position (Drysdale, Gurr, & Goode, 2016). The focus of research has mainly centered on the school principal or equivalent (e.g., Head teacher in England). Often school principals are the people in the middle of an educational system. In nonsystemic schools, they may be the head. There is increasing development of leadership programs for middle leaders (Gurr, *in press*; Lipscombe, Tindall-Ford, & Lamanna, 2021) and emerging interest in programs for pre-service teachers (Acquaro, 2019). In this chapter, we focus on programs related to the principalship.

To identify and promote effective leaders it is important to define what is meant by effective leaders. The concept of effective leaders in educational administration has progressed through various theoretical approaches including the behavioral movement from the 1940s where particular behaviors were identified as being important for success; leadership styles in the 1950s and 1960s where a combination of task and maintenance (people skills) were identified; contingency and situational leadership in the 1970s that identified different styles of leadership were more effective in different situations; and transactional and transformational leadership in the 1980s where transformational leadership was seen as more effective than transactional leadership (Leithwood, Seashore-Louis, Anderson, & Wahlstrom, 2004). These shifts in the history of leadership largely mirror the business administration literature. From the 1990s we can see three major trends in educational administration that were used in conjunction with effective leadership – transformational leadership, instructional leadership, and distributed leadership (Leithwood, Harris, & Hopkins, 2020). More recently, leadership for learning is emerging as a *why* to combine these views (Townsend, Berryman, Gurr, & Drysdale, 2020).

---

## The Importance of School Leadership

Leadership is important in schools and the principal role is the one that has the most responsibility, expectation, and opportunity to exercise leadership. It is therefore vitally important that those with the potential to be outstanding principals are identified early in their careers, and then supported to develop appropriate characteristics, qualities, skills, and knowledge. It is generally reported that leadership is second only to classroom instruction among school-related factors that contribute to student outcomes (Grissom, Egalite, & Lindsay, 2021; Leithwood et al., 2004; Louis, Leithwood, Wahlstrom, & Anderson, 2010).

One of the challenges of identifying and promoting effective leaders currently is that the definition of effective leaders continues to change. For example, Roza, Celio, Harvey, and Wishon (2003) in addressing the supply and demand for principals argued that demand is driven by the need for new and different kinds of principals. The deficit is the lack of high-level leadership skills. A further challenge is to what extent do aspirant principals need to already demonstrate leadership effectiveness, or is identifying “potential” for this sufficient? Added to this, there is consensus among scholars that the role of school leaders is becoming more complex and difficult, and is having to respond rapidly to major context changes (Clarke, 2016; Harris & Jones, 2020).

---

## Preparation and Development Programs

In reviewing school leadership development programs across 11 countries, Hallinger (2003) identified seven global issues critical for the preparation of school leaders in the future:

- Evolving from passive to active learning
- Creating systemic solutions that connect training to practice
- Crafting an appropriate role and tools for using performance standards
- Creating effective transitions into the leadership role
- Evaluating leadership preparation and development
- Developing and validating an indigenous knowledge base across cultures, and
- Creating a research and development role for universities

It will be shown in this chapter that nearly two decades later, while there has been some progress on these issues, there is still much to do.

Preparation programs are now a common approach to identifying, developing, and promoting aspiring leaders to principal positions. While most providers are universities, programs are also provided by colleges, private and government institutes, professional associations, and commercial enterprises. The number and diversity in providers has meant that there have been concerns about the quality of some of the programs. In the next section, we address these concerns by describing critical research from several countries that exposes limitations and criticisms of the preparation programs.

---

## Limitations and Criticisms of Preparation Programs

### The United States

University-based leadership preparation programs are common in the United States and have the responsibility for preparing candidates to serve as school principals and in other leadership capacities. There has been general criticism that many programs do not adequately prepare leaders.

At the time of the Hallinger (2003) review, there were various US reports that highlighted problems. The United States Department of Education (2003) argued that traditional preparation programs lacked vision, purpose, and cohesion. Major criticisms came from Elmore (2000) and Levine (2005). Levine (2005) contended that most principal preparation programs ranged from inadequate to appalling and suggested that the programs were “engaged in a counterproductive race to the bottom in which they compete for students by lowering admission standards, watering down coursework and offering faster and less demanding degrees” (p. 1). Farkas, Jean, Duffett, Foleno, and Foley (2001) studied principal preparation, and found 69% of their respondents believed traditional principal preparation programs were not in touch with the true challenges of the principalship. In a later study, Hess and Kelley (2005) argued that graduate schools lacked the capacity to make changes to programs. In further research, Hess and Kelley (2007) confirmed the concerns raised about the quality of preparation programs when they collected and analyzed the syllabi from 31 programs and found that they did not meet the needs of candidates and were divorced from reality.

A decade after Hallinger’s (2003) review, and across two special issues in the *Journal of Planning and Changing* (2012, Volume 43, issues 1/2), several authors outlined the positive and negative aspects of preparation programs in the United States. The overall conclusion was that while leadership preparation programs provided some practical experiences and new skills, they did not provide sufficient preparation. Soon after these issues, the Wallace Foundation (2016), in conjunction with American Association of Colleges for Teacher Education, the School Superintendents Association, the American Institutes for Research, and the University Council for Educational Administration, stated that as many as 700 university-based programs in the United States may be falling short in their goal to prepare principals adequately. The report noted five areas that required attention:

1. The quality of principal preparation programs was a concern for District leaders.
2. Strong district partnerships were often absent.
3. Preparation programs were not related to the real work of principals.
4. University policies and practices were often a barrier.
5. Many state authorities were ineffective in improving preparation programs.

They argued that preparation programs needed to be redesigned based on research and high quality models and learning experiences that reflected the role of a principal; there should be stronger connections between universities and districts; and, state policy makers should actively encourage high-quality programs.

## **Other Countries**

As noted previously, criticism is not confined to the United States and here are several examples.

## **International Study of Principal Preparation**

The International Study of Principal Preparation (ISPP) was an international collaboration between scholars from Australia, Canada, England, Jamaica, Mexico, Scotland, South Africa, Turkey, and the United States. The authors explored preparation in their own countries and then compared across countries. Overall, the research questioned the effectiveness of current programs. For example, Cowie and Crawford (2007) reported on policies for preparation and standards-led approaches in England and Scotland, and questioned the effectiveness of the programs in addressing the needs of special populations. Wildy, Clarke, and Slater (2007) compared principals' preparation programs in England, Scotland, Australia, and Mexico. Their findings showed that the apprenticeship model used in Australia and Mexico provided inadequate training and preparation. Clarke, Wildy, and Pepper (2008) reported on a qualitative study of five novice principals in Western Australia that showed how the training and support provided was not sufficient to make them feel adequately prepared for their roles. Continuing this line of research, Clarke, Wildy, and Styles (2011) reported on a survey developed for phase three of the ISPP in Western Australia and given to 45 novice principals. The survey explored the most severe challenges experienced by principals in the first 3 years in the role and to what extent preparation programs had prepared them for the challenges. They found that there was a lack of formal and appropriate preparation programs to meet the needs of beginning principals. Slater, Garduno, and Mentz (2018) found that preparation programs failed to adequately consider the context in which leaders were training. They argued that leadership programs must understand the broader social, political, and economic forces affecting students. These studies demonstrate some of the program limitations identified by candidates from several countries.

## **7 Systems Leadership Study (7SLS)**

Harris and Jones (2015) led the 7SLS that explored leadership preparation and development programs in Australia, England, Hong Kong, Indonesia, Malaysia, Singapore, and Russia. The research was published in a special edition of *Asia Pacific Journal of Education* (2015 Volume 35, issue 3). Four diverse country examples are provided here, with the remaining covered briefly later in this chapter.

### **Indonesia**

Sumintono, Sheyoputri, Jiang, Misbach, and Jumintono (2015) explored the perspectives and experiences of principals' professional preparation and development in different parts of Indonesia. They reported that principal preparation programs had evolved considerably with the introduction of a standardized training program in 2007 and a certification process to become a principal in 2009. Their study focused on the experience of 18 secondary principals involved in a principal preparation program. This program focused on student management, human resource management, curriculum development, school development planning, monitoring and evaluation, and information and communication technology in school. The program also included an internship involving two school placements. While the respondents

reported that there were valuable outcomes from the program, and that their experience in placement was most rewarding, there was a major disconnect between completing the training and selection as a principal. Selection was not based on merit or qualification, but on political expediency – through candidates having political connections, or the favor of the mayor of the local district. There was also criticism that the program did not deliver all that was expected and failed to address topics such as system leadership and change leadership.

### **Russia**

Although there are Russian national standards (Federal State Standards) that govern preparation programs for principals, training and certification are the responsibilities of regions or municipalities. Interestingly, almost all principals in Russia have a higher degree in education and have graduated from a pedagogical university. Unfortunately, there is little empirical research that explores preparation for principals in Russia. However, as part of the 7SLS project, Bysik et al. (2015) conducted a survey that evaluated their experiences with preparation of 300 principals across four regions. Preparation mainly focused on education law, management, and finance, which supported the notion that the role of the principal was that of a manager rather than an educational leader. Another important aspect was that training mainly took place after principal appointment. The study showed that the principals valued that the content was easy to implement in practice (34%), personal and interpersonal management skills were improved (21%), they obtained new knowledge (11%), and experienced self-improvement (9%). Less effective aspects were that training was not personalized to their context, there was too much theory and too little practice, and the program was delivered by people who did not understand schools. The general recommendations were that training should take place prior to appointment, there should be more regional and district support for ongoing training, there should be a refocus on collaborative leadership compared with command and control styles, and there should be a re-definition of the role of the principal in improving lasting educational outcomes.

### **Malaysia**

Jones et al. (2015) outlined recent changes in the educational system in Malaysia that highlighted the strategic intention to equip all schools with high-performing school leaders who will be pivotal players in improving student outcomes. Accordingly, the Ministry of Education initiated the Malaysian Education Blueprint 2013–2025, to prioritize training and development of principals, which was evidenced by a new mandatory qualification (National Professional Qualification for Educational Leaders) for all new principals. This was a substantial improvement from past experience when principals were appointed on seniority and performance as a teacher. The new program included adhering to competency standards that included policy and direction, instruction and achievement, managing change and innovation, resources and operation, people and relationship, and personal effectiveness. The program was in its early stage and the authors claimed that results were encouraging as the principals saw themselves as changing their practice. However, their study did show that there was no significant difference in principals' practices between those

who attended professional preparatory training and those who had not, which provided a challenge for the nature of the program and its delivery in the future.

### **Australia**

Gurr and Drysdale (2015) described the Australian situation. Australia is an example of a country where there has been considerable research on principal preparation programs. The process contrasts significantly with US requirements, as Australia has no mandatory certification process for school principals. There are, however, national and state/territory leadership standards, which provide guidelines for teachers in government and nongovernment systems. Generally, aspirant leaders must navigate their own career pathway and self-identify as a leadership candidate. Unfortunately, the self-managed process offers little guidance to judge preparedness for the principalship. There was a variety of leadership preparation and development programs available; however, only a third of principals in a survey reported having a formal leadership qualification or accreditation, and of these 47% were issued by universities, 23% by employers, 15% by professional associations, and 8% by teacher registration authorities (McKenzie, Weldon, Rowley, Murphy, & McMillan, 2014).

While there were numerous quality programs offered by universities and systems (Matthews, Moorman, & Nusche, 2007), there was minimal evidence of the impact of these programs (Gurr & Drysdale, 2015, 2016). For example, Russell and Cranston (2012) explored professional learning offered by a system and found that while principals and aspiring principals used these programs, they believed they had little impact on school or student outcomes, and that their professional learning needed to be supported by other activities such as networking, mentoring and coaching, access to university expertise, and that activities needed to be related to school tasks.

In a commissioned report for the Australian Institute for Teaching and School Leadership (AITSL), Watterston (2015a) conducted a comprehensive environmental scan of principal preparation programs that covered all eight government school systems, ten nongovernment systems or associations, seven commercial providers, two universities, and six national principal associations. While the programs included a comprehensive range of topics and activities, and had sound processes in place and the ingredients of quality programs (e.g., trained mentors, small cohorts, networking, pathway clarity, rigorous selection, principal support, feedback), there was little clarity about how the readiness for principalship was measured. Jensen, Hunter, Lambert, and Clark (2015) did a desk-top review of best-practice leadership development programs in education and other sectors and concluded that programs needed to take account of the developmental needs of participants and form part of a larger development continuum.

The four examples show that countries understood the importance of principal preparation and described their efforts to introduce new policies and practice to build the capacity of aspiring principals and principals to lead school improvement and change. However, the evidence showed that while there was improvement in helping candidates to be more ready for the job, there was more that had to be done.

## Changing Nature of Preparation Programs

While there has been significant criticism of preparation programs, there is research that shows that preparation programs are addressing many areas of concern identified by Hallinger (2003) and others. Many programs have been redesigned to reflect better identification of candidates, better learning experiences, curriculum that is related to the real job, and partnerships with stakeholders.

Caldwell (2015) outlined significant changes in preparation programs over the past two decades. He noted that early development programs focused on management subjects such as change management, finance, human resource management, leadership, organizational development, planning and policy at the expense of the core work teaching and learning, support for teaching and learning, and curriculum and pedagogy. He also noted there were stronger partnership between school, school systems, and universities.

Noting the positive aspects of preparation and development programs, Davis, Darling-Hammond, LaPointe, and Meyerson (2005) found that effective programs tended to be research-based, had curricular coherence, provided experience in authentic contexts, used cohort groupings and mentors, and enabled collaborative activity between the program and area schools. There were multiple pathways for leadership development described with programs run by universities, districts, third party providers, and in partnerships between stakeholders. There is also now good evidence about the worth of these programs (e.g., Darling-Hammond, LaPointe, Meyerson, Orr, & Cohen, 2007). Michelle Young, the Executive Director of the University Council for Educational Administration (UCEA), claimed that it is known what effective leadership preparation looks like and what it can do (Young, 2015). A special issue of the *Journal of Research on Leadership Education* provided descriptions of two exemplary programs (Cosner, Tozer, Zavitkovsky, & Whalen, 2015; Merchant & Garza, 2015). Features of these programs included strong program cohesion and focus; rigorous student recruitment and selection; a substantial number of faculty teaching in the program (including academic and clinical personnel); close partnership with districts; rigorous and high expectation curriculum linked to leadership standards; active, evolving, and collaborative pedagogy centered in practice, extensive and meaningful clinical practice, and evidence of program success that includes work placements, personal development, and a demonstrated impact on the learning outcomes of students (Jacobson, McCarthy, & Pounder, 2015).

Editing a special issue of the *Educational Administration Quarterly* (2010, Volume 47, issue 18), Orr and Orphanos (2010) studied exemplary leadership preparation programs and found they had a positive impact of leadership knowledge and practices and school improvement. Darling-Hammond, Meyerson, LaPointe, and Orr (2009) confirmed previous research on effective programs and found that successful preparation programs included aggressive recruitment; close ties with schools in the community; on-the-ground training under the wing of expert principals; and a strong emphasis on the cutting-edge theories of instructional and transformational leadership.

More recently Anderson et al. (2018) claimed that Levine (2005) and Hess and Kelley (2007) exaggerated the criticisms citing significant errors in the research. They studied data from the *Initiative for Systemic Program Improvement through Research in Educational Leadership* (INSPIRE). This included 97 principal preparation programs affiliated with the University Council for Educational Administration (UCEA) programs. Anderson et al. (2018) found that quality programs aligned their curriculum and assessment design to national standards, actively engaged in formalized partnerships with districts, engaged their candidates in a variety of assessment practices for formative and summative purposes, and worked to offer coursework that bridged classroom assignments to field-based experiences.

The current approach to preparation moving forward is to have a comprehensive approach. Young and Perrone (2016) noted that in the mix, leadership standards, licensure preparation, program design, and accreditation are integrally related. In a literature review of preparation programs, Crow and Whiteman (2016) noted several critical elements that influenced preparation programs. The changing context, in which more internal and external forces impact on schools, have increased the complexity of preparation programs. They noted licensure, certification, standards, and changing state policies as examples of the external forces that were impacting preparation programs.

While we know what makes up an excellent preparation program and that there has been significant progress, several challenges are ongoing: recruitment of candidates, admission processes, curriculum cohesion and content (equity, social justice, and diversity issues), design and delivery, pedagogy, effective internships, and assessment of programs and candidates. In the next section, we explore some of the common elements of excellent preparation programs.

---

## Internships, Coaching, and Mentoring

Common elements of preparation programs are internships, and coaching and mentoring. These concepts are interrelated and often coaching and mentoring are used interchangeably. As important ingredients of preparation programs they are worth commenting in more detail.

### Internships

Internships are commonly integrated into preparation and development programs. While they might vary in duration and type of activities, overall they provide valuable on-the-job experience. Typically, they provide an opportunity to work and learn from more experienced school leaders and attempt to link theory and practice. Activities can include shadowing leaders or getting immersed in the day-to-day activities of principals. In many jurisdictions, activities are highly structured, linked to standards, and are monitored by program supervisors, coaches, or mentors.

While the overall research underpins the value of internships, it is important that the internship activities are authentic. While it is not in the scope of this chapter to provide thorough accounts of research studies on internship, in summary, internship activities are most effective when candidates can practice skills and translate theory into practice (Havard, Morgan, & Patrick, 2010; LaPlant, 1988; Wilmore, 2002), change perceptions of the principalship (Browne-Ferrigno, 2003; White & Crow, 1993), focus on instructional leadership (Cunningham & Sherman, 2008), deal with real job demands (Darling-Hammond et al., 2007; Davis & Darling-Hammond, 2012), collaboratively design internship activities (Geer, Anast-May, & Gurley, 2014), and, have strong mentors and coaches (Clayton & Myran, 2013; Darling-Hammond et al., 2009).

What the research definitively shows is that quality of internship matters. To improve the experience during internships, candidates require depth in practicing the new skills and knowledge required (Barnett, Copland, & Shoho, 2009; Davis et al., 2005) and they need quality coaching and mentoring (Fletcher & Mullen, 2012).

## Coaching and Mentoring

There is general agreement that coaching and mentoring are important elements of leadership development because it helps candidates understand the role and supports ongoing development. Crow and Whiteman (2016) did a literature review on studies in the United States and noted that design, delivery, program resourcing, mentor quality, and effective mentor/mentee interaction were areas of concern. Programs were more effective when mentoring and coaching were well resourced and the programs increased the confidence of candidates, developed instructional leadership skills, focused on community building skills, and created a culture of continuous development (Daresh, 2007; Mitgang, 2007; Woolsey, 2010). Overall, Crow and Whiteman's (2016) review noted the positive aspects of coaching and mentoring, but concluded that "[r]esearch on mentoring and coaching still lacks rigorous examinations of the effectiveness and outcomes of mentoring programs" (p. 137). Lewis and Heckman (2006) noted that issues of selection of suitable coaches and mentors, coach-principal match, and long-term commitment were key challenges.

Kappler-Hewitt, Von Dohlen, Weiler, Fusarelli, and Zwadyk (2020) suggested that coaching should continue into the initial years of administration with internal and external coaching. However, they also argued there was little evidence of how coaching influenced interns' leadership practice. Hayes and Burkett (2020) advocated for strong partnerships with district and universities to support coaching if it were to be more effective.

It is worth noting that within other educational jurisdictions in other countries, research has valued the importance of coaching and mentoring. In a review of preparation programs in Australia, Gurr and Drysdale (2016) identified several studies that supported mentoring and coaching and which extended to activities such as networking and the use of critical friends (Hansford & Ehrich, 2006; O'Mahony & Barnett, 2008; O'Mahony & Matthews, 2006; Russell & Cranston,

2012). Degenhardt (2013) coined the term, “professional companioning,” to describe these support roles, and suggested that ex-principals might be able to take on this role because of their knowledge and experience. Van Nieuwerburgh, Barr, Munro, Noon, and Arifin (2020), in a study of 14 aspiring principals receiving external coaching in a leadership preparation program in Australia, reported that having time to reflect, focusing on personal needs, and being in a safe environment produced positive emotions in the coaching program.

In the next section, the emerging area of talent management is considered.

---

## Talent Management

Chambers, Foulon, Handfield-Jones, Hankin, and Michaels (1998) published a paper in the *McKinsey Quarterly* entitled, *The War for Talent*. They argued that leadership talent would be the biggest challenge for the next 20 years as the demand for talent went up and the supply went down. Corporations around the world quickly embraced and implemented talent management strategies. The importance of this did not miss education, and early in the 2000s there was accumulated evidence of a pending shortage of teachers and school leaders into the future (Davies & Davies, 2011). The crisis for talent came into sharp focus with studies in the United States, Canada, Australia, and the United Kingdom noting the shortage of principal applications (see below). This later spread to Europe. To compound the challenge was the perceived view that the nature of school leadership was more complex and challenging. The challenge was to reframe school leadership and a talent management strategy was recommended by several scholars (e.g., Macbeath, 2006). Despite the advocacy for a systematic approach to identifying, selecting, and developing school leaders, there is a limited amount of research into talent management in school education. Some of the research is reported next.

## Examples of Successful Implementation of Talent Management

There are some examples of success. A report by Hull, Supovitz, Newman, and Prociw (2011) from the *National Association of State Boards of Education (NASBE) Leadership Development Study Group, Successful Leaders for Successful Schools, Building and Maintaining a Quality Workforce*, focused on a talent management approach. The report underlined the importance of programs that articulated talent management frameworks or leadership development pipelines. Hull et al. (2011, p.7) defined school leadership development as “identifying, recruiting, developing, monitoring, compensating, and retaining talented school leaders.” They stated that:

For a leadership development system to be effective, it must be based upon a uniform and well-articulated set of leadership standards. These standards comprise the expectations and required competencies for school leaders and therefore drive all other components outlined in the framework (Hull et al., 2011, p. 12).

In another study, Robinson, Horan, and Nanavati (2009) outlined a strategy for attracting, developing, and sustaining educational leaders in Ontario, Canada. They outlined the “MentoringCoaching” program as an example of program designed to increase the number of aspiring principals.

Using the term “pipeline,” Groves (2007) provided a model that integrated development and succession planning and identified and codified leadership talent, assigned developmental activities and developed pervasive mentoring relationships. They noted the model could be used in multiple settings.

Hitt, Tucker, and Young (2012) proposed building leadership capacity by identifying, recruiting, inducting, and developing educational leaders. Interestingly they found that years of experience as a teacher was more strongly correlated with effective leader practice than other types of experience.

A more recent example of success was Gates, Baird, Master, and Chavez-Herrerias (2019) who explored the outcomes of the Principal Pipeline Initiative (PPI), an initiative sponsored by The Wallace Foundation to describe a range of talent management activities used to help prepare school leaders. Gates et al. (2019) described the principles of a pipeline in six districts who implemented a pipeline strategy organized around leadership standards. Its aim was to guide pipeline activities, pre-service preparation opportunities, selective recruitment, on-to-job induction, and evaluation. They concluded that PPI components were important for success in improving schools.

## **Grow Your Own**

“Grow your own leaders” is another approach to talent management. Rhodes, Brundrett, and Nevill (2008) reported on a program funded by the National College for School Leadership (NCSL) in England to explore talent identification, development, succession, and retention of leaders in primary and secondary schools in England. The aim was to encourage long-term planning and recommended that schools improve their in-house training to grow one’s own leaders. It put the responsibility in the hands of schools to lay the ground for leadership development, supply, and continuity. Sun (2017) reported that in an intensive, test-oriented environment like that in the United States, there was a need for schools to grow their own leaders and this was best achieved using on-the-job mentoring and coaching. As evidence of the effectiveness of “grow your own,” Thompson (2010) explored pathways for assistant principals in Victoria, Australia, and found that strategic planning of leaders on their careers through internal development processes were more valuable than external processes.

## **Progress to Date**

As noted previously, there has been some progress, but there is little to confirm the widespread adoption of talent management strategies. Behrstock (2010) reported

from a literature review that compared with the private sector, strategic talent management approaches in the educational sector lagged. Formal succession systems that effectively identify and promote individuals are rare (Myung, Loeb, & Horng, 2011). Odden (2013) argued that the scene was changing and that the strategic management of educational talent was making slow progress in policy and practice agendas. Odden (2013) outlined several promising initiatives in some states in the United States, but his research acknowledged significant challenges.

In exploring talent management in Academies in England, Davies and Davies (2010) argued that to survive, Academies needed to develop leadership talent. Weisberg, Sexton, Mulhern, and Keeling (2009) argued that districts in the United States were not doing enough to foster talent management. Fusarelli, Fusarelli, and Riddick (2018) recommended creating strategic, long-term leadership growth plans that could build leadership capacity and help identify and develop effective leaders.

In Australia, Watterston (2015b) reported that identifying and nurturing talent was not the norm. She recommended a systematic approach that would identify and nurture talent through structured, transparent career pathways and clear selection prerequisites for promotion.

To sum up the research on talent management as a means of identifying and promoting effective leaders, a review of the literature by the George W. Bush Institute (2016) stated that the policies and practices to ensure effective leadership development are commonly incoherent. Most systems struggle to recruit, develop, and retain great school leaders. There was also little evidence that policy, programs, and practices targeted toward candidates prior to certification have any impact of student achievement.

Sadly, the early rush to embrace a talent management strategy in the hunt for school leaders appears to have dissipated. In the two decades, since “The War for Talent” by Chambers et al. (1998) was published, research shows that, when compared with industry, educational jurisdictions, systems, and groups of schools have failed to exploit the potential that talent management can offer to identify and develop effective leaders.

---

## Identifying and Assessing Effective Leaders

Clearly, the focus of research has been on preparation programs. While formal programs appear to be the traditional path to school leadership, there has been relatively little research on the identification and selection of candidates for these programs. What we can say is that identifying who are the most effective leader candidates for school leadership differs greatly across jurisdictions around the world.

Gurr and Drysdale (2017) conducted research on the identification, selection, and development of aspiring leaders in several countries as part of larger project for the Victorian Department of Educational Leadership Institute (Bastow Institute of Education). The overall project aimed to create several measures (instruments and tools) to determine aspiring school leaders’ readiness for principalship and to identify professional development needs. Gurr and Drysdale (2017) provided background

information on what was occurring in different jurisdictions. This was important because for the first time it gave a snapshot of processes in jurisdictions across the world. The questions were:

1. Who are the people who are identified as aspiring principals?
2. How are they identified?
3. What are they being assessed on?
4. What are the methods used to assess them?
5. How is the assessment used?

The methodology used a modified Delphi of two rounds where questions were sent to academics representing Australia, Brazil, Canada, Finland, Germany, Hong Kong, Mexico, New Zealand, Norway, Singapore, Spain, Sweden, United Kingdom, and the United States. Table 1 provides a summary from 12 jurisdictions taken from the data. An early summary was included in an unpublished report, which formed part of the early stages of the larger project (Gurr & Drysdale, 2017). Except for England, which has been updated, Table 1 is based on information collected and analyzed in 2017.

## Summary of Delphi Process

### 1. *Who the aspiring principals were.*

In most jurisdictions, aspiring principals were self-selected teachers in schools or within an educational system. In three cases, non-teachers or people outside education could apply. In other systems, the focus was on candidates who were in leadership positions, or had completed a specific qualification such as a Master's degree. The ability to attract suitable candidates was challenging in some contexts (especially in remote locations).

### 2. *How they were identified*

Table 1 shows that in most jurisdictions candidates were self-selecting. Often they were encouraged, tapped on the shoulder, nominated, or recommended by significant others (supervisors, principals, administrator, academics) because they demonstrated potential or showed leadership skills. Many candidates came from leadership positions within the school. Candidates could emerge through participation in formal or informal leadership programs. In some cases, candidates completed a qualification to demonstrate their potential. In Singapore, potential leaders were identified early and put on a leadership track where they could complete a series of assessment activities toward accreditation. Most systems offered leadership programs and preparation programs to build aspirant leadership capacity. While there was an advantage in identifying talent early to ensure a pipeline for the principalship, others were encouraged to apply for a range of leadership positions in the school (middle leadership and assistant principals) to build their experience before considering the principalship. Jurisdictions often recognized latent talent that might emerge at any point in a teacher's career. In some systems (Sweden and Brazil) training took place after candidates had been

**Table 1** Summary of responses that identify and assess candidates for the principalship in 12 jurisdictions, Gurr and Drysdale (2017)

Country	Who are the participants being assessed?	How are they identified	What are they being assessed on?	What is being used to assess them?	How are the results of the assessment being used?	Suggestions
Australia (Queensland)	Mainly system identified and focused on middle management – deputy principals, acting principals, and middle leaders like Heads of Departments	The Queensland Education Leadership Institute (QELi) is supported by the government, Catholic, and private systems to provide professional learning programs for school personnel. QELi relies on school/system nomination and self-selection so that candidates have already reflected on their desired career progression and value an aspirant leadership development program	Attributes assessed are usually derived from the performance plan of candidates and aligned to the Australian Institute for Teaching and School Leadership, (AITSL) principal capabilities. Queensland does not have a formal assessment process or standards requirement for aspiring principals, and when applying for a principal role, candidates are evaluated against the AITSL principal standard	Queensland does not have an assessment process for aspiring principals	No response.	No response
Brazil	Self-Selected and individuals who are career focused	60% elected by staff and community Small percentage appointed by district	No standards Some courses available but not compulsory	Preferable for training to take place before appointment	No response.	No response

(continued)

Table 1 (continued)

Country	Who are the participants being assessed?	How are they identified	What are they being assessed on?	What is being used to assess them?	How are the results of the assessment being used?	Suggestions
England	Self-identification Certification is no longer mandatory. Anybody who is a teacher can apply	How are they identified or region based on personal knowledge of supervisor or both	Most training takes place after the appointment although these are not compulsory Areas addressed include: a range of hard and soft management skills	Demonstrate leadership learning and leadership practice Organization fit (matching skills with school needs) Provide references from current or previous employer Qualifications are still important	Aspiring Head teachers need to satisfy the selection criteria of the school. Selection panels can use various methods to test candidates. Methods may include: presentations, leading discussion with students, conducting a learning walk, completing an in tray exercise, personality profiling, case studies, observation of a lesson	Introduction of Head teacher standards in 2020 by Department of Education

Hong Kong	Variable across various types of schools. Commonly assistant principals or teacher with significant leadership responsibility one rank lower than AP. They are identified either internally or externally	Self-identification. Teachers with Certificate for Principalship are qualified to apply for the job. This is open to anyone who aspires to be a principal. Internal promotion and external recruitment is common. Appraisal systems operate in government schools	To attend a Certificate for Principalship, candidates are assessed on six capacity areas. Candidates create a portfolio that is evaluated externally or internally by the school	Strengths and weaknesses are identified through a needs analysis during the enrollment in the certificate. Candidates. They complete a portfolio that integrates six core leadership areas. Some School Sponsoring Bodies design their own development program	The Certificate Program is required for appointment	Principals have expressed concern that Certification program does not address the realities of a changing context
Mexico	Targeted at teachers, middle leaders or assistant principals, but those without a strong education background can also sit the principal certification test as the minimum requirement is 2 years of experience working in the education system	Self-selection. Teachers apply to enter and take the test to access a position. A teacher's experience and knowledge are evaluated also. No recommendation from a senior educator is needed to be able to sit for the test	Anyone aspiring to be a principal will be assessed through a test that includes five factors (knowledge, aptitude, seniority, discipline, and punctuality) and across five management competency dimensions	A knowledge test validated by the National Institute for Evaluation for Education (INEE). The exams included qualitative and quantitative sections	Candidates are scored highest and lowest, and available places allocated accordingly with the results reported by the INEE. Knowledge of legislation and educational principles are important	No response

(continued)

Table 1 (continued)

Country	Who are the participants being assessed?	How are they identified	What are they being assessed on?	What is being used to assess them?	How are the results of the assessment being used?	Suggestions
New Zealand	Aspirants are generally regarded as those that are Heads of Departments in secondary schools, Syndicate Leaders in primary schools, and Assistant and Deputy Principals	Self-identification is the main pathway. Promotion into one of the middle or senior leadership roles indicates a degree of preparedness and may indicate interest in the principalship	Complete one or more support programs to identify leadership potential. Programs are based on leadership standards. These can be commercial or government programs	Assessed on a variety of methods – learning blogs, active participation with online communities, learning modules focused on the role of the principals, personalized coaching, shadowing, contribution to professional learning communities, projects		
Nordic countries (Finland, Norway, and Sweden)	Self-selection. Teachers, middle leaders, or assistant principals. For example, in Norway, there is no base qualification to become a principal. Aspiring principals chart their own career path. Legislation leaves it	Self-selection or encouraged by administrators to apply. Sometimes administrators will support prospective candidates	No leadership standards are used. Applicants are required to meet principal selection criteria by demonstrating experience and qualities. Universities offer a range of courses with different	Training qualifications are required after selection and not before. Upon appointment, principals are either required to complete a course or recommended to do a course. For example, in	As there are no systematic or required assessment processes	No response

Scotland	<p>open for anyone to be a principal. No courses are compulsory</p> <p>Aspirants who hold a school leadership role and can evidence significant leadership practice and experience relevant to their own context and want to commit to continued development in the role of headship</p>	<p>Aspiring school leaders are encouraged to apply for headship by colleagues, line managers, or employers, or can decide for themselves that they feel ready to apply by completing an application and is endorsed as being ready</p>	<p>Demonstrated competency in a range of skills: self-evaluation, communication, people management, leading change, policy, legal, and legislation responsibilities</p>	<p>Sweden, principals are required to complete a 3-year program</p> <p>University assessments, multiple choice test, verification of demonstrating a strategic change initiative in their school. (interviews and site visit)</p>	<p>University assignments and professional verifications are used to evidence successful completion of university modules. And scores from online modules to be awarded qualification for headship</p>	<p>No suggestions</p>
Singapore	<p>The Ministry of Education has a leadership career track for teachers. Those who join the track will be considered for various leadership responsibilities and appointments, including for principalship</p>	<p>Aspiring principals are required go through three formal processes of appraisal: yearly appraisal system (Enhanced Performance Management System), interview with Ministry officials, assessment center</p>	<p>Competencies include self-leadership, creating a vision for the future, managing people, inspiring others</p>	<p>Aspiring principals are required to satisfactorily complete an interview, pass an assessment center, and complete a leadership program at the National Institute of Education Singapore</p>	<p>Assessment will determine remuneration, promotion into leadership track, complete an interview and assessment center, and complete a leadership program</p>	<p>(continued)</p>

Table 1 (continued)

Country USA – California	Who are the participants being assessed? Teachers, middle level leaders, or assistant principals who have 5 years of teaching experience, and a Master's degree in educational administration. The experience and qualification leads to a state credential that qualifies them to serve as a principal	How are they identified Applicants to the program are largely self-selected. They may be teachers or assistant principals who are encouraged to apply by their supervisors	What are they being assessed on? Pass six California Professional Standards for Education Leaders (CPSEL): visioning, instructional leadership, managing learning the environment, community engagement, ethics, and policy and context	What is being used to assess them? Completing a Master's degree using a range of assessments based on the CPSEL standards	How are the results of the assessment being used? The rubric results for each class are compiled by the College Assessment Office. These results are returned to the program area for review. The program area writes a report and outlines areas of improvement to be addressed	Suggestions Need for more diversity and cultural sensitivity Address equity issues, for example, scholarships Include as a Ed. D with formal mentoring
USA – Indiana	Teachers with some leadership experience and assistant principals who are self-identified or "tapped" by current administrators (principals and/or superintendents)	Self-identified and tapped by current administrators. Usually they are identified by demonstrated expertise in teaching, e.g., curriculum development, instruction, classroom management	Leadership skills (interpersonal, communication, strategic thinking, etc.) Public speaking Public relations and community relations Classroom management/discipline Curriculum	Usually the assessment is informal and passed along orally by those who know the aspirant. Also through success in educational leadership courses (mostly determined by grades). Less often used are portfolios outlining	Sponsor uses the results to recommend aspirants Universities sometimes use the results for admission decisions into educational leadership programs	Use of assessment centers has increased but not totally supported. New developments in great partnership universities and districts Use of attributes, dispositions, and identities is emerging

<p>USA – Texas</p>	<p>Aspiring principals from the teacher, middle level, and senior leadership areas To be eligible for a Texas Principal's Certificate, educators must have at least 2 years of teaching experience, have completed an accredited Master's degree program, and pass a state assessment (TExES Principal Examination)</p>	<p>Self-select and/or be nominated/encouraged by a colleague. For some programs a letter of support from their principal is required For admission to degree candidates are assessed on specific criteria that includes: teaching experience; rationale for applying, commitment for working in complex cultural settings, to school improvement; demonstrates leadership potential</p>	<p>development Teacher evaluation Use of data for instructional decision making Budgeting</p>	<p>experience, achievements, references from community</p>	<p>Assessment of a range of course leadership activities: visioning, equity audits, teacher observation, data analysis, community projects, leadership inventories, self-reflection Develop a learning experience capstone to demonstrate, for example, an improvement in learning, address an urgent school problem, lead and improvement process</p>	<p>Assessment of assignments not only results in course grades for students, but also provides them with opportunities for self-growth as well as products and documents they can utilize when applying and interviewing for administrative positions</p>	<p>Suggested move toward field-based internships Develop a "fitness to lead" policy where faculty can recommend removal of a candidate</p>

appointed to the principalship. It appears that various systems are keen to develop more cohesive and strategically aligned processes focused on aspiring principals as a component of their leadership development programs more broadly.

3. *What they were assessed on.*

Some systems had licensure or certification processes that were based on a set of competencies, principles, or standards. Standards are the common approach in North America but not in European countries and South American countries (Brazil and Chile). England, Australia, and New Zealand are more complex as they have standards but these are not compulsory for principal selection. Many systems have developed their own leadership frameworks, which guide leadership programs and, in some cases, selection criteria. Some systems required completion of compliance modules prior to or during the first year of principalship.

In jurisdictions where there were no identified standards, desirable criteria for training after selection included: understanding rules and regulations, finance, human resources, and a range of “soft skills.” In most jurisdictions, whether there are standards or not, there is an expectation that aspiring principals demonstrated a range of intra-personal, personal, and interpersonal skills; knowledge of the system (rules, legal requirements, and accountability measures); educational/instructional leadership (teaching and learning and curriculum); community relations and cultural awareness; school administration and finance; and human resource management.

4. *Assessments methods used*

Some jurisdictions required aspiring principals to be licensed by completing an examination or approved formal program (doctoral or Master’s program). Standards were often applied to selection of candidates for pre-licensure programs (leadership screening and assessment centers). In the United States principal licensure based on standards was common across the states.

How candidates were assessed varied, and added together they combined to form a complex and often disparate set of measures. The ability of candidates to demonstrate the necessary requirements to be ready for principalship was underdeveloped in most systems. The following summarizes the various measures used:

1. Application for principalship: Demonstrate in application that they have the qualities, knowledge, competencies and experience to meet the selection criteria
2. Complete formal licensure program: Examination assignments and field work, practicum; written and oral exercises administered by state officials, portfolios (mentoring, formal tasks, coaching) and assessment based on rubrics
3. Formal qualification (Master’s or doctoral program)
4. Assessment centers (leaderless group, in-basket, fact finding, interview)
5. Formal and informal interviews
6. Inventories (paper test)
7. Artifacts from previous leadership programs
8. References
9. Assessments that combine university and school district attributes and assessment processes

10. Online elements that may be assessed by multiple choice tests, video observation and analysis, case study analysis, vignettes
11. Portfolios of practice based on practice in own or other schools and as part of a group or solo portfolio
12. Internship experience throughout the year
13. Coaching and mentoring as part of induction program

There appeared to be consensus that multiple assessment tools were necessary to determine readiness.

#### 5. *How the assessments were used*

Results were used to determine readiness to do the job, whether it was through certification, licensure, formal qualification, or demonstrated competences on a test. This would allow candidates to apply or be appointed as principal. Often candidates will be selected based on qualifications, applications, practice experience, personal disposition, and capabilities.

The Delphi results shows the range of approaches and challenges to identifying and promoting effective leaders. Each country does provide leadership development programs before, during, and after principal appointments. The greatest challenge remains in identifying the best talent to appoint to the role.

---

## Conclusions and Reflections

With research clearly identifying the impact of school leadership, and principal leadership in particular (Grissom et al., 2021), and the belief that leadership can be developed, identifying and promoting effective leaders has become a priority in many educational jurisdictions across the world. Despite this focus, it remains a developing area with different views on how to do it and uncertainty of program impact, even in those systems that have a considerable history of doing this.

There has been a focus on leadership preparation programs to manage the process. Despite criticisms and shortcomings of these programs, there is considerable knowledge about what works. The evidence is that the programs have evolved to the extent that we can now identify the characteristics and qualities of exemplary programs. These are comprehensive in content and process. The best programs take place over time and focus on relevant curriculum content that combines theory and practice and is aligned to the job of principal. Assessment is normally based on some form of leadership standards or demonstrated competencies. Activities typically include mentoring, coaching, and practical on-the-job or field-based experience (internship). Evaluation is both formative and summative. Licensure and certification are common in many jurisdictions although not all systems see the need for licensure.

However, there are several challenges that remain. Many systems struggle to identify and support potential leaders early in their careers. In terms of the principalship, determining when a candidate is ready for the principalship remains a challenge in most jurisdictions. While there are standout programmatic examples, such as Singapore, most efforts are somewhat ad hoc and often rely on self-identification and self-management. Education systems seem reluctant to adopt best practice from other areas. For example, most systems are yet to adopt and implement a long-term talent

management strategy. One of the hurdles to greater adoption of support programs is that the impact of programs on improving student and school outcomes remains unclear. We know that proper resourcing of appropriate programs and support is important and many of the stand-out programs are expensive to run. We also know that this resourcing is variable across jurisdictions, and so while identify and developing educational leaders is acknowledged as important, often this is not matched by appropriate resourcing.

## Abstract

All states in the United States made education compulsory for students in 1918. For students with disabilities, compulsory education was not enforced and they were often denied access to an education with their peers. The move in a positive direction in providing special education services to children with disabilities would take a series of events centered around litigation, legislation, advocacy, and research. That is how this chapter is organized by the authors. Issues with monitoring compliance with disability law, interpretation of legislation, distribution of resources, family involvement, access to individualized education programs, and inclusion of students with disabilities continue even today. The role of advocacy cannot be understated in ensuring access and acceptance of student with disabilities. While effective treatments for students with disabilities have been

established, this knowledge and training on effective interventions is often not filtered to and within states and to more rural schools. Research-based interventions should be taught, implemented, and supported by all administrators and staff and parents should be equal partners in the education process as the field evolves.

History of special education · Litigation · Legislation · Research · Advocacy · Effective interventions · PBIS · RTI · MTSS

**The Field of Memory**

As *Brown vs. Board of Education* (1954) set precedent in the education of students of color in public schools, the passage of Public Law 94–142 (Education of All Handicapped Children Act (1975) established the public educational rights for students with disabilities. The global shift from a medical model (focused on what a person cannot do) to a social model (focused on changing norms and providing accommodations) began in the United States in the 1970s and influenced schooling, community living, employment, and social interactions of individuals with disabilities. Individuals with disabilities went from exclusion to inclusion in school, community, employment beginning in 1972 through a series of initiatives surrounding litigation, legislation, advocacy, and research. Individuals with disabilities went from being seen as a disability first (autistic person) to a person first (individual with autism) as a result of the shift to person-first language.

**The Field of Presence**

The Individuals with Disabilities Education Act (IDEA) and its updates and revisions have established the current educational rights and lexicon that special educators must meet for students with disabilities including the terms and practices of Least Restrictive Environment (LRE), Individualized Education Program (IEP), and Behavior Intervention Plan (BIP). Least Restrictive Environment for individuals with disabilities means placement as close to peers without disabilities as possible, enhancing social awareness and acceptance for both groups. Special educators are leaders in their schools. They are considered the special education and disability experts. The requirement for professional development informs current practices based on peer-reviewed research. Ensuring educational benefit (*Board of Education of the Hendrick Hudson Central School District v. Rowley*, 1982; *Andrew v. Douglas County School District*, 2015) going from minimal progress to appropriately ambitious goals.

**The Field of Concomitance**

Least Restrictive Environment – the need for structure and issues with academic development and challenging behaviors exists alongside the right to educational benefit in an inclusive environment. Many research-based interventions were developed through the discipline of psychology, specifically the field of applied behavior

analysis (ABA). These include reinforcement, prompting, positive behavior supports, visual supports, behavioral momentum, choice and preference, and modifications of demands that enhance inclusion in school, community, and employment. Ensuring educational benefit (*The Board of Education of the Hendrick Hudson Central School District v. Rowley*, 1982; *Endrew v. Douglas County School District*, 2015) moved from minimal progress to appropriately ambitious goals.

### **Discontinuities and Ruptures**

Least Restrictive Environment stopped exclusion from school and exclusion from activities with peers toward more inclusive strategies. From exclusion to inclusion, from disability first to people first. Barriers were removed in schools as a result of Section 504 of the Rehabilitation Act of 1973. The concept of minimal progress (*Rowley*, 1982) was superseded by the requirement to an education program that is appropriately ambitious (*Endrew*, 2015). Litigation, legislation, advocacy, and research forced US education to include students with disabilities in the public education process. Barriers are systematically being broken and disrupted. The move from a medical to social model of disability fosters inclusion as rupture to the existing social norms of the 1960s. Access for those with disabilities means access for all since each of us has potential to be injured or ill subject to a need for accommodations.

### **Critical Assumptions**

Individuals with disabilities were a marginalized population in education. Disability rights rose out of the Civil Rights movement. Concepts that rose from the Civil Rights Movement include inclusion/access to public spaces and employment as mandated by law. Multi-Tiered Systems of Support (MTSS) assumes that inclusion is the default placement for all students. Those needing differentiated instruction and accommodations are provided them based on assessments and data from a multi-disciplinary team of educators and specialists. Inclusion assumes that accommodations level the playing field for all students (with and without disabilities), including English-language learners, and those from other underserved populations.

---

## **Introduction**

The history of special education in the United States evolved out of educational and civil rights litigation, legislation, advocacy efforts by families, and through research in the field. At one time persons with disabilities were considered useless and worthless, with no future. Because of this perception, children with disabilities were kept at home and denied an education.

Even with compulsory education legislation sweeping through state legislations (beginning in Massachusetts in 1852) and the passage of The Education for all Handicapped Children Act (EAHCA; 1975; Public Law [PL] 94–142), children were often excluded from a public education because of disabilities or conditions. The right to a public education in the United States is not mentioned in the US

Constitution; and the 10th Amendment to the Constitution states that powers not specifically granted in the Constitution are reserved for each state. Therefore, public education in the United States is the responsibility of each state (Yell, 2012). The perception of disability and implementation of legislation have differed based on state resources and the involvement of families as advocates in the policy-making process.

---

## History of US Special Education Litigation

Until the 1950s, many students with disabilities were excluded from attending public schools (which was a legal option) and those who did attend often dropped out. The state court upheld this exclusion practice in *Beattie v. Board of Education* (1919), which ruled to exclude a student with a disability because his presence was harmful to best interests of the school (his physical condition was seen as distracting and nauseating to other students and adults), even though he could do the work and keep up with peers (LaNear & Frattura, 2007). Students with more significant disabilities were excluded, often institutionalized or remained at home (Pardini, 2002). Even when schools accepted students with disabilities as part of their responsibilities, they were usually segregated in separate classrooms and schools (Heward, 2013). In the United States during the 1950s and 1960s, the Civil Rights movement impacted changes in educational practices for children with disabilities. The landmark case *Brown v. Board of Education* (1954) challenged race segregation; it was determined that separating children in separate schools without resources by race was not equal. Added to that were the emerging women's movement and the disability rights movement as well as veterans returning from Vietnam returning with disabilities. As a result, parents of students with disabilities also asked why the principles of equal access to education did not apply to their children (Bagenstos, 2003; Heward, 2013; Yell, 2012).

Prior to the 1960s, most students with disabilities were educated in special facilities (e.g., Thomas Hopkins Gallaudet's American School for the Deaf in Hartford, founded in 1817, and the Perkins Institute and Massachusetts School for the Blind in Boston, founded in 1823). By the 1960s, a larger number of children with disabilities who attended public schools were housed in substandard academic programs and separated from the general student population in special education classes, which were often located in basements or boiler rooms, or portables away from regular classrooms. School officials often regarded special education as disability daycare (Phillips, 2008).

It was not until the 1970s that special education as a civil right for individuals with disabilities was practiced. Disability rights advocates worked to change the concept of disability in the United States from a medical model of disability (focused on what a person could not do) toward a social model of disability, which focuses on how existing social arrangements and norms exclude individuals with disabilities and how they could be changed. Special education grew out of the disability rights movement's objectives (Bagenstos, 2003; Heward, 2013). The exclusion of students

with disabilities, because they would not profit from the public education system, was challenged in the 1972 court cases *Pennsylvania Association for Retarded Children (PARC) v. Commonwealth of Pennsylvania* and *Mills v. District of Columbia Board of Education*. These class action cases challenged the exclusion of exceptional children from public schools and the parents prevailed. The passage of EAHCA in 1975 changed the dynamic of the education exclusion of students with disabilities legally and lead to a shift in litigation focus.

Nationally, while earlier litigation addressed access to school, the issue became ensuring educational benefit. For example, since the passage of PL 94–142, a number of cases have focused on educational attainment for students with disabilities and how far should school responsibility go. The *Board of Education of the Hendrick Hudson Central School District v. Rowley* (1982) addressed this issue. Amy Rowley, a fourth-grade student who was deaf, received special education services with a sign-language interpreter in the classroom. After a few years, the school terminated this service when it was determined that she was proficient at reading lips. The school argued that Amy was making adequate educational progress while the parents maintained that special education services should maximize her potential educational growth. The US Supreme Court ruled in favor of the school and determined that Amy was making progress and gaining adequate educational benefit. The school was no longer required to hire a full-time interpreter (Heward, 2013; LaNear & Frattura, 2007; Yell, 2012). Thirty-five years after *Rowley* (1982), the Supreme Court determined in *Endrew F. V. Douglas County School District* (2017) that minimal progress (i.e., *de minimus*) was not enough. They determined that the individualized education program (IEP) must be “appropriately ambitious in light of his (the student’s) circumstances” (*Endrew*, 2017; p. 14; Prince, Yell, & Katsiyannis, 2018; McKenney, 2017; Stevenson & Correa, 2019). This case extended the requirements for schools to utilize more effective interventions, ensure more than minimum progress, and calculate IEPs that are rigorous in nature.

---

## History of US Special Education Legislation

The passing of Section 504 in the Rehabilitation Act of 1973 motivated disability rights and special education advocates. Section 504 prohibited any and all discrimination on the basis of disability within federally funded programs. It also set the stage for a shift in the way society viewed disability from a medical model of exclusion based on a disability to a push for social accommodation. This contributed to a realization that public school systems should accommodate students with disabilities and was a factor in the evolution of modern special education (Phillips, 2008).

Along with Section 504 of the Rehabilitation Act and on the heels of the *PARC* and *Mills* cases in 1972 came passage of the Education for All Handicapped Children Act of 1975. At its core, the EAHCA was the first piece of legislation to mandate that students with disabilities are granted to the right to public education and made exclusion from education due to disabilities illegal. As parents, schools,

and advocates began applying to the law into practice, several reauthorizations and amendments would be needed to improve and clarify the law. Thus leading to the Individuals with Disabilities Education Act (IDEA) of 1990 (Hulett, 2009; Yell, 2012), The Individuals with Disabilities Improvement Act (IDEIA) of 2004, and the Every Student Succeeds Act (ESSA) of 2015. The first set of reauthorizations and amendments (IDEA, 1990; IDEIA, 2004) established the principles of a) zero reject, b) nondiscriminatory evaluation, c) appropriate education, d) least restrictive environment, e) procedural due process, and e) parent and student participation (IDEA, 1990; Turnbull, Turnbull, Wehmeyer, & Shogruen, 2013). All of which have been the crux of education law for students with disabilities since the 1990s. In addition to the base principles, IDEA gives every qualified child in the United States access to special education from age 3 until they turn 21. Advocacy for these individuals must be in place to ensure they receive program benefits and services as required by IDEA. It falls to the adults to identify a disability, to evaluate the student for eligibility for individualized services, and to individualize that education to provide a free appropriate public education (FAPE; Phillips, 2008). See Fig. 1 for a list of 13 eligible categories for special education services.

At turn of the century, The No Child Left Behind Act (NCLB; 2001) was passed and required increased accountability by schools to include a) increased parental choice, b) site-based management, c) research-based teaching methods, and d) highly qualified teachers and paraprofessionals in order to receive federal funding (Hill & Hill, 2012; Yell, 2012). NCLB had both supporters and opponents in the special education community. Some applauded the law for addressing achievement gaps for students with disabilities and requiring school accountability in standardized testing and teacher qualifications (Berwick, 2015). Others note that the law requires an exceptionally high hurdle for special educators to be considered highly qualified and that assessment provisions may not be fair to students with disabilities. NCLB was dogged with controversy throughout its existence. However, the passage of the ESSA (2016) made NCLB obsolete.

## IDEA 13 Disability Categories

Multiple Disabilities	Autism
Orthopedic Impairment	Deaf-Blindness
Other Health Impairment	Developmental Delay (ages 3-9)
Specific Learning Disability	Emotional Disturbance
Speech/Language Impairment	Hearing Impairment (including deafness)
Traumatic Brain Injury	Intellectual Disability
Visual Impairment (includes blindness)	

**Fig. 1** Disability categories as identified by the individuals with Disabilities Education Act

Along with IDEIA, the ESSA (2016) is the current major educational legislation and as such impacts all students including those with disabilities. State education agencies (SEAs) and local education agencies (LEAs) can define their standards with flexibility, control their assessments, and adjust their standards of discipline for failing schools (ESSA, 2016). Under ESSA, state departments are expected to manage more duties in developing and implementing mandatory state accountability plans. They are now responsible for intervening in low-performing schools, crafting and executing new state report cards, and imposing teacher-evaluation systems (Burnette, 2017). Dulgerian (2016) examined the impact of ESSA on rural schools and sees ESSA as an improvement for them, which is important, since rural schools make up around 50% of all the districts in the United States. She indicated that ESSA helps rural schools balance a proper education with meeting federal and state standards, resolving the burdensome administrative requirements under which they once suffocated. See Fig. 2 for a timeline of significant legislation and litigation in special education.

---

## Advocacy and Support for Children with Disabilities

Advocacy is an important component of the complex special education process (Burke & Goldman, 2018). A good special education advocate is well versed in the law, parent rights, and education of students with disabilities. These advocates (parents and teachers) educate and empower parents in the special education process (Mueller, 2015; Wakelin, 2008). Parents themselves play a key role in ensuring the rights of students with disabilities and are instrumental in orchestrating changes in policy. Many families find that having a formal special education advocate to support them in navigating the special education process important to meeting the needs of families impacted by disability (Wakelin, 2008). The Family Navigator model was formalized and evolved out of the rise and need for advocacy for children with disabilities. A family navigator has the *lived experience* navigating systems on behalf of a child with disabilities. They meet specific qualifications and are hired by many local and state education and other agencies to assist families in this process (Weiss & Sweeney, 2019).

People with disabilities have worked hard to secure federal legislation protecting them from discrimination in all areas of life. Today, this movement constantly struggles to ensure enforcement of these rights. State laws still discriminate against people with disabilities, often people with mental disabilities, in areas like family law, voting, commitment proceedings, and the provision of benefits (Waterstone, 2014). Phillips (2008) questioned one of IDEAs key assumptions: that parents possess the tools to advocate for their children in special education matters. She argued that many parents need assistance in the IEP process because of the complexity of disability and the formal requirements of the system. She also discusses the need for external advocacy in special education for families of students with disabilities. Policymakers have understood the importance of an adequate education. Congress recognized that public education should not exclude children with

**Fig. 2** Important events impacting the evolution of special education in the United States.

<b>Timeline of Important Special Education Decisions</b>	
<b>YEAR</b>	<b>LEGISLATION/LITIGATION</b>
1919	*Beattie v. Board of Education (upheld the exclusion of a student with a physical disability from a public education).
1954	*Brown v. Board of Education (civil rights case regarding exclusion of students from public education because of race).
1972	*PARC V. Pennsylvania (challenged the exclusion of students with disabilities to public education).  *Mills v. District of Columbia Board of Education (challenged the exclusion of exceptional children from Washington, DC public schools).
1973	**Rehabilitation Act, Section 504 (made it illegal for any activity or program receiving federal financial assistance to discriminate against a person with a disability; most schools receive federal funding).
1975	**Public Law 94-142 Education for All Handicapped Children Act (EAHCA; Would later become IDEA).
1982	*The Board of Education of the Hendrick Hudson Central School District v. Rowley established adequate minimal progress was acceptable
1990	** Americans with Disabilities Act (extended Section 504 to private companies, public services, accommodations, transportation, and telecommunications).  **Individuals with Disabilities Education Act (IDEA; includes the right to a free appropriate public education (FAPE) in the least restrictive environment (LRE) with peers without disabilities).
1999	*Olmstead v. L. C. (addressed the disability rights movement's goal of moving people with disabilities out of institutions and into the community).
2001	**No Child Left Behind Act of 2001 (increased federal funding for public schools as long as schools employ "highly qualified" teachers and make adequate yearly progress).
2004	**Individuals with Disabilities Improvement Act (IDEIA; updated and reauthorized).
2015	** Every Child Succeeds Act of 2015 (states manage more duties in crafting and executing the mandatory state accountability plans, intervening in low-performing schools, state report cards, and teacher-evaluation systems).
2017	* Endrew F. V. Douglas County School District (determined that the IEP must be "appropriately ambitious in light of the student's circumstances")

*Note:* \*Litigation, \*\*Legislation

disabilities by passing IDEA, and thereby extended the benefits of free and appropriate public education (FAPE) to a class of children who, prior to the 1970s, had been drastically underserved. Congress also recognized that advances in special education have vastly improved the educational prospects of children with disabilities, but without effective advocacy the requirements of the law are often overlooked.

The *Mills* and *PARC* decisions were class action lawsuits brought by 20 sets of parent advocates between the two cases. The results of this litigation found that children with disabilities have the same rights to public education as do other children. These cases served as powerful tools for the special education movement and the strength of advocates when they build coalitions. By 1975, lawyers in many states were basing their arguments on the *Mills* and *PARC* precedents and led Congress to recognize a child's right to special education (Phillips, 2008). *PARC* and *Mills* were important because they gave parents the opportunity to participate in the educational decision-making process for the first time. Prior to the development of special education laws, many parents begged for educational services for their children with special needs but lacked legal rights. Unfortunately, even after *PARC* and *Mills*, many parents were still intimidated by school professionals or misinformed about the education of students with disabilities (Phillips, 2008).

IDEA recognized parents as the most effective representatives of their children's general interests. Parents are child-specific experts most qualified to assess and pursue their children's educational needs. IDEA resolved to involve parents at every step of the process, from diagnosis to the development of an individualized education program (IEP). The responsibility of parents in the IEP process can be overwhelming. Some have argued that there is a need for external advocates to supplement their efforts in order to achieve results in the best interest of the child (Burke, Rios, & Lee, 2019; Phillips, 2008). Many parent advocacy groups exist and grew out of grassroots efforts and are registered as 501c3 nonprofit organizations at the local level, and some are authorized through state legislatures, or funded by federal law such as Public Law 106-402 through the Administration on Intellectual and Developmental Disabilities (AIDD, 2020).

---

## Research and Training Special Education Professionals

In the United States, 13 separate categories under IDEA exist since its reauthorization in 1990 (Hulett, 2009; Vaughn & Boss, 2011; Yell, 2012) and interventions to support them have been researched and examined for efficacy. These interventions can benefit all students, especially those who might be culturally and linguistically diverse (Boutot, 2017; Heward, 2013). Special education teacher training programs (pre- and in-service) incorporate research-based interventions in university coursework and workshops. While states are required to provide access to services in the least restrictive environment (LRE) for students with disabilities, research was being conducted to determine which interventions work best for students with disabilities. Using a framework described as Multi-Tier System of

Supports (MTSS), state educational legislation has mandated schools use these frameworks to address student needs in the areas of academics and behavior. Response to Intervention (RTI) and Positive Behavior Interventions and Supports (PBIS), both considered MTSS frameworks, apply research-based interventions, are trained to teachers, and utilized school wide by local education authorities (LEAs). RTI is used to address academics and PBIS is used to address behavior with both designed to work for all students, not just those identified for individualized instruction through the IEP process (Shapiro, 2015). Sugai and Horner (2009) describe common elements that most MTSS frameworks share including (a) multiple tiers of intervention that increase in intensity, (b) universal screening for early of needed supports, (c) data collection, (d) data-based decision making, (e) valid implementation integrity, and (f) guided instruction and placement based on assessment.

---

## Multi-tiered Systems of Support

With the Individuals with Disabilities Improvement Act (IDEIA, 2004), LEAs are required to use research-based interventions as part of the evaluation process for special education services. Previously, to receive special education services in academic areas, students were referred after they displayed a gap between IQ score and achievement score and if they met a discrepancy threshold (Fuchs & Fuchs, 2006). This was termed the “wait to fail” method since students were far behind their peers when identified. RTI was seen as a proactive method to reach students before they fail. Prior to referral for special education, interventions designed to help all students at risk for failure must be implemented, data collected, and decisions for placement made based on the information collected through the RTI process in conjunction with other assessments. Additionally, general education, special education, and specialists (e.g., speech, occupational therapy) collaborate in the RTI process. Some students “catch up” when RTI is implemented and are not referred for special education.

While RTI focuses on the academic arm of an MTSS framework, PBIS (now more commonly seen as School-Wide PBIS; SWPBIS) is applied for students with behavioral challenges. SWPBS is a 2- to 3-year process that a trained leadership team (i.e., MTSS team) implements throughout the school setting that evaluates data to make intervention decisions regarding behavioral supports for students (Horner, Sugai, & Andersen, 2010). SWPBS incorporates a number of elements and principles to form the conceptual model for implementation. See Fig. 3 for a list of components for SWPBIS.

A key component of MTSS (whether RTI or SWPBIS) is the use of a tiered model of intervention. Most MTSS frameworks use a three-tiered model with each tier increasing the level of intervention intensity based on the student needs and data (see Fig. 4). The interventions in this tiered framework describe quality and intensity of the intervention level, not necessarily the place where the intervention occurs. At Tier I, it is expected that 75–80% of students will be successful. This is generally considered a universal tier in that all students who need supports will begin here. The interventions introduced here are universal that will either apply to

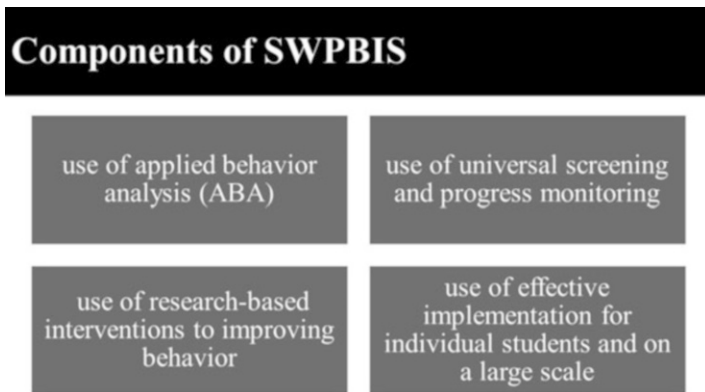

Fig. 3 Components of school-wide positive behavior interventions and supports

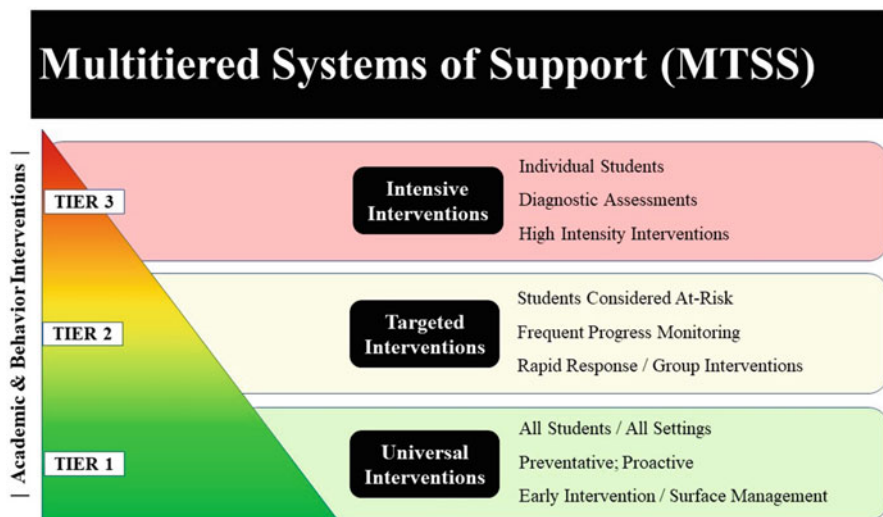

Fig. 4 Multi-tiered systems of support

most or all of the students in the school, whether identified for special education services or not. When students fall below the benchmarks or objectives for Tier I they are considered at risk for failure, and they receive small group instruction (generally up to 8 other students), in the area of need (based on assessments during Tier I). Tier II instruction can occur inside or outside the general education classroom depending on the instructional intensity and the teacher training level or personnel capacity. Tier II is aligned with Tier I instruction, but at Tier II they are differentiated, scaffolded based on assessed individual student need. Tier III is designed for students not responding well to Tier II interventions and delivered by a highly trained teacher (typically a special educator) in that area of instruction

with specialized materials and intervention strategies. Tier III interventions differ from Tier II since they typically take place outside the general education classroom. They also differ in the amount of time devoted to instruction. Students referred for special education services are generally in Tier II–III academically and/or behaviorally (Shapiro, 2015).

---

## **The Individualized Education Program (IEP) and Inclusive Education**

As specified by IDEA, students with disabilities are entitled a free, appropriate, public education (FAPE) in the least restrictive environment (LRE). For most students, this is the inclusion setting (general education classroom with peers without disabilities). When an individualized education program (IEP) is developed for a student with a disability, the IEP team (including teachers, administrators, parents, professionals who provide related services, and the student when appropriate) determines the LRE for that student closest to the general education classroom to the maximum extent appropriate where the student can make satisfactory educational progress in his or her individualized program (Heward, 2013; Yell, 2012). LRE can occur across a continuum that includes (from least to most restrictive): a) general education classroom, b) general education classroom with consultation from a special educator with additional instruction/related services, c) resource room where the student is pulled out for specialized instruction for part, but not the majority of the day with smaller groups, d) separate classroom where services are provided by a special educator and paraprofessionals, e) separate school with specially trained staff in a separate facility during the school day, f) residential school where the student receives education and care 24 h a day, and g) homebound or hospital where services are provided in that setting for a portion of the day (Heward, 2013; Yell, 2012).

Inclusion for students with disabilities in general education settings with supports can benefit not only the student with a disability but typical peers in the classroom through interaction and acceptance by peers without disabilities. Parents have both supported and rejected the inclusive setting (Havey, 1999). Supporters of inclusion focus on maintaining the intensity of services required as a separate piece of inclusion. They see inclusion as a right, with the extent of restricted placement being based on the student's need to make educational progress without sacrificing the right to a free, appropriate education as close as possible to that of students without disabilities. Placement should be reexamined on a regular basis as the student makes progress toward educational, behavioral, and social goals. Inclusion fosters collaboration between general and special educators and should include regular training on how to differentiate (individualize) instruction for all students. Accommodations made for students with disabilities can benefit all students (Heward, 2013). Accommodations can include peer tutoring, structuring the classroom, providing scaffolded assignments, and grading rubrics, which enhance learning for all students. Visual supports help culturally and linguistically diverse students

as well as students with disabilities such as autism spectrum disorder (ASD). Inclusion fosters awareness and acceptance by peers without disabilities.

Carefully planned interventions and classroom structure can help students with disabilities navigate the classroom successfully. Some antecedent interventions include use of behavioral momentum, providing choice, incorporating preferences, prompting and cueing which can subsequently be faded, environmental enrichment, modification of task demands, teaching rules and expectations using specific, observable examples, seating, proximity and adult presence, errorless learning, thematic activities, interspersal of preferred, non-preferred activities, modeling correct demonstration of a task, peer training and peer modeling, graphic organizers, story-based interventions, video modeling, scaffolding assignments, teaching self-management, visual prompts, and schedules incorporating pictures (National Autism Center, 2009).

There are times when the inclusion setting (or general education classroom) may not be the best placement for a student. The multidisciplinary team must weigh the factors that impact setting and student progress toward goals.

Another influential aspect of LRE placement (i.e., inclusion in general education classrooms) and academic interventions for students receiving special education services is behavior. An additional legal mandate from IDEA (1990) is the use of Functional Behavior Assessments (FBA) which led to the development of Behavior Intervention Plans (BIP). FBAs are usually conducted at Tier III of an SWPBIS if a student is not receiving special education services. It is designed to determine the function of a student's behavior (i.e., what is the purpose for a behavior) and developing BIPs to address the behavior and appropriate replacement behavior that are effective in the context of daily life. FBA/BIP procedures are behavior analytic in nature and incorporated into SWPBIS. The BIP might include changes to events that precede the behavior, teaching effective replacement behaviors that serve the same purpose as the inappropriate behavior, and changing reinforcement from inappropriate to appropriate behaviors by the student (Cipani, 2018; Cooper, Heron, & Heward, 2013).

---

## Conclusions and Reflections

The history of special education in the United States evolved through litigation, legislation, advocacy, and research efforts. Compulsory education and the civil rights movement helped make an education of those with disabilities mandatory. All states within the United States had compulsory education laws in place by 1918 (Yell, 2012) but equal access for students with disabilities would evolve over the century. From the foundation of the Civil Rights Act of 1954 and seminal court rulings in favor of children with disabilities and their parents (e.g., *PARC vs Pennsylvania Board of Education and Mills vs. the District of Columbia Board of Education* [1972]) came the opportunities for students with disabilities to receive public education commensurate to and with their peers without disabilities. Since those initial waves of educational progress, students with disabilities and their advocates have continued to fight for educational rights.

The future history of special education is still being written. The pillars of change that shaped special education (litigation, legislation, advocacy, and research) will continue to shape its future. While progress was made for students with disabilities and the field of special education as whole, advocacy for rights and resources still and will continue to be the foundation of change. Parents and advocates demanding the best for students with disabilities are needed to drive positive change. History will also show an increase in self-advocacy by individuals with disabilities as they receive that training. Since those initial legal victories, there have been court cases addressing every aspect of education for students with disabilities, from types of services students should receive to where should they receive them and how often. This trend will undeniably continue alongside broad educational shifts. Legislation regarding educational progress will also shift and change with the broader educational goals of local, state, and national elected officials. Updates and revisions to existing mandates will occur, however, future legislation will be necessary to improve the educational opportunities for students with disabilities. Lastly, positive change in the outcomes for students with disabilities will be effected by research. Research provides us with evidence of what works, how well things work, and what works best for whom. Research has always been necessary to help students with disabilities maximize their progress. Looking back at the history of special education continues to inform the future. As history is still being written, advocates will continue to push for improved outcomes for students with disabilities through legislation, litigation, and research.

### Abstract

Critically considering the history of educational assessment, this analysis problematizes the way in which certain constructions of assessment have achieved privileged status over others in the past two centuries in Western discourses, particularly in the US educational landscape. The analysis adopts the position that a centralized, authoritarian control through various government mechanisms has resulted in the gradually diminishing power of school leaders and teachers, who once had the responsibility of not only designing learners’ assessment tasks, but of presenting or “exhibiting” their outcomes to the public. It traces the *épistémès* of both *thought* and *practice* and the way in which standardized testing has become an end in itself rather than a means of assessment and improvement; an “unquestioned” social-educational norm, capturing state agents’ push for quantitative measures that do not fully appreciate the complexity of teaching and

learning. In the name of neoliberal agendas and economics, these calculative power discourses have shaped public understandings of educational “performance,” identifying standardized tests as the key tool to control funding entitlement and other incentives. Using the Foucauldian framework of archaeology, the analysis portrays the ideas, assumptions, beliefs, ideologies, and theories which have formed, evolved, and ultimately normalized the ruptures and discontinuities resulting in reductive standardized assessment. In developing an intellectual archaeology of evaluation, the analysis offers the concept of *reproductive power* as a way to capture the circularity of mechanisms intended to centralize the power for decision-making and administration in the hands of state policy actors. It concludes with commentary on future trends in evaluation and assessment.

Assessment · Evaluation · Foucault · Archaeology · Discourse · Épistémès · Teaching and learning · School leadership

The judges of normality are present everywhere. We are in the society of the teacher-judge, the doctor-judge, the educator-judge, the social worker-judge; it is on them that the universal reign of the normative is based; and each individual, wherever he may find himself, subjects to it his body, his gestures, his behavior, his aptitudes, his achievements.

Foucault, *Discipline and Punish: The Birth of the Prison* (1977, p. 304)

### Field of Memory

This analysis identifies and discusses the historical circularity of assessment practices in the US educational landscape over the past two centuries. It unpacks the memorable use of *visible* “exhibition”-based emulations, often seen as “examination” procedures, intended to assist various state agents capture and present the effectiveness of teaching and learning in the growing schooling system. Portraying the rise of standardized testing mechanisms as governing reflections of a centralized controlling authority, the analysis illuminates subtle transitions from a visual and communal exhibition to a detached and scientific approach of examination. Within this restructured space, calculative power discourses were born, (re)shaping public understandings of “quality education,” and social actors’ perceptions of what constitutes “useful” or “effective” assessment of educators’ practices. With powerful state agents promoting logocentric beliefs and insisting on a stable and unmoving set of positivist rules as to what constitutes reliable and valid schooling assessment, *épistémès of thought and practice* have mediated new educational knowledges. Such knowledge, while notably criticized, corresponds with widespread neoliberal approaches heavily tied to the logic of markets – amplified in the field of presence.

### Field of Presence

Scientific approaches of examination are part and parcel of contemporary teaching and assessment discourses, capturing discursive processes and governing initiatives

of *reproductive power* in the US educational system. In the name of “quality” education, state agents have been refining measures and controlling tools, calculatedly reproducing their own hold on power in the process. History repeating itself, practices of “exhibition” resurface to assure visible educational success, highlighting a focus on assessment as an exercise of power, rather than an authentic examination of the outcomes of teaching and learning. Subject to somewhat familiar critical scrutiny, new educational knowledge is then produced and assessed in processes of reciprocal collaboration of state agents as well as nonstate commercialized and “scientifically” driven actors. Such complex collaborations not only mirror the blurry lines between public and the private interests, but help refine long-existing, memorable, and sophisticated controlling initiatives of assessment – now outsourced almost completely to nonstate agents to assure powerful governing and success. These processes, in turn, have created new *épistémès* of thought and practice that sustain networks of power and privilege under the guise of accurate schooling assessment.

### **Field of Concomitance**

Connected to broad policies promoting ideals of economy-incentivized society – assuming that standardization and commercialization can help achieve better outcomes – the educational landscape thus becomes entrenched in mixed discursive spheres that negotiate between individuals’ day-to-day practices and state agents’ exercise of power and control. In an effort to extend the latter, memorable communal authority resources are now accompanied by nonstate sources of power, seen as the driving force behind different social systems and authorities that are subordinate to the needs of the individual (the student, in this case) as a customer. Reinforcing practices of control in the name of “quality,” social systems (e.g., schools, higher education settings, hospitals) are thoroughly implicated within a political economy that extends the governing control of some social actors while diminishing the power of others. Internalizing expected ways of thinking and behaviors, practitioners ultimately adopt, adapt and accept new discourses that are powerful enough to create positions that lead them and other individuals to give assent to the realities they face. Promoting rigorous practices of assessment for the sake of “excellence” can help establish a well-oiled system that extends the power of those in control and lead to practitioners’ self-influence and influencing others in more subtle ways.

### **Discontinuities and Ruptures**

Illustrating the shifts in the metanarratives of assessment and schooling, as “stories which not only tell a grand story. . .but also claim to be able to legitimate the story and its claims by an appeal to universal Reason” (Smith, 2001, p. 354), this analysis portrays the discontinuities in practices of visible communal exhibition; moving towards a more scientific driven, widespread approach of examination that reproduces power and control that support neoliberal agendas. In this space, *épistémès* of both thought and practice reflect the way in which standardized public/private tools become an end in themselves rather than a means of assessment and improvement.

### Critical Assumptions

In light of the above philosophical positions, then, this analysis situates the chronological development of the way assessment ideologies have been conceptualized, put into practice, and legitimized through successive historical power structures and controlling groups. In doing so, vested interest groups at different times have adopted positions that framed the concept and exercise of assessment to their own interests. This has marginalized other positions, “defining” them as either unethical, illegitimate, or impractical. The analysis, therefore, considers a holistic view of the conflicting metanarratives that in their totality represent discursive struggles in attaining visibility, and acceptance.

---

### Introduction

For years, US public schools have been using and reporting student standardized test scores. Similar testing schemes take place in other Western nations such as Australia and the UK, rigorously promoting one-size-fits-all evaluation mechanisms, intended to assess, calculate, test, and (re)define schools’ “success” through regulatory state systems and national measures – becoming a main source of concern for educators (e.g., Keddie, 2017; Lingard, 2010). Conversely, “standardized practices” have been playing a significant role in shaping policymakers’, educational leaders’, teachers’, and families’ discourses. It is only the recent, unprecedented COVID-19 pandemic that stopped at once (for now) the engagement with this “monotonic,” yet persistent, exercise of control, leaving policymakers and politicians in awe and anticipation for the right and suitable time to revive this long-standing convention of evaluation.

The current analysis draws upon, and critically considers, William Reese’s (2011, 2012, 2013) historical framework of educational evaluation and assessment in US schools. It seeks to problematize the way in which certain institutional controlling constructions have achieved privileged status over others in Western discourses. The analysis adopts the position that a centralized, authoritarian control was achieved through assessment mechanisms, obscurely used as a means to diminish the power of educators and school leaders who once had the responsibility of designing “examination” or “exhibition” tasks for students, and presenting or “exhibiting” their outcomes to the public. It traces the conceptual power history of standardized tests and the way they have gradually assumed the role of a normalized apparatus in US educational settings. Highlighting Foucault’s metaphor of archaeology, the analysis unpacks the power dynamics and ideologies that remain embedded in “normative” standardized apparatus. Developing an intellectual archaeology of evaluation, it suggests the concept of *reproductive power* – capturing the circularity of mechanisms intended to centralize the power for decision-making and administration in the hands of state policy actors – to comment on future trends in evaluation and assessment.

As a way of beginning, the analysis outlines the adopted methodology, discussing the Foucauldian approach of archaeology. In tracing the *épistémès* of school-based assessment in the US over the last two centuries, it conducts an archaeological

analysis. Specifically, the analysis delves into the gradual shifts from exhibition-based emulations of learning achievement, to written forms of assessment, to comparison-based systems, to statistics and quantitative measures – embedded within frameworks of state-sanctioned and controlled mechanisms of greater standardization and control. Next, the analysis assesses contemporary realities of evaluation, characterized by market-oriented controlling mechanisms and extensive involvement of outsourced nonstate providers. It concludes with an account of the *épistémès* that are likely to become more conspicuous in the future.

---

## Methodology: Discourse and Archaeology

This analysis adopts the Foucauldian conceptualization of discourse which anchors around the notion of a specific form of “systematicity.” Within this notion, rules govern which objects, concepts, norms, and voices are legitimated and accepted and which are not. In this sense, discourse refers to recurrent and persistent patterns of knowledge, codified and institutionalized over time, and manifested through disciplinary structures connecting knowledge and power. Foucault further extends this in his description of archaeology, adopted here as the core of methodology:

Discursive practices [have] a type of systematicity which is neither logical nor linguistic. . . [They] are characterized by the demarcation of a field of objects, by the definition of a legitimate perspective for a subject of knowledge, by the setting of norms for elaborating concepts and theories. Hence each of them presupposes a play of prescriptions that govern exclusions and selections. (Foucault, 1994, p. 11)

In the context of this analysis, the “field of objects” constitutes government machineries, such as policies and regulations that legitimize certain views of assessment as valid and truthful, at the cost of marginalizing and dismissing others. Such machineries also set norms in terms of what can be said (or cannot be said), or, in other words, what can be heard and what remains unheard. Historically then, forms of acceptance appear to eventually be taken for granted and become normalized, soliciting unquestionable acceptance.

However, such framing of discourses does not preclude the formation of *counter-discourses* or alternative views. Foucault’s later work on technologies of the self-proposed ways in which subjects (in this case, US schoolteachers) can still negotiate and “craft” their actions by engaging in practices of freedom (Mansfield, 2000, pp. 54–59). Within discourses, therefore, Foucault (1972) argues, multiple meanings are possible, because a discourse also potentially “contains the power to say something other than what it actually says, and thus to embrace a plurality of meanings” (p. 118). For agents who operate within discursive structures, such plurality of meanings offers opportunities in which individuals can construct opposing views. In this respect, Gramsci’s conceptualization of hegemony (1999) can assist in further extending this analysis. Ideology, which can be difficult to distinguish from discourse (Määttä, 2014) and is “acquired, confirmed, changed and perpetuated through

discourse” (van Dijk, 2006, p. 115), is a site of antithetical struggles, allowing for the possibilities of resistance while offering spaces for counter-ideology or counter-hegemony through which dominant ways of acting can be compromised by the subordinate class. Although Gramsci refers mainly to *cultural* hegemony, his frame can help unpack discourses constructed by institutes and individuals in power to establish certain values as dominating over others.

This analysis entails clusters of discourses, namely, “*épistémès*” (Foucault, 1977) of assessment within which historical configurations of schooling performance are embedded. *Épistémès*, which Foucault defines as historically contingent structures of thought and ways of thinking, allow us to establish priori beliefs that accommodate and normalize discourses in a particular historical period as normative and routine. It is the codification of such routines that makes us conform and uncritically accept “unconscious” structures underlying the production of “scientific” knowledge in a particular time and place. *Épistémès* are the *totality* of discursive practices of a society at a particular point in time, while archaeology is the methodology that Foucault uses to identify *épistémès*, adopted in this analysis.

The analysis in the following section broadly relies on Foucault’s archaeological method, used as an analytical tool, that helps deconstruct the discourses that at different times established themselves as dominant and normative by state machineries, and to an extent by teachers and educational leaders. Such an archaeological analysis also reveals how power and knowledge come together in the formation of established discourses in school assessment which remain unquestioned until the benefit of retrospection allows any possibility of counterargument. Unlike a critical analysis which concerns an exploration of “hidden meanings,” archaeology is premised on the principle of exteriority, allowing the analysis of discourse as amorphous and historically discontinuous. In doing so, it aims to unearth the bases on which knowledge and truth were formed at different historical periods, within what space of order reality is (and can be) known and the shifts in between *épistémès* where new knowledge can be created.

Archaeology in this sense is not so much about history, as it is about a spatiotemporal discovery of frames within which knowledge is constituted. Indeed, it is a “systematic rejection of historical analysis. . . postulates and procedures” (Foucault, 1972, p. 138) which aims to focus on the specificity of statements within particular discourses. By designating general descriptive themes which question the already-said at the level of its existence, it qualifies the enunciative function that operates *within* it, of the discursive formation, and the general archive system to which it belongs. In short, an archaeological analysis situates discourses as practices specified in the historical archive of multiple and discontinuous sayings (Foucault, 1972).

As alternative forms of speech, Foucault (1990) proposes the notion of invisibility and silence which can embed layers of hidden power and resistance. Such silences of utterance (in the formation of discourses) can accommodate the “unspeakable,” or in van Manen’s (1990) terms, the “epistemological silence” beyond the palpability of discourses. Therefore, drawing “binary divisions” (p. 27) between what is said and what is not said, may fail to capture all utterances. Foucault

proposes the discovery of alternative ways of engaging with such unuttered sayings, which can be done through an archaeological analysis.

---

## **An Archaeological Excavation of School Assessment in the US**

### **Between “Exhibition” and “Examination”: Complexities of Emulation**

The idea of school evaluation and student testing does not represent a new tradition. Standardized tests’ origins can be traced back to the nineteenth century, when US policymakers reflected on the great success of the previous generation to create a free, compulsory elementary public schooling system where all American children can attend. This “double-headed” system was comprised of reading schools (focused on liberal arts such as geography, history and spelling), mostly taught by female teachers, and writing schools (focused on commercially oriented subjects such as arithmetic, penmanship, and bookkeeping), having children spend the morning in one and the afternoon in the other.

Although reforms triggered by the state-controlled standardized testing No Child Left Behind (NCLB) came into operation only about 20 years ago, student testing in the US dates back almost 200 years. In 1838, US reformers initiated the conditions that would see, for the first time, formal and measurable assessment of student achievement. The following decades saw rapid extension of official written testing replacing oral examinations – which coincided with the massification of American education. Before the more “formal” state tests came along, school *exhibitions* or festivals of learning were used as a tool for parents and citizens – taxpayers – to judge the effectiveness of teachers and accomplishments of students in the growing educational system. Once the days of exhibition were announced, principals’, teachers’, students’, and even parents’ (some with minimal schooling, themselves) feverish preparations began, eager to impress the public with their great knowledge and high achievements. Similar to students’ taking high or low-stakes tests today, students were focused on the task at hand, memorizing topics and reciting ideas to impress the crowd. Impressions did not only rest upon students’ public performance, but the teachers’ appearance or ability to successfully discipline their students as well (Reese, 2011).

These school exhibitions brought teachers, members of the school committee and trustees, Common Council, legislators, invited clergy, and politicians who distributed prizes for meritorious achievement. While in the case of small schools, exhibitions were held in churches, town halls, rented rooms, or other locales, exhibitions in large schools often attracted many people, to the extent that an overflow crowd caused a school building in Malden, Massachusetts to collapse in 1802. As William Reese eloquently described in his prominent book *Testing Wars in the Public Schools*, similar accidents occurred, for instance, in Pennsylvania and Maryland. Being entertaining, such exhibitions became so popular that they were often reported by the press, lifting community pride, and morale (Reese, 2013). With this “social obsession,” it is therefore, not surprising that the students, at

times, were more worried about their appearance on stage than about their knowledge. This questionable approach, and the way students seemed to embrace *emulation* for the crowd, was noticed by many observers who condemned the *theatricality* at many exhibitions, speculating the almost invisible line between theater and schooling.

Theoretically speaking, the concept of “exhibition” was often used interchangeably with “examination.” While the examinations were mostly oral (i.e., students were quizzed, asked to recite and exhibit memorization and understanding skills), they often happened at the same time as the exhibitions where students’ copied books, drawings, and embroidery works were assessed. In other words, exhibitions and examinations were inseparable, hindering efforts to gather reliable statistics that could help compare learners and schools. Over time, written examinations became more common in large schools, while recitations and oral performance remained the bread and butter of exhibitions in rural areas. Critical voices, such as those of journal editors and other citizens, lamented how examinations measured students’ mental acquisitions, whereas exhibitions served as a social means of entertainment (rather than a determination of academic achievement).

By the 1840s, observers urged to start testing and examining students in a more “critical” manner than a “simple exhibition” (Reese, 2013, p. 35). The superficiality of such competitive exams and the mounting “rehearsals” undertaken by so many social agents to secure public recognition – preparing to the exhibition or the “show” – were criticized as promoters of unethical behavior that pushed aside Christian values of community for competitiveness and (deceiving) appearance.

## **Pencil and Paper Exams: Moving Beyond Social Impression**

Over time, “examiners” began asking students to explain their answers fully, seeking to counter widespread criticisms about students’ inability to redefine what they memorized or recited to the crowd. But something had shifted with the opening of high schools in the 1820s. Students wishing to apply had to take written admission exams – set locally, varied from year to year – intended to generate numerical scores that move beyond social impression. Some students found themselves taking written tests from both their classroom teachers and external examiners, as the spirit of emulation soared. While the number of students was scarce, it was the first time that numerical test scores assisted, and prompted, educators to compare student performance; leading to some speculation (but no consensus) about why some students from certain elementary schools performed better than others. The process was the beginning of deliberations over raising high school admission standards as a way to enhance elementary schooling quality (Reese, 2012).

With Boston’s impressive commitment to schooling – establishing the prestigious Latin grammar school and Harvard University – it was only a matter of time until different agents began questioning the idea of separate committees and governance of the various schools in the district. It is true that admiration for these institutions abounded in national media outlets, and Bostonians stood high and tall, proud and

pleased, when “crowned” as having the best national schooling system of all. However, fundamental questions also swirled around quality and effectiveness. What makes one school “better” than other/s? What makes excellent teaching? How can we identify change in teacher practice and student learning? And what does it even mean to be an effective educator? Visiting and examining committees seemed to lack the tools to wrestle with such and related complex queries, yet the need for such tools was increasingly felt.

Obscured hostilities of power swirled. Boston schools were governed by different distinguished boards, operating with very high levels of autonomy. They were highly praised for their well-educated head teachers (“masters”) and teachers (“ushers”), who were men of distinction, equipped with social and cultural capital, capturing not only very close connections with School Committee but much influence on curricular and textbook development.

As such, they had very high levels of control of their schools, being able to even decide who enrolled from the primary schools. While the committee physically visited its assigned school at least once a month to “observe” the manners and progress or to deter negligence and immorality of the master, and whereas it helped the master identify students who deserved academic medals, municipal policy leaders were keen in asserting more control over head masters. After all, they possessed more power than the administrators higher up in the schooling system (Schneider, 2017).

## **(Re)assessing American Schooling: Utilitarian Suggestions to Reclaim Power**

With every school controlled and navigated by its own master, a counter discourse of a “united assessment” approach emerged, calling for a novel strategy that could help (re)assess the comparative degree of schools’ quality. Samuel A. Wells, a prosperous trader who established and headed a Committee of a nonclassical English high school, suggested building a cohesive schooling system, where students learn with other students their age and take the same annual exam (on the same day) to measure their achievement and their master’s instruction. Students who do not pass the exam, Wells argued, should not advance until they do (Reese, 2012).

However, how to better measure educational outcomes in practice, compare schools, and determine the best instructional approaches seemed somewhat impossible unless the grammar schooling system was to reorganize – wishful thinking given complex realities (Reese, 2013). In other words, by that time, it had become clear that the educator is vital to academic success and the features of effective teaching should be “identified and widely imitated” – an essential notion in the “emerging ethos of testing,” as the education policy historian William Reese observed (Reese, 2013, p. 46).

At this stage, it may be safe to say that confrontations of power had bubbled. School Committeemen sought to assert more control over masters and ushers, replacing in some cases, male masters with female teachers who were cheaper to

employ and held less social power. On their end, masters drafted and published lengthy reports, refusing to let reformers' voices stand as the final word on teaching and learning. However, critics loomed over masters being arrogant, practicing careless teaching methods, neglecting a range of topics, assuming vicious corporal punishment practices, and "performing" to the observer-visitors. Newspapers highlighted horrific maltreatment cases of students of color in segregated schools, noting heightened criticism of the lack of accumulated statistical records of corporal punishment, with records being destroyed after a quarter. The public was left in the darkness of pure facts, questioning if African-American children received a decent education in Boston's segregated schools. These and the superficiality of the annual exhibitions and their unclear worth were good enough reasons for the politically driven School Committee members to expand their power in the educational realm. Mimicking their colleagues in medicine, these well-educated wealthy fellows, some of whom had won nominations for political offices or ran on a political ticket, sought to create rigorous scientific and systematic mechanisms to education. And so, they surprised Boston schools in 1845 with what became a testing controversy.

That summer, a strong politically moderate group had not only given a unified written test to the highest classes, but it also "ranked the schools from best to worst, embarrassing many teachers and pupils alike" (Minutes of the Boston School Committee, 1845, p. 225). This was a well-planned move by the reformer Horace Mann of Massachusetts who together with other legislative leaders such as Samuel Gridley Howe, William B. Fowle, and William Brigham, were hoping to restrict corporal punishment, set up clear and high teaching and learning standards, promote ideas of age-graded classes increasingly taught by female teachers, improve pedagogical methods, and tighten up supervision of educators by hiring a superintendent.

With an ongoing public battle between the masters and the reformers, Howe and Mann decided to put an end to this façade of the masters being god-like once and for all, believing that external exam results would shame the masters. Articles were planted in advance in various newspapers, urging immediate reform in Boston schools where masters have no say in student exams. Questions were secretly drawn for the students' test and the staff protocol including direct questions to the masters (e.g., How often did they strike children? Did they whip students for poor recitations or hit them on the head? Did they spend time with parents, if at all?) (see Reese, 2013, p. 95). Yet, assuming practices of resistance, masters and ushers did not engage with such questions, refusing to cooperate with the ongoing scrutiny from the reformers.

## **Resistance, Cheating, and Statistics**

Materializing in 19 grammar schools in the last week of June 1845, reformers made sure that students had only one hour to complete their answers on a blank answer sheet. Covering at first the subject of Geography (every day was devoted to a different subject), the new examiners observed student cheating in action. Stressed out students not only looked for the right answers in their textbooks, but also shared

their responses with classmate peers and passed along questions to their friends in neighboring schools. On their end, shocked masters confronted examiners, blaming them for not only stressing out, scaring, and discouraging students, but using them for their own political desires/ends. They also shared their fierce criticism with other masters across the city, adding fuel to the master/reformer discipline battle fire. The new reality of competitive, written (rather than oral), consistent exams that offer statistical configurations and the quantification of teaching and learning became the center of a forever debate about the politics and the meaning of testing.

With newspapers owned and edited by the politician-reformers, their published reports helped situate teachers in the public gaze. Harsh criticisms lamented the low performance of Boston school students, revealing how Howe's committee had given its tests to several schools outside the city, ridiculing the masters who now genuinely feared for their jobs. A tsunami of condemnations included anonymous citizens sharing disturbing images of masters sadistically flogging helpless students. On their end, masters and ushers – known for their social, economic, and cultural capital – displayed their resistance, refusing to complete a survey on their perceptions on corporal punishment or the taught textbooks. Instead, they sought to use their higher up connections to prevent the reformers from promoting ideas of eliminating the double-headed system, hiring a superintendent, and the prevalence of this written examination saga; knowing that many influential citizens had a vested interest in maintaining the reputations of their old schools.

Amazed by the intellectual developments and the complex statistical practices assumed by educators in the UK, Mann tutored Howe on how to present numbers and figures in ways that help illustrate the association between test scores and school quality. Both strongly believed that statistics could, and should, buttress reform. Like other reformers, they promoted written examinations, among other ideas, as a means to not only “reveal hidden truths about the nature of schools,” but to “undermine outmoded forms of school organization” and hold teachers and students accountable (Reese, 2013, p. 129).

Responding to masters accusing them of immoral behavior that mitigates teaching and learning to gain control and authority, the reformers stressed their wish “to have as fair an examination as possible; to give the same advantages to all; to prevent leading questions; to carry away, not loose notes, or vague remembrances of the examination, but positive information, in black and white; to ascertain with certainty, what the scholars did not know, as well as what they did know; [and] to test their readiness at expressing their ideas upon paper” (p. 131). Ultimately, while the reformers acknowledged their own limited quantitative assessment expertise and the written tests limitations in providing a rich picture of each and every single school, they initiated the quantitative revolution in American schools.

## **Standards and Control**

Seeking to create a strong system of governance that would give them direct control over schools, and specifically, help them shift the autonomy of masters to their own

hands, the reformers designed new testing tools. These novel examination instruments were devised to capture a range of educational aspects that moved beyond student recitation and memorization, enabling reformers to interrogate the complexity and strength of masters' instruction. While most of the exam questions aligned with the textbooks' problems – many of which were written by masters who strongly resisted the reformers – some questions sought to inspect students' ability to understand, apply, and analyze what they have memorized. These abilities were now seen as an essential part of the masters' work.

As the reformers expected, exams' scores depicted an unfortunate picture where masters repeated "textbook knowledge," disregarding students' need to understand, apprehend, and build on the material. Simply put, the exams' results assisted the eager reformers to pile up alarming evidence against the masters. There were enough data to suggest that despite the increasing funding support to masters and schools, and notwithstanding the overwhelmingly positive impressions the schools received throughout the years, students' achievements, in fact, remained poor. Pointing a blaming finger to the masters, Horace Mann of Massachusetts stressed, "hearing recitations from a book, is not teaching" (Reese, 2013, p. 136), adding to other reformers' statements on the need to stick to scientific facts and numbers instead of social views and personal opinions.

### **Glossy Statistics**

The road to American scientific policy, then, one that fascinates the nation with glossy statistics seizing the conception that teachers make the crucial difference in student achievement, had now been paved. With the tests becoming a key ingredient in the educational discourse, hunger for more knowledge of statistical methods grew. The examiners, for example, did not acknowledge that girls often performed better than boys. They also failed to account for the range of students' ages. Combining these tests with observations (impressions) to achieve a clear, well-rounded schooling picture seemed inevitable. Having connections in the American Statistical Association definitely helped the reformers in presenting the data and using it tactically as part of well-planned (and ultimately successful) political campaigns.

Accused for ruining the "strong foundations" of the Bostonian educational system by neglecting children and facilitating deplorable education, some masters were shamefully fired. Master campaigns blaming the textbooks for problematic scores did not help much. Reformers had already moved on to the next phase, lobbying for permission to hire a superintendent devoted to uncovering the actual conditions of the schools. By the 1850s, reformers won the battle against the double-headed system, which helped them, with a superintendent in place, push out more masters of the system as they saw fit. With time, written examination results became part and parcel of the educational assessment discourse in US schools, particularly in urban areas – moving far beyond Horace Mann and his colleagues' imagination. The tests' instrumental power helped promote various pedagogical and organizational reforms, including abolishing racially segregated schools and expanding superintendents' authority.

As much as the written exams' analysis was daunting and overwhelmingly exhausting, detailed configurations of student score responses were the bread and butter of the reformers' work who sought to incorporate statistical tables and figures that enabled marking/ranking educators and students to centralize authority and impose uniform practices. The tests assisted controlling not only issues of teacher promotion and leave but also high school acceptance and graduation, eroding pedagogical approaches and shaping individuals' pathways.

### **Novel Forms of Assessment**

It seemed as if every desired educational change involved, at some point or another, some kind of written competitive testing, followed by public scrutiny. In many places, written tests became an integral part of the teaching certificate standards; requiring preservice teachers to engage with new forms of assessment if they wished to properly join the educational system. In some cases, these exams played a key role in a holistic assessment plan that included external observation visits, check-ups over uniform textbooks and other pedagogical instruments (e.g., globes, blackboards), and, where necessary, additional written tests.

Some superintendents blatantly required principals to implement more and varied types of written tests. The tests, turning over time into a printed instrument involving questions which could not be aided by books or other communications, appeared to be a mere reflection of practices of control. These depicted an ethical apparatus intended to raise the education standards for everyone. That did not prevent teachers from expressing their resistance or growing anger over the exams as an untrustworthy school ranking instrument that undermined the educational system and the teaching profession. But there was no way back – American schools had already transformed into statistical, measurable entities. As Reese (2013) concludes, “competitive testing arose in an age of reform marked by deep social, racial, and political conflicts, and the debates and controversies of the nineteenth century and of our own times bear an uncanny resemblance” (p. 230).

In this respect, one would contend that the 1930s and 1940s particularly felt the rapid entrenchment of multiple-choice tests in schools. Critics, like Dewey, argued back then that such tests encouraged rote learning and guessing – diminishing creativity and critical thinking in the name of objectivity and to the advantage of teachers involved in assessing their students. In 1929 Dewey (p. 486) expressed his concern at testers gaining the upper hand with quantitative tests:

Our mechanical, industrialized civilization is concerned with averages, with percents. The mental habit which reflects this social scene subordinates education and social arrangements based on averaged gross inferiorities and superiorities.

And to this day, for many policymakers, reformers, families, and students, high or low-stakes test scores are synonymous with effective schooling. Thus, such assessment tools unsurprisingly became an inseparable part of a global, corporate business.

## **Reproductive Power: Contemporary State Mechanisms of Control and the Rise of Edu-Business**

Student standardized test scores are tightly woven into the fabric of contemporary American schooling and society. Reforms of the No Child Left Behind, legislated and pursued by George W. Bush in 2002 (initiated by Bush senior in 1991), and the Every Student Succeed Act issued by Barack Obama in December 2015, for example, promoted the idea of test-based accountability as a crucial element of academic competence and school success (e.g., Baker & Wright, 2017; Polikoff & Porter, 2014; Schneider, 2017). Describing this “obsessed number-driven” culture as a “testing charade,” Koretz (2017) lamented the unethical implications of a system driven by standardized scores. He referred to Don Campbell – one of the founders of the science of program evaluation – and his enlightening observation that extensive use of quantitative indicators for social decision-making may be subject to corruption pressures. According to Koretz, teachers’ and principals’ resistance to policymakers’ relentless exercise of control is reflected in ethically questionable practices such as score inflation, struggling student exclusion (from taking the test) and cheating.

On their end, to reproduce their power, policymakers have been engaging with practices of reallocation, namely, focusing on improving the “controlling” measures rather than on enhancing processes of teaching and learning. They have also been lowering standards to assure their own “success”, and putting much emphasis on coaching, that is, focusing test prep on incidental (rather than important) characteristics for accountability. History repeating itself, public criticism of the “score-oriented” educational system has been an integral part of the American schooling discourse (e.g., Pizmony-Levy & Green Saraisky, 2016), highlighting discursive rules that acknowledge and (re)define evaluation as an exercise of power, rather than authentic assessment of teaching and learning.

Interestingly, despite the mixed implications, policymakers have tended to avoid criticizing the overuse and the over emphasis of standardized testing in US schools. In fact, they appear to “combine powers” with private, nonstate agents, in what looks like a paradoxical means to centralize their own authority further. With dominations of testing capturing a major commercialized industry – providing plentiful nonstate actors a foot in the door of state schools by the early 1920s (Schneider, 2017) – the somewhat ubiquitous bond between school reformers and edu-business necessitates further elaboration.

### **Assessment Reflections in Philanthropic/Reformer Initiatives**

It was not that long ago that reformers partnered with the Bill & Melissa Gates Foundation which invested nearly \$215 million in a project promoting an extensive use of observations and standardized-based Measures of Effective Teaching (MET) – with the hopes of evaluating and improving school quality. Fully committed to the philanthropic initiative, at least theoretically, participating districts supplied matching funds, with the total cost coming to \$575 million (Stecher et al., 2018). Encountering numerous challenges, including navigating time constraints and the

underlying tensions or “confusion” between assessment for improvement (formative) and assessment for judgment (summative), some schools found themselves extensively “examined” or “inspected” by external administrators. This is despite teachers’ ongoing resistance, acknowledging that while this very expensive initiative succeeded in measuring teaching effectiveness, it failed to improve student achievement – which is the “declared” purpose of such initiatives.

Working closely with policymakers and spending over \$3 billion since 1999, the Gates Foundation has (re)shaped educators’ and millions of students’ lives. The Foundation’s scientific practices, discursively woven and celebrated in education policy enactment, highlighted the materiality of contemporary American testing discourses. Exhibiting exceptional collaboration, states and districts developed and implemented, together with the Foundation, multiple-measure teacher evaluation systems, including observational and/or student feedback surveys and standardized measures of teaching quality (e.g., Polikoff, 2015). This is despite, for example, a growing criticism over observational measures as practices that can not only generate teacher and student discomfort and mitigate teaching and learning but may also compromise students’ privacy and teachers’ ethical reasoning (Finefter-Rosenbluh, 2016). Capturing a form of social representation or domination, some former Gates Foundation staff ultimately assumed high positions in the US Department of Education, putting their ethical-professional standards and the way they form policy agendas in question (Finefter-Rosenbluh, 2021).

In other words, blurring the lines between the public and the private, contemporary controlling initiatives of evaluation and assessment are now often outsourced almost completely to the private sector. Reformers’ reproduction of power is reinforced with the help of nonstate, commercialized, and so-called scientifically driven companies such as Pearson – a UK based company that successfully secured a five-year testing deal contract worth more than 30 million dollars, with the state of New York. Heavily promoted by education policymakers, the company also secured a nearly half a billion-dollar testing contract with Texas state schools, marking another industrial revenue success (see, for example, Strauss, 2015).

### **Intensification of Power Relations and Control**

These deals are only a drop in the ocean of state and edu-business collaborations (see Chowdhury & Ha, 2014; Sidhu 2005). Other “inspection initiatives” include the use of student feedback surveys to evaluate teachers (see in Hanover Research, 2013; The Colorado Education Initiative, 2019), with 17% of the largest American districts administering some form of such surveys (Steinberg & Donaldson, 2016), entangling mixed responses from teachers (Finefter-Rosenbluh, 2020a; Gehlbach, Robinson, Finefter-Rosenbluh, Benshoof, & Schneider, 2018). Survey companies like the Tripod Education Partners (2019) help reformers assess and evaluate school quality, assisting them in governing from afar and present their “normalized” calculation of effective education through the lens of consumerism and commodification (Ball, 2004). Simply put, reformers seem to strengthen their own power with

the assistance of edu-business institutions that offer a well calculated, scientific approach to assessing and evaluating educators across the US.

It is no secret that education systems, including in the US, have been gradually shaped by marketization ideas with an allure of commercialization and devolution of governance that perceive schools as increasingly accountable for self-management and “client” recruitment (e.g., Chowdhury & Ha, 2014; Clark, 2009; Kenway & Bullen, 2001; Sattin-Bajaj, 2016; Savage, 2011). Similar to other nations promoting ideas of school choice, “buy education” and school privatization (e.g., Kabir & Chowdhury, 2021; Adonis, 2012; Olson Beal & Hendry, 2012; Scott, 2013), the Trump administration, for instance, has long believed that the federal government should assist nonstate agents in evaluating (or controlling) schools, molding educators’ practices in the process (Meckler, 2020). The COVID-19 outbreak only highlighted the administration’s push for “the parent power revolution” (Fabian & Wingrove, 2020; Hilton, 2020), where educational systems are “observed,” and their quality is heavily “examined,” by the public.

A quick reminder of the history? Indeed. Equally, Secretary of Education Betsy DeVos has been rigorously promoting ideologies of school choice and privatization, urging parents and communities to take more control to their hands. Imagining privatization as vital for social progress, DeVos announced in the midst of the pandemic that the US Department of Education will award “at least \$85 million over the next five years for disadvantaged students from families with lower incomes in Washington, D.C., to attend private schools of their choice, as part of the D.C. Opportunity Scholarship Program” (USDE, 2020). The reformers’ message here is crystal clear: let the crowd judge. Such intensification of power relations and control in schools – constraining educators’ autonomy – can not only shape educators’ practices and the self (Ball, 2003), but generate particular norms that may become a “mini-public” ideology that feed into patterns of morally complex acts of educators’ self-preservation (Finefter-Rosenbluh, 2020b).

---

## Concluding and Reflections

Archaeology is not so much concerned with probing or uncovering the “intent” of actors; it focuses on the identification of the taken-for granted norms that shape “the limits and forms of what is sayable,” utterances that eventually “enter human memory, ritual, pedagogy, publicity, circulation” (Foucault, 1971, pp. 12–13). At the same time, archaeology identifies which utterances disappear and re-appear, how they are circulated and thereby legitimized, by which vested interest groups and, crucially, to what ends. This analysis used archaeology to identify statements repressed and subjugated by groups. By establishing the “limits and forms of memory,” it can also advance the analysis of discursive formations – identifying statements which are valid or invalid, abandoned, and excluded.

Postmodern theories, such as the discussed Foucauldian framework, have allowed designing an analysis that investigates the complex discursive connections or *épistémès* between viewing and discussing the world. Foucault’s works have

problematized these connections, showing that interactions between individuals, institutions, subjects, governments, and populations can be contradictory when looked through the lens of discourse. Subsequently, discourses “constitute knowledge... social practices, forms of subjectivity and power relations which inhere in such knowledges and the relations between them” (Weedon, 1987, p. 108). Drawing upon Foucault’s archaeology, this analysis enabled unpacking the historical complex formation of assessment in US schools over more than a century. It illustrates how *épistémès* are not only developed and produced historically, but they can be, and have been, contested by individuals and groups in the way of creating new knowledges and practices. Further, the analysis sheds light on the way discursive constructions can be nonlinear and circular, often repeating themselves through newer configurations of rationalizing premises.

Such historical changes in discourse are accompanied by attendant modifications in the language that embodies them, which in turn provide a clue to “the discontinuities and thresholds that appear” (Foucault, 1972, p. 41) within the discourses of a particular historical moment. They “map the first surfaces of their emergence” of new discourses. In relation to the history of school-based assessment, for instance, the analysis describes how perceptions have changed over time, reflected in the changes in terminology and attitude from emulation and exhibition, to tasks, to written tasks, and finally to summative measurable assessments. Such shifts in naming provide a new way of constituting knowledge and frameworks that explain the link between constructions of power and subjectivity (Chowdhury, 2015; Finefter-Rosenbluh, 2020b).

An archaeological analysis has allowed capturing these *épistémès* as historically contingent sets of social practices through which “reality” is made comprehensible, albeit still remaining vulnerable to negotiation and contestation. Resolving such tensions requires an engagement with power, which can only be done by further ongoing analysis of the historical configurations of these *épistémès*.

### Abstract

Tests were first designed for student assessment and advancement at the individual level and have since expanded to national and international accountability (Smith WC, *Educ Policy Anal Arch* 22(116), 2014). Assessment and accountability are central to both comparative education and educational leadership. Dilemmas include the conflict between accountability and contextualization and the innovation that has occurred as a result of such stringent guidelines. Relying on Foucault's fields of memory, presence, and concomitance, this chapter explores these intersecting phenomena by considering how assessment and accountability movements have spurred an increased focus on contextualization. The field of memory is characterized by the mass expansion of assessment and accountability, while the field of presence is characterized by movements toward

contextualization. Outside of the field of education, economics, particularly human capital theory and neoliberalism, has played a significant role in perpetuating global norms associated with assessment and accountability, which is described in the field of concomitance. The chapter concludes with a discussion about future possibilities of contextualization in comparative education and educational leadership.

**Keywords**

Comparative education · Educational leadership · Assessment · Accountability · Contextualization · Education reform · Neoliberalism · Standardized testing · Comparison · Education policy

**The Field of Memory**

Tests and assessments were first designed to measure individual student understanding at the classroom level; however, they have since expanded in scope and significance. Assessments have been increasingly linked with teacher, administrator, school, and national accountability in education.

**The Field of Presence**

While assessments for accountability are still a dominant narrative, there is push back by educational researchers and practitioners to differently assess students and reshape how assessments are linked with professional accountability.

**The Field of Concomitance**

The assessment and accountability movements in education have been influenced by human capital theory, national economic development, return on educational investment, neoliberalism of education.

**Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field**

Contextualization, or pushes to shift control of education policies and practices to the local level, such as the “opt-out” movement, disrupts the dominant assessment and accountability narratives. The COVID-19 pandemic presents an opportunity for these movements to become embedded in education structures and reshape understandings of assessment and accountability.

**Critical Assumptions or Presupposition**

Education reform, specifically movements toward increased assessment and accountability, has shaped the field and practices of comparative education and educational leadership. The indirect objects of our discussion, then, are countries that actively participate in the global neoliberal agenda.

## Introduction

The field of comparative (and international) education has been fraught with controversy since its beginning, which itself is debated (Kandel, 1936; Passow, 1982). Such controversies include epistemological, theoretical, and methodological debates. One area around which debates have persisted is an understanding of comparison. Whereas some scholars define comparison explicitly, with two or more boundaries across which similarities and differences can be analyzed (Raggatt, 1981), other scholars argue that comparisons may also be implied through the researcher or reader examining places beyond their own (Ragin, 1989).

Similarly, educational leadership has its own set of contentions surrounding the lack of consensus on defining the field (Bush, 2007; Gunter, 2004). The very notion of leadership has been contested and changes depending on the context in which leadership is exercised (Hockin, 1977; Lee & Hallinger, 2012). Researchers have argued that seeking to define leadership may unnecessarily limit its “thought and practice” (Leithwood & Riehl, 2005, p. 13). Regardless of how leadership has been defined, however, the consensus within education is that it involves setting direction, building relationships, and developing people, which are essential components to stable and productive educational institutions (Bush, 2007; Cunningham, 1985). Interestingly, though, educational leadership has remained largely a separate field, not making smooth transitions across borders, cultures, or contexts (Dimmock & Walker, 2000).

Comparison occupies a key position in both comparative education and educational leadership. Despite challenges to define each field and its characteristic parts, they are innately linked through the use of comparison in the forms of assessment and accountability (Dimmock & Walker, 2000). Therefore, international comparisons are important in both educational leadership and comparative education. Debates about comparison are particularly relevant in neoliberal systems, where there is a heavy focus on measures of accountability, often through standardized tests at state or national levels (Smith, 2014). Large-scale international tests, such as TIMSS and PISA, rely on comparisons, as evidenced by a focus on league tables and the occurrence of PISA shock in countries around the world (Waldow, 2009).

Although numerous alternatives to large-scale standardized tests have been presented, including pre- and post-assessments, portfolios, and project-based learning, standardized tests remain the primary method of measuring students’ success and determining school quality (Nichols, Glass, & Berliner, 2012; Popham, 1999; Sacks, 1997). Student data has even been taken a step farther, to assign grades and rankings to schools and districts (Figlio & Lucas, 2004). Standardized tests rely on comparison, whether by comparing students to other students (norm-referenced) or to criteria (criterion-referenced), these tests rely on comparisons to be useful to teachers and administrators (Popham, 1999). Even when comparison is not explicitly stated as a target or outcome, it is inherent in the discourse of accountability and assessment (Sjøberg, 2016). Therefore, comparative education and educational leadership overlap on the use of comparison as a tool for accountability.

While the narrative around such measures of accountability has changed over time, especially in the United States in the last five years, as evidenced by parent-led anti-testing movements (Pizmony-Levy & Cosman, 2017), standardized tests remain a primary measurement tool (Morgan, 2016). Within the United States, test scores are increasingly used to grade and rank school districts within states, beginning with the oft debated A+ Plan for Education in Florida (Figlio & Lucas, 2004). In addition to signifying which school systems are the most desirable (e.g., Finland, Singapore), participation in international assessments can signify legitimacy (Addey & Sellar, 2018). This legitimacy seeking is not only a reflection of national systems of education but is also closely linked to economic and political systems as well, as education is positioned as a vehicle for individual and national development (Baker & LeTendre, 2005). Despite much resistance since the initial PISA tests, such assessments have maintained their position as primary measurement tools for accountability (Addey & Sellar, 2018; Kamens & McNeely, 2009; Wiseman, 2013).

Educational leaders and policy makers are faced with the challenge of providing students with requisite skills for the job market (problem solving, team work, etc.) but who are also expected to perform well on standardized tests (Schoen & Fusarelli, 2008; Smolin & Clayton, 2009). Furthermore, the use of standardized tests to rank and compare the strength of countries' school systems is part of the neoliberal imaginary that the value of such measures of accountability will allow a country's citizens to compete more effectively at the global level (Rizvi, 2017). Though there is the argument that globalization has increased and intensified the connection between countries (Block, 2008), there is a counter argument that the implications for education have been dire, creating greater levels of inequality, competition, self-interest, and mistrust (Rizvi, 2017).

Over the last 50 years, changes in education, including community demands, as well as local, national, and global pressures to perform and increase accountability, have complicated the educational environment. Furthermore, policy changes have created "the kinds of leadership that seriously damage teachers, teaching and student learning" (Blasé & Blasé, 2004, p. 245; Hutton, 2011). Educational leadership is often tied to building and district administration, which is then linked to local and state test scores for funding and recognition (Sacks, 1997; Smolin & Clayton, 2009). Therefore, administrators are forced to address comparisons both within their schools by identifying the best teachers via class test scores and across comparable schools and districts to ensure they remain competitive in meeting federally imposed achievement standards (Turner, 2009).

Subsequently, comparison causes contention, and the more levels of comparison, the more divisions (Bray & Thomas, 1995). Within the field of comparative education, and education more broadly, comparison has caused conflict, as exemplified by debates about accountability, test scores, and school ranking systems. Diane Ravitch is one example of such conflict, as she originally was a major proponent of school choice and accountability, and now advocates against the very ideas of which she was once a major proponent (Ravitch, 2010). Throughout the history of the field of education, conflicts between theories, methods, and their relationships to education in practice have occupied a central space (Bush, 2007; Day, Harris, & Hadfield,

2001; Kandel, 1936; Ragin, 1989). More recently, debates within comparative and international education have become more epistemological, with questions around what counts as knowledge and whose knowledge counts (Nguyen, 2016). The intersection between comparative education and educational leadership, then, can be considered through a Foucauldian perspective, as his methodological approach to examine historical development highlights such moments of conflict.

---

## Foucault's Methodology

Foucault's (1972) *The Archaeology of Knowledge* presents an alternative methodology to discourse analysis, stating that rather than examining "discourse as document," an archaeological method seeks to examine discourse as "monument" (pp. 137–138). Rather than "transform[ing monuments] into documents" (p. 7), Foucault argues that monuments should reveal "discourses as practices" (p. 131). According to Foucault's conceptualization, monuments represent stand-alone objects which were built upon previous understandings of the world. In applying an archaeological approach, as Foucault defines it, "comparison does not have a unifying, but a diversifying, effect" (p. 160). These two elements: the focus on documents as monuments and embracing discontinuity are central to the analysis presented in this chapter.

Within his archaeological methodological framework, Foucault (1972) identifies three "enunciative fields in a discipline" (p. 57), including the field of memory, the field of presence, and the field of concomitance. These three fields create boundaries on which to focus the archaeological examination of assessments and accountability. The field of memory focuses on "statements that are no longer accepted or discussed" (p. 58) but whose echoes can be heard in current discussions and practices in the discipline. The field of presence includes "all statements...acknowledged to be truthful, involving exact descriptions, well-founded reasoning, or necessary presuppositions" (p. 57). This field is not exclusive to statements which agree and affirm the status quo, as it also includes statements which are "criticized, discussed, and judged, as well as those that are rejected or excluded" (p. 57). The inclusion of such contradictory statements alludes to the discontinuity Foucault embraces and which is very present in the field of comparative education. The third field is that of concomitance, which includes statements external to the discipline but which have made their way into comparative education and educational leadership.

Foucault (1972) addressed comparison and contention through discussions of the discontinuity of history, where he advocated for the acceptance of such ruptures to understandings. Whereas many approaches attempt to smooth over or connect disparate thoughts about a field or discipline, Foucault seeks to embrace these differences and use them to further understanding, which aligns with his way of defining terms through explanations of everything they are not.

Foucault acknowledges that understandings of the world and words change over time. Comparative education is one example of this, as understandings of the field

have been in flux since its beginning (Kandel, 1936; Passow, 1982). Additionally, understandings of assessment and accountability have likewise changed over time, and while they may not move in a linear fashion, new understandings build upon or react against previous ones. Drawing on these tenets, this chapter will examine large-scale assessments and their associated accountability and their relationship to comparative and international education and educational leadership. The monuments considered are large-scale international and national assessments which have been leveraged as tools of accountability, causing disruption as the fields of comparative and international education and educational leadership have developed. These disruptions have led to the current dilemmas that continue to influence both comparative education and educational leadership, specifically debates about the role of contextualization in local and global policies and practices.

---

## The Field of Memory

While Foucault's (1972) field of memory represents understandings which may not be commonly accepted, they are necessary to examine, as all current and future understandings draw on this foundation to establish new definitions. According to Foucault's understanding of knowledge, discrepancies and discontinuities are particularly important to fully understand monuments. This section, then, will examine how understandings of assessment and accountability have changed over time.

While tests started at the classroom level so teachers could measure students' learning, their purposes have since expanded beyond the classroom. Smith (2014) identified several common uses and targets of testing throughout history. These approaches include testing for assessment, which describes traditional classroom tests given by teachers to their students in order to evaluate students' mastery of a subject, as well as testing for advancement, which includes high stakes tests that determine if students should progress to the next level of education. While testing for assessment and advancement are both student focused, recent trends in testing have shifted to holding teachers, administrators, districts, and states accountable for students' educational progress (Smith, 2014). While such assessments may have started with the best of intentions, they have since been weaponized to create crises of education and shift control to the national level. As the international assessment scene has expanded, testing trends have shifted from focusing on systemic measures of educational effectiveness to holding local actors accountable for students' progress (Smith, 2014) and as an impetus for driving education policy reform (Sjøberg, 2016).

Large-scale international assessments are multiple choice tests in core subjects, such as math, science, or reading comprehension, which are administered cross-nationally. Such tests consist of measuring certain subsets of students as outlined by assessment organizations, then participating countries – or sections of countries – are charged with implementing the testing procedures and protocols with fidelity. These assessments have two potential roots which cater to two specific subsets of countries. Many such assessments were positioned as ways to measure equality and quality in

international education development programs which were designed to meet initial EFA and MDGs of promoting access to primary education and gender equity and then the SDGs promoting access to secondary education and quality education (Smith, 2014). These assessments were also positioned as a way to objectively measure the quality of education in participating countries (Pizmony-Levy & Bjorklund, 2018).

Standardized testing, from its inception until present day, remains fraught with controversy (Linn, 2001). The varied use of testing, whether to achieve grade level promotion or to access tertiary education, or purportedly to contribute to a country's economic growth, has been the recipient of both critique and approval for several decades (Cronbach, 1975; Komatsu & Rapple, 2020; Resnick, 1982; Sjøberg, 2016). Though the utility of testing within the twenty-first century has shifted, it remains "a tool for improving efficiency" (Linn, 2001, p. 29). Sacks (1997) opines that standardized testing has been used as an implement of meritocracy in the United States to differentiate students who are "academically worthy" from those who are not. Similarly, when a school scores high on standardized achievement tests, it is more likely to be evaluated as successful or effective (Popham, 1999). This is problematic, since students' test results do not accurately depict the quality of instruction being received, school resources available, difference in curriculum between schools, etc. Importantly, the creators and owners of standardized tests are forced to contend with different educational objectives at the district and state levels (Popham, 1999). Ultimately, standardized tests become a "one best way" (Taylor, 1911) of evaluating not only student achievement but also teacher effectiveness and school quality. At the international level, PISA has assumed an apparent ubiquity through its acceptance "as a reliable instrument of benchmarking student performance worldwide" (Breakspear, 2012, p. 4).

This ubiquity is evidenced by a 50% increase between 1995 and 2012 in participation in international assessments, including TIMSS, PISA, and PIRLS, and a 16% increase in schools which participate in more than two standardized tests in a year (Smith, 2014). However, despite this growth, nations have taken different approaches to how information and data from such tests is used to inform policy. For example, Australia's mediocre performance on TIMSS and PIRLS in 2012 spurred an initiative to move Australia to the top five places on international assessments (Gorur & Wu, 2015). Despite performing relatively well on PISA assessments, some countries, including Canada and Finland, used the results to make changes to the education systems (Baird et al., 2016). Regional comparisons resulted in the implementation of shared indicators across provinces and territories in Canada, and PISA scores were cited as contributing to a move to coordinate the core curriculum across the Finnish education system (Baird et al., 2016). Therefore, across participation and results, participation in these international assessments encouraged similar structures of education around the world (Wiseman, 2013).

On the other hand, the United States' response to their initial performance on PISA did not result in any change in national education policy as there was the prior expectation and recognition of "its poor educational outcomes" (Breakspear, 2012, p. 6; Dobbins & Martens, 2010). By contrast, the UK had already implemented

widespread educational reform and was perhaps buttressed from the PISA shock that Germany experienced, although their performance was considered moderate. Interestingly, the OECD, through the administration of various international assessments, such as PISA, has been instrumental in influencing national education reform, but more critically, perpetuating the need for “quantitative evaluations of national education systems” (Niemann & Martens, 2018, p. 268).

Despite varied approaches to international assessments, many countries continue to implement high-stakes testing at the national or state levels, such as the National College Entrance Exam in China, which not only serves as a selection tool for higher education opportunities, it also assesses educators for accountability purposes, linking students’ achievement with teachers’ financial benefits (Emler, Zhao, Deng, Yin, & Wang, 2019). Influence of international assessments has also been observed outside of the Global North, with the South African case providing a unique example. After disappointing results from the country’s participation in the TIMSS and PIRLS, South Africa withdrew from international testing and subsequently intensified its own national testing structures and began participating in regional assessments (Spaull, 2013; Thulare, 2018). South Africa’s history with international assessments and high-stakes national tests are reflective of the neoliberal influence that accompanies assessment and accountability, namely centralizing decision-making and decentralizing responsibility for performance (Astiz, Wiseman, & Baker, 2002).

Ultimately, though countries may opt out of international assessments, organizations such as the OECD have been successful in promoting human capital development as central to a country’s ability to compete globally. Particularly for countries in the Global South with small-scale economies, their ability to implement large-scale educational reform is often contingent upon rules and regulations instituted by international organizations (Niemann & Martens, 2018). Therefore, testing has been co-opted as a neoliberal control mechanism (Kamens & McNeely, 2009). Formerly, testing was utilized as an element of ensuring educational efficiency, similar to concepts of business (Linn, 2001). Currently, the shift in focus is presumably on raising standards for *all* students through accountability measures and quality control mechanisms. Interestingly, this is creating greater disruption in the field of educational leadership as there seems to be an almost insatiable occupation with “improving” the education system through high-stakes testing.

Although heavily critiqued, assessment and accountability have arguably progressed education and drawn attention to issues and challenges facing educators around the world. More precisely, increased accountability (Hess & Kelly, 2007; Wallace Foundation, 2013) and accountability frameworks (Miller & Hutton, 2014; Styron & Styron, 2011) across global education systems have generated increased demand for educational leaders. Subsequently, school leaders’ responsibilities have expanded to include, among other things, student discipline, safety and security within and across school buildings, relationships with staff, students, and parents,

evaluation and supervision of staff, test scores, and meeting adequate yearly progress goals (Hoerr, 2007, p. 84; Stronge, 1993).

This “work intensification” (Grace, 1995) has caused educational leaders to rethink school goals and priorities. This greater demand for more competent educational leaders has also created a need for improved professional development programs, which have been criticized for their failure to produce leaders who are able to turnaround schools and improve student outcomes (Darling-Hammond, LaPointe, Meyerson, Orr, & Cohen, 2007; Davis & Darling-Hammond, 2012; Levine, 2005). The public and policy makers are requiring educational leaders to be better while simultaneously expanding their scope of responsibilities, which highlights the dichotomy of this movement, resulting in both improvements and increased challenges.

The accountability movement which really took off in the United States in the 1990s has backfired. Standardized and high stakes tests have created an environment of accountability that has been untenable for educational leaders. Rather than improving students’ academic growth and inspiring teachers to innovate in their classrooms, education grew singularly focused on meeting yearly test score requirements causing teachers and administrators to abandon compelling instructional practices to “teach to the test,” a method which has been critiqued for foregoing creativity and curiosity in lieu of how to select the best answer on multiple choice tests (Longo, 2010; Olivant, 2015).

Accountability, in itself, is not bad; however, accountability which defunds and de-professionalizes educators works against the original intent of such policies. This accountability movement has also created a culture of fear, where educators must produce results at the threat of losing their jobs or their schools losing federal funding (Smolin & Clayton, 2009). Failure to do so could result in schools being labeled as failing (Baltodano, 2012; May & Sanders, 2013) or removal from leadership positions. This fear has resulted in district leadership in cities such as Washington, DC and Atlanta coming under fire for changing individual students’ answer sheets (Straus, 2015).

Once schools are labeled as failing, they are unable to deliver the contextualized education that would most benefit the student population, both on state or national assessments and in their longer educational careers. Such accountability movements purportedly to promote educational equity and quality often result in mounting divisions between schools across socioeconomic lines. After decades of assessments and accountability, there have been increasing calls for greater contextualization both within the United States and internationally. Within the United States, these movements may take the shape of parents and students protesting standardized exams by refusing to participate. Internationally, contextualization is apparent through movements focused on indigenous education and considers countries’ cultural, social, and political norms (Phillips & Ochs, 2003). Such policies and practices are gaining increasing traction in the current realm of education especially with the flawed premise of “a universal conception of success and . . . set of skills” (Sjøberg, 2016, p. 111).

## The Field of Presence

The second field through which to consider the implications of assessment and accountability in comparative education and educational leadership is the field of presence (Foucault, 1972). The field of presence is in a constant state of evolution. Understandings change over time, as evidenced by the changing nature of comparative and international education and educational leadership. The field of presence focuses on the most current understandings, whether or not they agree with one another. This discontinuity is central to Foucault's archeological approach. It includes both advocating for and pushing against assessment and accountability narratives. The following section examines how movements toward contextualization have influenced assessment and accountability. For the purposes of this discussion, we refer to the contextualization of education as policies and practices which move the control of education back to local communities (Wiseman & Chase-Mayoral, 2014).

The field of memory shapes the ever-changing field of presence (Foucault, 1972), and in the case of assessments and accountability, decades of reactions against the education reform movements, including globalization and neoliberalism, have shifted the focus toward contextualization (Mitra, Mann, & Hlavacik, 2016). While local has always been included in "global to local," recent trends in both comparative education and educational leadership have drawn attention to physical and individual contexts, including how to authentically discuss positionality in relation to research (da Costa, Hall, & Spear, 2016; Vickers, 2019), as well as the inclusion of indigenous research methods (Sumida Huaman, 2019). While these themes have existed for decades, their prevalence has grown in recent years, as evidenced through special issues and conference themes.

This shift toward contextualization developed, in part, as a reaction against education reform movements, which have promoted and enforced a culture of testing, testing, and more testing (Pizmony-Levy & Cosman, 2017). Therefore, contextualization occurred through grassroots movements led by parents to push back and "opt-out" of testing requirements for their children. We define this as contextualization as it represents individual families' reactions against one-size-fits-all assessment strategies and the negative impacts of such assessment strategies on students' overall educational experiences (Pizmony-Levy & Cosman, 2017), as well as protests against judging teachers by students' scores and the privatization and capitalization of education (Pizmony-Levy & Saraisky, 2016). Ambiguity between the initial No Child Left Behind/Elementary and Secondary Education Act (ESEA), and its subsequent reauthorization as the Race to the Top/Every Student Succeeds Act (ESSA), provided more leeway for parents to interact with – and against – education policies (Mitra et al., 2016). Additionally, pushback against testing has come from educators who have been increasingly in favor of other types of assessments to evaluate students' competencies in terms of what they can do, rather than an almost unitary focus on their ability to take and pass tests (Sacks, 1997).

Despite parental involvement, research suggests that these movements do not, in fact, work against the equity issues that assessments and accountability were

designed to correct (Mitra et al., 2016). A parent who identifies with the opt-out movement is typically “highly educated, white, married, politically liberal parent whose children attend public school and whose household median income is well above the national average” (Pizmony-Levy & Saraisky, 2016, p. 6), thus indicating that those students who “opt-out” represent the privileged elite. High-stakes standardized tests are critiqued for enhancing inequalities; however, movements which have gained traction against such assessments have not increased educational equity or quality. Moreover, education within the United States is steeped in standardized testing despite backlash, leading Sacks (2000) to comment, “like a drug addict who knows he should quit, America is hooked. We are a nation of standardized testing junkies” (p. 25).

Interestingly, the global COVID-19 pandemic of 2020 enforced opt-out policies as all 50 US states were excused from end of year assessments required by ESSA (Gewertz, 2020). In addition to eliminating required tests, states could apply to pause procedures labeling schools as needing improvement or failing (Gewertz, 2020). Likewise, the OECD postponed the PISA 2021 and 2024 assessment cycles (OECD). Several European countries, including France, the Netherlands, and the United Kingdom, cancelled their school-leaving exams; however, such cancellations were not the case worldwide, as the Czech Republic, Slovakia, and Germany chose to continue their school leaving exams (Henley, Giuffrida, & Burgen, 2020). CollegeBoard’s Advanced Placement tests continued, although in a greatly modified and at home format (CollegeBoard, 2020). In response to these cancellations, many colleges and universities modified their admission requirements related to qualification exams (Gewertz, 2020; Henley et al., 2020). Therefore, a movement that started slowly through parental-led protests was carried to completion as a result of natural causes. However, while the short-term implications of this forced anti-testing movement are positive to many assessment and accountability critics, only time will tell the long-term implications of these rapid and drastic policy shifts.

Against the backdrop of testing and accountability, the movement within educational leadership has been to prepare leaders with the requisite skills and competencies to be able to assess student learning, but not within the narrow confines of standardized tests (May & Sanders, 2013). Levin (2013) has asserted, though, that the current era of standardized testing and accountability demands greater skills from educational leaders, “making the task seem impossible for ordinary mortals” (p. 5). Student achievement and knowledge can no longer be based on prior eras or rote learning and memorization but needs instead to be couched in twenty-first century skills of critical thinking, problem solving, and communication (Smolin & Clayton, 2009).

An additional element in current leadership discourse has been issues of equity and social justice. Standardized tests by their very nature are difficult to apply equitably as there have been debates around leaders engaging in unethical practices such as providing answers for students during testing (Smolin & Clayton, 2009) in a bid to deliver results and improve school performance (McGhee & Nelson, 2005). Research has shown that despite funding provided for schools that serve historically marginalized populations, African American and Latino students continue to be at a

disadvantage in terms of their performance on standardized tests, when compared to their white counterparts (Williams & Parker, 2002). This dependence on high stakes tests then furthers the education gap between white and non-white students as they are increasingly viewed as “tools for racializing decisions about children, schools and communities” (Knoester & Au, 2017, p. 5). Subsequently, contextualized education becomes more important as a viable response to reducing such inequities.

Context has been a dominant narrative in comparative and international education since the field’s beginning (Crossley, 2009). However, there is a disconnect between the ideals advocated for in the academe and practical implementation. Often the comparative side is cited as relying on large-scale, decontextualized data to compare and rank systems-level educational achievement, while the international side is connected to the implementation of development programs worldwide as well as trends in student movement in higher education (Epstein, 1994; Wiseman & Matherly, 2009). The international side is sometimes considered the practical side with the comparative side connected with theory (Epstein, 1994; Wiseman & Matherly, 2009). Interestingly, however, both the theoretical and practical sides critique one another for not sufficiently embedding data collection and analysis – of all types – in the context. Additionally, the entire field, encompassing both comparative and international education, often relies on organizations such as the World Bank, OECD, and UNESCO for funding while simultaneously critiquing these organizations for the lack of contextualization in their projects and data (Vickers, 2019). These continuous internal debates are examples of how discontinuity characterizes both the memory and presence of comparative and international education.

Assessment and accountability play significant roles in the work of international development organizations, such as UNESCO and World Bank, and are often critiqued for disseminating an economics-focused narrative veiled under educational equity and quality (Heyneman, 2003). As stated by Smith (2014), some international expansion of large-scale assessments stemmed from an organizational desire to prove programs were achieving their equity and quality goals. Such assessments and accountability – often referred to as monitoring and evaluation in the development sector – have historically relied heavily on quantitative indicators (Tilbury, 2007), although there has been much controversy around this issue, as many researchers and practitioners advocate for the inclusion of qualitative data, especially from the voices of participants, for more holistic understandings of evaluations (Cullen & Coryn, 2011; Hayward, Simpson, & Wood, 2004). This theme, which connects the field of memory and presence, is ongoing in the field, as researchers and practitioners seek ways to include contextualized knowledge and outcomes in program evaluations.

---

## Field of Concomitance

The final field to consider from Foucault’s (1972) archaeology of knowledge is the field of concomitance, which considers how external factors have contributed to understandings of assessment, accountability, and contextualization in comparative

education and educational leadership. While this chapter considers how these phenomena have developed in education, they occur in tandem and as a result of numerous external factors related to economic, social, and environmental systems. Policies, beliefs, actors, and phenomenon outside of schools influence what happens in classrooms, sometimes to a greater extent than administrators, teachers, or students (Bereday, 1964). A discussion of the field of concomitance may be quite expansive; however, in this section we will focus specifically on how economics – especially human capital theory and neoliberalism – has influenced the rise of assessment and accountability (Baker & LeTendre, 2005; Kamens & McNeely, 2009). Likewise, just as contextualization in education has developed as a reaction against these policies, contextualization has also occurred outside of education as a reaction against the increased privatization and capitalization pushed by neoliberal policies.

Such influence has contributed to interactions between education and numerous other fields. The interdisciplinarity of comparative education has been critiqued for lacking unique theories or methods (Manzon, 2011), rather drawing on fields across the social sciences, including sociology, political science, economics, anthropology, psychology, and education (Davidson, Park, Dzotsenidze, Okogbue, & Wiseman, 2018). Educational leadership is similarly interdisciplinary, drawing from fields of management and organizational behavior, sociology, psychology, and public administration, among others (Riggio, 2011). However, researchers in educational leadership have agreed that though it may draw from several disciplines, educational leadership's ultimate focus has to be on the aims and goals of education (Bush, 2007).

Education has been influenced by other disciplines such as human capital theory, which existed in economics before its application to education. Human capital theory developed as a method to delineate various kinds of capital such as education, computer training, and even medical care, and how investment in these areas would redound to a nation's productivity and efficiency (Becker, 1993; Schultz, 1971). When free and compulsory education was rapidly spreading starting in the late 1800s (Meyer, Ramirez, & Soysal, 1992), it was considered the responsibility of the state or individual families. However, in the post-World War II era, education was linked with economic gains, with numerous scholars attempting to quantify the returns on investment in education (Resnik, 2006). While this has occurred at an individual level, education has been considered a key factor in national economic development (Baker & LeTendre, 2005). UNESCO and the OECD are major players in the economics of education, with UNESCO's 1960 adoption of a resolution which directly linked economic development with technical training and education provided by international organizations and national governments, a move which opened the doors for international development money for education projects (Resnik, 2006).

As an extension of human capital approaches, the neoliberalism of education also is not a new phenomenon, and much research has examined how this agenda moved into educational spheres (McKenzie, 2012). Neoliberalism has been viewed as a tool that has compromised public education (Baltodano, 2012). Similar use of standards

has also impacted educational leaders who have been fearful of reprisal for failing to meet state imposed standards, another product of neoliberalism (Pinto, 2015).

Just as assessment and accountability have been used for multiple purposes, so too has the neoliberal narrative played out differently in different contexts, but with similar end results. Through the publication of various reports and studies, citizens within the United States were fed the narrative that public education was broken, precipitating the “need” to fix the perceived ills and focus instead on creating productive citizens (Hurst, 1987) who have successfully met the imposed standards (Turner, 2009). Similar narratives can be found across Western European countries, including Germany (Waldow, 2009). Similarly, neoliberalism in the Global South has been characterized as a tool to promote equality. Neoliberal policies are couched as promoting equality and quality, although evidence demonstrates that such policies continue to perpetuate inequalities (Wiseman, 2008). Organizations, such as the IMF and the World Bank, further exacerbate the impact of neoliberalism (Davies & Bansel, 2007).

---

## Conclusions and Reflections

The previous exploration of the links and overlap between comparative and international education and educational leadership through assessment, accountability, and contextualization provide one example of how these fields and phenomena are rife with conflict and discontinuities. However, as has been argued for decades, these tensions do not decrease the value of educational researchers and practitioners in both fields; rather, they provide space for growth and an opportunity for engagement. While additional conflicts will continue to emerge, academic discussions about the roles and relevance of assessment, accountability, and contextualization will continue to be central to the evolution of any education discipline, including comparative education and educational leadership. The echoes of critiques of education reform movements can be seen beyond assessment and accountability policies and practices, as movements toward are also apparent in other areas of comparative education and educational leadership.

As the field of memory and the field of presence continue to evolve, new and additional points of contention will develop. This can already be seen in the theme of the Comparative and International Education Society’s 2020 Conference theme, “Education Beyond the Human.” This conference sought to include a wide spectrum of responses, including both considerations of education during and after the Anthropocene, which is the current geological era characterized by the dominance of human influence on global ecology (Crutzen, 2006), as well as the influence of augmented and virtual reality and artificial intelligence on education systems. These two perspectives represent two very different sides of the epistemological and theoretical spectrums.

The implications for such continued contentions and disruptions invariably shape the expansion of the field of educational leadership. Educational leadership research has focused on aspects such as ethics, courage, and managing emotions (Goleman,

Boyatzis, & McKee, 2002; Gu & Day, 2013), various leadership styles (Bush, 2007) to an understanding of the importance of context in the exercise of leadership (Hallinger & Heck, 2011; Leithwood & Levin, 2008; Murphy, 2005). While high-stakes testing has highlighted the need for more equitable practices in education, the push toward “new levers to improve school performance and education quality becomes particularly critical in a context of increasing global competition and tight fiscal constraint” (UNESCO, 2016, p. 12). These shifts have also determined how new educational leaders are prepared as they need to be taught to manage and solve complex problems. The multiple definitions and concepts of leadership continue to support the notion of the inherent tension within the field of leadership, but undeniable is the acceptance that the current demands of globalization, information technology, and a knowledge-based economy – itself a social phenomenon with political intent (English, 2006) – has had concomitant impacts on leaders, leadership development, schools, and how schools need to be led (Clarke, 2016).

The futures of both comparative education and educational leadership currently hang in the balance as the COVID-19 pandemic may serve as a tipping point to move education back to local contexts, where those who are at the level of practice have much more say in policy development and implementation.

## Abstract

Since the turn of the millennium there has been sustained interest in successful school leadership, beginning as an attempt to expand the focus of effective schools research. This has included research dedicated to exploring the area, and the repositioning of other research to contribute to understanding successful school leadership. This chapter provides a history of the development of the area, and explores findings from key studies and reviews to give a sense of the development and possibilities of the study of successful school leadership. This review consists of two parts. The main body of the chapter reviews nine influential studies/projects, and this is supplemented with a reflective commentary that draws on a variety of research to expand on the areas of effective and successful schools, effective and successful school leadership, sustainability of success, and leadership and context.

**Keywords**

Successful school leadership · Successful schools · School effectiveness · School improvement

**The Field of Memory**

Successful school leadership, as an area of study within educational leadership, has a substantial history of only two decades (although there are traces back at least 50 years). Within that time there are no ideas from the early formation that have disappeared. Rather they are continuing to evolve, and the area of study remains in the early stages of conceptual development.

**The Field of Presence**

It is an emerging area of study that includes within and between country research groups and utilizes both qualitative and quantitative research methods, with an emerging preference for mixed-methods. There is agreement about key leadership areas – setting direction, development people, developing the organization, and improving teaching and learning – and description of several other important areas such as engaging with the multiple contexts within and surrounding schools.

**The Field of Concomitance**

Successful school leadership draws from school effectiveness and improvement research, and from the three major educational leadership areas of instructional, transformational, and distributed leadership.

**Discontinuities and Ruptures**

From the discussions in the sixties about whether schools made a difference to student outcomes beyond student circumstances, to researching effective schools and effective school leadership, the study of successful school leadership was a shift to consider broader ideas of effectiveness and to consider the quality of schools. The development of an evidence-based exploration of school and leadership success has led to important and trustworthy understandings about general and contextual leadership ideas and the sustainability of success.

The study of successful school leadership evolved from school effectiveness research through studying schools that were effective in more than the traditional areas of literacy and numeracy performance. It also follows a tradition that begun in the sixties.

**Critical Assumptions or Presupposition**

As in all areas that explore leadership there are assumptions that leadership exists and is a knowable phenomenon. There is also an assumption that leadership matters to schools and students. While these are listed as assumptions, the overwhelming evidence, some of which is presented in this chapter, is that not only does leadership exist, but that its impact on schools and students is significant.

---

## Introduction

Since the turn of the millennium there has been interest in successful school leadership, beginning as an attempt to expand the focus of effective schools research. Since then, there has been research dedicated to exploring the area, and the repositioning of other research to contribute to understanding successful school leadership. This research has been international in scope. This chapter provides a history of the development of the area, and explores findings from key studies and reviews to give a sense of the development and possibilities of the study of successful school leadership. This review consists of two parts. The main body of the chapter by Gurr reviews nine influential studies/projects, and this is supplemented with a reflective commentary by Drysdale that draws on a variety of research to expand on the areas of effective and successful schools, effective and successful school leadership, sustainability of success, and leadership and context. Gurr and Drysdale have both been involved in the study of successful school leadership since 2001.

## The Search for School Effectiveness

There are well rehearsed histories of the search for effective schools. These typically begin with the *Equality of Educational Opportunity* report (often referred to as the *Coleman Report*) in the mid-1960s (Coleman et al., 1966). This report, led by an influential sociologist Coleman, was the product of a requirement from the Civil Rights Act of 1964 to

...conduct a survey and make a report to the President and the Congress, with two years of the enactment of this title, concerning the lack of availability of equal opportunities for individuals by reason of race, color, religion, or national origin in public educational institutions at all levels in the United States, its territories and possessions, and the District of Columbia. (Coleman et al., 1966, p. iii)

The report that resulted from this request is a complex document of a large-scale survey of students, teachers, school leaders involving thousands of schools, principals, and teachers, and hundreds of thousands of students. Halfway through the report of 737 pages, there is an often cited statement that "...schools bring little influence to bear on a child's achievement that is independent of his background and general social context..." (Coleman et al., 1966, p. 325). With provocative statements like this, the report proved to be hugely influential with debate ensuing for several years about its merit. For example, Jencks et al. (1972) did a reanalysis of the data and argued, among other matters, that equalizing the quality of schools and increasing resources was likely to have minimal impact on student learning. In response to this, the *American Journal of Sociology* provided a review symposium

by Coleman, Pettigrew, Sewell, and Pullum (1973), in which Coleman provided a severe rebuttal. Whilst one interpretation of these findings was that schools had only a small impact on student learning, there was ambiguity and complexity with, for example, Coleman et al. (1966) noting that schools in challenging contexts had a far greater influence on student learning. Nevertheless, it was widely interpreted that schools did not matter. A response to this was the birth of the effective schools movement and the research that continues today to understand the qualities and features of effective schools and how effective schools can be constructed (the parallel and intertwined school improvement movement). An early pivotal moment for the effective schools movement was Edmonds' (1979) short summary of the knowledge about effective schools. The six claims about the characteristics of effective schools are well known and while most writers will summarize these, it is perhaps more pertinent to use Edmonds' own language:

I want to end this discussion by noting as unequivocally as I can what seem to me the most tangible and indispensable characteristics of effective schools: (a) They have strong administrative leadership without which the disparate elements of good schooling can neither be brought together nor kept together; (b) Schools that are instructionally effective for poor children have a climate of expectation in which no children are permitted to fall below minimum but efficacious levels of achievement; (c) The school's atmosphere is orderly without being oppressive, and generally conducive to the instructional business at hand; (d) Effective schools get that way partly by making it clear that pupil acquisition of basic skills takes precedence over all other school activities; (e) When necessary, school energy and resources can be diverted from other business in furtherance of the fundamental objectives; and (f) There must be some means by which pupil progress can be frequently monitored. (Edmonds, 1979, p. 22)

While these qualities retain great relevancy 40 years later, what is overlooked from this important paper is Edmonds' call to action:

It seems to me, therefore, that what is left of this discussion are three declarative statements: (a) We can, whenever and wherever we choose, successfully teach all children whose schooling is of interest to us; (b) We already know more than we need to do that; and (c) Whether or not we do it must finally depend on how we feel about the fact that we haven't so far. (Edmonds, 1979, p. 23)

This is a powerful refutation to all those who challenge how much schools matter. In essence Edmonds is saying that there is no reason all schools cannot be effective and that if we do not strive for this then we are giving away the main tool governments have for quality and equitable education.

In the decades after Edmonds' statement, instructional leadership took over as the main view of educational leadership because it was linked tightly to effective schools; it was the "strong administrative leadership" that provided direction and coherence to the activities that promoted high expectation and "orderly environments," with targeted use of "energy and resources" that supported the "the instructional business at hand" to ensure that "acquisition of basic skills takes precedence over all other school activities" and in which student progress is "frequently monitored"

(Edmonds, 1979, p. 22). Models of instructional leadership were developed with the view of Hallinger and Murphy (1985) becoming the most well-research version. Their model included three dimensions: defining the school mission, managing the instructional program, and creating a positive school climate. It also included ten instructional leadership functions across the dimensions: framing and communicating clear school goals; supervising and evaluating instruction, coordinating curriculum, and monitoring student progress; protecting instructional time, promoting professional development, maintaining high visibility, providing incentives for teachers, and providing incentives for learning. While this remains an important view, too often the research was linked to improvement on standardized test of English and mathematics; and remember that Edmonds focus was on basic skills acquisition.

---

## Interest in Successful School Leadership

At the turn of the millennium there was increasing interest in moving beyond the narrow outcome focus of effective schools to include schools that were focused on a broad range of student outcomes beyond basic literacy and numeracy skills (e.g., Day, Harris, Hadfield, Tolley, & Beresford, 2000; Leithwood & Riehl, 2003; Leithwood, Jantzi, & Steinbach, 1999; MacBeath, 1998; Mulford & Silins, 2003; Mulford, Silins, & Leithwood, 2004). While the language used often still described effective schools, there were the beginnings of a move to describe successful schools and successful school leadership. Three important studies highlight this shift.

The first was a study of English Headteachers by Day et al. (2000). Commissioned by the National Association of Headteachers, this study employed multiple perspective case study methodology to explore the leadership of 12 Headteachers who were regarded as effective; the use of this methodology was to become important for future research on successful school leadership. The views of head teachers, deputy head teachers, governors, parents, students, support staff, and teachers were sought from schools that included small primary schools through to large secondary schools, and including a specials schools. The study was focused on the personal qualities and professional capabilities of the Headteachers of effective schools. The notion of effectiveness was broadly defined in that school selection was based on positive school inspection reports, above expected improvement over time in student outcomes on national tests and examinations, and acknowledgement by professional peers of effectiveness as a leader. The headteachers were found to be able to manage many competing tensions and dilemmas, were people centered and exercised what was described as values-led contingency leadership. This is principal leadership that has personal and organizational alignment in visions and values, in which the principal is seen to act with integrity, works well with internal and external contexts through being adaptive and balancing involving other and taking individual action, and fosters professional development of others and self. It was clear from this study that these principals were more than effective, and so when Day went forward with another research project, he decided to study school and leadership *success*. In 2001, Day created the International Successful School Principalship Project (ISSPP),

which is described below in some detail. One of the founding members of this project was Leithwood, who is one of the authors in the second study mentioned below.

At the time of the creation of the ISSPP, Leithwood and Riehl (2003) were Commissioned by Division A (Administration, organization and leadership) of the American Educational Research Association (AERA) to provide the first major review of successful school leadership. Considering evidence mainly from published quantitative and multiple or systematic case study research, they arrived at six claims about successful school leadership, which are worth describing in detail (Leithwood & Riehl, 2003, pp. 9–36):

Claim 1: Successful school leadership makes important contributions to the improvement of student learning.

Claim 2: The primary sources of successful leadership in schools are principals and teachers

Claim 3: In addition to principals and teachers, leadership is and ought to be distributed to others in the school and school community.

Claim 4: A core set of “basic” leadership practices are valuable in almost all contexts. These are: setting directions; developing people; redesigning the organization.

Claim 5: In addition to engaging in a core set of leadership practices, successful leaders must act in ways that acknowledge the accountability-oriented policy context in which almost all work, which includes market, decentralization, professional accountability and management accountability.

Claim 6: Many successful leaders in schools serving highly diverse student populations enact practices to promote school quality, equity, and social justice such as building powerful forms of teaching and learning; creating strong communities in school; nurturing the development of family’s educational cultures; expanding the amount of students’ social capital valued by the schools.

These claims have had an enduring and substantial influence in two ways: as foundational to a four-element school leadership view that evolved later (see claim 2 from Leithwood, Harris, & Hopkins, 2008, 2020); and, establishing a “defensible claim” orientation to research about school leadership which has been seen in many papers since (Day et al., 2010; Leithwood, Day, Sammons, Harris, & Hopkins, 2006; Leithwood et al., 2020). While Leithwood has usually described it as a transformational leadership model (e.g., Leithwood & Jantzi, 2006), it is perhaps best described as a transformational/instructional educational leadership framework. Later versions of the framework added the instructional leadership focus of improving teaching and learning to the list of basic leadership practices (Leithwood & Sun, 2012). These later versions also added related practices, which included the transformational leadership practices of contingent reward and management by exception active, passive and total (Leithwood & Sun, 2012). The model has been used as the basis for major systemic reforms, such as the *Ontario Leadership Framework* (Leithwood, 2012).

The third study is the *Leadership for Organisational Learning and Student Outcomes* (LOLSO) project. This was being conducted at the same time as the previous two studies. While not as influential as the previous two studies, it is a compelling study in terms of how it connected complex leadership ideas of transformational leadership, teacher leadership, and organizational learning, with a broad view of student outcomes that included student participation, engagement, and academic achievement. This was a large survey-based study exploring leadership, organizational learning, and student outcomes (Mulford & Silins, 2003; Mulford et al., 2004). The research gathered survey responses from 3500 students to 2500 teachers in 96 government secondary schools in two Australian states, South Australia and Tasmania (including all of the eight secondary schools in Tasmania at the time). The research demonstrated that leadership made a difference in schools in an indirect manner: “leadership contributes to organizational learning, which in turn influences what happens in the core business of school – the teaching and learning” (Mulford & Silins, 2003, p. 183). In a model describing the findings, principal transformational leadership, impacted on teacher leadership and administrative team leadership to influence organizational learning, which in turn influenced teacher work, and through this the three student outcomes. School size, home educational environment, and socioeconomic status exerted influence on the variables. For example, larger school size negatively influenced principal transformational leadership, teacher leadership, and student participation, but positively influenced academic self-concept. Mulford (2007) noted that this model placed much less emphasis on organizational, managerial, and strategic elements, and more on dispersed leadership and organizational learning cultures to improve student outcomes.

Both Mulford and Leithwood were engaged with the beginning work of the ISSPP, and the LOLSO research helped to inform the ISSPP research, especially regarding the construction of principal and teacher surveys. Mulford used these surveys in primary and secondary schools in Tasmania, Australia (see Mulford & Edmunds, 2009; Mulford, Kendall, Kendall, Edmunds, Ewington, & Silins, 2008) to construct a successful school leadership model that described how principals and teachers influenced student academic achievement, social development, and student empowerment (Mulford & Silins, 2011).

---

## Two Major Short-Term Studies on Successful School Leadership

Following on from these early studies, in this section the focus is on two studies, one from the UK which is well known, and one covering six countries that is perhaps less well known, but still important. These are examples of complex research projects exploring successful school leadership.

The first study is a large mixed-method study conducted in England. The authors of the research report of the project claimed that the “Effective Leadership and Pupil Outcomes Project is the largest and most extensive study of contemporary leadership to be conducted in England to date” (Day et al., 2009, p. 1); Day, Sammons, and Grogan (2020) labeled this as the IMPACT project.

The aims of the study were to:

i) establish how much variation in pupil outcomes is accounted for by variation in the types qualities, strategies, skills and contexts of school leadership, in particular those of heads as “leaders of leaders”; and ii) to determine the relative strengths of the direct and indirect influences of school leadership, especially that of the head, upon teachers and upon pupils’ outcomes. (Day et al., 2009, p. 6)

The research involved a literature review to frame the research, analysis of national test results to select schools that were effective and improving over a 3-year period, two surveys of headteachers and key staff, and 20 case studies conducted over 2 years with interviews of headteachers, key staff, and stakeholders, observation, and a survey of year 6 (10 primary schools) and year 9 (10 secondary schools) students (as appropriate) in each of the 2 years.

While it is labeled as a study of effective school leadership, the focus of the study on a wide variety of student outcomes (e.g., student academic achievement, behavior, attendance, motivation and engagement) and school outcomes (e.g., teacher motivation, school improvement pathways), and a mixed method research design, means that this study fits well with the focus in this chapter on successful school leadership.

The *Effective Leadership and Pupil Outcomes Project* was a partnership between the National College of School Leadership (NCSL) and the Department for Children, Schools and Families (DCSF) with researchers from the University of Nottingham, the Institute of Education, University of London, and the University of Toronto. The project produced government research reports of the literature review (Leithwood et al., 2006) and project outcomes (Day et al., 2009), with companion summary journal articles (Day et al., 2010; Leithwood et al., 2008, respectively); a book of the project was also produced (Day et al., 2011). More recently, three of the researchers have revisited the seven claims made in the original literature review (Leithwood et al., 2020); it is curious that the findings of the *Effective Leadership and Pupil Outcomes Project* (Day et al., 2009, 2010) had only two citations in this revision paper.

Table 1 provides a summary of the major claims arising from the literature review and research phases of the project.

There is not space in this chapter to explore these findings in detail and it must suffice to say that this large study of English school leadership has many powerful findings to inform school systems worldwide, such as support for the basic leadership practices of: building vision and setting direction; understanding and developing people; redesigning the organization; and managing the teaching and learning program. Importantly, as Leithwood et al. (2020) showed, the findings can be updated and built upon as new evidence appears. The findings are similar to the conclusions arrived at through the successful school leadership review of Day et al. (2020) which is considered below.

While perhaps not as well-known as the study just discussed, Caldwell constructed an international project to explore successful school leadership (Caldwell & Harris, 2008). Unlike the previous research, Caldwell was concerned to find knowledge

**Table 1** Summaries of findings from the Effective Leadership and Pupil Outcomes Project

<i>Literature Review phase</i>	<i>Revisiting claims</i>	<i>Research phase</i>	
<i>Seven strong claims about successful school leadership</i> (p. 3) Leithwood et al. (2006) Leithwood et al. (2008)	<i>Seven strong claims about successful school leadership revisited</i> Leithwood et al. (2020) (Revised claims in italics)	<i>The impact of school leadership on pupil outcomes</i> Day et al. (2009)	<i>10 strong claims about successful school leadership</i> Day et al. (2010)
“School leadership is second only to classroom teaching as an influence on pupil learning” (Leithwood et al., 2006, p. 4)	<i>Revised claim: “School leadership has a significant effect on features of the school organization which positively influences the quality of teaching and learning. While moderate in size, this leadership effect is vital to the success of most school improvement efforts” (p. 6)</i>	“The Primacy of the Headteacher Headteachers are perceived as the main source of leadership by school key staff. Their educational values and leadership practices shape the internal processes and pedagogic practices that result in improved pupil outcomes” (p. 183)	“Headteachers are the main source of leadership in their schools” (p. 3)
“Almost all successful leaders draw on the same repertoire of basic leadership practices: - building vision and setting direction - understanding and developing people - redesigning the organisation - managing the teaching and learning programme” (Leithwood et al., 2006, pp. 6–7) 14 leadership practices described	“Almost all successful leaders draw on the same repertoire of basic leadership practices: - set directions - build relationships and develop people - develop the organization to support desired practices - improve the instructional program” (pp. 7–8) 22 leadership practices indicated, although only 19 are listed in Table 1, on page 8 of the chapter	“Basic Leadership Practices Almost all successful leaders draw on the same repertoire of basic leadership values and practices. However, there are differences in the time and attention which heads give to elements within these” (p. 183) Setting Directions, “Developing People, Redesigning the Organization and Managing the Teaching and Learning Programme” (p. 183)	“There are eight key dimensions of successful leadership: – ‘define their values and vision to raise expectations, – set direction and build trust – reshape the conditions for teaching and learning – restructure parts of the organisation and redesign leadership roles and responsibilities – enrich the curriculum – enhance teacher quality – enhance the quality of teaching and learning – build collaboration internally – build strong relationships outside the school community” (p. 4)

		statistically significant differences in certain leadership practices between each group” (p. 190)	
		Leadership Difference by Socioeconomic Context “There are relationships between the extent of the disadvantaged context of schools (FSM band) and the amount of change in leadership practice reported by primary and secondary heads” (p. 190)	

across countries about successful school leadership practice. The *International Project to Frame the Transformation of Schools* focused on schools that had been transformed or had sustained success. The research included a literature review to construct a five-element framework (intellectual capital, social capital, spiritual capital, and financial capital, and achieving alignment through outstanding governance), a survey to explore the framework, administration of the survey in 22 workshops across nine countries, and multiple-perspective case-studies of five schools in each of six countries (Australia, China, England, Finland, the United States, and Wales). Table 2 summarizes the key findings for each of the capitals and governance. The leadership of principals was central to all common practices identified.

The project provides international support for many of the findings from the English study of Day and colleagues, and provides emphasis for the importance of leadership *and* governance. More international evidence comes from the ISSPP discussed next.

## Major Long-Term International Studies on Successful School Leadership

Apart from the study by Caldwell and Harris (2008), the studies described above have been centered on particular country contexts. The ISSPP provides a truly international perspective to research on successful school leadership. It is a continuing project that has been going for 20 years and involving research groups from over 20 countries focused on exploring the characteristics and practices of successful

**Table 2** Common practices in the successful schools (Caldwell & Harris, 2008, various pages)

Domain	Domain description	Common Practices
<b>Intellectual capital</b>	The level of knowledge and skills of those who work in or for the school	Local staff selection and staff professional development, especially in-house sharing
<b>Social capital</b>	The strength of formal and informal partnerships and networks involving the school and all individuals, agencies, organizations, and institutions that have the potential to support and be supported by the school	Strong relations with other schools (especially feeder schools), and other organizations
<b>Spiritual capital</b>	The strength of moral purpose and the degree of coherence among values, beliefs, and attitudes about life and learning	Clearly defined values, with student well-being as a priority
<b>Financial capital</b>	The money available to support the school	Receive government funding, as well as funding from other sources
<b>Governance</b>	The process through which the school builds its intellectual, social, financial and spiritual capital, and aligns them to achieve its goals	Led by valued and visionary leaders in locally appropriate leadership structures, with high levels of freedom for day-to-day management

principals in successful schools. With four project books, eight special journal issues and more than 300 chapters and journal articles, it is by far the most substantial research project on successful school leadership. The project has conducted multiple perspective cases studies, multiple perspective observational cases studies, surveys of principals and teachers, and principal identity interviews. Several research groups have revisited principals after 5 years to explore sustainability of success, and some groups have explored leadership in underperforming schools in advantaged and less advantaged contexts. With more than 200 case studies reported across the many and varied publications, it is a difficult project to fully understand, although several models have been created to help (Gurr, 2015). During 2021, the first synthesis of the corpus of publications is being conducted by ISSPP members, led by Jingping Sun. In the meantime, the best articulation of the overall findings of project can be found in the synthesis chapter by Gurr and Day (2014) of the fourth project book (Day & Gurr, 2014) which included 15 chapters devoted to describing the work of successful principals from the project. The synthesis of these chapters was developed from a thematic review of the chapters and connections with previous research findings from the ISSPP. The main features of successful principal leadership included (Gurr & Day, 2014, pp. 194–208):

- High and reasonable expectations for all.
- Pragmatic/active leadership approach: No single model of leadership satisfactorily captures what successful principals do.
- Not transformational or instructional leadership, but transformational and instructional leadership.

- Leadership distribution.
- Core leadership practices, plus. . . Setting direction, developing people, leading change and improving teaching and learning, plus: use of strategic problem solving; articulating a set of core ethical values; building trust and being visible in the school; building a safe and secure environment; coalition building; promotion of equity, care and achievement.
- Heroic/post-heroic leadership: challenging, risk taking but with the support of others.
- Capacity development – people centered and focused on staff development.
- Trust and respect.
- Continuous learning.
- Personal resources: for example, Acumen, optimism, persistence, trust, tolerance, empathy, alertness, curiosity, resilience, benevolence, honesty, openness, respectfulness, and humbleness, and driven to provide the best educational environment they can for all students.
- Context sensitivity: context sensitive, but not context driven.
- Sustaining success includes elements such as establishing direction consensus, balancing competing discourses, and having a positive attitude to change.

The project continues to evolve, and the research synthesis being conducted in 2021 will mesh with a new complexity/system theoretical orientation that will mean that the project will likely explore leadership broadly (system, principal, senior leaders, middle leaders, teachers, students, parents) and utilize mixed method inquiry more often.

Over the first two decades of the millennium there are other major international educational leadership projects that have been conducted and some of these have findings relevant to the successful school leadership. For example, Gurr, Drysdale, and Goode (2020) provide an overview of the ISSPP, the International Leadership Development Network (ISLDN), Leadership for Learning (LfL), and International Study of the Preparation of Principals, while Gurr, Drysdale, and Goode (2021) update this by also considering some more recent emerging projects: 7 System Leadership Study (7SLS), Asia Leadership Roundtable (ALR), and the World School Leadership Study (WSLS). While these studies have much to offer, they do not exclusively explore successful school leadership. There is not space to explore the findings of these projects in this chapter. The interested reader can follow these projects through the overview publications noted above, which provide concise summaries and references to project publications.

---

## Other Reviews of Successful School Leadership

Since the first major review of successful school leadership by Leithwood and Riehl (2003), Day and Sammons (2014) have also provided a review of successful school leadership, which was updated in Day et al. (2020). For the purposes of this chapter, only the later review is referred to. In the review, the authors focused particularly on

evidence about transformational, pedagogical/instructional, and distributed leadership, the leadership of principals and others, and overall sought to “increase knowledge and understanding of school leadership and its relationship with school improvement and student personal, social and academic outcomes” (Day et al., 2020, p. 8). After reviewing evidence related to transformational, pedagogical/instructional, and distributed leadership, they reviewed the *Effective Leadership and Pupil Outcomes Project* described above, before exploring findings from international research projects, such as the ISSPP, and findings on leadership values, before returning again to explore further findings from the *Effective Leadership and Pupil Outcomes Project*. As an overall summary the report described key dimensions of successful school leadership as:

- Defining the vision, values and direction
- Improving conditions for teaching and learning
- Redesigning the organization: aligning roles and responsibilities
- Enhancing effective teaching and learning
- Redesigning and enriching the curriculum
- Enhancing teacher quality (including succession planning)
- Building relationships inside the school community
- Building relationships outside the school community
- Defining and modeling common values
- Ensuring students’ well-being and providing equitable access to support for all students.

(Day et al., 2020, p. 6)

This list is similar to the findings from *Effective Leadership and Pupil Outcomes Project*, and this is not surprising given the dominance of this project in their review at the expense of other projects that could have been given more prominence such as the ISSPP. While the review seemed to be centered on the English research, it covered many areas related to successful school leadership and, with over 120 references provided, connected with a substantial literature base.

---

## Other Research

Much as Day et al. (2020) reviewed literature about transformational, instructional, and distributed leadership as part of their successful school leadership review, this chapter could include several other research strands. Space does not permit this, but a brief connection with some of research from the Wallace Foundation (<http://www.wallacefoundation.org>) is worthwhile. This philanthropic US organization has produced many papers and research reports about school leadership. Here I briefly highlight three papers that, considered together, provide a clear statement of the importance of educational leadership in general, and principal leadership in particular.

As the precursor to a major national mixed-method study, Leithwood, Louis, Anderson, and Wahlstrom (2004) conducted a literature review on how school

leadership influences student learning. This was the report that first made the often cited claim that:

Of all the factors that contribute to what students learn at school, present evidence led us to the conclusion that leadership is second in strength only to classroom instruction. Furthermore, effective leadership has the greatest impact in those circumstances (e.g., schools “in trouble”) in which it is most needed. This evidence supports the present widespread interest in improving leadership as a key to the successful implementation of large-scale reforms. (Leithwood et al., 2004, p. 70)

They also produced a ten-element model that related school leadership indirectly to improved student learning. This report reinforced the worth of studying successful school leadership in projects like the ISSPP. The study involved surveys and case studies across the USA and the final report reinforced the importance of school leadership:

In developing a starting point for this six-year study, we claimed, based on a preliminary review of research, that leadership is second only to classroom instruction as an influence on student learning. After six additional years of research, we are even more confident about this claim. To date we have not found a single case of a school improving its student achievement record in the absence of talented leadership. Why is leadership crucial? One explanation is that leaders have the potential to unleash latent capacities in organizations. Put somewhat differently: most school variables, considered separately, have only small effects on student learning. To obtain large effects, educators need to create synergy across the relevant variables. Among all the parents, teachers, and policy makers who work hard to improve education, educators in leadership positions are uniquely well positioned to ensure the necessary synergy. (Louis, Leithwood, Wahlstrom & Anderson, 2010, p. 9)

More recently, Grissom, Egalite, and Lindsay (2021) built on the review of Leithwood et al. (2004) and provided a systematic synthesis of the impact of principals on students and schools over the previous two decades. They reviewed 219 studies from nearly 5000 considered sources. They showed that the differences between a below average principal compared to an above-average principal can be as much as 3 months of learning in mathematics and reading, with this being comparable in size to teacher effects on student learning. They also noted that effective principals impact on other outcomes such as improved attendance, improved teacher satisfaction and working conditions, and reduced teacher turnover. They make the powerful observation that:

Principals really matter. Indeed, given not just the magnitude but the scope of principal effects, which are felt across a potentially large student body and faculty in a school, it is difficult to envision an investment with a higher ceiling on its potential return than a successful effort to improve principal leadership. (Grissom et al., 2021, p. 43)

Principal success was related to three primary skill areas (people, instruction, and organization) and four domains of high leverage behaviors (engaging in instructionally focused interactions with teachers; building a productive climate; facilitating collaboration and professional learning communities; managing

personnel and resources strategically). They also emphasized the importance of leading with an equity lens to be culturally responsive.

---

## Conclusions and Reflections

The study of successful school leadership has emerged in the two decades since the turn of the millennium. It is an area of study that has several notable research papers and projects, but which also has conceptual and empirical overlap with other areas of educational leadership (like school effectiveness and improvement). Nevertheless, the focus on broad student and school outcomes, and a variety of research methods (case studies and mixed-method inquiries) is providing rich understandings of what successful school leadership is and what it does. There is not a consistent terminology that defines the study area, and it is necessary to consider research that has other labels, such as effective school leadership. Nevertheless, there are substantial projects, such as the ISSPP, which are helping to establish the area as a legitimate addition to the educational leadership field. Future research is likely to involve large, mixed method projects that explore leadership broadly and include principals and other members of the school (e.g., teachers, students, parents, governors) and the wider context (e.g., education systems, communities). These projects will likely be within and across country contexts. There are exciting possibilities for research over the next decade as the study of successful school leadership matures.

## Commentary from Drysdale

This section offers a reflective commentary by Drysdale and expands on three areas: effective and successful schools and effective and successful school leadership; sustainability of success; and, leadership and context.

### Effective and Successful Schools and Effective and Successful School Leadership

This commentary expands on the use of effectiveness and success in the transition from effective schools to successful schools and from effective school leadership to successful school leadership. It suggests that interest in notions of success rather than effectiveness can be located at least a decade earlier than the turn of the millennium.

The move to success rather than effectiveness was because previous definitions of effectiveness focused on narrow student achievement measures such as performance on standardized literacy and numeracy tests (Goodlad, 1984). Sergiovanni (1991) argued that *successful* should be used because it communicated a broader definition of effectiveness. Sammons, Hillman, and Mortimore (1995, p. 7) described effective schools in terms of how much value they added to student outcomes, but they emphasized “a wider range of outcomes (academic and social).” Other writers have elaborated on this and suggested that school effectiveness should comprise a

wider range of factors including outcomes broadly defined, such as tangible and intangible academic and general educational goals, physical, mental, and emotional competencies, behavior, citizenship, employment, community goals, and student values and attitudes (e.g. Day et al., 2009; Mortimore & Stone, 1991; Organisation for Economic Co-operation and Development [OECD], 1989; Sammons, 2007; Silver, 1994). These views highlight a degree of confusion amongst school effectiveness researchers about what they were studying.

To resolve this confusion, from the 2000s, some researchers focused on “success” rather than “effectiveness” because success as a concept was seen to be more inclusive and broader. It was felt that a focus on success would provide another dimension that was not clearly included in previous definitions of effectiveness. In the ISSPP, to better understand success as compared with effectiveness, the researchers investigated perceptions of success at the school level and explored the contribution of the principal to the success. Typically, the ISSPP researchers defined success as school achievements and milestones, improved student outcomes in range of areas, whole school improvement, and the provision of services, resources, and amenities. In addition to these factors, and how the researchers measured success, schools also defined success in their own terms and within their specific context. Commonly the school leaders and staff defined success far more broadly. Examples of success included: achieving individual potential; student engagement; self-confidence and self-direction; sense of identity; sense of community and belonging; positive school staff morale; a focus on the whole child; prizes and rewards, enjoying learning, and sporting achievements (Gurr & Drysdale, 2016). Furthermore, success was not only centered on student outcomes, but also school, staff, and community. Examples include: school reputation; having a united staff; staff commitment; a positive school culture; enrolment growth; parent support; sponsorship programs; and community and industry partnerships.

Because of strong correlation between leadership and performance, concepts of effective and successful school leadership follow a similar pattern of widening the definition over time. As far back as 1982, Sweeny reviewed research on effective schools and concluded that the evidence indicated that principals do make a difference. He outlined that effective principals emphasized achievement, set instructional strategies, provided an orderly atmosphere, frequently evaluated student progress, coordinated instructional programs, and supported teachers (Sweeny, 1982). As identified earlier in the chapter, the emphasis was clearly on instructional leadership which was the mainstream of the 1980s and 1990s (e.g. Hallinger & Murphy, 1985). However, there was a trend to expand the definition of effective school leadership. Riley and MacBeath (1998) in leading an international research team studying four countries (England, Scotland, Denmark, and Australia) questioned the narrow use of the term “effective” and suggested that while there was no recipe for effective leadership in their study, effective leaders responded to changing contexts. They concluded that effective leaders were “distinguished by their vision and passion and by their capacity to bring a critical spirit into the complex and demanding job of headship, whilst at the same time focusing on staff and pupil performance, and on classroom pedagogy” (Riley & MacBeath, 1998, p. 149).

As has been described in this chapter, whilst there is research on successful school leadership, major studies still refer to the impact of school leadership on performance in terms of effectiveness. Nevertheless, many of these studies are more closely aligned with the broader idea of successful school leadership. For example, Leithwood et al. (2004) focused on the impact of effective leadership on student learning, but also described how effective leaders created synergy of many other elements. Grissom et al. (2021, p. xviii) described how effective principals impact beyond student achievement, such as equity and that overall:

Effective principals orient their practice toward instructionally focused interactions with teachers, building a productive school climate, facilitating collaboration and professional learning communities, and strategic personnel and resource management processes.

Pashiardis and Johansson (2020) argued that it was important for school leaders to be successful and effective. While they distinguished between the meaning of effectiveness and success, they also noted that many key writers in the area use the terms interchangeably. That the terms are sometimes used interchangeably may be justified by the expanded roles and responsibilities of school leaders over the past two decades, with both terms describing the same phenomenon.

While there are numerous references to successful school leadership, the delineation between effectiveness and success is not clear. It appears that the consolidation of successful school leadership as a movement it is still not clearly defined, particularly since the definition of effective school leadership has widened and is more encompassing. The common features of successful and effective school leaders are: they are contextual literate; leadership is distributed; they use transformational and instructional leadership interventions to enhance performance; they are value driven; and manage conflicting goals of equity and student outcomes. In the earlier part of this chapter the authors outline an also identical list of effective and successful school leadership features (Day et al., 2009, 2020). The blurring of effective and success in the literature undermines the claim of separateness and distinctiveness of the successful school leadership movement. Today whether we use effectiveness or success as descriptors may be a moot point.

### **Sustainability of Success**

There was little discussion in the chapter about how school leaders succeeded in maintaining or improving performance over the long term or whether schools sustain their success when the principal departs. Several examples exploring sustainability of success from different perspectives are provided here.

In the research covered in this chapter there are examples of researchers exploring the history of a successful school. For example, as part of the ISLDN project, Okilwa and Barnett (2018), explored the sustained academic success of a USA school over a 20 year period involving four successive principals. There have also been examples of research exploring the improvement pathway of schools. In the Effective Leadership and Pupil Outcomes Project, the 20 school case studies included a process with head teachers and other key staff that asked them to “provide retrospective

perceptions of leadership actions that led to their success over time” (Day et al., 2009, p. 128). This process produced maps of leadership strategies over several years (the map of Eyhampton school went back 10 years: Day et al., 2010, p. 16).

The ISSPP included a dedicated research process to explore sustainability of leadership and school success. In phase 2 of the ISSPP, researchers re-visited many of the first case study schools 5 years after the initial research to explore the sustainability of success. The issue was that while there was strong evidence that successful leaders could significantly contribute to a school’s success, there was a lack of evidence that school success could be maintained or improved. The findings from six countries and eight educational systems were reported in Moos, Johansson, and Day (2011). The findings noted several dimensions to the principals’ leadership which helped to sustain school success. Mostly these were like the factors that helped them achieve success such as their values, qualities, skills, and knowledge that enabled them to influence teachers’ teaching and students’ learning. Relationships were found to be a key factor in sustaining success, both relationships within the organization and beyond. For example, Day (2011) found that in working in challenging circumstances in England, three factors were important: moral purpose and social justice; organizational expectation and learning; and, identity, trust and passionate commitment were the key to sustaining success. Drysdale, Goode, and Gurr (2011) found in schools in Victoria, Australia, that principals’ attitude to change had an impact on the level and type of school success and certainly on the capacity of the school to sustain change. Jacobson (2011), reporting on schools in the USA, found that distributed teacher leadership and professional self-renewal as processes were central to sustaining success, and, in at least one US case, a change in organizational governance was necessary to allow these processes to continue over time. Day, Johansson, and Moller (2011) noted that of the qualities and skills identified, resilience, resolute persistence and commitment were key factors.

In other ISSPP publications, Ylimaki and Jacobson (2011), in an edited book exploring US and Cross-National Policies, Practices and Preparation, suggested that successful principals could sustain their success through being people oriented and demonstrating trust, optimism, persistence, empathy, resilience, humility, honesty, openness, and respectfulness. Notman and Henry (2011), reporting on six primary and secondary school principals in New Zealand as part of the ISSPP, identified critical self-reflection, responsive leadership, building relational trust, and personal resiliency.

Goode (2017) and Gu and Johansson (2013) found that understanding the nature of schools’ internal and external context and how school leaders mediated between these contexts was essential for sustaining performance. They found that school leaders worked successfully to build and maintain a positive school environment and successfully responded to external pressures such as accountability and performativity demands.

Looking more broadly, there are other research programs that contribute to the knowledge about sustainability of school success. For example, Andrews and Conway (2020) outlined findings from two decades of research from the Leadership Research International (LRI) group based at the University of Southern Queensland. They highlighted the importance of leadership in sustaining improvement and confirmed that sustainability required building personal, social and organizational capacity

building if improvement was to be sustained. Capacity building included focused leadership, collaborative leadership with school and teacher leaders, and building a professional learning community.

While there is evidence from international studies of the impact of leadership on sustainability, further research is needed to consolidate the findings.

### **Leadership and Context**

Throughout the chapter there is reference to leadership and context; however, the challenge for future researchers is to do more in-depth studies that explore this relationship.

Numerous writers have challenged the lack of research on leadership and context. In the wider debate on organizational behavior, Johns (2006) points out that context is not sufficiently recognized or appreciated by researchers. Within educational administration, Bush (2018) argues that research on context is limited compared with the literature on leadership. Belchetz and Leithwood (2007) noted that context matters, but they are not sure how much it matters.

The international studies take the position that leadership is a pattern of influence and that leadership is embedded in context, and that leadership is not restricted to formal positions but leaders can influence anywhere in a social system. These studies also recognize that context is multilayered and has a reciprocal relationship with leadership. Context can include diverse external and internal factors or specific aspects of context such as high needs and social justice (ISLDN), or schools in challenging circumstances (ISSPP) (Gurr et al., 2021). Gurr et al. (2006) compared 63 ISSPP case studies and they identified 16 different contexts that were reported on. The ISSPP research reported by Doherty (2008), Gurr, Drysdale, Longmuir, and McCrohan (2018, 2019), and Longmuir (2017) showed how leadership and context can influence each other. The Social Justice Strand of the ISLDN has explored social justice leaders in multiple contexts, for example, in macro and micro contexts (Angelle, Morrison, & Stevenson, 2015b) across countries (Angelle, Arlestig, & Norberg, 2015a; Arar, Beyyoglu, & Oplatka, 2017) and in diverse contexts (Richardson & Sauers, 2014).

The overwhelming finding from an international perspective is that no matter what the circumstances or layers of context, successful school leaders can navigate the situation to improve or maintain improvement. The findings affirm that relationship between leader and context is complex and that it can be reciprocal. This is particularly important when we are exploring multiple levels of context and how each layer or a combination of layers influences leaders and vice versa. More research at a deeper and more nuanced level of investigation needs to happen as there is much about the interchange between context and leadership that remains as a “black box”.

---

### **Summary**

The international perspective includes a wide range of writers and themes on successful school leadership. It also includes several international studies and projects. The consolidated data provides a far better understanding of educational

leadership. There is now a better understanding of the characteristics and qualities of successful educational leaders and how they contribute to the success of their schools. There are still areas that need to be resolved. There is confusion with the terms effective and successful in terms of schools and leadership. In many cases the terms are used interchangeably, and the definitions have changed over time. There does not appear to be a delineated pathway for the successful schools and leadership movement. The research on leadership in relation to sustainably of performance is underdeveloped. There is further scope to investigate how schools can sustain their success with the same leader or with successive leaders over time. There is more to understand about the complex relationship between context and leadership.

## Abstract

Since the foundation of educational administration as a field of study around 150 years ago, its scholars have employed varied strategies to gain a scientific legitimacy among the social sciences. The aim of this chapter is to debate the meanings of science in EA and the kind of science EA field can be based on an analysis of science constructions and of historical debates in the field’s discourses throughout the last several decades. It is suggested that EA researchers seek new knowledges related to educational leadership and management and attempt to understand the educational reality from organizational and managerial stances. They acknowledge the limitation of objectivity and universality and combine both positivistic and naturalistic methodological paradigms. But, EA is, first and foremost, an applied field of study whose major orientation is to improve EA practice and support the work of educational leaders. Some implications of this type of science are discussed at length in the second half of the chapter.

**An Explanation Under the Following Headings****The Field of Memory**

Pure science, speculative science, the prescriptive nature of the field, the theory movement, logical scientific positivism, objectivity in science. For example, the advocates of the Theory movement in the field of educational administration (EA) during the 1960s–1970s have juxtaposed “science” with positivistic research. In their view, in order to be considered as “science” the research on educational administration ought to be conducted by robust methodologies just like happens in natural sciences. Otherwise, educational administration would likely produce knowledge base that is based on subjective experiences of educational leaders rather than on objective reality.

**The Field of Presence**

Multiple theoretical paradigms, the naturalistic methods, applied science, scientificity is medium in the field of educational administration. For instance, students of educational administration and leadership become familiar with a wide variety of leadership models that have been adopted by scholars of educational leadership, such as leadership for social justice, shared leadership, and instructional leadership.

**The Field of Concomitance**

Disciplinary knowledge, generalizable knowledge base, conceptual rigor, real science, ultimate and universal truth, “Mode 2” knowledge production. For instance, many researchers in the field of educational administration explore the lives and career of educational leaders not only for the sake of pure knowledge, but many times in order to provide prospective and current leaders with practical tools to improve their managerial practice and lead their staff more effectively.

**Discontinuities and Rupture Which Form the Different Viewpoints of the Field**

Pure vs applied science, positivistic vs naturalistic scholarly paradigms.

**Critical Assumptions or Presupposition**

The demise of science, an academic knowledgebase in educational administration, lack of regulations regarding the predictability of events in educational administration, the limitations of subjectivism and critical theory.

## Introduction

Since their foundations, many social science disciplines have employed varied strategies to become more scientific; they allied with the “pure” sciences and connected to more scientifically established bodies of knowledge to gain legitimacy and increase their public image. Institutional leaders in the applied disciplines and professions have struggled to help them evolve to science status through the acknowledgment of stakeholders in their developmental process of reaching to a higher status and through the relevance of their knowledge to practice.

The term “education sciences” has appeared for the first time in 1812 in the work of Marc-Antoin Jullien de Paris “*Esprit de la méthode d’éducation de Pestalozz*” (Plaisance & Vergnaud, 2012). Ever since, many scholarly debates in the education scholarship have adopted science as a label and structured their activities as purely scientific (e.g., research design, scientific knowledge). They have borrowed scientific concepts and informed practice in pursuit of scientific development. Thus, a science of education interrogates the other sciences for synthesizing their conclusions under the forms of theories that are intended to inform the education practice (Plaisance & Vergnaud, *ibid*). Yet, the science of education is vast; it is not oriented solely toward pedagogy and teaching, but draws on the dominant social science disciplines to study varied educational issues (McCulloch, 2017).

One of the subfields of education sciences is educational administration (named also “educational management” and in recent years “educational leadership”). From the establishment of educational administration (EA) as a field of study in the final quarter of the nineteenth century, its early scholars have been preoccupied with the definition and philosophical nature of science, debating whether EA is a science or something else. Culbertson (1988), for instance, claimed that the first book about school administration was written by Harold Payne in 1875 and has labeled this period through 1900 as “a quest for a science of education” (p. 4).

Thus, between 1875 and 1900, concepts of speculative science were widespread. Pioneers such as William Payne and William Harris, who sought for an academic legitimacy for the new field, emphasized the need for a scientific approach to school administration in order to better understand the art of running educational systems and schools (Culbertson, 1988; Heck, 2006). In the view of EA founders, science was the basis upon which a new generation of school leaders could be trained and developed (English, 2003). However, the scope of their inquiry, as Culbertson noted, was as broad as civilization, past and present. The result was a transition from the successful-practitioner type of generalized courses in principal preparation programs in the early 1900s toward a more scientifically organized type of instruction, as Callahan (1962) indicated many years ago.

It was only in the mid-1950s, however, that the spirit of logical scientific positivism has emerged in the field. Until that time, EA was substantially oriented to normative concerns, taught by senior practitioners such as superintendents and principals. In their retirement, the former educational leaders delivered their practical knowledge and wisdom to prospective school principals. But, this kind

of knowledge was far from being “scientific”; common dissatisfaction with the prescriptive nature of the field led to the appearance of the “theory movement,” which defined the knowledge in EA in accordance with conventions of a modernist, positivistic, rational-empiricist approach to science (Culbertson, 1988; Griffiths, 1983; Willower, 1996).

In its advocates’ optimistic view (e.g., Andrew Halpin, Daniel Griffiths), an improvement in the administrative practice of educational institutions would be brought about when a stable, cumulative, empirical, and generalizable knowledge base will be used in principal preparation programs and in in-service trainings for current principals. They further believed that the adoption of such a knowledge in the field would increase its academic legitimacy as an area of study underpinned by scientific principles. This, in turn, would lead the field to have an honorable place in the ivory tower. Twenty years later, Getzels (1977) wrote:

The third period in administrative thought has been variously called the theoretical area, the social science era, the behavioral science era, the social systems era, or the social psychological era. . . The essential shift was for conceiving of EA as a domain of action only to conceiving of it as a domain to study also. The shift moved the focus of effort from an orientation based on solutions, where experienced administrators gave answers to questions of ‘how to do it’ to an orientation based on inquiry, where problems were posed and understanding was sought regarding the phenomenal of administration in their own right (p. 9).

According to Halpin (1970), the basic ideas of the “theory movement” were that hypothetical-deductive research is prioritized, that EA cannot be viewed as distinct from other fields of administration, and that the field should draw heavily from insights developed in the social sciences.

In light of the dominance of the “theory movement” in EA field, the field borrowed relevant concepts and theories from social science disciplines, and its programs became more specialized and increasingly theoretical and quantitative (Walker, 1984). Two decades later Willower (1996) commented:

The optimism of those days included the notion that if schools were studied using ideas and methods from developed and relevant specialties, it would be possible to bring about positive changes in education (p. 346).

The belief of many EA scholars in those years was that a knowledge base produced in the disciplines and “translated” into the practice of EA would improve the work of educational leaders considerably.

This conjecture, however, evoked an enormous intellectual controversy in those years. Some scholars have criticized “the trend toward a discipline-based approach to the study of EA” (Culbertson, 1974, p. 7), calling to replace it by trends toward the use of more applied bodies of knowledge. In their view, the field could not be grounded in the social science disciplines due to their low scientific development per se. In this sense, what the disciplines had to offer was not well-validated theoretical principles or empirical laws on which EA field members could base applied procedures (Campbell, 1972; Hills, 1978). Campbell explained:

... We also failed to take concepts and methodologies and reshape them to fit our world. ... we realize that many of the concepts have little utility in the study of administration and those that do may have to be adapted and modified to our purpose. We are more problem oriented and we continue to ask what light the respective disciplines can shed on the problems. . . (p. 14).

Notably, one of the most dominant criticism against the theory movement, i.e., against the attempts to “scientify” EA as a positivistic field of study, came from Thomas Greenfield (1986). In his view, science cannot be equated with positivism because it is too narrow to capture what inquiry is about, particularly the creative aspects of inquiry. Greenfield further explained that inquiry has both creative and critical aspects. The creative aspects include curiosity, speculation, and the invention of concepts, ideas, and explanations. The critical aspect has to do with skepticism, doubt, and the process of verification or falsification, and even efforts to disprove hypotheses. Similarly, willower (1979) indicated that “science” has long been understood to imply a certain standard of experimental or conceptual rigor and of methodological clarity. In this sense, the claim of many social science disciplines to award a scientific status has meant the assertion of some fundamental resemblance to natural science, usually regarded even by social scientists as the core of “real” science – as temporally prior and logically exemplary. This spirit has characterized also the EA field in the early and mid-decades of the twentieth century.

Nevertheless, EA scholars seem not to have been concerned with applying strict definitions of science since 2000s, simply because the type of papers advocating EA as a science no longer appears in the field’s books and journals. Likewise, EA scholars accept seemingly notions of EA as an applied field of study rather than a “pure science” (Oplatka, 2020). Some even suggested fundamental flaws to justify the demise of science and its methods in EA. Willower and Uline (2001) responded to this notions:

Our critical inquest on the alleged demise of science demonstrates the value of examining such allegations carefully. In this case, the intimation that science is about to cross the Styx seems fatuous, perhaps an artifact of the wishes of those with that preference. After all, preferences often influence debates in one-sided ways. Science bashers frequently try to make their case by attacking positivism whose demise, in sharp contrast with science, would be hard to deny. That the two just do not equate seems irrelevant to them. All this has given writing about epistemology in educational administration its never the twain shall meet quality, that is, its failure to generate substantive debate (p. 463).

Note, science cannot be juxtaposed with positivism. It is a much broader concept and human activity as I discuss in the next pages. The aim of this chapter is to debate the meanings of science in EA and the kind of science EA field can be. The rejoinders to these ponderings may shed light on the epistemological purposes of the EA field and on the nature of its scholarly and empirical activities.

---

## The Meanings of “Science”

The concept and practice of science are not stable and unified. It has evolved over time, with many upheavals and turns, leading, among other things, to a lack of an agreed-upon definition of science (Lui & Burguete, 2014). The word “science”

comes from Latin word “scientia,” meaning “knowledge” or “the pursuit of knowledge,” and especially “established theories” when it first appears (Ferris, 2010, p. 3). Lui & Burguete (ibid) elaborated on this concept:

Science is humans’ pursuit of knowledge about all things in Nature, which includes all (human and nonhuman) material systems, without bringing in God or any supernatural (p. 16)

Generally speaking, the basic goal of science is to enhance knowledge so as to explain, understand, and intervene in a particular reality. More specifically, the objective of all sciences is to understand the world in which we live without appealing to God. Scientists describe what they observe, discover regularities, and formulate explanations in order to reduce our uncertainty about the world such as risk, ignorance, and indeterminacy (Stirling, 2010). For example, the organizational science attempts to describe and explain regularities in behavior of individuals and groups within organizations and organizational scientists “seek general frameworks and basic propositions that provide an understanding of structure and dynamics of organizational life” (Roberts, Hulin, & Rousseau, 1978, p. 23).

In the modern era, the term “science” has been used to characterize a type of knowledge that is neither “common” nor philosophical in character. The word science indicates, primarily, the habitual disposition of those who have devoted themselves to systematic research in a certain domain (Kockelmans, 1979). Research, in turn, means an investigating activity intended to uncover and yield new knowledge, or solving particular theoretical or practical problems (Harman, 2006; Humes & Bryce, 2001). Thus, knowledge has played a significant role in human life as human action has always required knowledge (Stehr & Meja, 2005).

Scientific research commences with the realization that the available repository of knowledge is insufficient to handle certain issues and problems, i.e., at the point where ordinary experience and ordinary thought fail to solve problems or even to pose them (Bunge, 2007). Therefore, a more complete definition of science may construct scientific research as the systematic and socially organized search for and acquisition of application of knowledge and insights brought forth by acts and activities involved in certain arenas (Tranoy, 1988).

It is apparent, then, that science is a dynamic process of developing, through experimentation and observation, an interconnected set of propositions that in turn produces further experimentation and observation (Conant, 1951). In fact, the basic aim of science is to find general explanations, called “theories.” Hoy and Miskel (2008, p. 9) defined theory as a “set of interrelated concepts, assumptions, and generalizations that systematically describes and explains regularities in behavior in educational organizations.”

Inherent to every “good” research, however, is novelty production, originality, and innovation, according to which every new outcome in science must be different from the preceding ones if it is to be regarded as a highly influential contribution to knowledge base (Whitley, 1984). In fact, the innovation brought on by scientists pushing the boundaries of the ever-expanding areas of knowledge is what keeps a university vibrant and relevant, and benefits the public good (Geiger, Colbeck, & Williams, 2007).

Two components of the scientific thought merit highlighting. Firstly, science emphasizes objectivity, i.e., an ideal intention of controlling for biases or being open and explicit about them are common prescriptions enforced by the possibility of peer criticism (Willower & Uline, 2001). But, scientists cannot be sufficiently objective because during the process of doing science they might be influenced by varied factors affecting their judgments, observations, and decisions. Thus, the results obtained by scientists are unlikely to be purely objective, although each scientist makes the best she/he can to minimize external influences upon his/her own interpretations of the research process and results. In fact, scientific results are supposed to be “confirmed” by experiments or practices, or, at the minimum, are consistent with established data (Lam, 2014, p. 23). The New Movement in EA gave social validation to the belief that an objective science for guiding organizations could actually be invented. It was the idea that principals should be trained in the science through programs of study in universities (Greenfield, 1986).

Secondly, although science has been fallaciously claimed to seek ultimate and universal truth, there are no attempts anymore to find final truths, because one of the main characteristics and great strengths of science its self-corrective nature (Willower & Uline, 2001). As opposed to religions, there are no final or universal truths in science. Theories can be assessed using a variety of logical and evidentiary criteria, and are subject to modification or replacement at any time. Science can be seen as open, changing, and growing, not as closed, static, and settled.

To sum up, congruent with our discussion about science thus far, EA researchers seek new knowledges related to educational leadership and management and attempt to understand the educational reality from organizational and managerial stances. They acknowledge the limitation of objectivity and universality and combine both positivistic and naturalistic methodological paradigms. When we analyze the scholarly and empirical activities of EA researchers (Hallinger & Kovacevic, 2019; Oplatka, 2010a, b) we realize that they view science as a style of thinking and acting, a description of science put forward by Bunge (2007). A support in this conjecture we gain from Lui and Burguete (2014). In their view,

Scientists tend to be interested in the nature and the behavior of kinds of things. A scientist is a person who honestly seeks knowledge about the nature without bringing in God or any supernatural. In other words, a scientist is simply a researcher. . . by this definition, apart from the natural scientists and social scientists, the humanists are also scientists, a consequence of the nature which includes human and nonhuman (material) systems (p. 18)

Thus, although administrative and organizational theories are probabilistic and not deterministic, one may conclude that EA field is a science like any other fields of study or disciplines in the university. Admittedly, however, EA is not completely a science in the classical meaning of “natural” sciences, however. It is part of the social sciences, i.e., these disciplines that focus on human beings and social institutions, such as economics, psychology, sociology, and the like.

The social sciences began to exert a strong influence on the field of EA after World War II, and rational ideas of organizational efficiency and effectiveness,

brought up by Nobel Prize scholar, Herbert Simon, have penetrated the EA field's discourse once again. As we saw, the advocates of the "theory movement" assumed that the incorporation of theories, concepts, and methodologies from social sciences into the field's knowledge will increase its scientific legitimacy. To become a science, they focused on predictability, validity, statistical analysis, and so forth.

Critics of this movement claimed, in contrast, that educational models are not able to predict the greatest educational challenges in the society, because of the limited predictive validity in social sciences (Hoy & Miskel, 2008). In other words, the scientificity of EA, i.e., the level of its scientific development is moderate. After all, scientificity is high for disciplines in "natural science," medium in social science and low in the humanities (Lui & Burguete, 2014).

Another strong advocate of the critical theory in EA was Foster (1999), who strongly argued that the idea of an academic knowledge base in EA is plainly a myth aimed at justifying the privileged positions of EA professors. In this regard, social scientists cannot develop hard rules and regulations regarding the predictability of events, at least in part because the concepts in these sciences are contested. There are rival explanations of each variant of the concepts, and each rival clashes upon ideological fields for supremacy. Forster explained:

Clearly a number of scholars in the social sciences and in the educational disciplines are both concerned about the basic paradigm within which their "normal" science operates and intrigued by the possibilities offered by alternative conceptions. This means that the social sciences need to consider their moral aspects; the necessary empirical work must be balanced by interpretive and critical understandings, for it is these that distinguish the human sciences from the natural sciences (Foster, 1986, p. 28).

The concepts in EA, then, do not lend themselves effectively to prediction or control and generalizations usually lack statements that tell us the precise circumstances under which the generalization may apply. If a science is to have any legitimacy, then it must be able to say that under certain conditions, *x* will happen, Foster further explained.

In fact, professional disciplines, like EA, are commonly characterized by a lack of well-marked scholarly boundaries, an absence of a clear sense of mutual cohesion and identity, and a greater apparent permeability of the loosely defined border zones that exist between neighboring disciplines. Permeation occurs across the span of a discipline, from frontier to core, and is accounted for by relations with neighboring disciplines, redefinitions of what is considered intrinsic and extrinsic to discipline, making disciplinary research and the epistemological structure of a particular discipline complex (Klein, 1993). In this sense, researchers working in soft applied fields are prepared to follow their problems into any other science whatsoever and to traverse all other sciences in order to investigate a certain phenomenon rather than restricting themselves to a particular disciplinary core (Becher, 1989). I elaborate on this type of academic fields in the remainder of this chapter.

## Toward an Understanding of EA as an Applied Science

The question of whether EA can be regarded as a form of science has attracted the attention of EA scholars since the establishment of EA as a field of study. Among these scholars, Evers and Lakomski's (Evers & Lakomski, 1991, 1993) books merit a particular highlighting. The authors sought to analyze critically the epistemological origins of various theoretical paradigms of EA that competed for supremacy over several decades, and to explore the ways by which EA knowledge was justified. Given major shortcomings in the traditional science approach (e.g., inability of science to account for ethics and for human subjectivity), their intention was to propose an alternative approach to positivism as a basis for a new science of EA. In their words, they suggested "to move ahead to a particular post-positivist theory of science that is broad enough to incorporate considerations of ethics and human subjectivity" (Evers & Lakomski, 1993, p. 141). Accordingly, they made abundantly clear the limitations of positivistic thought and of subjectivism and critical theory, both of which attacked positivism and attained new popularity after long periods of intellectual marginality. Theory in EA, they maintained, is supposed to guide practicing administrators, inform the collection of facts, and explain and describe the nature of administration.

**The Essence of an Applied Field.** Evers and Lakomski's view brings us to discuss a type of science that has become very common in social sciences, in general, and in professional disciplines, in particular – an applied science. Researchers in professional disciplines (e.g., social work, education, management, and nursing) tend to follow their problems into any other science whatsoever and to navigate all other sciences in order to explore a certain phenomenon rather than restricting themselves to a particular disciplinary knowledge base (Becher, 1989).

Scholars in social sciences probed into the meaning of applied knowledge. Gibbons, Levitt, and Lewis (1996) put forward the idea that a new form of knowledge production, "... a distinct set of cognitive and social practices, is beginning to emerge" (p. 3). This set of cognitive practices is what he called "mode 2" knowledge production that can be distinguished from mode 1 (i.e., "pure" knowledge) by being developed in a context of application as opposed to a context governed by a specific academic community, transdisciplinary as opposed to disciplinary, and heterogeneous as opposed to homogenous.

Mode 2 knowledge is usually prevalent in professional disciplines such as marketing, whose scholarly aim is focused, according to Hunt (2002), on problem-oriented research intended to improve decision-making and to marketing management practice in organizations. According to Swanson and Chermack (2013, p. 6) "applied disciplines are realms of study and practice that are fully understood through their use in the functioning world." Thus, the function of a "professional discipline" is more application-oriented. Researchers in the professional discipline are responsible, though, for producing knowledge that can be or has the potential to be applied by practitioners (Hunt, 2002). In this sense, the researcher is seen as a public intellectual with responsibility to contribute to debates on matters of public policy and to the public good (Humes & Bryce, 2001).

Professional disciplines aim also to have some kind of effect on the world and their focus might be clinical. They act as “trustees of categories of practical interests and needs of society and its members” (e.g., the maintenance of health), and “assume responsibility for managing ongoing practical processes and for seeking and finding solutions to concrete, practical and managerial problems” (Hills, 1978, p. 2). This means that applied disciplines are intended, among other things, to generate a specialized body of knowledge that is organized around the problems of practice.

More specifically, researchers in professional disciplines are intended to provide solutions to problems, assist practitioners at work, guide policy, provide insights and understandings, or establish fundamental principles of learning (Nisbet, 2005). Groves (1968), claimed many years ago against the centrality of “pure,” theoretical knowledge and implicitly in favor of applied knowledge production:

Existing knowledge and theory are of little relevance when taught for their own sake; they are important only as they assist in answering questions and solving problems with which we are now faced. Most importantly, each younger generation must continually develop its capabilities to prepare for realities virtually unrecognized by the previous generation (p. 70).

“Mode 2” knowledge production, though, has penetrated the discipline of “education” (Nisbet, 2005). Accordingly, a good research can be used in practice and identifies what works. The significant role of applied scientific knowledge is in meeting the demand for “how-to-do-it” knowledge by many public and industrial agencies (Stehr & Meja, 2005). Thus, academic policy research, according to Dredge (2014), includes a wide range of studies such as “descriptive research” (e.g., describing aspects of policy), “normative research” that provides policy guidance and recommendations, “procedural research” that describes and analyses planning and policy processes, “predictive research” that predicts the consequences of actions and strategies, and “evaluative research” that evaluates the performance of policies and plans.

In addition, due to public pressures for accountability and utility in education, applied research might be given priority over theoretical and long-term studies, which often prove eventually more important in bringing about major alterations of attitude and understanding (Nisbet, 2005). This approach has been debated by EA scholars for many years.

**EA as an Applied Science.** In 1967, Jean Hills asked: “what are the functions of research for educational administration (EA)?” and answered:

For the most part, we have simply assumed. . .that research has important functions both in the training of teachers and administrators, and in the practice of teaching and administration. . .in short, we have defined our problem as one of improving education by getting research into practice without ever raising the question of what it is that research contributes to practice (Hills, 1967, p. 26).

I would like to argue, then, that EA is an applied science that produces knowledge just like any other kind of science. But, this knowledge that is organized around the problems of the educational-managerial practice is assumed to guide education policy-makers, provide professors with tools to better prepare educational leaders,

and assist educational leaders and teachers at work. Notably, EA is an applied field that aims to improve the educational system, in general, and educational policy and leadership, in particular, by scientific means (e.g., research, critical writing). Thus, congruent with social science disciplines, EA aims to describe the reality and explains it as well as to understand and improve this reality, as Foster (1986) indicated. Note, its researched reality is demarcated by scholarly boundaries that define the core knowledge EA researchers are expected (or we better say “allowed”) to produce by their colleagues (the expectations are transmitted many times by editors and reviewers in the field’s refereed journals). Put another way, EA researchers may be regarded as applied scientists whose areas of study are constrained to issues of educational administration, management, and leadership.

Oplatka (2010a) found some examples of applied knowledge production in the field’s journals, such as essays and conceptual papers that were intended to provide policy-makers with practical models and tools to analyze their policy-making process and its implications for schools, normative models of how to conduct teacher appraisal successfully or how to implement school changes effectively, and many descriptions of effective managerial strategies and tools (e.g., Total Quality Management) to be used by school principals. Likewise, works that aimed at exploring the quality and feature of principal preparation programs (PPPs) offered better ways to prepare future educational leaders. Some EA researchers are oriented toward knowledge production of the kind of effective teaching methods in PPPs, learning materials, principles of mentoring, or the best way to organize cohorts in these programs.

It is likely that EA field is the sole responsible within education studies and management studies (e.g., public administration, organizational studies) for the production of knowledge that might contribute to the improvement of the administrative and organizational aspects of the school. Its researchers are committed to explore problems related to improving professional practice (Heck, 2006), through the production of better ways of knowing within the practice of developing longer-term perspectives through the description of practice and an understanding of that practice (Gunter & Ribbins, 2003). Bush (2000) summed up this commitment clearly:

The study and practice of EA in the twenty-first century are likely to take place in the context of stronger links between educational outcomes and economic development. Governments will expect schools, colleges, and universities to help their countries to compete in the global economy. . . (p. 280).

---

## Conclusion and Reflections

In its pursuit for academic acknowledgment and legitimacy, EA field has aspired to be a science as much as possible; its researchers have followed the major scientific principles of objectivity and multiple truths and used different theoretical and methodological perspectives in their studies. Consistent with major definitions of “science” indicated above, EA researchers aim to enhance knowledge in order to explain and understand managerial and organizational phenomena in educational

systems and institutions. In this sense, they follow the purposes of science just like any other scientists in academic disciplines, indicated by different scholars in this chapter (e.g., Lui & Burguete, 2014). They also conduct dynamic scientific researches that include observation, interviewing, survey, and the like (Hallinger & Kovacevic, 2019). In doing so, they formulate explanations intended to reduce our uncertainty about educational leadership, administration, and policy, a purpose that reminds the work of scientists in each academic discipline (Stirling, 2010; Tranoy, 1988).

Yet, the EA field faces a host of dilemmas in regard to its theoretical vs professional orientation (Oplatka, 2010b; Ribbins, 2006). On one hand, it aims to develop new theories and concepts that systematically describe and explain regularities in behavior in educational institutions, as expected from any science (Hoy & Miskel, 2008). Like any other science, its research should be novel, original and innovative to keep the field vibrant and relevant in the university. Its self-corrective nature is expressed, among other things, by the development of new models and perspectives of educational leadership. On the second hand, however, the EA field is called publically to provide solutions to problems and devise “how-to-do-it” models and tools. One can see EA as an applied science whose core is rooted in fundamental scientific principles but its outcomes are intended to improve the educational arena.

An applied science, nevertheless, faces many shortcomings, both scientifically and practically. Scientific research cannot exclusively be guided for the benefits of a particular group of practitioners (Hunt, 2002), at least in part because knowledge production is far more dynamic in that theory and practice vitally interact and one renews the other (Boyer, 1982). Science is supposed to examine, explore, and understand the reality drawing on theories, models, and concepts (i.e., an academic scholarship) that has been built on a series of scholarly developments and on a sequence of ideas. Every study is expected to contribute to this scholarship, first. Coburn and Stein (2010) indicated that educational research seems to deal with questions deriving, basically, from the researchers’ own interest (i.e., scholarship) rather than from the needs of policy-makers and educators who have limited access to research findings anyway.

Likewise, Boyer (1982) pondered the extent to which scientific knowledge could be responsibly applied to consequential problems and the ways by which it can be helpful to individuals as well as institutions. It seems that many applied research findings are becoming increasingly less useful for solving practical problems, as Rynes, Bartunek, and Daft (2001) noted in respect to organizational science. In EA, the benefits of this knowledge in a form of practical implications for practitioners is highly questioned (Oplatka, 2020), unfortunately.

## Abstract

National standards for educational leaders became a prominent discussion in the mid- to late 1980s as the idea of what administrators needed to know to lead schools evolved. This chapter furthers this discussion and includes an overview of both the national standards and national educational leadership standards. The chapter starts with the dominant historical narrative espoused in the field of education about standards and goes on to briefly review that same narrative about national educational leadership standards. The chapter then interrogates the accuracy of the dominant narratives by juxtaposing the historical realities related to the context of the time and challenges the idea that national educational leadership standards are inclusive and objective.

## Keywords

National standards · National educational leadership standards · Critical race theory · White supremacy · Implicit bias · Racism

**The Field of Memory**

The idea that there are universal understandings of how to develop national standards for education and educational leadership; the belief that standards are objective measures which provide baselines for school building and districts administrators and that the standards outlined for programs preparing leaders are objective.

**The Field of Presence**

Years of persistent educational reform have yielded mediocre results at best; calls for more accountability on the part of accreditation organizations to better prepare graduates for educational leadership to navigate existing twenty-first century challenges.

**The Field of Concomitance**

It includes anthropology, sociology, psychology, history, the Civil Rights Movement, and Black Lives Matter Movement.

**Discontinuities and Ruptures**

National educational leadership standards are based on the postmodern view that there are no single, unitary, undisputed views of “reality” (English, 2006); the ahistorical context of education, inclusive of the field of educational leadership, requires critical interrogation of the legacy of white supremacy and institutionalized racism in educational leadership.

**Critical Assumptions**

The inadequacy of national educational standards sustains and maintains opportunity gaps in the field of pre-K-12 education and the white supremacist ontology and epistemology with higher education; the idea that standards are not influenced by an individual’s personal ontological and epistemological beliefs is false; the lack of criticality in the field of education and educational leadership contributes to the opportunity gap; if standards are going to be impactful, standards have to move away from the rigid perception that there is equity within the field and must account for the history of white supremacy and the legacy of racism that continues to impact education and educational leadership.

---

**Introduction**

National standards for educational leaders became a prominent discussion in the mid- to late 1980s as ideas about how school administrators should be prepared to effectively lead schools and support teachers, shifted. The idea of “principal as manager” expanded to include responsibilities such as serving as the chief instructional leaders inside schools, and discussions about what principals needed to be prepared to do so also began to expand. There has been a good amount of discussions regarding the scope and roles assigned to teachers and school building administrators over the years and yet there has been limited consideration of how

systemic racism and white supremacy have aided in maintaining inequity in the field of education. In alignment with the current trend of examining curriculum, lesson plans, and resources to ensure these materials are culturally responsive, national educational standards need to be interrogated to ensure alignment with the goal of dismantling white supremacist ideology and interrupting the pathology of racism that plagues the field of education, broadly, and educational leadership.

Infusing criticality, specifically, utilizing critical race theory (CRT) (Ladson-Billings and Tate, 1995) can allow one to interrogate the historical gaps, omissions, and misnomers about *who* the “standards” in the field of educational leadership were intended to help. The standards were designed to assist school building and district administrators be able to outline “. . .foundational principles of leadership to guide the practice of educational leaders so they can move the needle on student learning and achieve more equitable outcomes (Council of Chief State School Officers [CCSSO], 2015, p. 1)” (National Policy Board for Educational Administration [NPBEA], 2015, p. 2). Utilizing CRT to examine the standards affords us the ability to consider how the gap between the goals and the outcomes of the standards may be connected to sustaining the legacy of white supremacy and racism in education. This is of particular importance in the field of educational leadership as school building administrators-principals and assistant principals contribute significantly to school climate and culture. It is also important because white supremacy, racism, and hegemony continue to permeate the walls of schools across the USA. Research indicates that these factors directly impact the quality of educational experience and indirectly influence student achievement.

The chapter begins with a brief overview of the dominant historical narrative on national education standards and goes on to briefly review that same narrative about national educational leadership standards. The chapter then interrogates the accuracy of these narratives by juxtaposing the historical realities related to the context of the time and challenges the idea that national educational leadership standards are inclusive and objective.

---

## Historical Context of National Standards

The history of national standards in the USA dates to 1892 when the National Education Associations Committee of Ten made the case for a standardized high school curriculum or a “national system of education that aims at certain common results and uses certain common means” (Greer, 2018, p. 101). The evolution of the quest for a national set of educational standards is well documented throughout the twentieth century. The goal was to construct a set of standards by which high school accreditations could be granted. This began in 1918 when the Cardinal Principles of Secondary Education were drafted, establishing a set of benchmarks students should be able to achieve as high school graduates (Greer, 2018). Establishing standards in education began to take shape in the USA during the twentieth century, partially in response to international developments and domestic educational case law demanding equity for Black children as well as students with disabilities. It was argued that to determine whether inequities existed, there had to be a benchmark by which one

could measure what students should be able to do because of the quality of education they received.

Although the Department of Education was founded in 1867 by President Andrew Jackson, the effort to ensure continuity became a national priority in the 1960s as education is not explicitly mentioned in the US constitution (US Department of Education, 2010). As a result, education, along with many other presumed fundamental rights, was relegated to states. A collective push to develop standards on a national level took shape when the federal government committed to providing resources and establishing an informal but prominent role to influence education sparked by international events such as the Cold War and explicitly the launch of Sputnik. These events ignited a national priority on education and subjects such as science, engineering, and math. The federal government sought to take a more prominent role and in the 1960s and 1970s to influence education in effort to ensure that US citizens could compete on an international level (US Department of Education, 2020).

The evolution of the Department of Education as well as the varying degrees and roles in which the federal government engaged in national governance in education continue today. Reports commissioned by the Department of Education such as the Equality of Educational Opportunity Report in 1966 (also known as the Coleman Report) and *A Nation at Risk* in 1983 continue to influence and drive federal education reforms, which in turn trickle down to both the state and local educational authorities (LEAs). The following are the federal reforms that have emerged in response to one or both reports: The Elementary Secondary Education Act (ESEA) 1965, National Assessment of Educational Progress (NAEP) 1969, Goals 2000: Educate America Act, Improving America's School Act 1994, No Child Left Behind 2000, Every Student Succeeds Acts 2015, and Race to the Top 2015. Federal intervention sets the stage for the current standards-based reform movements present in the field today (Greer, 2018). Within the last 40 years, reforms have shifted the focus on exploring the existing levels of inequity in education to seeking to bring national unity on the instructional core in pre-K-12 education. The goal of such national efforts was to develop standards to help "America's students to promote student achievement and preparation for global competitiveness by fostering educational excellence and ensuring equal access" (US Department of Education, 2010). In response to these standards, national standards in education leadership were born to help identify the skills educational leaders need to support pedagogues in meeting standards and "improving student achievement [which] is the central responsibility of school leadership" (NPBEA, 2011).

---

## Historical Context on National Standards in Educational Leadership

National standards for educational leadership have historically been tethered to national standards on education. The Committee for Advancement of School Administration (CASA) was founded in 1955; this was after the National Council for the Accreditation of Teacher Education (NCATE) was established in 1954

(Hoyle, 2005). CASA was the result of the American Association of School Administrators (AASA) and the Kellogg Foundation brokering a deal to create a committee within NCATE to develop a set of priorities for the preparation of school administrators (Hoyle, 2005, p. 23). The “standards” created by CASA were published in 1958 by AASA and were “. . .influential in increasing the use of standards of preparation, professional development for school administrators, school board procedures for selected school superintendents and suggestions for needed research in the field (Moore, 1964)” (Hoyle, 2005, p. 24). It should be noted that these standards were used in the accreditation process by NCATE and AASA’s CASA.

Scholars pushed back against the standards challenging the validity of them in the accreditation process, and in the 1970s, CASA revised the standards in response to the feedback from scholars in educational administration preparation programs. In 1982, the AASA partnered with CASA to revise the standards. These new standards came to be known as the new *Guidelines for the Preparation of School Administrators* and went on to serve as the benchmark for licensure in several states and were applied by NCATE as the standard for administrator preparation programs from 1983 to 1995 (Hoyle, 2005).

Coincidentally, those who critiqued the standards and the revised *Guidelines* maintained that they relied too heavily on what they believed were antiquated management models. As a result, additional stakeholder groups, which were made possible as the result of new philanthropic investments in the field of education, emerged (Douglass, Scott, & Anderson, 2019). The 1987 report of the National Commission on Excellence in Educational Administration gave birth to the National Policy Board of Educational Administration (NPBEA) (NPBEA, 2021). A part of NPBEA’s charge was to reform “. . .preparation programs in educational leadership and developing initiatives to revitalize the profession of educational leadership, including the setting of national school and district leadership standards” (NPBEA, 2021).

In 1994 a new group comprised of current NPBEA members and Council of Chief State School Officers (CCSSO) merged to create the Interstate School Leaders Licensure Consortium (ISLLC). This body was commissioned and committed to “. . .regrounding the profession” (Murphy, 2003, p. 8). The 1994 ISLLC standards were the inaugural set of national standards for school administrators. There were six standards comprised of common knowledge, dispositions, and performances that the consortium believed all school administrators, ranging from early career to advanced career, should possess and be able to demonstrate. The ISLLC standards were updated in 2008 to reflect “. . .how the six updated standards are grounded in the latest research on instructional leadership, which now finds that setting the school’s direction and culture influences how teachers perform and are the area where principals can make the greatest impact” (CCSSO, 2008).

With the support of NPBEA, the 2008 ISLLC standards were revised by the Educational Leadership Constituent Council (ELCC) and presented to NCATE in 2011 because “clearly defining what successful learning or performance looks like has become increasingly evident during the past decade” (p. 5). The NPBEA stated that “without a doubt, the better one understands what excellence looks like, the

greater one's chances are for achieving – or surpassing – that standard” (NPBEA, 2011, p. 5). In 2015 the ISLLC/ELCC standards were updated to the Professional Standards for Educational Leaders (PSEL).

The PSEL are the most current standards for educational leaders, and these standards were updated to help leaders navigate challenges in school buildings and districts that may not have exist in 1996 when ISLLC was developed. The following rationale was articulated regarding the need for the 2015 PSEL:

But the world in which schools operate today is very different from the one of just a few years ago – and all signs point to more change ahead. The global economy is transforming jobs and the 21st-century workplace for which schools prepare students. Technologies are advancing faster than ever. The conditions and characteristics of children, in terms of demographics, family structures, and more, are changing. On the education front, the politics and shifts of control make the headlines daily. Cuts in school funding loom everywhere, even as schools are being subjected to increasingly competitive market pressures and held to higher levels of accountability for student achievement. (NPBEA, 2015)

Currently, the 2015 PSEL and the 2018 National Educational Leadership Preparation (NELP) Program Recognition Standards for Building and District Levels are the most recent iterations of national educational leadership standards.

---

## **Discontinuities and Ruptures: Misnomers, Lies, and the Counternarrative: A Case for CRT**

A vast chapter of western thought is thus made to disappear by sleight of hand, and this conjuring trick corresponds, on the psychological or psycho-historical level, to the collective suppression of troubling memories and embarrassing truths. . . The history of imperialism, colonialism, and genocide, the reality of systemic racial exclusion, are obfuscated in seemingly abstract and general categories that originally were restricted to white citizens. (Mills, 1997, pp. 117–118)

In 1954, the Supreme Court ruled that “racial segregation of children in public schools was unconstitutional in what is cited as a landmark case *Brown v. Board of Education of Topeka, KS* (History.com, n.d., Will, 2019). A year later, 1955, the same year that CASA was established by AASA and the Kellogg Foundation, the Supreme Court ruled on a case referred to as *Brown II* “. . . which remanded future desegregation cases to lower federal courts and directed district courts and school boards to proceed with desegregation “with all deliberate speed” (History.com, n.d.). This case reversed *Plessy vs. Ferguson*, the 59-year-old discriminatory case that legalized racial discrimination based on race in public spaces, essentially ending federal, state, and locally sanctioned segregation based on race in the USA. Understanding the historical context of the time which was that separate but equal was far from equitable, Black communities and communities of color, broadly, were relegated to less desirable facilities and forced to struggle to make do with inadequate resources. The dominant narrative espoused about national standards is framed as coming from an equity-oriented, just, and colorblind perspective; however, the counternarrative is that the individuals responsible for the initial iteration of national

standards attended racially segregated schools and likely had deficit perspectives on the abilities and potential of Black children and children from communities of color. Additionally, the standards published in 1958 were likely not drafted with *Brown II* or any expectation that school integration would be realized.

Given the dominant narrative in the field of education which presumes parity, equality, and access for all along with objectivity, fairness, and meritocracy, it is imperative to highlight the historical context of the time and to chronologically situate or juxtapose how assertions of objectivity, fairness, and meritocracy in education are misguided and false. When Africans were kidnapped, sold into slavery, and brought to the USA in the sixteenth century it was illegal for enslaved Africans to learn to read. In fact, it remained illegal for enslaved Africans to be educated in the USA until the late nineteenth century. Additionally, there was a presumption of superiority and the intent to marginalize and assimilate communities of color that were othered; for example, Indigenous natives were forced to attend boarding schools designed to “civilize” or teach them to assimilate to Euro-American culture.

It is also important to interrogate narratives of history that obscure the role of global white supremacy, to problematize the inconsistencies of the white settler colonial narrative as the foundational narrative of the USA, and to illuminate the role that the hierarchy of whiteness plays in establishing a “White” ethnicity as the dominant culture in US history (Gerber, 1999). West (1993) said it this way “without the presence of black people in America, European-Americans would not be ‘white’ – they would be Irish, Italians, Poles, Welsh, and other engaged in class, ethnic, and gender struggles over resources and identity” (pp. 107–108). In the field of education, discourse about equity, equality, and opportunity take place in the present day without acknowledgment that the idea of collective or public schooling was conceptualized and designed without Black, Indigenous, Latinx, Asian, Asian American, Pacific Islander, or Native Hawaiian communities in mind. Prior to Horace Mann’s and Henry Bernard’s quest to establish and then reform the common schools in the Northeast, education in this country was restricted to White, male, landowners who were wealthy enough to have tutors come to their homes and educate their children (Isenburg, 2016). The common school was established in the nineteenth century for the children of White Anglo-Saxon Protestants (WASPs) who were not wealthy, and their children were largely uneducated or undereducated. These schools also included children of Jewish, Irish, Italian, and other European ethnic cultures that were not considered “White” until they immigrated in mass to the USA in the twentieth century (Brodkin, 1998; Ignatiev, 1995; Roediger, 2007).

Yet, discourse about the academic performance of communities of color is disguised in deficit-laden language such as “achievement gap” and terms such as “sub-group.” These words are used to describe children of color, poor children, children from the LGBTQIA+ and immigrant communities, and students with disabilities regularly in districts around the country. There is no recognition or acknowledgment that the current state of education is the legacy of intentional, strategic, and racist policies or that these policies contribute significantly to the conditions of schools and communities around the country. Additionally, the “achievement gap” continues to persist despite best efforts to close it. The reason these policies continue to affect the field today is because they were

implemented with fidelity. If the legacy of white supremacy and racial discrimination were acknowledged it might lead to the much-needed reckoning within the field of education.

“Standards rooted in an epistemological and ontological premise of white supremacy will produce ahistorical and uncritical standards guiding ELPP [educational leadership preparation programs]” (Waite, 2021, p. 15). Unless national standards require ELPPs to confront the legacy of white supremacy and institutionalized racism issues such as inequity, discrimination, and anti-Blackness will continue to prevail in pre-K-12 education. If accreditation granting organizations do not require that the field of educational leadership authentically grapple with and provide explicit guidance for ELPPs these issues will not only continue to persist they will worsen. A lack of criticality in the standards themselves is foundational to sustaining both white supremacy and institutionalized racism in the field. This has been evidenced by lack of acknowledgment of race in the standards themselves.

Gooden and Dantley (2012) proffered that a framework for educational leadership was necessary and salient to both speak to the changing demographics in schools and to address issues of race in the broader social context of schooling. The researchers indicated that the use of race and/or racialized language in preparation programs could be instrumental in preparing aspiring and existing educational leaders feel equipped to engage with shifting demographics within communities that directly impact schools. In *Color-Blind Leadership: A Critical Race Theory Analysis of the ISLLC and ELCC Standards*, Davis, Gooden, and Micheaux (2015) analyzed the language of the ISLLC and ELCC standards along with the accompanying reports using a CRT framework which allowed the researchers to examine the domains and components of the standards for use of race or language affiliated with race.

The researchers found that 2008 ISLLC standards did not use the words race, ethnicity, color, diversity, equity, and social justice at all. The word culture was used in the standards twice, twice in the functions or elements of each standard, and once more in the accompanying report. The word diversity was used twice in the functions or elements of the standards. Similarly, the words race, ethnicity, and color were not used in the ELCC standards at all. However, the words culture and diversity were used three times in the standards, twice in the functions or elements of the standards, and 76 and 40 times, respectively, in the accompanying reports. The words equity and social justice were used once each in the standards, once each in the functions or elements of the standards, and 24 and 14 times, respectively, in the accompanying reports. At the time of publication, the authors acknowledged that they were heartened and encouraged by the inclusion of and explicit use of race and racialized language in the proposed 2015 revisions of the ISLLC and ELCC standards, which would go on to become the PSEL standards. While the proposed 2015 revisions reflected movement toward the guidance offered by Davis et al. the studies published by Johnston and Young (2019) and Rogers and Tienken (2020) suggest that educational leadership preparation programs are still not producing educational leaders who feel their programs adequately prepare them to navigate racial and SES issues related to diversity, equity, or social justice.

Johnston and Young (2019) found that 40% of principals and teachers participants felt that their preservice programs did not prepare them to support Black, Latinx, and low-income students. Among that 40% of participants, they also found that “White principals and teachers had lower rates of agreement that their preservice training prepared them to work with black, Latino, and low-income students compared with their nonwhite peers” (p. 2). The American Superintendent (AASA) 2020 Decennial Survey by Rogers and Tienken had 1218 respondents from 45 of 49 states affiliated with the AASA. The findings of the survey indicated that the participating superintendents reported the following perceptions of effectiveness; they felt most effective enhancing perceptions of the district, managing finance and budgets, and improving school climate. These superintendents felt less effective with improving student achievement, navigating issues of diversity, and supporting social emotional learning. In 2020, presumably prior to covid, superintendents articulated that they felt least effective at improving student achievement. Yet, the purpose of the national educational standards is to provide a first step for state and local education agencies to create “comprehensive, locally tailored approaches for developing and retaining high-quality leaders. . .[and] to raise student achievement” (CCSCCO, 2008, p. 5).

National standards are based on the idea that there is a single, unitary view of reality and that these objective standards reflect it. The belief that standards are, in and of themselves, objective, unbiased, benchmarks is problematic. It is equally problematic that these beliefs are established as fact and that the field of education governs itself under this fallacy. There was dissension among scholars about the validity of standards and the process by which they are developed. English (2006) indicated that the development of national educational leadership standards was “. . .antidemocratic” (p. 463) as “the knowledge base that was fashioned in the political process of creation remains truncated, ahistorical, decontextualized, and most important, immobile” (p. 465). Hoyle indicated that

The development of professional standards in educational administration/leadership is a continuous quest to find consensus among scholars and practicing administrators about a common body of knowledge and a set of competencies, dispositions, and language to seek quality in the professional preparation and development of school leaders. (2005, p. 23)

Using CRT to examine the standards allows scholars and practitioners, alike, to correctly situate the development of educational leadership standards in the historical context of the time. The “standards” published in 1958 and the subsequent updated iteration dubbed the *Guidelines for the Preparation of School Administrators* did not explicitly account for preparing administrators to meet the needs of the Black community or communities of color, broadly. In 1892 when the National Educational Association Committee of Ten came together to ponder developing “. . .a national system of education that aims at certain common results and uses certain common means” (Greer, 2018, p. 101), the country had transitioned from the Black codes during reconstruction to Jim Crow laws in which separate and unequal treatment was legal and experienced throughout the country (National Park Services, n.d.). Yet, national standards for educational leadership have historically boasted that

“The [2015] Standards have been recast with a stronger, clearer emphasis on students and student learning, outlining foundational principles of leadership to help ensure that each child is well educated and prepared for the twenty-first century” (NPBEA, 2015, p. 2). Clearly the 1958 standards and *Guidelines for the Preparation of School Administrators* were not developed to factor in the education of children of color. If the standards have been in a constant state of revision, how could it be possible that the current iteration of “standards” outline foundational principles of leadership? When the idea of creating a standard was conceptualized in 1892 it was illegal for enslaved Africans to learn to be educated. National education and leadership standards are not and have never been objective and that is largely because there is not one single, unitary perspective of reality. Criticality, and specifically, CRT creates the space for us to ask these types of questions and engage in conversations that can push us toward understanding how our personal epistemologies directly influence our professional praxis.

### **The Necessity of Criticality Within National Educational Leadership Standards**

Organizations developing national educational standards, national educational leadership standards, and national accrediting organizations must acknowledge the role that both white supremacy and racism have played in education. This requires understanding that the history around educating people of color in the USA has been redressed via reforms and interventions rooted in racism and deficit-laden narratives. For African Americans and Black immigrants, the global epistemology in education is anchored in Afro-pessimism or the idea that “Black people exist in the social imagination as (still) Slave, a thing to be possessed as property, and therefore with little right to live for herself, to move and breathe for himself (Gordon, 1997; Hartman, 1997, 2007; Sexton, 2008; Wilderson, 2010)” (Dumas & Ross, 2016, p. 429). It is this ideology that led the Supreme Court Justices to draft the majority opinion in *Plessy vs. Ferguson* in 1896. Four years prior, in 1892, the Committee of Ten began conceptualizing the idea of creating a “standard” in education, at a time when Blacks were seen as second class at best. The legacy of that perspective is still alive and active in schools via data on discipline referrals, referrals to special education, and underrepresentation in gifted and talented and/or honors programs. Afro-pessimism is still present today as evidenced through deficit-driven language used to describe Black students, students with disabilities, multilingual learners, and Title I students and their families as “subgroups.”

Low expectations and negative thinking about communities of color have negatively impacted generations of students in the USA. This has been demonstrated in the field thorough “best practices” which have been revised because they were detrimental to student performance such as forcing multilingual learners to only speak English in their homes. Fortunately, the research evolved and demonstrated that multilingual learners who had strong foundations in their native language were able to acquire proficiency in a second language like, English, easily

(Garicá, Kleifgen, & Falchi, 2013). Similarly, the growing body of literature on the merits of culturally responsive education demonstrates that strong cultural identity has led to improvements in the academic performance of many aboriginal communities around the world (Duncan-Andrade, 2007). The historical patterns are clear, it is evident that the issue is *not* within communities of color, the issue is the structured silence of white supremacy within national educational and leadership standards. Saad (2020) indicated

White supremacy is a racist ideology that is based upon the belief that white people are superior in many ways to people of other races and that therefore, white people should be dominant over other races. White supremacy is not just an attitude or a way of thinking. It also extends to how systems and institutions are structured to uphold this white dominance. . . . [In this book] we are only going to be exploring and unpacking what white supremacy looks like at the personal and individual level. However, since systems and institutions are created and held in place by many individual people, it is my hope that as more people do the personal inner work in here, there will be a ripple effect of actionable change of how white supremacy is upheld out there. This work is therefore not just about changing how things look but how things actually are – from the inside out, one person, one family, one business, and one community at a time. (p. 12)

As Saad suggested, the work must begin internally and include reflective praxis, particularly for organizations developing guidance for ELPPs which are responsible for the training, development, and endorsement of state credentials for both school building and district level leaders.

National organizations developing national and educational leadership standards *and* ELPPs owe a debt, moral and ethical, to the students and families who have been impacted by the shortcomings of the graduates ELPPs have recommended for state licensure. The practice of graduating and recommending students for leadership who do not feel they leave these programs equipped to “. . . move the needle on student learning and achieve more equitable outcomes (CCSSO, 2015, p. 1)” (NPBEA, 2015, p. 2) in spite of graduating from a “rigorous” state-accredited program is deeply troubling. “The bold, radical, transformative experiences required to develop culturally responsive school leaders who are actively anti-racist and social justice-oriented are achieved through powerful, transformative learning experiences informed by critical theory” (Waite, 2021, p. 15).

National standards within educational leadership do not require that educational leaders at either the school building or district levels explore how the historical legacies of slavery, racism, and anti-Blackness are tied to some of the challenges faced in present day within schools. School building and district leaders are often not trained to interrogate how these historical events contribute to the construction and development of the communities they serve nor how the inequities of the past create the current environments which impact the condition and the quality of experience inside their buildings and districts. This limits their ability to support the students and the families they serve. However, recent studies indicate that teachers and leaders are graduating from preparation programs across the country and transitioning into teaching and leadership positions feeling unprepared to serve students

from communities of color as well as Title I students. Leaders must understand how the demographics of the families in their schools/districts directly impact school finances and budgets. They should also understand the historical context regarding the resources their schools receive, for example, special funding weights and allocations or specialized programming. If the social capital of family demographics (particularly families with lower socioeconomic standing) is not considered, how can the impact of additional funding be assessed? How can they improve the quality of education for their students without access to financial resources and other supports? How can ELPPs prepare leaders to redress challenges and inequities that exist beyond the walls of the school that influence what takes place inside of schools? Discrimination in housing, employment, access to food, adequate health care, and a host of other factors contribute to the opportunity gap. Racism, implicit bias, and overt discrimination at the federal, state, and local municipal levels are responsible for the marginalization of communities of color and poor communities. However, none of this is addressed within national standards, nor is there a requirement that ELPPs include this information in course or curriculum.

Given the responsibilities of aspiring and current school building and district-level leaders it is vital to infuse criticality and, specifically, to use racialized language explicitly when developing national educational leadership standards. Davis et al. (2015) stated it best:

We understand the need for standards and strongly support having them. However, the absence of an explicit consideration of race and its impact on the thinking and practice of educational leaders is concerning, especially given the well-documented impact of race on teaching and learning in schools. (Dixson & Rousseau, 2006; Howard, 2010; Ladson-Billings, 2006a, 2009; Milner, 2003, 2010, 2012) (p. 337)

---

## Conclusions and Reflections

To adequately prepare school building and district educational leaders, the field of educational leadership must examine the historical context linked to national standards. Currently, the external issues directly impacting schools are not viewed as factors within a school's control and the historical gaps about *how* and *why* communities continue to underperform nationally are not examined. In many ELPPs there is little consideration of the context behind the words "historically minoritized communities" in relationship to education and/or how history continues to impact underserved communities in real time. Continuing to ignore the legacy of white supremacy and the reality that there *is* a hierarchy of whiteness maintains impoverished, rural White communities in which poor White children persistently underperform because they, too, are impacted by an opportunity gap as their families lack resources.

The inherent racism, classism, and elitism in education broadly and in the field of leadership, specifically, is exacerbated by the ahistorical context of history in the field. The "bootstrap narrative" or the myth of meritocracy is reinforced by the ideology of colorblindness in education. To be clear, merit is real. However, the idea that in the USA there is equal access to opportunity if you demonstrate a

commitment to hard work is false. This is because national educational leadership standards have been set up to require inequity permanently in society and “. . . within it, fixed schools. For this reason, the standards have been open to the criticism that they have permanently embedded social injustice for marginalized or oppressed groups within them (English, 2005; Tillman et al., 2003)” (English, 2006, p. 465). Without explicit commitments from national accrediting organizations and professional organizations in the field of educational leadership, this cycle will continue to persist. To redress these foundational problems, the field will have to begin interrogating its foundation. That starts by openly and honestly examining and interrogating the misnomers, unintended consequences, and the incongruities of national educational leadership standards. DiAngelo (2021) said it this way:

Take action to address our own racism, the racism of other white people, and the racism embedded in our institutions. Insist that racism get on the table, and work to keep it on the table. Center antiracism work by resisting the pull to include every kind of diversity so that nothing is addressed in depth and racism is sidelined. (p. 192)

It is disingenuous at best for the discussion about national educational leadership standards to continue omitting the legacy of white supremacy and institutionalized racism within the academy (Wilder, 2013). However, Mills (1997) highlights that the white settler colonial narrative perpetuated as the history of this country is necessary to employ the narrative that “the United States was founded on noble moral principles meant to include everyone, but unfortunately, there were some deviations” (p. 122). The counternarrative to this fallacy or lie is that the founding of the USA was made possible via implementation of a “. . . de facto phase of white supremacy” as a global power (p. 122).

Just as CRT rejects “the inherent belief in law to create an equitable society” (Lynn & Parker, 2006, p. 260), this author rejects the idea that the existing national educational leadership standards will guide ELPPs to produce social justice, equity-oriented, actively anti-racist school building, and district-level leaders. White supremacist ideology undergird the policies, systems, and structures that sustain institutionalized racism in pre-K through postsecondary education. Criticality, specifically, CRT, offers a framework and lens through which we may all examine the world and interrogate both our role within education and the role we play in sustaining *or* interrupting the pathologies of white supremacy and racism in school districts across the country. The national standards maintain the structured silence of white supremacy in educational leadership. The question is now, what will be done to interrupt the pattern?

## Abstract

Life writing, a collection of writing practices including biography, educational biography, autobiography, autoethnography, oral history, life history, collective biography, prosopography, social fictions, and other variants, has been an understudied area in the field of educational leadership. Reexamining the history of the commingling of leadership concepts with life writing conventions opens up new pathways for understanding how life writing can powerfully propel leadership development. The conceptual history of life writing is traced by using the mapping tools offered by Foucault's (1972. *The archeology of knowledge and the discourse on language*. New York, NY: Pantheon Books) *The Archeology of Knowledge and the Discourses on Language*, specifically "the field of memory," "the field of presence," and "the field of concomitance." Creating an intellectual archaeology of the use of biography in the field of educational leadership, and other forms of life writing, opens spaces for reimagining theoretical and practical possibilities for impacting the way educational leaders are defined, described, educated, and evaluated.

## Keywords

### **The Field of Memory**

What are the statements, ideas, or practices that are no longer in vogue, or discussed, yet still linger as part of the central starting points of understanding the uses of biography and life writing in general and as it has been applied to preparing educational leaders? What are the ideas that must be accounted for before any meaningful dialogue can be engaged, or future discourse can be introduced regarding life writing? What ideas have been pushed aside in favor of different lines of thinking?

### **The Field of Presence**

What are the statements, understandings, concepts, practices, and ideas about biography and life writing that come forth, are considered “truthful,” and yet give little rise to competing viewpoints? What ideas are currently considered to be the most viable?

### **The Field of Concomitance**

What are the statements, ideas, or theories that are prominent in other fields or disciplines that have been, or can be, transported to the field of educational leadership in a way to help transform current understandings of the role of biography in shaping educational leaders? Why are these ideas compelling? How do ideas, or sets of ideas, create ruptures in traditional ways of thinking and knowing?

### **Discontinuities and Ruptures**

What discontinuities and ruptures have occurred over time that have altered the path of understanding what role biography and life writing may play in conceptualizing educational leadership as well as in preparing educational leaders?

### **Critical Assumptions**

What are the major critical assumptions associated with the relationship between educational biography and the field of educational leadership? Critical approaches to life writing can transform the questions we are willing to ask about how lives are narrated, and by whom, as well as propel new understandings of the conditions that shape lives of educational leaders and others. The following *Ten Proposition About Critical Approaches to Life Writing* (Mulvihill & Swaminathan, 2017, pp. 10–12) anchor the critical assumptions embedded within this chapter:

1. Critical approaches to life writing understand the constructed nature of the “self” (Bakhtin, 1986, 1992).
2. Critical approaches to life writing privilege and empower individuals to talk and write as critics of oppression. Life writers engage with concepts of voice, ethics, reflexivity, and the politics of representation.
3. Critical approaches to life writing engage with discourses, history, and ideologies to explain and contextualize a life (Kelly, 2013).
4. Critical approaches to life writing work against forms of division and compartmentalization as they create portraits of lives that are meaningful (Kadar, 2014).
5. Critical approaches encourage individuals to counter-narrate or tell counter stories that create meanings of their lives that challenge the dominant discourses of race and class or gender or disability (Solorzano & Yosso, 2002). Such

approaches confront a singular, dominant understanding of social and political conditions surrounding a life.

6. Critical approaches resemble what other education literatures refer to as culturally responsive approaches. There are many resources to help grapple with the mindset and the actions that educators can take to forge more culturally responsive pedagogies (see for example the work of Gloria Ladson-Billings, Geneva Gay, Tyrone Howard, and others). And, in much the same way, researchers engaging in any form of life writing must be culturally responsive researchers willing and able to deeply investigate and understand the context within which a life is lived.
7. Critical life writing projects have the potential to elevate the interdisciplinary and transdisciplinary knowledge we have about people in meaningful ways, resulting in greater understanding and empathy for the human condition (Baena, 2013; Egan & Helms, 2002).
8. Critical approaches to life writing often foster social justice lenses to be used when interpreting lives. A variety of perspectives are used to examine assumptions, analyze power dynamics as they are played out within particular contexts, and interrogate the processes of how narratives simultaneously make some aspects of the lived experience highly visible and other aspects interminably invisible.
9. Critical approaches are “messy.” Life writers struggle with these choices and communicate their awareness of the consequences of their choices through a process of reflexivity. By engaging in reflexivity, life writers share their decision-making processes and interrogate their own position vis-a vis the project with which they engage.
10. Critical approaches make possible the “compatibility of feminist and post-colonial critical practices” (Moore-Gilbert, 2009).

---

## Introduction

Life writing, a collection of writing practices including biography, educational biography, autobiography, autoethnography, oral history, life history, collective biography, prosopography, social fictions, and other variants, has been an understudied area in the field of educational leadership. Reexamining the history of the commingling of leadership concepts with life writing conventions opens up new pathways for understanding how life writing can powerfully propel leadership development. The epistemological assumptions that frame much of the life writing research within the field of educational leadership in the United States of America (USA) have been long standing. The written and oral traditions within the field of educational leadership often conceptualized educational leaders as part of the “great man” tradition where only a select few are exalted as worthy examples of a form of leadership embodied by white males destined to save the community by leading legions of women (the laboring teaching force) with “scientific” proclamations about the way to extract learning from unruly youth.

The conceptual history of life writing can be traced by using the mapping tools offered by Foucault’s (1972) *The Archeology of Knowledge and the Discourses on*

*Language*, specifically “the field of memory”, “the field of presence”, and “the field of concomitance.” Tracing this history of ideas matters. Creating an intellectual archaeology of the use of biography in the field of educational leadership, and other forms of life writing, opens spaces for reimagining theoretical and practical possibilities for impacting the way educational leaders are defined, described, educated, and evaluated. The first section attends to *field of memory*-related questions: what are the statements, ideas, or practices that are no longer in vogue, or discussed, yet still linger as part of the central starting points of understanding? What are the ideas that must be accounted for before any meaningful dialogue can be engaged, or future discourse can be introduced? What ideas have been pushed aside in favor of different lines of thinking?

Positivism, as a thought-system, has a powerful grip on the conscious and unconscious ways leadership has been studied, understood, and communicated within educational leadership preparation programs. And this way of thinking has permeated the ways biographies of leaders have been introduced on the margins of the curriculum. Most often following the European tradition of biographical dictionaries where profiles are brief and follow a formula. The narrative of the *exalted leader* is an example of how common ways of referring to educational leadership are reliant on the positivist forms of biography applied to educational leaders. The arc of the biography often points out the early life challenges faced by the leader and how they overcame those difficult circumstances in order to give rise to their skills and abilities as an educational leader, including the motivations they hold for enacting the role for which they are destined to carry out. These types of biographies move the reader to understand and agree with the noble and distinguished rise of the leader to meet the sociopolitical circumstances facing communities. The underlying assumption is that the key to positive social change within a democracy is rooted in our educational system and specifically in the hands of the leaders compelled to bring forward a renewed and refreshed version of the promise of democracy. Within the US context the biographies of Horace Mann (1796–1859), known as the father of the common school, and John Dewey (1859–1952), a philosophical pragmatist connecting the school room experiences of children to the larger health of an American democracy, for example, play large in this stream of thinking, as does the more contemporary biographical treatments of such figures as Geoffrey Canada, an African American who grew up in the South Bronx and rose to become a Harvard-educated leader responsible for founding the Harlem Children’s Zone, or Mike Rose, a second-generation, working-class, Italian American who became a University of California-LA graduate, and is well-known for his scholarship on working-class populations and literacy issues, and as the autobiographical writer of *Lives on the Boundary* (1989).

Glaringly absent from the litany of such venerated auto/biographies are women’s contributions as leaders within educational movements and practices, such as the scant treatment often given to the nineteenth-century educators, Catherine Beecher, Mary Lyon, Emma Willard and her sister Almira Hart Phelps (Mulvihill, 1999), who built teacher education programs in the new republic. As well as Jane Addams (1860–1935), the social work activist who led the settlement house movement, founded the acclaimed Hull House in Chicago, won the Nobel Peace Prize in

1931, and was credited by revisionist historians as the intellectual grounding for much of John Dewey's influential work. These are just quick examples within corresponding time periods as Mann and Dewey. And other more contemporary US women leaders are likewise not often incorporated into educational leadership curricula such as *Linda Darling Hammond* (Professor Emerita, Stanford University and President and CEO of the Learning Policy Institute). Or *Diane Ravitch* (Research Professor of Education at New York University, historian of education, and former Assistant Secretary of Education under President George H.W. Bush, and the Founder and President of the Network for Public Education). Or *Gloria Ladson-Billings* (Professor Emerita of Urban Education, University of Wisconsin-Madison and author of the biographical text *The Dreamkeepers: Successful Teachers of African American Children* (1994) and a thought leader related to culturally relevant pedagogies). Or *Christine Sleeter* (Professor Emerita, California State University-Monterey Bay and author of many autobiographical pieces as well as autobiographical social fiction such as *The Inheritance* (2018) and other field defining work in multicultural education). Or *Sonia Nieto* (Professor Emerita University of Massachusetts-Amherst and autobiographical author with her daughter of Nieto, S., & López, A. (2019). *Teaching, A Life's Work: A Mother-Daughter Dialogue*. Or *Randi Weingarten*, (former high school teacher and President of the American Federation of Teachers a member organization of the AFL-CIO). Or *Sara Lawrence-Lightfoot*, (Professor Emerita Harvard University, a Swarthmore College, The Bank Street College of Education, and Harvard educated sociologist who is well known for her development of the research methodology portraiture in *The Art and Science of Portraiture*, with an espoused direct application for studying educational leadership, and the debates it generated (English, 2000), as well as her autobiographical writing in *Balm of Gilead: Journey of a Healer* (1988) and *Reflections on Portraiture* (2005)).

These and many more women are often muted figures within the educational leadership curriculum, even with the important turning point of Heilbrun's (1988) *Writing a Woman's Life*, where she provided a compelling rationale for the correctives needed. This obfuscation is continuous throughout every historical timeframe. The rich tapestry of possibilities for educating the reflective practitioner (Schon, 1987) using curriculum centered on auto/biographies remains underexplored.

The second set of questions pertain to *the field of presence*: what are the statements, understandings, concepts, practices, and ideas about biography and life writing that come forth, are considered "truthful," and yet give little rise to competing viewpoints? What ideas are currently considered to be the most viable?

Conceptual disagreements still abound in the creases where clashes remain active between disciplinary, interdisciplinary, and transdisciplinary notions of knowledge construction, knowledge containment, and knowledge dissemination. Critics defending the status quo often parade out the "straw man" or fallacious argument that creating or consuming autobiographical life writing, for example, is "navel-gazing" or a self-indulgent form of "me-search" (where notions of subjectivity and objectivity are scrutinized) and they ultimately argue that life writing has little or no utility for understanding the contours of educational leadership. Life writing, under this view, is linked to dominant ideas about the self as constructed by Freudian

psychology, and is sidelined as ornamental rather than transformative within the curriculum for preparing educational leaders. Alternatively, the explanation provided by Adichie, C.N. (2009) in her popular TED-Talk entitled *The danger of a single story* further highlights the benefits of expanding our awareness and engagement with multiple points of view and perspectives as they are embodied within people. A clear reminder of the notion that ideas are situated and arise amidst particular social, political, cultural, and economic conditions. This includes ideas about the self. Audrey Lorde's (1984) proclamation that "the Master's tools will never dismantle the Master's house" further brings home the powerfulness of the interconnecting elements of a hegemonic system that threatens to reduce or eliminate new thinking and related ways of living, and serves to prepare those seeking social change for the realities they will encounter. Under this theory of social change, there is no benefit from the idea that well-meaning people tinkering toward utopia will propel forward the realization of the desired just and equitable society. In fact, this naive belief in incremental change is all a ruse. Instead, wholesale, more radical, forms of social disruption and complete reconfiguration of social relations are needed according to some social change agents. These are examples of the provocative questions and debates that are centered when introducing life writing into the curriculum for educational leaders.

The next set of questions are derived from *the field of concomitance*: What are the statements, ideas, or theories that are prominent in other fields or disciplines that have been, or can be, transported to the field of educational leadership in a way to help transform current understandings of the role of biography in shaping educational leaders? Why are these ideas compelling? How do ideas, or sets of ideas, create ruptures in traditional ways of thinking and knowing?

The impact of ideas from the discipline of sociology, such as those contained at the heart of *The Sociological Imagination* (1959) where C.W. Mills argued for the intersection of history and biography within sociological thinking is a prime example. And, the evolution of the sociological life history method, once highly contested, demonstrated how the surrounding social conditions impact an individual life, and is an approach that notably forged texts such as Thomas and Znaniecki's (1919) *The Polish Peasant* and Shaw's (1930) *The Jack Roller*. This combining of disciplines helped forge new pathways of thinking. It could also be interpreted as a significant rupture from earlier sociological studies determined to amass large (mainly quantitative) data sets in order to establish social patterns of human behavior while eschewing in-depth tales of individual lives which traditional sociologists argued are best left to psychologists who may speculate about concepts such as "motivation" or historians crafting the "great man" tradition.

Another set of important interdisciplinary ideas that are being merged creatively, and impact understandings of the role biography or life writing play in crafting cultural interpretations, can be found in the classic work of Lakoff and Johnson (2003/1980). *Metaphors We Live By*. This book contributed to elevating the awareness of social scientists to metaphors as the central organizers of meaning-making including the liminality contained in metaphorical constructs that provoke both potentially restricting and simultaneously freeing ideas. They often serve as

crucibles of new understandings of how humans make sense of and move through the world. What is also notable is how frequently biographies of educational leaders are laden with metaphorical language from the natural sciences such as making the science of plant/garden growth analogous to the science of democratic progress. Life writing that engages in theoretical and metaphorical analysis can be pedagogically potent for educational leaders.

Fenwick English (1995, 2006) and Gronn and Ribbins (1996) offered correctives relative to how the curriculum used to prepare educational leaders could bend toward an astute reorganization around life writing. English (1995) noted that while biography and other forms of life writing have been identified as pedagogically important for hundreds of years, they have been notably neglected in the curriculum designed to prepare educational administrative leaders. He convincingly argues the root of this neglect is situated in the marginalization of literature not deemed “objective” as well as the persistent problem of conflating the concepts of leadership and management. The tendrils of this context remain active even in light of significant counter arguments. And examples of postpositivist lines of inquiry leading to major shifts in understanding what constitutes best practices for cultivating leadership potential in educational leaders, abounds. English (1995) offered a four-point argument for the reconsideration of the role of life writing and biography within the educational leadership curriculum:

1. “Biography is a superb teacher of context and hence meaning . . . by providing a contextual framework to study leadership, biography provides the basis for discerning the meaning of leadership its hermeneutics can be explored or deconstructed. When a life is considered a kind of text, a biography is a text within a text” (English, 1995, p. 212).
2. “Biography restores the human variable to a study of leadership (by coup d’état) (English, 1995, p. 213).
3. “Biography is a superb way to approach moral leadership . . . [employing] the Kantian categorical imperative . . . [reinforcing the idea of] morals as pre-agreements forming the grounds for ethical cognitivism” (English, 1995, p. 214).
4. “Biography is an unparalleled source for modeling the artistry involved in reflective practice. Reflective practice involves the use of coaching students in educational administration as they strive to solve simulated problems in the field” (English, 1995, p. 214).

Fenwick English is clear that “centering a curriculum with biography or autobiography is quite different from salting the traditional curriculum with short portraits or profiles of leaders. . . . A course centered on biographies and portraits presents organizational theory quite differently” (English, 1995, p. 216). Gronn and Ribbins (1996) claim biography (with an emphasis on how a person’s values framework and workstyle are galvanized) paired with ethnography (with a lens on situational cultural conditions that shape the leader) are two neglected methodologies when it comes to studying educational leadership and making their argument parallel to the one advanced by English (1995).

English (2006) further contributed to building a theoretical and practical bridge between life writing and the field of educational leadership in a way that invites those responsible for preparing educational leaders to dissolve the artificial barriers that previously prevented this type of curricular transformation. Within this chapter by English, readers are urged to carefully examine in particular, Table 1. *Definitions and Examples of 12 Life Writing Forms* (p. 147), Figure 1. *Locating First- and Third-person Life Writing Forms on Indices of Contextual Density and Life Span Scope* (p. 148), and Figure 2. *Positioning Life Writing Forms Within Organizational/Sociological Perspectives* (p. 151). These visual summarizations drive home the central argument English (2006) offered by asserting that “the continued dominance of organizational theory in educational leadership preparation programs works to marginalize the importance of not only leaders as individuals, but of all humans in educational organizations. . . . Life writing is not important as long as lives are not important . . . a full consideration of the benefits of biography and life writing as important sources in understanding leadership will involve a serious re-consideration of how leadership has been reduced to a select set of social science variables and finally earmarked as unnecessary at all in the grand scheme of things. . . .” (p. 152). English has expertly prepared the reader for disrupting the long-held and rarely challenged notions about the relative power of life writing, and the related epistemologies, that ought to guide a radical curricular transformation focused on preparing educational leaders where context erasure does not abound.

Additional permutations are taking shape whereby concepts and ideas from other areas of study are fusing with life writing practices to create new pathways of possibility. For example, Kridel’s (1998) edited collection approaches to *Writing Educational Biography*, and ideas from the field of critical disability studies offered by Couser (2009) and Singh (2016) “have added measurably to our understanding of transgressive possibilities for life writing as a force for social action” (Mulvihill & Swaminathan, 2017, p. 13). And the work of anthropologist Catherine Bateson, the daughter of Margaret Mead and Gregory Bateson, represents another form of life writing using conversational interviewing among academic women who she identified as her peers to help merge the personal and the communal lessons gained (Bateson, 1989, 2011). And the exquisite work of Laurel Richardson in her innovative *Fields of Play: Constructing an Academic Life* (1997) and her door opening chapter on *Writing: A method of inquiry* (2003) substantially impacted the way academic life writers started to envision their work in new ways.

Another promising example is in the field of feminist geography where prior boundaries between autobiography, autoethnography, and collective biography are dissolved and elements of all three approaches are incorporated into life writing by some feminist geographers interested in a “critical reflexivity sensitive to power relations and an affinity with analyzing processes of subject formation” (Hawkins, Falconer Al-Hindi, Moss, & Kern, 2016, p. 167). This group of feminist geographers opened a portal for new life writing expanses this way: “Collective biography uses researchers’ written memories about a set of experiences as texts for collective analysis. As a feminist approach to research, collective biography draws centrally on the idea that significant memories are critical in the constitution of the self, and

maintains that in analyzing memories collectively, researchers can begin to tap into wider social processes and structures. Though rarely used in geography, collective biography could be useful in data collection and analysis for geographers” (Hawkins et al. 2016, p. 165). Collective biography has also been used to advance notions of collaborative leadership among women leaders in higher education (Mulvihill, 2011), illuminate the opportunities of comparative educational biography (Mulvihill, 2009), and advance the pedagogical possibilities of infusing a biographical approach into the curriculum (Mulvihill and Swaminathan, 2020).

The theoretical work being accomplished around the cultivation of reflexivity by those engaged in life writing offers another productive example of the far-reaching impact reflexive life writing can have on educational leaders. This form of introspection taken up primarily by qualitative researchers is at the heart of knowledge creation aimed at transforming understandings of the human condition. For example, Wanda Pillow explores the “ontological and theoretical investments surrounding reflexivity as a way to map and make sense of what reflexivity does to research. . . [and she uses] Kathy Ferguson’s essay, ‘Interpretation and Genealogy in Feminism,’ as a model for tracing interpretation and genealogy in research reflexivity. Differentiating *reflexivity as interpretation* and *reflexivity as genealogical* identifies unmarked intentionalities in research as well as the irreducible necessity of both approaches in research reflexivity” (Pillow, 2015).

Autoethnography and duoethnography are qualitative research methodologies centered on active reflexivity combined with biographical life writing that have been rapidly developing within the last decade especially within educational research. Autoethnography and duoethnography both (1) require a historical and sociological framing of issues, (2) focus on the interface between people and the surrounding culture, (3) are anchored in the biographical, and (4) aim to make transparent the intellectual and emotional wrestling that takes place when researchers are grappling with the ways in which individuals experience and understand themselves, others, and the subcultures they occupy. There is also great emphasis placed on the storying process or narratives people construct as they are working out pluralistic understandings of their shared reality. Autoethnography refers to a research approach where scholars first self-identify a culture or subculture where they hold membership and then examine the nature of those experiences with others who also self-identify as holding membership in that space. This insider perspective helps illuminate the details of how culture is a shaping framework for all other experiences and often emphasizes the evocative nature of the storytelling that results from a shared examination. Increasing the use of autoethnography within the field of educational leadership would be a tangible way of forging new understandings for educational leaders often in positions to be culture-shapers. For example, McClellan’s (2012) autoethnography of reconciliation provides educational leaders with insights about how she, as an African American educational leader, negotiated her leadership identity in the midst of an educational leadership discourse dominated by white middle class men and women. This dominance was evidenced in the literature about leadership and by those who held positions of educational power and authority. McClellan reports how her race and gender identity played a critical

role in how her educational leadership identity developed and the impact her growing knowledge about Black women leaders and Black feminist epistemology had on her. And the further impacts it had on the research she was conducting about Black male educational leaders. This autoethnographic project led her to ask disrupting questions about the ways in which Black male educational leaders participated in sexism born from insidious impacts of systemic racism. McClellan implores her readers to understand that “Theoretically and experientially, Black women and men should be allies with one another in the fight for equality and justice. Black liberation represents freedom from sexism and racism and embraces a Black female/male partnership . . . Through this autoethnography and by way of my leadership praxis. . . Black men [are challenged] to critique and analyze sexism and gender politics with their peers and colleagues [and] to develop frameworks that situate the condition of Black women alongside that of Black men (see Byrd & Guy-Sheftall, 2001; Cole & Guy-Sheftall, 2003) in an effort to create leadership frameworks and praxis that diminish and destroy interlocking forms of oppression” (McClellan, 2012, p. 96). McClellan demonstrated how participating in an autoethnography can have a direct and lasting impact on a person’s understanding of educational leadership from a vantage point unlike other approaches. More traditional means of acclimating educational leaders to the complexity of their work would not generally include evocative readings and less likely to require educators to directly engage in this form of praxis.

Similarly, duoethnography, a collaboration between two (or more) scholars intent on deeply examining educational problems or issues as they manifest in the lives of the researchers, is ripe for use in by those preparing educational leaders. Duoethnography as defined by Sawyer and Norris (2015) includes four features: “polyvocal/dialogic nature, the examination of life history as curriculum, the intent not to profess but rather to learn and change as the result of the conversation, and the importance of learning from difference” (Sawyer & Norris, 2015, p. 1). The benefit of using duoethnographic processes as a central component of the curriculum to prepare educational leaders is that it provides them with a direct experience with *currere*. Pinar (1975) posited that *currere* is a method that draws connections between a person’s life history, their sense of identity construction, their personal experiences in academic spaces, and their process of actively reconstructing meaning as a result of prolonged and guided reflexivity. From this understanding Pinar developed a writing process to move educators through four stages, namely, (1) regressive (focused on past experiences), (2) progressive (focused on potential future experiences), (3) analytical (focused on the known present), and (4) syncretical (focused on integrating stages one through three). The pedagogical implications of duoethnography are great and easily deployed within preparation programs for educational leaders as a time and resource accessible practice. For example, Guerra and Pazez (2016) two educational leadership faculty members took up duoethnography as a way to further develop themselves as educational leaders and to determine if duoethnography ought to be included within educational leader preparation programs. They posed the question, “How can we effectively prepare aspiring leaders for social justice without making this journey ourselves?”

(Guerra & Pazez, 2016, p. 1755). At the conclusion of these duoethnographic exchanges they emphatically determined that

“If trust is established between the researchers, duoethnography serves as the vehicle of safety where (a) risks can be taken, (b) vulnerabilities can be revealed, (c) tough questions can be asked, (d) uncensored responses can be exchanged, (e) underlying assumptions can be challenged, and (f) deficit thinking can be surfaced, deconstructed, and reframed” (Guerra & Pazez, 2016, p. 1778). These are all useful examples from the literature on autoethnography and duoethnography for those interested in curricular innovations related to preparing educational leaders.

*Discontinuities and ruptures* have occurred over time that have altered the path of understanding the relationship between educational biography and educational leadership. Permutations of educational biography have led to positive disruptions fanning out into a whole array of ways to conceptualize life writing in the singular and the plural. New understandings of “the self” and “the other,” as well as fusions between the fields of history, sociology, anthropology, and qualitative inquiry have propelled new epistemologies impacting the forms and functions of life writing. In addition, the theoretical perspectives offered by constructivism, feminist theories, critical race theories, and theories of social change have further ruptured prior understandings of how to narrate a life story, who is eligible to narrate, what is the difference between “fiction” and “nonfiction,” what are the tools for narration, and how are audiences impacted by narratology (the study of how narrative and narrative structure impacts the creation and experience of culture). Prior definitions of categories of life writing are no longer stable. For example, these new varieties of life writing often infuse novel descriptors/phrases/categories into the lexicon including educational biography, collective biography, prosopography, collaborative autoethnography, auto/biography, social fictions, arts-based educational research, speculative fiction (combining elements of science-fiction and dystopian writing), etc. This evolution of the form and function of life writing holds promise for expanding our understanding as well as placing greater value on human variety. Furthermore, it promotes a deeper introspection of the contextual elements that produce conditions for leadership and for the individuals who arise as leaders within particular contexts. These conditions ought to prompt those responsible for preparing educational leaders to transform the “curriculum” accordingly.

---

## Conclusions and Reflections

Using Foucault’s work as an advance organizer permits new thinking about the history of ideas and their impact on lived experiences of educational leaders. And, can serve to propel new considerations, and perhaps even new vistas, related to preparing educational leaders as they meet the challenges of our collective circumstances. Below is a list of questions to contemplate when considering the potential impact of the proliferation of biographical methodological approaches, and other forms of life writing, on the field of educational leadership:

1. What varieties of life writing should educational leaders be exposed to?
2. What forms of life writing should educational leaders be engaged in creating?
3. How can biography and other forms of life writing be pedagogically transformative for educational leaders?
4. How might an increased agility with critical approaches that interrogate socially constructed concepts such as gender, race, ethnicity, class, dis/ability, etc. impact the stories created and shared with educational leaders?
5. What new ruptures might be provoked by the increasing ease of multimodal and multimedia representations of a life?
6. How might new technologies such as three- (or four-) dimensional holograms reshape how lives are narrated and the audiences that engage with these narratives?
7. How might film documentaries and podcasts as forms of life writing reshape the curriculum for educational leaders?
8. What additional pedagogical innovations, and related implications, might materialize if educational leaders valued the life writing process and the panoply of products and experiences that might emerge?
9. What new, or recurring, ethical issues might need focused attention?
10. What else may be on the horizon for this area of inquiry as the social, political, economic, and educational landscape evolves?

If critical approaches to life writing and biography can transform the questions we are willing to ask about how lives are narrated, and by whom, as well as propel new understandings of the conditions that shape lives of educational leaders and others, then it is worth considering giving these approaches a more prominent place in the overall curriculum designed to prepare educational leaders.

## Abstract

Images of principals are often of a seasoned educator well into their teaching career, having risen through the ranks, gaining experience in middle- and senior-level leadership, ideally having completed some form of leadership preparation, and given license to lead a school. Their leadership development, most likely self-managed, perhaps including some formal studies, and most certainly including experience in leadership roles, occurs well into their careers as teachers. So, the idea of introducing pre-service teachers to notions of educational leadership in their initial teacher training is far from conventional thinking. This chapter explores new possibilities in leadership preparation arguing that because today's teacher graduates are entering educational settings that are rapidly changing and increasing in complexity, they need to be prepared for leadership early in their careers. Distributed leadership structures are now commonplace with increasing opportunities and expectations for leadership across all levels. Graduates entering the profession can find themselves leading very early in their careers without any

leadership knowledge, experience, or competencies. This chapter challenges leadership norms by rethinking how we prepare teachers for the profession recognizing the need to better equip teacher graduates for the reality in schools, the changing nature of a teachers' role, and the need to create a pipeline of experienced leaders to lead the schools of the future. After sections describing the changing nature of schools and school leadership, teacher roles, and initial teacher education (ITE), the chapter considers how ITE courses are responding to these pressures through the provision of leadership learning.

---

**Keywords**

Leadership in initial teacher education · Teacher leadership · Distributed leadership

**The Field of Memory**

Leadership in schools has historically been associated within rigid hierarchical structures with minimal opportunity for leadership outside of the office of the principal. The focus was on individual leadership, exercised by few. Since the turn of the millennium, the areas of distributed and teacher leadership have developed as a response to, and a reflection of, changes in schools to more collaborative practices in more accountable environments. Incorporating leadership programs in ITE is a recent idea and so it is an emerging field.

**The Field of Presence**

As an emerging field, there are few established ways of proceeding, with universities and other providers of ITE exploring and constructing their own ways to provide pre-service teachers exposure to leadership ideas. As collecting evidence of impact beyond the ITE programs is not common, it will be some time until indication of best practices emerges.

**The Field of Concomitance**

Leadership programs in ITE draw from the wider educational literature. General educational leadership views are dominant (e.g., instructional, transformational, and transformative leadership), albeit that these have mostly focused on the work of principals. But there is increasing development of particular leadership views focused on principals, middle leaders and teacher leaders, and increasing use of views of distributed leadership practice (especially distributed leadership). Non-education views are not strongly evident, but they are incorporated in two ways: mostly in the extent to which these views have influenced some of the educational views used (especially transformational leadership) and, less often, through direct use (e.g., adaptive leadership). Sociological (e.g., personal and organizational capitals), psychological (teacher identity), and activist (social justice) views also contribute to preparing graduate teachers to be leaders early in their careers. There are parallels in other fields to leadership development in ITE, with calls for the

development of leadership skills in other professional programs such as medical and engineering training; there is little overlap between these programs at this stage.

### **Discontinuities and Ruptures Which Form the Different Viewpoints of This Area or Field**

The field is too new for any major ruptures and discontinuities to have occurred as yet.

### **Critical Assumptions or Presupposition**

As in all areas that explore leadership there are assumptions that leadership exists and is a knowable phenomenon. There is also an assumption that leadership matters to schools and students and that it is important to expose teachers to leadership training and development as early as possible, and especially in ITE. While these are listed as assumptions, the overwhelming evidence, some of which is presented in this chapter, is that not only does leadership exist, but that its impact on schools and students is significant. Evidence in relation to the impact of leadership learning in ITE is scarce.

---

## **Introduction**

Interest in school leaders and school leadership has a long history. Hill (2002, 2019) described how in the early decades of the twentieth century the roles of teachers and school administrators began to separate as the rise of Taylorism led to larger schools requiring principals who could focus on management and administration. For the next decades, the roles remained separated, and it was not until the 1980s that principals began again to have a role in teaching and learning directly; this was the era of the principal as instructional leader (Hill, 2002, 2019).

While there were earlier research endeavors, the formation of school leadership as a field of inquiry can be dated back to the 1950s with the formation of the USA organization, the University Council for Educational Administration (UCEA) in the USA in 1954, and a proliferation of similar organizations in many countries over the next two decades; such as the Commonwealth Council for Educational Administration in 1970, British Educational Administration Society in 1971, and the Australian Council for Educational Administration in 1973. From the 1980s, instructional leadership, transformational leadership, and distributed leadership have emerged as the most researched areas, but there have been other important areas, such as middle leadership and teacher leadership. Both instructional leadership and transformational leadership have been principal centered. Distributed leadership, however, is a break from principal-centered research, with the areas of middle and teacher leadership providing some overlap with distributed leadership.

As schools continue to evolve, there are increasing demands on new teachers to show leadership early in their careers, both formal and informal. Because of this, many in ITE are now considering how to best prepare new teachers for these demands. This chapter explores the evolution and practice of leadership development in ITE. It provides another chapter to the story and to the history of school

leadership with a “new” way of thinking about teacher preparation. The chapter begins by considering changes in schools related to the rise of distributed and teacher leadership, and changes in ITE, before focusing on leadership learning in ITE.

---

## **Changes in Schools: Leadership Opportunities in Contemporary Educational Settings**

The organizational structures of contemporary educational settings are rapidly evolving, making schools dynamic and fluid spaces responding to the twenty-first-century needs of local communities and society at large. Across many nations, schools have adopted more diverse and complex leadership structures to better meet student and school needs (Supovitz, D’Auria, & Spillane, 2019), with decisive moves away from the traditional individual view of leadership residing mainly with principals, to a distributed leadership structure with leadership expected from many more at all levels.

In 1998, Leithwood and Duke provided an influential review of the main ideas in educational leadership and identified six leadership areas. In order of the extent of research, the areas were instructional, transformational, moral, participative, managerial, and contingent leadership. Distributed leadership had not emerged substantially although there were hints of it in the participative category. Yet, over the last two decades there has been a surge of literature around “distributed leadership” whereby leadership is no longer centered around the individual school leader.

While in its early development distributed leadership was often interchanged with shared (Pearce & Conger, 2003) or collective (Leithwood & Mascall, 2008) leadership, however, distributed leadership is now well established within the educational leadership literature as an important part of schools and school effectiveness (Supovitz et al., 2019). While principal leadership research remains important, Harris and Jones (2017) suggested that distributed leadership is one of the major research interests in educational leadership, and, alongside teacher leadership, has overtaken interest in middle leaders. Led by researchers such as Spillane in the USA, Harris in the UK, and Gronn in Australia and the UK, distributed leadership has become part of school leadership orthodoxy. Soon after the Leithwood and Duke (1998) article, Gronn (2000) challenged leadership norms by inviting the academy to consider the future of leadership as a result of organizational shifts in schools. Distributed leadership practice allowed for “maximizing sources of information, data and judgement, and spreading the detrimental impact of the consequences of miscalculation and risk” (Gronn, 2000, p. 334). Gronn (2000, p. 334) argued that the “pooling of expertise and sources of advice...affords an increased likelihood of detecting errors in judgement and more attention being accorded feedback...[which amount to]...an overall widening of the net of intelligence and resourcefulness.” Spillane has long argued that a distributed leadership approach can offer dynamic possibilities for collective leadership with multiple actors engaged at various levels as opposed to a more siloed, individual view or more traditional leadership views (Spillane, 2006; Spillane & Zuberi, 2009; Supovitz et al., 2019). His view is an

interaction perspective in which the practice of leadership and management is the product of the school leaders, followers, and their situations (Spillane, 2006).

While addressing the logistical and practicable issues of leading in a more networked and connected contemporary school, a distributed approach enables specialized leadership skills and capabilities to be harnessed. Distributed leadership involves both formal leaders and others as needs arise, and so it can value teacher voice, skills, and capabilities through teacher involvement. A distributed approach offers schools greater scope to offer more through a larger number of people leading various portfolios, projects, or activities.

Although somewhat inconclusive, there is emerging evidence that distributed leadership can impact indirectly on student learning and have important organizational effects such as enhancing teacher self-efficacy, job satisfaction, organizational commitment, and supporting change programs, but perhaps at the cost of higher teacher workloads, while retaining hierarchical structures (Tian, Risku, & Collin, 2016). Nevertheless, distributed leadership today has gone from a radical concept to a common way to think about dispersing leadership, and providing opportunities for teachers to contribute to school imperatives, develop individual and collective skills and capabilities, and providing a pipeline for middle and senior school leaders.

---

## Changes in Teachers' Roles: The Rise of Teacher Leadership

Just as schools have evolved, so too has the work of teachers. Where the role of a teacher has traditionally focused on the transmission of knowledge to students in a classroom setting, teaching today is far more complex comprising a vast array of responsibilities and possibilities (Zhao, 2018). The focus remains undeniably on teaching and learning, however working with students also requires a focus on the social, emotional, and individual learning needs of students, necessitating an understanding of relevant legislative and organizational policies and collaboration with external professionals. Alongside this, teachers' work also consists of setting goals, motivating, prioritizing, planning, developing courses, creating resources, negotiating, managing conflict, problem-solving, training, mentoring, coaching, assessing, evaluating, and networking. While simply seen to be part of the evolution of the teaching role, one could argue that many of these tasks are indicative of the work of leaders in other professions, and so there has been a focus over the past two decades on the concept of teacher leadership (Harris & Jones, 2017; Webber & Okoko, 2021; Wenner & Campbell, 2017).

Albeit an established area of educational leadership research, the concept of teacher leadership remains contentious with wide-ranging and competing views (Harris, 2003; Webber & Okoko, 2021; Wenner & Campbell, 2017; York-Barr & Duke, 2004), from claims that "teaching is leading" (Collay, 2011) to those that describe both the work of teachers in formal leadership positions and leadership by teachers that is informal and not aligned to a leadership position (Wenner & Campbell, 2017; York-Barr & Duke, 2004). Those definitions which assume teacher leaders require specific leadership positions tend to be related to research that is

describing middle leaders rather than teacher leaders (De Nobile, 2021; Harris & Jones, 2017).

While there are definitional issues, teacher leaders are identified as key players in school and system improvement and recognized for the important role that they play in “leading” educational change (Muijs & Harris, 2006; Murphy, 2005). Unfortunately, by the time of Wenner and Campbell’s (2017) major review, there was still no research identified that linked teacher leadership to improved student learning. In the literature there seems to be a belief that if schools utilize a broader set of skills and capabilities of teachers, “leadership” becomes a collective action safeguarding sustainable long-term school improvement. This idea is not dissimilar to Gronn’s (2000) view of distributed leadership (see above) and suffers from a similar lack of research evidence. A more recent review by Schott, van Roekel, and Tummers (2020) noted that while research was exploring broad impacts across teacher, school, and student outcomes, the quality of research meant that a clear sense of teaching leadership impact was still emerging.

In many jurisdictions, teacher leaders are being formally defined. For example, within Australia, teacher leadership is commonly associated to the “Lead Teacher” classification within the national standards that regulate the profession (Acquaro, 2019). Across Scotland and Ireland, both the Scottish Professional Standards for Teaching and the Irish Teaching Council’s Framework for Teacher’s Learning set the expectation for teachers to lead be it in “their own classrooms, their own learning and that of their colleagues through mentoring or induction” (King, McMahon, Nguyen, & Roulston, 2019: 17). However, mostly teacher leadership is associated with broader definitions that also include the spontaneous leadership that can emerge close to the classroom level, through advocacy, teamwork, or collaboration among teachers.

Regardless of the title or recognition associated with teacher leadership, the action of leading lifts the quality of practice in schools through collective teacher effort to improve teaching and learning (Hargreaves & O’Connor, 2018). The breadth and scope of formal and informal leadership also opens opportunities for aspiring leaders and creates a pipeline of educational leaders of which there is a documented shortage across many systems (Anderson & Turnbull, 2019; Thompson, 2021). It is somewhat ironic that the focus on school principals being instructional leaders is now being met at the other end of the continuum with the benefits of teachers acting as leaders supported by a range of middle leaders (Gurr, 2023; Lipscombe et al. 2021). The impact of leaders and teachers independently improving student outcomes is well documented, however the potential of parallel leadership where leaders and teachers work collaboratively to improve instructional practices and student outcomes is yet to be fully explored.

---

## **Changes in Initial Teacher Education: Attracting Teachers to the Profession**

The recruitment and retention of teachers continues to be a problem across many countries worldwide (See, Morris, Gorard, Kokotsaki, & Abdi, 2020). Attracting the best and brightest to teaching has been viewed as the answer to lifting student

outcomes (Barber & Mourshed, 2007), however the best and brightest are often opting for more lucrative occupations with career incentives and opportunities for growth. Teaching has typically been associated with women's work, and this is reflected in the gender imbalance in teaching courses with women accounting for the majority of students in ITE (Tani, 2019). While for women average salaries are higher in teaching than other professions and so teaching continues to be an attractive option, for men the opposite is true, with most opting for other professions where the income is higher (Tani, 2019).

The status of teaching is an important element in attracting high-quality students to the profession. Job satisfaction is linked to opportunities for professional development and growth, which are interconnected with leadership opportunities. While we first and foremost should be attracting teachers to "teaching," we should also be recognizing the complexity of schools, the need to engage on multiple levels within the profession, and varied opportunities to "lead" across a career as a teacher.

The role of ITE continues to be scrutinized with poor student outcomes regularly attributed to inadequate teacher preparation (Saavedra, 2021). System-level reviews are regularly conducted exploring what constitutes best practice teacher preparation, and, in the case of reviews in England, a continuing push to move ITE from universities to school-level providers (Clarke & Parker, 2021). Australia is no stranger to reforms in initial teacher education resulting predominantly from concerns about declining student achievement in international testing. In fact, since the 1970s, Australian teacher education has faced over 100 reviews with the latest recently announced in April 2021 aimed at improving school standards which have steadily worsened in the last 20 years (Bahr & Mellor, 2016). The focus currently is on how to attract and select high-quality candidates into the teaching profession, and how to prepare them to become effective teachers. The attention placed on teacher preparation is once again driven by the desire to lift school standards and place Australia in the top group of education nations globally by 2030. Encouraging high-performing and highly motivated school leavers to become teachers has been identified as a means of lifting the profession, however shifting conventional constructions of what constitutes a teaching career is key to achieving this (Zhao, 2018).

To further lift the quality of teachers and initial teacher education, professional teaching standards have been introduced across numerous countries with more countries expected to follow given the recent development of the Global Framework of Professional Teaching Standards Education International & UNESCO (2019). The USA, England, Australia, Germany, and New Zealand are among 24 nations that have introduced standards regulating initial teacher education which has resulted in a streamlining of systemic practices and tighter controls around quality assurance through teacher education course accreditation and teacher registration processes. The introduction of professional standards for teaching began in 1964 with the foundation of the National Commission on Teacher Education and Professional Standards in the USA whose primary objective was to raise the quality of the profession. Since then, the place of standards continues to be debated globally with great attention placed on top performing countries who prioritize student selection and training in teacher education (Call, 2018).

The introduction of national standards for teacher training and regular reforms may have made a positive contribution toward improving ITE through selection, minimum benchmarks, and consistent assessments, however their introduction has indirectly created a rigid set of requirements which regulate the space sparking debate about the balance between regulation and innovation.

---

## Leadership Learning in Initial Teacher Education

Initial teacher education is charged with ensuring that teacher graduates are classroom ready. However, teachers' work extends well beyond independent practice in one's own classroom. Expectations and opportunities in schools often call for teachers to work in teams, lead curriculum development, and support and mentor colleagues, and through these opportunities to be exercising leadership early in their career. Acknowledging the critical roles that teachers have beyond the classroom when entering the profession, the dynamic contexts in which they enter, and the expectations and opportunities around leading practices, underscore the importance of introducing leadership learning during teacher training.

Key priorities in preparing teachers for the profession include competence in subject and pedagogical knowledge, the ongoing role of research, evidence, and evaluation in practice, and the ability to respond to, adapt, and thrive in changing educational landscapes. Central to this is better understanding of the evolving organizational structures within schools and the leadership expectations and opportunities for teachers to contribute to school improvement efforts.

Leadership learning in ITE can be defined as developing the capabilities and knowledge required to understand and practice leadership in schools (Acquaro, 2019). For early career teachers this may revolve around leading oneself, leading others and understanding the impact of collective action for school reform. Leadership learning has also been seen to play a part in cultivating a profession capable of team building, priority setting, problem-solving, and evaluating best practice. The development of graduate teacher leadership literacy is important in developing self-efficacy and resilience, and attracting and retaining leaders within the profession, thereby making them able to navigate the professional expectations and opportunities presented over the course of a teaching career.

Creating a discourse around leadership within initial teacher education has gained momentum with many leading ITE providers globally now highlighting links to leadership knowledge and skill development within their teacher preparation courses and the opportunities for this in creating a more highly skilled workforce.

Table 1 outlines the results of an audit of the visibility of leadership studies within the marketing materials or subject handbook information of ITE programs offered by the top 20 universities in education as per the 2019 QS World Rankings (Acquaro, 2019). At the time of the research, the top-ranking universities were in the UK (3), the USA (8), Hong Kong (2), Canada (2), Australia (4), and Singapore (1). Across the 20 universities, there were 117 initial teacher education courses available,

including diplomas, degrees, postgraduate diplomas, and masters-level courses. The top ten Universities only offered postgraduate teacher preparation programs.

The research demonstrated that 16 of the 20 universities promoted leadership development within ITE courses. Leadership-centric subject content was visible in the subject handbooks of nine of the universities including The Education University of Hong Kong and Harvard University which offered the highest number of educational leadership subjects within their initial teacher education courses.

Acquaro's (2019) research noted: (i) a shift in how initial teacher education is recognizing that teacher training is evolving to better prepare graduates for the organizational and leadership structures of contemporary educational settings; (ii) the importance of developing leadership understandings and skills in pre-service training to build leadership capacity; and (iii) that attracting high-quality students to a profession in teaching may be more alluring if leadership development is offered as part of initial teacher education.

Considering the data presented in Table 1 and other literature on leadership learning in ITE, Acquaro (2019) suggests there are several ways that university ITE providers are building leadership knowledge and skills, including:

- The introduction of leadership concepts through leadership-focused subjects taken as part of teacher training
- Development of leadership skills through specialized pathways to develop competencies required of a subject learning leader (such as literacy or numeracy leaders within elementary school contexts)
- The opportunity to conduct action research on school leadership
- Through subjects which develop a broader understanding of leadership through work-integrated or service learnings

This audit, albeit a snapshot in time, provides some insight into the importance placed on leadership and leading, particularly given the emphasis in the marketing material promoting ITE to prospective students and the shifts in content with the inclusion of leadership-focused subjects across various ITE courses. This research identifies a pivot toward leadership learning in ITE, which suggests that value is being placed on leadership preparation for teacher graduates.

---

## Examples of Leadership Learning in Initial Teacher Education

Although in its infancy, research on leadership preparation in ITE is steadily growing. Educational research within early childhood education has impacted on the Australian early childhood policy context with leadership now embedded in the national quality framework (NQF) regulating the early childhood and care settings (Diamond, 2014; Nuttall, Thomas, & Henderson, 2018; Page & Waniganayake, 2019; Stamopoulos, 2015). Leadership training in ITE has been linked to capacity building, collective leadership, and cohesion within early childhood settings (Nuttall et al., 2018) with understandings of how effective leadership practices can impact on

**Table 1** Initial Teacher Education Program Audit

2019 QS Rank	University	Country	Initial Teacher Education Program			Leadership promoted in marketing material	Subject handbook available online	Evidence of Leadership Studies offered in ITE programs

the provision of high-quality learning (Page & Tayler, 2016). Research in early childhood education has found that effective leaders require expert knowledge of teaching and learning in order to lead best practice (Page & Waniganayake, 2019). Nuttall, Thomas, and Wood (2014) found that understandings of leadership have broadened in early childhood and care services with the introduction of leadership development within early childhood initial teacher education with a shift now evident in how leadership is understood and enacted with greater attention to “children’s pedagogy and adult learning” (Page & Waniganayake, 2019, p. 26).

Across Northern Ireland, the Republic of Ireland, and Scotland, King et al. (2019) investigated the extent to which leadership learning is embedded within ITE across Ireland and Scotland. They found that leadership learning in ITE encouraged graduate teachers to lead from the beginning of their careers, encouraging a willingness to take on leadership opportunities, and instill confidence in exhibiting leadership skills. Graduates demonstrated receptivity toward leadership learning and indicated that “the seeds [of leadership] need to be planted in pre-service teacher education” (King et al., 2019, p. 11). The leadership programs seemed to create in the graduates an expectation to practice leadership from the commencement of their careers, understanding the impact of their individual and collective efforts in supporting student learning and improving the school. Graduates gained a sense of self-efficacy and confidence from the programs and the leadership learning developed leadership “readiness and confidence. . .for occasions when they might encounter resistance or opposition” (King et al., 2019, p. 14). Explicit leadership learning was seen to increase graduate teacher confidence in applying research to practice when entering the profession by developing an awareness and subsequent confidence to share expertise and lead their peers.

In a study conducted by Thomas and Brown (2019), they found that pre-service teachers were able to develop leadership capacity through collaborative inquiry in group activities. Their two-year study analyzed 453 student survey responses and 38 instructor survey responses and identified that pre-service teachers developed the four dimensions of teacher leadership skills: brokering, participative leadership, mediating, and forging close relationships (Harris, 2002) in small groups as they codesigned interdisciplinary learning units. Their research (Thomas & Brown, 2019) found that theory-informed instructional design within ITE has resulted in the development of teacher leadership skills in pre-service teachers. These findings will inform a redesign of ITE at the University of Calgary not only to best prepare graduates for teaching but to broaden their skills for teacher leadership in the profession.

As part of a redesign of all Master of Teaching courses at the University of Melbourne, leadership learning will become one of the key areas in the preparation of graduate teachers from 2022. Pre-service teachers will explore broad notions of teacher professionalism and leadership and develop understandings of the skills and capabilities needed in leading others as well as leading themselves. The new graduate entry courses will look to foster leadership among its teacher graduates in a range of ways, including the introduction of a core stand-alone leadership subject at the early childhood and secondary levels aimed at developing contemporary

understandings of “leadership” and “leading” in educational settings. This introduction of a leadership-focused subject will build on understandings of the role of teachers and explore their capacity to lead at all levels in educational settings. Leadership will be developed through specialized pathways in the primary course where pre-service teachers will develop the knowledge and capabilities required of subject learning leaders (such as literacy leaders and numeracy leaders) in primary settings. Furthermore, all Master of Teaching pre-service teachers will also extend their understandings of leadership and leading through work-integrated learning experiences which will drive their capstone research. The University of Melbourne approach to leadership learning in initial teacher education is aimed at attracting prospective students to a career in teaching by creating leadership awareness and developing leadership competencies in readiness for the opportunities to exercise leadership. Recognition of the importance of presenting a whole of career view of teaching including the role of leadership in centers and schools will better prepare graduate teachers for the reality of the profession as they enter, and hopefully retain them in the profession for the opportunities that lie ahead.

---

## Conclusions and Reflections

Leadership in ITE is an emerging field of practice and research, and one that seems to now have a place in educational leadership. There is a continuing mounting of evidence of the impact of school leadership on student and school outcomes (Leithwood, Harris, & Hopkins, 2020; Louis, Leithwood, Wahlstrom, & Anderson, 2010), across principal (Grissom, Egalite, & Lindsay, 2021), middle leader (Gurr, 2023; Leithwood, 2016; Lipscombe, Tindall-Ford, & Lamanna, 2021), teacher leader (Schott et al., 2020; Wenner & Campbell, 2017), and distributed levels (Supovitz et al., 2019; Tian et al., 2016). It not only seems logical to now explore leadership preparation in ITE, but imperative to do so given how schools and the work of teachers is changing (Zhou, 2018).

There are many university ITE programs that now have some type of leadership learning (Acquaro, 2019), although there is considerable variation in these programs (Acquaro, 2019; King et al., 2019; Nuttall et al., 2018; Page & Waniganayake, 2019; Thomas & Brown, 2019). Although the programs seem to be well received and impactful on the graduate teachers within their ITE programs, there is a paucity of research about best practice leadership learning and the impact of these programs on graduates as they enter the profession. As more ITE programs incorporate leadership learning, it will become important to understand how these impact on preparedness of graduate teachers early in their careers, their motivation to lead, and the impact of leadership learning from their formative years to their leadership experiences later in their careers. Longitudinal research tracking the career of teachers who received ITE leadership training, and evaluations of various approaches to leadership preparation in ITE programs, will help to establish the field and lead to further refinement of programs.

This chapter is somewhat of a call to action. Although leadership in ITE is an emerging field, it is gaining momentum as many universities seek to better prepare their teacher graduates for school environments that are calling on leadership skills early in teaching careers. Indeed, it is perhaps a moral and professional responsibility to have leadership programs in ITE – as a response to the environments graduates face, but also as part of the leadership pipeline of graduate teachers, teacher leaders, middle leaders, and senior leaders, culminating in the principalship. Leadership by many is now an important part of school success, and preparing teacher graduates for this is now an important part of ITE.

## Abstract

For decades now, mentoring has been hailed as an important workplace learning and career development activity for women and men across a variety of organizational contexts including universities and schools, hospitals, corporations, government departments, and not-for-profit and community-based establishments. Since the 1970s, there has been a recognition that mentoring has great potential to enhance the learning and career outcomes of women and, for this reason, there has been a proliferation of formal mentoring programs established to support them. These formal mentoring programs for women are ubiquitous in universities in

Australia and overseas. Their purpose ranges from providing women with career planning support, to socializing them into the role of academic, to developing their learning and specific skills in research and/or teaching. A recent development in the literature has been the argument for sponsorship for women academics rather than mentoring based on the assumption that the former is primarily associated with enhancing career outcomes while the latter tends to be concerned with psychosocial development. This chapter reviews the research and literature on mentoring for women in the academy in order to gain a better insight into its nature, purpose, scope, and benefits and challenges. It also considers some of the theoretical literature that has impacted upon and shaped its conceptualizations. The position taken in the chapter is that women in academe are likely to require multiple forms of mentoring and the specific type and focus will depend on their personal circumstances, interests, and needs.

**The Field of Memory**

The origins of the term mentor go back to the eighth century BCE to Homer's epic saga, *The Odyssey*. It is here that the character Mentor makes his first appearance in the literature. In *The Odyssey*, Mentor was the loyal servant of Odysseus who played the role of "father figure" to Odysseus' son, Telemachus, when Odysseus fought in the Trojan War which took him away from his family and homeland for over a decade. Odysseus entrusted Mentor to care for his son, to be in "loco parentis," and to be a watchful eye over him. After Mentor left the royal household, it was Athene, Goddess of wisdom, who took the form of Mentor and stepped in to provide role modelling, guidance, and support to Telemachus (Homer, 1992). Since the eighth century BCE and up until the latter part of the twentieth century, mentoring was a source of patronage in the arts, sciences, and across the professions. Mentors were often powerful, experienced, and successful men who used their influence to open doors for and support the work and careers of their protégés who invariably were men. In the 1970s, mentoring moved from being an individualistic elitist activity to one embraced by organizations where it became formalized and offered to women and members of target groups.

**The Field of Presence**

Mentoring today takes many forms, and there are three main types. First, a traditional approach to mentoring is akin to sponsorship. Here a more experienced person, a mentor, actively seeks out an up-and-coming talented protégé to develop and support and uses their power and influence to open doors for them in their career. Second, mentoring can be viewed as an "informal activity" where the mentor and mentee find each other. This type of relationship tends to be less hierarchical than traditional mentoring, but like traditional mentoring, it happens idiosyncratically. The third

perspective of mentoring that came into prominence in the 1970s is the formalized mentoring program. Based on the benefits of mentoring for the person receiving the mentoring, organizations designed targeted programs to support staff development. Today, formalized mentoring programs are used to develop novices and leaders alike as well as an affirmative action strategy where women and members of minority groups are identified as those recipients who would benefit mostly from a mentoring relationship. It is common practice among universities in both Australia and New Zealand to provide formal mentoring programs for women (Devos, 2008). Regardless of the type of mentoring arrangement or relationship in place, mentoring continues to be advocated as a valuable learning-, development-, and career-enhancing approach for individuals especially women.

### **The Field of Concomitance**

Mentoring is a field of research and writing that has borrowed heavily from a variety of disciplines, theories, and perspectives over the past decades. For example, disciplines such as economics, psychology, and sociology have influenced the way mentoring has been depicted in the literature and enacted in practice. Within economics, human capital theory and leader member exchange theory view mentoring as a transactional activity or exchange that takes place between a mentor and a protégé/mentee. In contrast, developmental psychology including adult learning theory and career development theory has viewed mentoring as a relationship based on learning, growth, and development. Taken from sociology is Foucault's (1983) concept of governmentality, which has been used to understand the interpersonal relationship between the mentor and the mentored as it considers questions as: Who can govern? Who are governed? There continues to be a lack of consensus on what mentoring is, and some writers cite the reason for this is due to the great diversity of perspectives and theories that continue to influence and shape the way it is conceptualized.

### **Discontinuities and Ruptures**

There have been several ruptures that have impacted on how mentoring is understood today. After centuries of mentoring being a source of patronage for professionals, the first rupture occurred in the second part of the twentieth century with the recognition that not only was access to a mentor likely to enhance the career outcomes of those who were mentored, but a formalized approach to mentoring was needed in organizations to ensure mentoring was a learning activity that could reach many people. In particular, women and members of minority groups were targeted as potential beneficiaries of these programs since they had been largely overlooked by traditional mentoring.

The second rupture was the move away from traditional one-on-one mentoring where the mentor is usually older and more experienced than the mentored to different arrangements of informal mentoring including co-mentoring, peer mentoring, mutual mentoring, network mentoring, community-based mentoring, and group mentoring – all designed to make mentoring a more collaborative, mutually supportive activity and beneficial to the parties concerned. A third rupture that occurred in the 1990s was the introduction of e-mentoring, made possible because of the influence of web-based

technologies pervasive in daily life and work. E-mentoring transcends geographical boundaries as a mode of communication enabling mentors and mentees to connect through a variety of electronic means. A fourth and final rupture that has been evident in the business sector and promoted within academe since 2010 has been a move toward “sponsorship” programs and activities for women based on the power of sponsorship to create career-enhancing opportunities and advancement.

### Critical Assumptions

Mentoring is a learning activity that provides both career development and psychosocial support. It can be experienced differently based on the type of mentoring that is undertaken, its focus, and degree of formality or informality governing the relationship. Its effectiveness can be understood within the context of a relationship between the parties concerned, usually a mentor, a more experienced person, and a protégé/mentee, a less experienced person. It can be one-on-one, or it can take the form of a network or community. While the research suggests that mentoring yields advantages to women academics, it is not without its challenges and issues. It is argued that women in academe are likely to require multiple forms of mentoring depending on their needs, interests, and personal circumstances.

---

## Introduction

The idea of a guide or mentor who teaches, cares for, and is a protective figure for another person can be found in western and eastern mythology. *The Hero with a Thousand Faces* by Joseph Campbell (2008) explores the universal journey – life – that all heroes or human beings must experience and endure. According to the mythology, a mentor is a central figure who helps another in their journey towards self-knowledge, supporting them as they face trials and triumphs along the way.

The term Mentor was immortalized in Homer’s saga, *The Odyssey*, and according to some scholars, its reappearance in the eighteenth century through the work of Fénelon was significant since Fénelon’s interpretation of *The Odyssey* is one that is more akin to common-day understandings (Garvey, 2017). Fénelon explored the themes within *The Odyssey* where he viewed a mentor as a person who provided opportunities for another to learn, grow, and reflect on their life experiences (Garvey, 2017). This perspective of mentoring fits with today’s definition that sees a mentor as a teacher or adult developer who supports and challenges another and provides psycho-social support.

A seminal book that emerged in the 1970s in the United States that was concerned with mentoring relationships was Daniel Levinson, Darrow, Klein, Levinson, and McKee’s (1978) *The Seasons of a Man’s Life*. They described mentoring as “one of the most complex and developmentally important a man can have in early adulthood” (p. 97). Yet, since the 1970s, researchers have argued that this relationship is important not only for men but also for women such as women academics (Meschitti & Smith, 2017; Voytko et al., 2018), women managers (Ehrich & Kimber, 2016), and women scientists (UNESCO, 2017). Mentoring has been identified as a critical relationship not only to support academic women’s career development but also to

help redress their underrepresentation in leadership positions and in traditional male-dominated areas such as science (Meschitti & Smith, 2017).

The focus of this chapter, then, is an investigation of mentoring for women in the academy or university. It begins with a discussion of three broad categorizations, moves on to consider some definitions, and provides an illustration of three theoretical insights that have been used to illuminate the relationship between women and mentoring. The next part of the chapter considers formal mentoring programs and provides some current examples of programs available for women in universities across the world. A discussion of the benefits and challenges of mentoring for women is discussed next. In the final part of the chapter, some consideration is given to the notion of “sponsorship,” an activity aligned to mentoring, that has been advocated in recent times as a way forward for women in the academy.

---

## Mentoring: Three Broad Categorizations

There are at least three different types of mentoring arrangements that are important to understand, and these are traditional, informal, and formal mentoring. Traditional mentoring has been around for centuries and refers to an experienced person who chooses to develop a protégé because the protégé shows certain abilities and talents. This version of mentoring usually includes the role of “sponsor” as the mentor uses their power and status to open doors for the protégé and helps them achieve career advancement. Informal mentoring arrangements sometimes occur when mentors and protégés/mentees find each other and decide to work together (Clutterbuck, 2004). Common to both traditional and informal mentoring is the idea that mentors and mentees work together of their own volition: traditional mentors seek out protégés, and informal mentors find mentees (or vice versa) with whom to form an alliance. In the context of higher education, traditional or informal mentoring usually occurs between a junior and more senior academic.

In contrast, formal mentoring is a twentieth-century phenomenon that was introduced to try to “recreate” traditional or informal mentoring (de Vries, Webb, & Eveline, 2006). Formal mentoring operates as part of a program used by organizations to develop new staff, aspiring leaders, or target groups such as women or members of minority groups. Formal mentoring programs can be described as a human resource development strategy in which the organization identifies the goals of the program, establishes its parameters, and selects and then matches mentors with mentees (Ragins & Cotton, 1999, in Ehrlich, 2008). A great advantage of formal mentoring programs has been their availability to staff who wish to be mentored.

---

## What Is Mentoring: Some Definitional Considerations

Mentoring defies simple definition and, to date, there is no consensus on a scientific definition (Jacobi, 1991; Meschitti & Smith, 2017). One of the reasons for its “definitional vagueness” (Jacobi, 1991) can be traced to the wealth and variety of different

theoretical perspectives or, as Garvey (2017) says, different “underpinning philosophies” (p. 3) of mentoring. Not surprisingly, it becomes problematic to review the literature on mentoring because mentoring fulfills different purposes: it can be about learning and growth; sponsorship and visibility; or mutuality between colleagues.

Based on an analysis of over 150 research-based papers on mentoring in education contexts, Hansford, Tennent, and Ehrich (2003) defined mentoring as “a personal, helping relationship between a mentor and a mentee or protégé that includes professional development and growth and varying degrees of support” (p. 5). According to the authors, mentors are more experienced persons (not necessarily older) than the person(s) they mentor.

Another definition often cited in the field is by Kram (1985). Based on her study of mentoring dyads in the United States (US), she arrived at two key functions mentors perform, and these are career functions including sponsorship, coaching, protection, visibility, and challenging work assignments and psycho-social functions such as feedback, advice, friendship, and encouragement. In the sponsoring work they perform, mentors act as significant others in the lives of those they mentor because they provide them with resources, opportunities, and visibility that helps them advance in their careers. The career functions therefore aid the protégé to become visible and credible as they are being prepared for advancement. What Hansford et al.’s (2003) and Kram’s (1985) perspectives reveal are two related yet different ways of understanding mentoring. Common to both is the psycho-social supportive functions provided by a mentor, but they part ways in terms of the notion of “sponsorship.” Kram’s perspective on mentoring fits with a more traditional view of mentoring that sees a mentor as an expert and a sponsor who uses their power and influence to benefit a protégé’s career, while Hansford et al.’s (2003) definition highlights the developmental or learning focus inherent in the relationship.

Clutterbuck (2004) makes the distinction between developmental and sponsorship mentoring. He maintains that a developmental focus on mentoring is one that recognizes that mentoring is beneficial to both parties where both share power and knowledge. It emphasizes “empowerment and personal accountability” (p. 19), in contrast to sponsorship mentoring that pays attention to the “effective use of power and influence” (Clutterbuck, 2004, p. 19) by the mentor.

Over the last couple of decades, alternative types of mentoring such as co-mentoring or collaborative mentoring (Mullen, 2012), peer mentoring (McManus & Russell, 2007), and mutual mentoring (Yun, Baldi, & Sorcinelli, 2016) have emerged in the literature and research. Common to these perspectives is a focus on a developmental relationship between both parties that is egalitarian, mutually beneficial, and involves power sharing. These alternative views emphasize the “development” side of mentoring because of their concern to create a relationship based on psycho-social support, collegiality, and learning. Because of the great variety and types of mentoring arrangements, mentoring relationships vary in intensity and focus and will have very different outcomes.

## Theoretical Insights Pertaining to Women and Mentoring

There have been multiple theories that have been used to understand mentoring ranging from developmental theories that focus on age and stage, to economic theories such as social exchange theory and human capital theory, to learning theories such as social learning theory. Three key theories, each of which offers a unique perspective regarding women and mentoring, are considered here. They are homosocial reproduction theory and homophily that offer an explanation as to why women tend to be overlooked in traditional mentoring relationships; relational cultural theory that has been used to explain the mentoring process most suitable for women in academe; and Foucault's notion of governmentality that has been used to explore issues of how women navigate power in institutions.

### Homosocial Reproduction or Homophily

Much of the early research on mentoring observed that women were being denied traditional mentoring relationships which had negative implications for their career opportunities. Indeed some current writing in the field (see Blood et al., 2012; Levine, Lin, Kern, Wright, & Carrese, 2011; van den Brink & Benschop, 2014) continues with this argument especially for women academics in non-traditional areas and in senior leadership positions. This point is explored later on. An early ethnographic study of a large corporation in the United States by Kanter (1977) found that male managers sought out and sponsored up-and-coming males in the organization rather than choosing female members of staff. She used the term "homosocial reproduction" to explain this exclusionary practice that had the result of restricting women's career advancement and growth. In more recent times, a related term, "homophily," has been used to explain the way similar people (in terms of gender, class, age) develop relationships, communicate with one another, and associate with each other more often than with people who are different from themselves (van den Brink & Benschop, 2014). When men form part of the critical mass or are in the majority in an organization, they will "tend to have more homophilous network relationships than women" (van den Brink & Benschop, 2014, p. 474). Choice homophily, then, is said to represent a bias when gatekeepers in an organization, such as a university, are men since women will find it challenging to access academic networks. By gatekeepers, van den Brink and Benschop refer to "elite academics" (p. 462) who have considerable power and influence to support and promote staff to professorial levels. The theoretical concept of homophily could also be extended to issues of race or culture to explain how people of color can be overlooked by traditional mentoring arrangements and informal networks.

## Relational Cultural Theory

The second theoretical insight considered here is relational cultural theory (RCT). It is grounded in human development understandings regarding the importance of relationships between people. It is attributed to the work of Jean Baker Miller and was developed initially as way of exploring women's psychological experiences but today is applied to understand all human experience (Jordan, Hartling, & Baker, 2008). Central ideas within RCT include "all growth occurs in connection . . . all people yearn for connection and . . . growth-fostering relationships are created through mutual empathy and empowerment" (Jordan et al., 2008, p. 1).

Hammer, Trepal, and Speedlin (2014) use the basic ideas behind RCT and put forward five relational mentoring strategies for women faculty. These are attend to power in relationship, focus on mutuality, foster authenticity, listen to voice, and build a sense of community and connection. Regarding power in the relationship, a "power with" stance is viewed as preferable to a "power over" stance (Miller in Hammer et al., 2014), where the mentor is able to use their power to empower the mentee. A focus on mutuality refers to the idea that both parties are seen to benefit and are influenced by the mentoring relationship. Fostering authenticity refers to mentors who would be open and willing to share experiences with mentees and to encourage mentees to be true to themselves. Listen to voice refers to listening to one another and providing opportunities for mutual support and encouragement (Hammer et al., 2014). The final strategy "build a sense of community and connection" (p. 12) is one where the mentor helps the mentee to confront fears and concerns by creating a climate of connection and support. Hammer et al. (2014) argue that all five strategies would be appropriate to use when mentoring female faculty.

Another paper that has argued the case for RCT to underpin the way mentoring relationships should be experienced by women is by Block and Tietjen-Smith (2016). They argue that women academics need other women academics to mentor because they have similar subjective experiences based on their lived experience of being a female. As a developmental perspective, RCT whether it is applied to male/female mentor dyads or female/female mentor dyads fits with alternative mentoring arrangements such as co-mentoring and peer-mentoring since it focuses on mutuality, sharing power, and growth-based relationships.

## Governmentality

The third perspective discussed here moves away from humanistic notions of mentoring as understood in relational cultural theory, to locate it within its political and institutional contexts. Devos (2007, 2008) uses Foucault's (1983) notion of "governmentality" and "subjectivity" as a way of understanding how mentoring for women can be construed within organizational power relations within universities. Based on interviews with women academics, Devos (2008) argues that mentoring positions women both as active subjects who manage themselves through their relationship with their mentor and acted upon or "fashioned as a suitable academic

subject” (p. 200) by their mentor. The former is considered “agentic” and is related to feminist theories of subjectivity, while the latter demonstrates a desire on the part of the woman mentee to be “acted upon by others” (Devos, 2004 in Devos, 2008). In this way, mentoring is construed “as a site of governmentality” where the woman is both self-governing and governed (Devos, 2007, p. 183).

Devos (2008) also points to two discourses that intersect, and these are gender equity and the enterprise culture of universities. For example, formal programs for women have been introduced as a gender equity initiative to redress some of the barriers they face in academe as well as help them develop new skills, knowledge, access to role models, and as a means of allowing them to feel less isolated. And at the same time, within the university as an enterprise, the performative culture demands that women not only improve their performance but also it governs women’s performance. Devos (2008) concludes that women seek to engage in mentoring programs so that they can improve themselves (in terms of the development of knowledge and skills) and to conform to institutional norms of success (Devos, 2008). Similarly, Brabazon and Schulz (2018) concur with Devos as they refer to these two competing discourses: gender equity and corporatism (characterized by performativity, quantifiable outcomes) in which mentoring has been identified as a strategy to support both. What Devos (2008) and Brabazon and Schulz (2018) have done in their respective papers is to underscore the impact of neoliberalism on the content and focus of mentoring arrangements for women.

---

## Formal Mentoring Programs for Women in Universities

For over three decades, formal programs have been used as an affirmative action strategy to develop women’s career prospects and advancement in the United States, the United Kingdom, and Australia (Quinn, 2012). They have also been used for recruitment and retention purposes (Steele & Fisman, 2014). For example, Steele and Fisman refer to two medical faculties in the United States that have introduced mentoring programs for women to redress the high attrition rate of women faculty. In both of these examples, the mentoring programs were seen as being highly successful in achieving the goal of retaining women faculty.

Yet within formal programs available to women, there can be great diversity due to the differing nature, purpose, and focus of such programs (Devos, 2008; Quinn, 2012). While some of these programs focus on retention of women faculty (Steele & Fisman, 2014), others are designed to support women regarding research and teaching. Some target women/early career academics’ mentoring, while others are designed to redress the poor representation of women in senior positions (Quinn, 2012). Some focus on helping new faculty assimilate into the university culture (Voytko et al., 2018), while others focus on productivity outcomes such as promotion, grant applications, and research publications (Mayer et al., 2014). Some are offered over a year, while others are offered for six months; some are part of leadership development programs (de Vries et al., 2006), and others are less structured and are based on a peer support model. Some match women mentees with women mentors, while other programs match women

mentees with either men or women mentors (Quinn, 2012). Usually all programs are voluntary for the participants (Devos, 2008). While these programs have become fairly common in universities across the world (Quinn, 2012), not all faculty departments have mentoring programs. For example, mentoring programs for women faculty in medicine are not common (Voytko et al., 2018), and formal mentoring programs are not necessarily pervasive in every country in the world. For example, Chitsamatanga, Rembe, and Shumba (2018) argue that while a type of mentoring exists in universities in South Africa, formal mentoring programs to support women academics do not exist.

As an illustration of formal mentoring programs for women academics, a brief description of four such programs from four countries (United States, United Kingdom, New Zealand, and Australia) is provided here.

Rush University in the United States, whose focus is healthcare, provides a mentoring program for women faculty to support them to achieve their career goals. (<https://www.rushu.rush.edu/about/faculty-affairs/rush-mentoring-programs/rush-women-mentoring-program>) According to the website, the program aims to help women with promotion into leadership ranks, provide visibility, and promote their successes, as well as uses peer mentoring to nurture a sense of community among women faculty. Rush University also offers two other mentoring programs (available to both men and women) that focus on research and teaching respectively.

Durham University in the United Kingdom offers a number of initiatives to advance women's equality in the university, and two of these initiatives are a network that brings together female staff to offer mutual support and networking to discuss key issues of importance; and the other is a women in academic mentoring program. The key aim of the mentoring program is to assist women's career in higher education. Interested women academics are matched with trained mentors across the university. (<https://www.dur.ac.uk/lets.network/femaleacademicprogression/femaleacademicprogressionmentoring/courseinformation/>)

A mentoring program provided by the University of Otago in New Zealand (<https://www.otago.ac.nz/hedc/staff/women/mentor/index.html>) is offered as part of a special women's professional development program. It has been designed for more senior experienced academics to support less experienced women academics with areas such as planning and development for their career, developing a research profile, helping enhance teaching, and establishing networks. On the expression of interest form, potential women mentees are asked to nominate the areas with which they would like their mentor to support/guide them. Included here are areas such as "creating and maintaining a research profile; enhancing teaching; career planning; knowledge of the wider university and its culture [and] establishing networks."

Introduced in 2000, Monash University offers a women's mentoring program to both female professional and academic staff on a biennial basis (<https://www.monash.edu/gender-equity/programs/mentoring>). As stated on the website, "the program facilitates mentoring partnerships which provide women with opportunities to reflect on and grow their leadership capabilities, build professional skills and more effectively navigate Monash."

From the aforementioned examples, some of the different foci of these programs include promotion and visibility, mutual support and networking, help with research and teaching, leadership and professional skills, and socialization into the university's culture.

Another argument for the introduction of formal mentoring programs for women has been to redress (at least in part) women's underrepresentation in senior leadership positions and also in non-traditional areas such as STEM (science, technology,

engineering, and mathematics). The next section highlights the extent to which women are underrepresented in leadership and STEM within the university environment.

## Women's Underrepresentation

In university leadership positions in Australia, women continue to be underrepresented. Based on 2016 statistics, 56% of students in Australian universities are women, yet one-third of vice chancellors were women in 2018 (WomenCount Report, in de Vries & Binns, 2018). In the same year in the United States, 30% of college presidencies (a role similar to vice chancellors in Australia) were held by women (Johnson, 2017 in Moreland & Thompson, 2019).

In Australia, women make up 25% of deputy vice chancellor roles and 25% of vice chancellor roles (WomenCount Report, in de Vries & Binns, 2018). In 2019, around 30% of women work at the professorial level (i.e., level E), and just under 41% work at the associate professor level (Level D) illustrating that women senior academics continue to be underrepresented in Australian universities (Universities Australia, 2020). According to Voytko et al. (2018), almost half of the students undertaking medical schools in the United States are women, while 65% of all women faculty work as assistant professors and instructor level. Only 13% of women faculty are full professors compared with 30% of males at that level (Voytko et al., 2018). Women's underrepresentation in the professorship is widespread in the European Union, where the average percentage of female full professors is 20% (European Union, 2012, in van den Brink & Benschop, 2014).

Women from minority groups in the United States such as Black African American, non-white Hispanic, native American, Alaskan, and Pacific Islanders are significantly underrepresented in STEM with Petersen citing that while they constitute nearly 18% of the population, they make up only 3% of academics in science and engineering tenure track faculty. According to Petersen, Pearson, and Moriarty (2020), women from minority groups are grossly underrepresented in STEM. Moreover, there is a lack of diversity at senior levels of leadership within universities (Block & Tietjen-Smith, 2016). While women's underrepresentation in leadership and STEM has been cited as justification for formal mentoring programs, another reason has been the range of benefits they yield for the women who are mentored. The next section of the chapter considers some of the benefits as well as the challenges of mentoring women in the academy.

---

## Benefits of Mentoring

Based on a comprehensive literature review of 51 articles concerned with mentoring and women in academe, Meschitti and Smith (2017) concluded that overwhelmingly mentoring has clear positive gains for women who are mentored. One of the key gains was in the area of psycho-social support. In terms of career outcomes, the

authors maintained that they were not as clear-cut since career outcomes would likely need a more long-term view. However, they cited some studies that did provide evidence of the career benefits of mentoring for women in academe. One of these studies was by Gardiner, Tiggemann, Kearns, and Marshall (2007).

A comprehensive longitudinal study by Gardiner et al. (2007) was used to explore the outcomes of a formal mentoring program implemented for junior female academics at an Australian university from 1998 to 2004. A control group of women academics of similar standing who did not receive the formal mentoring was used for comparative reasons. Not only did the majority of mentees find the mentoring experience positive, but compared to the control group they were more likely to stay at the university (i.e., 14% compared to 33% of those in the control group); had higher rates of promotion (i.e., 68% compared to 43%); had a higher average amount in external research grants; and produced a higher rate of scholarly publications. In one area, job satisfaction, there was little difference between the mentored women and the women in the control group. The findings of the study led Gardiner et al. to conclude that the university's formal mentoring program was highly beneficial.

Based on an integrative literature review involving 27 research studies concerned with mentoring outcomes for female health academics, Cross et al. (2019) found there were five key benefits for these women. These included career development (including career planning, opportunities for visibility, and achieving academic goals conducive to promotion and academic success); personal development (including access to role models and opportunities for reflection upon their values); academic craftsmanship which is said to include specific skills involved in academic teaching, research, publication, and grant writing); psycho-social support (including confidence, assertiveness, caring); and job satisfaction. The 27 studies were said to represent a variety of mentoring arrangements including formal and informal mentoring, traditional mentoring, and peer and collaborative forms of mentoring.

Within their literature review of mentoring women in the academy, Meschitti and Smith (2017) reported that alternative forms of mentoring such as peer mentoring and group mentoring as well as mentoring circles were found to be beneficial for women involved in them. They outlined the benefits as "increased opportunities of learning from others, sharing information, and avoiding isolation" (p. 180). These alternative arrangements were also seen as beneficial because they allow more women who are seeking mentors to have access to other mentors. A study by Koontz, Walters, and Edkin (2019) explored a specially designed program called "community mentoring" which combined multiple mentors, peer models, networks, community support, and vertical mentoring for women. Thirty-five women faculty with mixed ranks, ages, and ethnicities from one university joined the program, and everyone was both mentor and mentee. According to Koontz et al. (2019), the women participants expressed "an increased awareness of resources and positionality, alongside a sense of empowerment through more consciously realising their career-goals and ability to address associated obstacles" (p. 110).

Another example of an alternative mentoring program that was virtual was discussed by Petersen et al. (2020). Their program which operated across 20 universities in the United States was designed to support underrepresented

minority women working in STEM. The women participants came from all ranks and levels across the 20 different universities, and among the participants were multiple mentors who played different roles according to their needs. According to Petersen et al. (2020), the key outcomes of the program were mainly psycho-social in focus as participants reported increased confidence, less of a sense of isolation, better coping strategies, and increased self-efficacy. The focus of the program was described as “empathetic mentoring” (p. 319) since it was based on the assumption that colleagues of similar racial backgrounds would be best able to understand and support each other. The findings from Petersen et al.’s study have echoed many studies that have explored the benefits of multiple mentoring arrangements (sometimes called network or communal mentoring) where women can gain input, support, and guidance from many mentors at different times.

---

## Challenges of Mentoring

While the literature has shown that mentoring for women in the academy has multiple benefits with few minor drawbacks (Meschitti & Smith, 2017), writing in the area of mentoring for women of color has revealed a number of challenges. Based on a meta-synthesis of 22 academic journal articles published between 2004 and 2015 exploring mentoring for women of color (i.e., any woman who is not white) in higher education, Cobb-Roberts et al. (2017) found that traditional mentoring arrangements tend to be unsatisfactory for women of color since they do not always address issues of diversity nor are they always culturally sensitive. Almost half of the articles reviewed reported on the benefits of alternative mentoring relationships such as peer mentoring, co-mentoring, and feminist mentoring for women of color as they were seen to be able to better cater to their needs. Another key finding was the importance of psycho-social support for mentees in cross-racial relationships. These are relationships where mentoring occurs among women of color from different disciplines and backgrounds and/or with white women/men.

Graham’s (2019) meta-synthesis of 103 papers that considered women faculty across African, Latino, Asian, and Native American (ALANA) backgrounds came to a similar conclusion to Cobb-Roberts et al. (2017) that “traditional mentoring models fail to fulfill their career advancement needs” (p. 14) and mentoring relationships are not always responsive to mentees’ diverse identities. Graham found that while there was some evidence of career advancement and career support experienced by women of color who were mentored, psycho-social support was viewed as inadequate because of the complexity of cross-cultural relationships. According to Graham, effective mentoring for ALANA women should include providing advice regarding promotion and tenure processes; how to meet various expectations; introduce them to networks that reduce their isolation; and provide them with resources. Moreover, relationships grounded in respect and mutual trust were seen as critical for the success of the mentoring relationships.

The reviews by Cobb-Roberts et al. (2017) and Graham (2019) have highlighted how issues of power, race, and gender can affect the mentoring relationship and how

mentors and those whom they mentor need to navigate and negotiate their relationship carefully. Another important issue raised by writers is the question of same-gender mentoring. The argument for same-gender mentoring relationships has been around for decades with key advantages including women being more comfortable working with other women, and women can act as role models for women (Clutterbuck, 2004; Hansman, 2002). Arguments against suggest that there may not be enough (senior) women to act as mentors to other women and if sponsoring mentoring is the focus, then perhaps a male mentor is preferable because of the likelihood of him having greater access to power (Clutterbuck, 2004; Hansman, 2002).

An issue that is discussed often in relation to cross-gender mentoring relationships is the difficulties that can emerge from these relationships based on concerns regarding “sexual innuendo [and] sexual harassment” (Hansman, 2002, p. 44). Clawson and Kram (1984) identified “sexual risks” as a challenge that can be present within male-female mentoring dyads, and these risks are said to occur when the relationship between the pair becomes sexual; when others suspect it is sexual (even if it isn’t); and when both parties play stereotypical roles (i.e., where the female is dependent and the male is all-knowing). Reflecting on women leaders in the university, Block and Tietjen-Smith (2016) argue that “men will continue to be important mentors for women, [and] . . . women also need to have access to the perspectives of other women who have forged the way into higher education administration at the same time” (p. 307).

While Meschitti and Smith’s review (2017) reported the benefits of alternative mentoring arrangements for women, they also pointed out the difficulties that can emerge in peer mentoring/mentoring networks. One of these difficulties relates to “group dynamics” (p. 182). Citing Esnard et al.’s (2015) research, Meschitti and Smith sum up some of these frustrations as “perceived passivity of some members; perceived pressure to perform; lack of willingness to address in-depth the issues related to race and gender” (p. 181). Because mentoring relies heavily on interpersonal interactions between and among the parties concerned, it is not surprising that tensions and frustrations can characterize the relationship.

---

## **What Type of Mentoring Is Needed for Women in the Academy? Is Sponsorship the New Answer?**

The aforementioned discussion has demonstrated that not only are there many types of approaches to mentoring women in the academy, but research has shown that both traditional and alternative forms of mentoring as well as formal and informal mentoring can yield important career and/or psycho-social outcomes for women. The argument presented here is one that was made by Ehrich and Kimber (2016) in relation to women managers. They argued that women would benefit greatly from access to multiple mentoring arrangements ranging from traditional mentoring to informal mentoring and working one-on-one or within a network or community of

others where women could appreciate the whole gamut of benefits from a mentoring experience.

As part of multiple mentoring arrangements for women, Ehrich and Kimber (2016) did not discount the traditional mentoring model that includes sponsorship as they saw its potential to support women's career advancement and development. According to the authors, they viewed sponsorship as a role played by traditional mentors following Kram (1985), whereby they use power and influence to enhance a woman protégé's career. Sponsorship has also been described as "the active and deliberate use of power (organizational position, professional standing, influence and connection) to facilitate the careers of others" (de Vries & Binns, 2018, p. 6). Although the research has shown that it is more difficult for women to be selected by traditional (male) mentors (because of homosocial reproduction and homophily), Ehrich and Kimber (2016) made an argument that if they were sponsored by a powerful other, they might be able to reap the rewards of this type of association just as men have done for centuries. Yet they were acutely aware that their argument was at odds with feminist values that eschew hierarchical and elitist notions of mentoring (Ehrich & Kimber, 2016). As discussed earlier in the chapter, feminist values are said to be firmly grounded in relational cultural theory where relationships between mentoring dyads are based on empowerment, the promotion of knowledge and skills, and personal autonomy (Schramm, 2000, p. 10).

In recent times, there has been a resurgence of interest in "sponsorship" for women based on a belief that mentoring programs have not gone far enough in advancing women's careers or in redressing women's underrepresentation in senior positions (Catalyst, 2010; de Vries & Binns, 2018; Workplace Gender Equality Agency (WGEA), 2016). For example, over the last 10 years, there has been a move to institutionalize sponsorship via programs and through other initiatives in the corporate world (Hewlett, Peraino, Sherbin, & Sumberg, 2010). Some of the sponsorship programs have targeted not only women but also women from diverse cultural backgrounds. de Vries and Binns (2018) along with other authors (Hewlett et al., 2010; WGEA, 2016) distinguish sponsorship from mentoring since they equate the former with career advancement (including promotion) and the latter with psycho-social support. de Vries and Binns (2018) give the following examples of sponsorship activities: recommending an academic to be on a panel or committee; providing letters of recommendation/references; introducing an academic to key people who could assist them in some way; providing resources such as funding or creating opportunities for an individual to visit another university; invitations to be part of research grants; and co-authoring and co-presenting research or other work (de Vries & Binns, 2018, p. 10). While de Vries and Binns (2018) present an unambiguous distinction between mentoring and sponsorship, it may not be so clear-cut. As indicated earlier, it would not be uncommon for a traditional mentor in a university context to engage in any or all of the activities of sponsorship. Moreover, a small body of research has revealed that some types of formal mentoring programs have been successful in yielding concrete career outcomes for women academics. For example, research conducted on a

formal mentoring program in an Australian university by Gardiner et al. (2007) revealed enhanced career outcomes for women in the program (i.e., promotion, securing of external grants, and greater research outputs) compared to those who were not part of it. Similarly, two important career outcomes – increased publications and promotion – were said to be the result of women faculty’s participation in peer mentoring programs (see Mayer et al., 2014; Turnbull & Roberts, 2005).

Based on their qualitative study with academics across two universities in Australia, de Vries and Binns (2018) continue to argue for mentoring programs for women based on their advantages and benefits, some of which have been identified in this chapter. Unlike others who advocate for sponsorship programs, de Vries and Binns’ position is that sponsorship is the responsibility of all senior leaders in universities and it should become a “legitimate business process” (p. 25). They claim that at present, sponsorship (like traditional mentoring) in universities tends to be *ad hoc*, informal, and demonstrated through unconscious decisions where some academics are given opportunities or access to resources and others are not. Their solution is to make sponsorship a visible, inclusive, and integral process of the work of senior leaders. “By taking sponsorship out from behind closed doors, . . . [organizations such as universities] will improve their accountability towards an equitable and fair career development and promotion process” (Carter & Silva in de Vries & Binns, 2018, p. 25). de Vries and Binns’ (2018) argument is a worthwhile one that can be construed as another important institutional response to support women’s career enhancement in universities.

---

## Conclusions and Reflections

This chapter has endeavored to provide a discussion regarding the importance and place of mentoring for women in the academy. The task was challenging because mentoring can be understood in so many ways because of the theoretical perspectives that underpin it and because of the unique way it can be experienced and enacted. The chapter has highlighted some of the beneficial outcomes for women including various forms of psycho-social support and friendship, career development, opportunities for learning and developing skills, and socialization into academe. At the same time, it has its challenges and examples that were considered included the problems associated with both cross-gender, same-gender, and cross-racial mentoring, in addition to tensions arising from interpersonal dynamics between the parties. The final part of the chapter considered the shift to sponsorship, a related but more focused career development activity, that has begun to gain currency in universities. The position taken here is that de Vries and Binns’ (2018) view of sponsorship is one more important initiative that fits within the overall framework of multiple forms of mentoring. As with mentoring programs, there will need to be not only strong institutional support for sponsorship to flourish but also a big commitment by senior leaders to be proactive, transparent, and visible in the ways they support the careers of women in their specific work areas.

### Abstract

When chronicling the rise and impact of online leadership preparation programs in educational leadership and management, there are a number of common issues and decision points involved. This chapter presents online leadership preparation programs from their beginning to the current state of “Must be included for program survival.” The major implications for educational leadership and management are providing the basis for asking reflexive questions about the inclusion and continuation of online delivery in leadership preparation programs. The chapter further utilizes the concept of presenting both a history and commentary about the field which includes ruptures and discontinuities in development. Additionally, the chapter includes what Michael Foucault terms “enunciative fields, in the discipline, to include: *The field of memory*, *The field of presence*, and *The field of concomitance*. The importance of perceptions cannot be overestimated, particularly when encountering a novel experience. Educators sometimes inappropriately generalize or project familiar, yet inappropriate, aspects of a situation to a new situation that may be nothing like the old. The Web classroom is arguably a revolution in teaching and learning. Even as it has grown in use, it continues to represent a radical departure from the familiar brick-and-mortar real-time face-to-face instructional experience.

---

### Keywords

Higher education leadership · School leadership · Online learning · Leadership preparation · Professional development · Distance learning · Leadership development

### The Field of Memory

Though it may seem that online education had its beginnings in the late 1900s, the concept of distance learning first came into practice in the mid-nineteenth century when the US Postal Service was developed. The notion of reliable, long-distance correspondence led to the development and implementation of what were called commercial “correspondence colleges,” where instructional missives would be distributed through the postal service between students and professors (Visual Academy, n.d.). Today, at-distance education programs have become more sophisticated and accessible due to the proliferation of the web and digital technology. Elite institutions around the world now offer open courseware, online degrees, and online classes that are both legitimizing and popularizing the idea of education from a computer. Additionally, it is estimated that one out of four college students are enrolled in at least one online class. According to the Visual Academy (n.d.), there were over 4.5 million students enrolled in online classes in 2009 and the most popular of these courses was a Master of Science in Business Administration (MBA). It is likely the

trend toward online learning will increase well into the future. In fact, 83% of US institutions have indicated they anticipate online enrollments increasing within the next 10 years (Visual Academy, n.d.).

### **The Field of Presence**

The Coronavirus Disease of 2019 (COVID-19) pandemic has created a radical variance in thinking as planning, by which all leaders are scrambling to find both answers and direction. There will be no returning to normal as educational leadership programs will be required to develop new norms, as the old norms will be nonexistent.

As educational institutions prepare to re-open in what will be a new post-COVID 19 world, these institutions, and their educational leadership preparation programs are all strategizing what this return will look like, and be like for students, faculty, and program leaders/decision makers. In many ways this will truly be a new day, with a new beginning in educational leadership preparation. All institutions will face the challenges of incorporating what was learned during COVID-19, both positive and negative, when implementing change. Without a doubt, more courses will be delivered fully online, or at least these courses will be delivered in blended format. With this change in course delivery, instructional methodology and pedagogy must also change to effectively meet student learning objectives. Students have now experienced firsthand the change to online instruction, and they will therefore demand programmatic change.

### **The Field of Concomitance**

As new theories in online learning continue to develop and shine different constructs on the nature of leadership, the impact of these new theories on online learning organizations and their leadership will become evident as stages of organizational development are studied. Resilience is a key life success trait that can spell the distinction in online learning success or failure of learning experiences for students, and the online classroom is characterized by some unique challenges regarding student resilience.

“Back in the day,” we understood that “distance” learning referred to both the physical distance between instructor and student and the fact that something mediated that distance. Then came the internet, and we began to learn what that meant and how that could mediate the learning experience much more directly and also modify the delivery of content. Eventually the internet’s inherent flexibility became obvious – and we began to call things “online,” referring to the mediating of the learning experience and delivery of content, regardless of physical distance. The flexibility of online learning became so appealing that it was no longer about physical locations at all but simply maximizing the flexibility in time and space. Students and instructors preferred the scheduling flexibility around which real life could still occur while programs of study were being pursued. Then complete degrees at all levels became possible.

Additionally, the technology of the internet and its webbed links changed how content was organized and delivered – and altered how content could be processed by students. Then came social media and the opportunities of real-time connections. This modified our approaches to instructional design as we began to realize some

content could be presented in real time, although asynchronous still provided the flexibility we all enjoyed so much. The advent of social media also changed how communication and exchange happened in society in general, and began to change the expectations of students. By this stage, wireless and mobility became advanced and changed the expectations of immediacy and connectivity for everyone.

Learning is inherently a social activity. By sharing insights and examples with one another, we are all enriched in our own individual learning journeys. The online learning environment has made it possible to forge such learner bonds on a global level. No longer are we restricted to the same concrete day, time, and place to “all study together,” as in the traditional face-to-face classroom setting. This global context allows for a broader scope and depth of exposure to a variety of learning ideas Dereshiwsky, p. 163.

As the growth of online education continues to expand exponentially, course developers and faculty must understand the importance of relationships there by establishing and maintaining virtual connectiveness.

As a result of COVID-19 the psychological impact of online learning will be increasingly studied. One study found that, (1) students have started to get bored with online learning after the first 2 weeks of learning from home, (2) considerable anxiety on research subjects whose parents have low income, because they have to buy quotas to be able to participate in online learning, (3) mood or mood changes occur due to too many assignments and are considered ineffective by students, (Irawan et al., 2020, p. 53). The findings of this research suggest there is a need for counselors and psychologists to make a concerted effort to support the psychological well-being of students (Irawan et al., 2020).

What are the latest technologies to impact the evolution of online learning? According to [eLearningIndustry.com](https://www.elearningindustry.com), there were “5 Amazing eLearning Trends in 2016”: Mobile Learning; Gamification; Video-Based Training; Competency-Based Learning; and Big Data. In 2021 there are many more.

### **Discontinuities and Ruptures**

In addition to the changes which students have experienced in course delivery, program faculty have also experienced a multitude of changes, and possibly more than their students have experienced. Faculty across the country who had never taught a course online prior to COVID-19 were forced to teach online courses with very short notice, and with very little preparation time. Even faculty who had limited online teaching experience were thrust into this new online world with minimal support. During this impending COVID-19 parading shift, universities will continue to scramble to develop quality professional development opportunities to meet the demands of faculty who want to increase their skills, knowledge and ability to provide remote instruction to their students. Faculty are likely to insist on the continuation of the positive aspects which have occurred in 2020.

Debate continues to exist in determining the quality of leadership preparation programs, as it relates to online, blended, and in-person delivery of courses. Knowing that educational leaders continue to work predominately in a face-to-face environment, does it make sense to assume that leadership preparation programs, and the courses which make up those precertification programs should continue to be

taught predominately in face-to-face or at least in blended format? This question is a key decision-making juncture in educational leadership programs. Can quality leadership development programs be taught in fully online environments? Can the interactive skills so necessary in the life of an educational leader be adequately acquired in an online program?

### **Critical Assumptions**

The growth of distance learning programs has many important side effects on higher. One of the important changes relates to the demographics of students enrolled. As an example, at the University of Phoenix, the average age of students is 33 and the majority of students enrolled in online classes are females. Moreover, 93% of all traditional universities including Harvard and Berkeley offer free online classes referred to as “open courseware” (Visual Academy, [n.d.](#)).

Graduate students are demographically, socially, and experientially different and ever changing. These students are requiring leadership preparation programs to be different than traditional leadership preparation programs. Today’s leadership preparation students are looking for convenience in program delivery as they shop for certification programs (driving distance, travel time, flexibility of course hours). Program cost is usually secondary to individual learning requirements and convenience in obtaining certification.

As technology improves and online programs become respected, education experts predict that distance education will continue to expand and complexify in the future. Some leaders in the realm predict that the number of online students will grow exponentially in the twenty-first century. As an example, to encourage online program growth, President Barack Obama pledged over \$500 million for the creation of new online course materials to fuel the industry.

Online leadership preparation programs are here to stay and the number of programs which are available, along with the increased variety of program delivery options, will only expand and be much more competitive, as the world shrinks, and as the field of leadership preparation becomes more competitive, especially from the “for-profit” higher education sector.

---

## **Introduction**

This chapter provides a conceptual framework along with a brief historical background of online learning in educational leadership programs. Additionally, this chapter identifies the key issues and decision-making points which leaders must have in place to administer online courses within leadership preparation programs.

Online learning has become a ubiquitous and ever-expanding feature of instructional programming in educational institutions from elementary school through post-secondary education. As of 2013, over 80% of US research institutions offered online coursework, and if for no other reason than a reaction to the COVID-19 pandemic, it is estimated that online course delivery at the post-secondary level is pushing 100% (Visual Academy, [n.d.](#)).

Few scholars would argue that online learning provides some benefits over in-person instruction, both for the learner, and for the learning institution. Learners gain convenience, ease of access, and, frequently, more personalized learning in the online setting. Institutions benefit from the ability to offer coursework without being limited by students' lack of proximity to a particular location. Institutions may also experience online delivery as a more cost-effective and efficient way to deliver instruction, potentially reducing expenditures for classroom facilities and for personnel. When designed well, online courses offer the potential for greater personal connections and differentiated learning for students.

Much is required of individuals in leadership positions, particularly those who lead online learning programs. The online learning landscape will continue to change dramatically in the coming years, and the coming changes will affect instructional practices, the tools of technology, curricular standards, methods of assessment, and the faculty and program evaluation process. The purpose of the chapter is to provide a road map which if followed may be helpful as more and more program leaders ponder the fate of online leadership preparation.

---

## Online Learning: Fad or Requirement?

According to a 2017 study by the National Center of Education Statistics (NCES), 94% of Children between the ages of 3 and 18 have access to a computer at home. Furthermore, NCES found that 65% of children had Internet access in 2015.

The use of technology is also prevalent in all aspects of professional life. For example, marketing depends on reliable access to current and prospective customers, as well as suppliers. Technology has expedited the speed and dependability of such communication channels. The ability to create databases and access them to generate financial reports has revolutionized the accounting function of business. Business documents can be more economically stored and retrieved from all locations without the need to generate mounds of paper (Crowder, *n.d.*).

Similarly, computer-based record-keeping and information retrieval occur in health care with regard to patient records. Laboratory analyses can be programmed in whole or in part for key medical tests. Furthermore, computer-assisted surgical systems (CAS) are now standard in the operating room (Corella, *n.d.*).

Likewise, government communications and record keeping have been revolutionized by technology. Document storage and retrieval of important records at the local, state, and national level can now occur with greatly enhanced speed and accuracy. Communications among various agencies can occur through multiple channels such as email and live chat. Additional examples, including promotions such as commemorative stamps issued by the United States Postal Service, are discussed on [techwalla.com](http://techwalla.com) (Suttle, *n.d.*).

The above examples barely scratch the surface regarding the applications of computer technology. A graduate program would be remiss in not preparing its students to be maximally qualified to apply such technology to their future activities in their personal and professional lives.

Indeed, online education reflects this need for maximum student preparation in its own ranks. As of 2018, there are over 28,662 fully accredited online higher education institutions, covering all levels from associate and certificate to doctoral degrees (2018 List of Accredited Online Colleges & Universities). This trend is supported by the concomitant growth of K-12 online educational institutions (Virtual Learning Academies & Online Private Schools, [n.d.](#)).

Given such evidence, some would argue that online learning is both a requirement and more importantly an opportunity both for students and faculty.

---

## **Why Go Online, and What Are the Benefits to Students?**

The availability and accessibility of technology to students is perhaps one of the most critical issues with online instruction. There may be a difference, however, between undergraduate and graduate access to technology. For undergraduates even if a computer is not readily available at home, there are other ways for students to gain reliable computer access. For example, public libraries and Internet cafés have computer access available. They may have a friend, relative, or neighbor who might allow access to their computer for their studies. In addition, schools are increasingly ensuring that online classroom content can be dependably accessed via smartphones and tablets. All of these means of connectivity are also ways for students to continue to develop their computer navigation skills.

Many graduate students not only have home computers, but may also have them at their school-work stations. No longer are students tied down to a fixed day, time, and place to “all study together” as in the traditional brick-and-mortar real-time classroom setting. This added flexibility is a special plus for busy working adults and those with small children at home. There is no longer a need to jump into a car after a long day at work and fight 5 PM traffic jams to get to a brick-and-mortar classroom.

This benefit corresponds to the preceding one. With the increased prevalence of laptop and notebook computers, as well as social media devices (e.g., tablets and smartphones), classrooms can literally carry classrooms wherever desired. This is such a plus for those students who travel regularly on business, or who have a family vacation coming up. They no longer have to choose between one and the other commitments. Both travel and study can now be comfortably accommodated.

## **Greater Accommodation of Some Special-Need Student Populations**

Those students who are hearing-impaired no longer have to worry about engaging the services of a signer through campus services to accompany them to real-time classroom meetings. With the typical text-only communication format of the online classroom, they now face a level playing field with that of their non-hearing-impaired colleagues.

Adult learning theory highlights the benefits of peer-to-peer experiential learning as one of its primary principles (Pappas, 2013). What better way to broaden students' access to a wider diversity of viewpoints and experiences than in an online course which may contain students from different locations in the same classroom?

A substantial amount of communication in the online classroom takes place asynchronously. For example, discussion forums require text-based posts in response to the main discussion question as well as to other posts by classmates and instructor. In the extreme, all communication may take place in text-only in this online classroom. Some live meetings can be built into the class as well, using online classrooms such as Collaborate or Adobe Connect. Even during live sessions, however, students may need to use the chat box to type in a comment or question they may have during the live session.

### **Greater Attention to Netiquette in Written Communication**

This benefit is an extension of the preceding point about effective writing. Text-based communication can sometimes be misunderstood without the added benefit of visual and verbal cues (Davich, 2017). For example, is a brief message intended to be efficient? Or does it risk being misinterpreted as abrupt?

This benefit is an offshoot of the greater diversity and breadth of viewpoints made possible when students from a variety of locations are enrolled in the same online classroom. It also extends to courteous and respectful communication.

---

### **Laying the Groundwork: Funding and Technology Issues**

There are three decision points which are important in moving to an online presence.

The first decision point is the extent to which the program personnel understand clearly the nature of the institution's mission and goals and with that the nature of the students.

The second decision point revolves around whether a program is going to maintain or enhance the levels of service and engagement through online education. Are the programs a good match for online delivery?

The third decision point involves a consideration of both time and effort, with a requisite funding source for this effort. Most institutions seemingly use in-house budget dollars from central administration to fund the startup, although various technology companies (Microsoft, Google, Facebook, etc.) have grant and partnership programs available.

---

### **The Importance of Structuring Effective Online Instruction: Implementing Best Practices**

There are five key areas involved in structuring an effective online program. The first decision point involves a choice of SIS and LMS. SIS stands for Student Information System. The second is the Learning Management System. This decision connects to

the decision of hosting locally on campus, or off-campus in a cloud solution, keeping in mind the needs of the students and faculty. The ongoing maintenance and funding of an online solution requires both dollars and staff time, so preparations should be made accordingly for additional FTE staff and related labor costs for the maintenance and management of the online solutions.

*The SIS* system houses student demographical information in addition to most class information, allowing students to enroll, have grades posted, and house transcripts. The student information should auto populate from SIS into the Learning Management System, or LMS. When selecting an SIS keep in mind most institutions have an engrained SIS solution on campus, with Banner (owned by Ellucian) and PeopleSoft (owned by Oracle) currently being leaders in the market. LMS solutions are typically found with Blackboard, Moodle, Canvas, among others, and most have a method or format for working with each other.

Historically institutions housed their data systems onsite; however, the last few years have seen the shift towards cloud-based solutions, using Software as a Service (SaaS). Labor costs for full time institutional employees, data center infrastructure costs to heat/cool and maintain the buildings, and security concerns have helped move software to cloud-based solutions. In most cases employees have stayed with the institutions into other roles, yet be aware of possible staffing implications should a cloud-solution be selected.

The needs of the student in relation to software purchases include a long list of requirements. These include but are not limited to the standard accessibility and section 504 accommodations (ADA), furthermore features such as mobile-friendly, off-line support, embedded video, testing solutions, ability to use AI for grading, multiple file support for submission, plagiarism detection (including self-plagiarism), and creating a centralized helpdesk support and ticketing system would be desirable.

Once the institution has adopted an SIS and LMS set of platforms, a decision point involves how they are going to be maintained. There may be monthly security updates for the computer systems to covering the labor costs associated with data entry, in addition to the on-campus or cloud-hosted systems that require expenditures. These costs quickly can add up, and with increasing enrollment the incremental costs need be factored into the budget.

---

## **Creating Online Content**

After the systems are initiated, the next decision point concerns a determination as to which courses are going to be put on line. This process can be done via a variety of methods, with the most typical process being centralized to the institution's office of online learning. How to staff and manage this office can take a variety of different formats, with some ideas to follow.

The next decision point involves whether the Office of Online Learning should become the clearing house to coordinate online education for the institution. Most large public universities already have a distance (correspondence) or university

outreach extension office in existence, so using this framework, nomenclature, and budget codes might be the path of least resistance to start.

One of the largest barriers to adapting a new technology platform can be support – or lack thereof – from faculty. Providing a centralized clearing house of informational support should be one of the early steps taken when moving to developing an online learning program. Some faculty members are very comfortable with new technology and adjust their classes to an online format. Another decision point is whether a survey of faculty attitudes toward technology should be administered in order to get a sense of where the faculty's comfort zone lies. The faculty's disposition toward technology in general and a particular system specifically might reveal some specific gaps for professional development in order to relieve unnecessary anxieties.

---

## **Supervising Effective Curricular Design and Pedagogy**

The expression on the face of the student was as surprising as the comment he had just made: “the instructor didn't respond to emails until after the semester was over, that way he could say it wasn't an issue any longer since grades were submitted. It is hard to believe one would have someone teaching who doesn't bother to respond to students via email.”

While system administrators may be surprised at this student's comment, it is surprisingly common within the institution to have non-email users, either by choice or by technology ignorance. A critically important issue is how does someone who oversees online learning ensure that faculty respond to student comments, including via email? The solution is not only technical and pedagogical, but also based upon the personality of individual faculty.

The method and practice of teaching (pedagogy) has not fundamentally changed significantly in hundreds of years – the “sage on the stage” continues with traditional classroom instruction as seen in most institutions. This format changes slightly with adult learners (andragogy) yet with online learning they find themselves having to adapt to a new delivery method – via video, assigned readings with related discussions, and an asynchronous feedback loop from the student audience.

As outlined earlier, a common method for the past 20 years has been for subject matter experts – faculty – to work with an instructional designer to put content into an online format, and then teach the class.

Some key decisions revolve around how to divide the course into manageable chunks and sizes for completion in a block of time. Some providers have sections that take 5 min or less to complete, others can take up to 3 h. A key design feature is to determine how long persons would like to sit and remain focused on a topic. The smaller the chunks of time involved ensures the greatest flexibility for

students to fit them into their home schedules and engage in effective time management. Students might be getting a small bit of course content time on a break at work, on mass transit on the way home, or during a child's nap. Instructors should consider dividing the work into the daily, or weekly, assignment blocks. The sense of accomplishment from completing each section brings the learner back again for more in the future.

LMS providers have customization features and templates that can be saved and reused for multiple courses. These include creating a clear standard for the course, and repeating it in future courses taught as well as considering changing the also changing the background colors, if possible, to help students taking more than one course to see which class they are currently viewing. Much like a biology lab is different from a lecture hall, a different space and feel can help students feel grounded in their location.

The standard collection of title, course numbers, meeting days/times, faculty information, including office location/email/phone along with boilerplate institution requirements are expected. Online classes should also help students by including information for campus technical support, vendor support if third-party sites are used, expectations of online behavior, and advice for dealing with technology problems.

Having clear learning objectives – composed as concisely as possible – allows a student to see at a glance what they should expect to cover in class. This information converted selection of program standards into measurable learning objectives also helps align the content to match the objectives, and remove any materials that do not fit with the objectives.

Interactions with the class content often comes in the format of discussion boards, with the faculty member posting questions related to the class content, and students replying. This threaded reply line allows a student to reply to the instructor questions, and then other students to reply to the first student in line. Students can learn from both the faculty member and fellow students.

Depending on the topic being taught, online education can help provide a real-world scenario for course content. In a class for computer security, a virtual lab environment can be developed where programs can be tested for security. For foreign language classes, VoIP calls can be made to known persons in other parts of the world to practice and use language skills.

It will be important to review the course through the Quality Matters Rubric to see if the course meets the standards for online education as set forth by Quality Matters, a respected group for online education at both K-12 and higher education levels. If there are areas in which the program needs improvement, step-by-step guides can be provided.

As online students begin to enroll from around the world, having a 24/7 help desk available for technical issues is an assumed must. Having academic advisors, student success coaches, mentors, or faculty available for guidance is an excellent way to differentiate a program as one of the best.

There are a variety of professional organizations focused on online learning, all of which have experts, best practices, and ideas for providing online education. The International Society for Technology in Education (ISTE) is the foremost organization in teaching technology in the classroom. As a result, ISTE has developed more than a dozen quality standards for how students, faculty, administrators, and computer educators should approach technology in the classroom.

As an example of professional development opportunities for leaders, the Online Learning Consortium (OLC) provides an Institute for Emerging Leadership in Online Learning on a yearly basis. Quality Matters (QM) is a well-known and highly respected organization which helps educational institutions to deliver their online promise to students: Learners need to improve and grow. It works to nurture them with well-conceived, well-designed, well-presented courses and programs.

---

## Awareness of Online Learning

Online education has become a growing area in the last 20 years, and new entrants into the market continue. Seemingly each week a well-known large institution announces a foray into online education. A key issue and decision point relates to determining how an online provider can generate market awareness of the program. Key decision points pertain to four main places to start, with each needing to be tailored to the market in a blended method that meets budget, enrollment, and time constraints.

Begin by searching online degree programs and dozens will pop up. How would a prospective student find a specific program? Purchasing keywords for the program by format, academic topic, geographic market, or other differential term is the first step done via both Google and Amazon sponsored via their “Advertise with Us” link on their homepages. From there, an easy-to-understand website with clear information about the requirements, cost, time to complete, and ability to connect to a live person for questions should be developed.

On campus already are a collective group of students taking face-to-face classes. Having this already aware group of students enroll into one – or more – online class should be an easy transition. Clear explanations of credit transfer, cost, and expectations are key to capturing this market.

The sides of buses and trains across the USA are plastered with ads for Penn State, University of Arizona, and other institutions courting online students. Billboards and radio ads abound throughout the country for online degree programs. Although expensive compared to the first two methods, these mass media advertising methods gain awareness of online offerings.

The old adage that an upset customer tells ten friends while a pleased customer tells no one is even more true with social media. If a frustrated student is already online attempting to complete class assignments, it is likely a social media platform is either open or a click away, with quick venting easy for a student to complete.

## Supervision of Online Faculty

As instruction moves online, the days of faculty congregating in their physical office area is shifting to virtual office areas. The use of email and phone for essential business functions continues, but lost are the days of casual visiting in the halls, developing new ideas for research projects, and in some cases collaboration between faculty with classes within the same discipline. Many institutions continue to have monthly faculty meetings at the main brick and mortar campus, with provisions made for remote attendance via video or telephone conference. Yet, a key issue involves understanding how supervision can occur. Some institutions such as Cochise College in Sierra Vista, Arizona, require a faculty retreat at the beginning of each semester, sometimes held off-site for a full day (or more) which all faculty must attend in person. This is specified as part of their contract with the institution to gather at this convocation. Still some faculty only appear on campus once or twice a year at convocation, and perhaps graduation. For the balance of the year, they are an icon on the instant messaging software or an email to the all-employee list, rather than a face in the faculty break room. This is not a bad thing, but managing the expectations and workload, along with supervising faculty at distance, present a new set of opportunities. Here are some common decision points regarding supervision of online faculty.

1. Weekly check-ins are common in the nonacademic workplace, with status updates, briefings from departments, and announcements being the common fodder during these meetings. For a department chair or director with numerous direct reports, more than a day per week could be taken up with meetings, so biweekly or monthly meetings might be more appropriate.
2. No longer being able to walk down the hall or catch someone after a meeting, at a distance faculty should have certain expectations set upon them for being available via phone/email/IM during a set schedule or perhaps business hours.
3. In brick-and-mortar classes a department chair could slip in the backdoor of class and observe a faculty member teaching in person. Now, with even less obvious signs, a department chair can drop into an online classroom and observe the student interactions via the discussion board, the content provided for students, and the general feel of the instruction being provided.

The standard format that has evolved in the past has made its way online in the last 20 years, and at the end of the semester students have the chance to provide feedback about, and to, the instructor. Reviewing these forms for trends can help provide the department chair with a level of effectiveness and engagement of the faculty member.

The policies used by institutions can spell out not only employment laws and rules but also expectations for availability, response time to students, and teaching format considerations. These documents should be used to help set a clear expectation up front for distance faculty. Often these are included as a memorandum of

understanding and conditions of faculty service, although each institution will call it something different.

---

## **Preparing and Recruiting Online Faculty: Skills and Dispositions**

It is a special breed of an online instructor required to enable an online program to be successful. The hiring of an instructor for student learning is undoubtedly the most important responsibility an educational leader must accomplish. It is well documented in the educational arena; a quality teacher is the most significant factor in student learning, and student learning is directly related to quality teaching, irrespective of age. Therefore, recruiting, hiring, supporting, and retaining quality online faculty is imperative.

Personnel needed by educational institutions are those who will have the ability, motivation, and creativity to: (a) enable the system to surmount its infirmities; (b) adjust the educational program continually to the needs of individuals living and competing in a dynamic society; (c) provide leadership that shapes the human organization in such a way that there will be congruence between the individual and the system; (d) create a climate conducive to maximizing voluntary growth and individual effectiveness; and (e) influence ordinary personnel to perform in an extraordinary fashion. Educational organizations, like all organizations, are created and maintained to achieve specific purposes (Hoy & Miskel, 2005).

The following checklist regarding aspects of course quality has been used by instructional designers at Northern Arizona University as a starting place for all faculty who are teaching online courses:

1. Provide alternate text (titles and descriptions) for all images in the course. Use images to complement Ext, rather than replace it and use alternate text (titles and descriptors) to describe graphs and charts.
2. Verify that all web pages and media components function correctly on major operating systems and different supported browsers and ensure that all necessary plug-ins or software to run video, animation, audio, presentations, and/or course content files are easily accessible and useable on all student computer systems.
3. Ensure that copyright clearance was obtained for all materials inside the course that do not fall under the TEACH act of Educational Fair Use.

---

## **Planning Necessary Support Services for Students and Faculty**

The issues and decision points for support services for online programs boil down to four areas: technology support, curricular design support, library support, and administrative support.

## Technology Support

This key area will be further subdivided into orientation and training, follow-up training and professional development (ideally conducted in partnership with curricular design specialists as well), and help-desk technical support.

Adequate orientation and training on how to navigate the online classroom is essential. If possible, in-person or technologically mediated live sessions should be offered as part of such training, even if the live component is limited to one or two sessions. It may be impractical for students and faculty who live at a distance from the main campus, or who work full time, to attend entire intensive online classroom navigation orientation sessions.

In addition to the above orientation, which is expected to be more time-intensive and comprehensive in nature, the university's IT department should also offer periodic shorter training and professional development opportunities, in conjunction with curricular design experts and experienced online faculty members.

This one seems almost self-evident. As the online instruction gets underway, both students and faculty need to have a dependable way to reach out for immediate help to tech support if they should encounter a problem. Such problems are bound to happen despite the best efforts at comprehensive training and orientation.

## Curricular Design Support

Prospective novice online faculty may not know what an online course actually looks like. More experienced online faculty who have been asked to develop an online course, or make major upgrades to an existing course, may need help in doing so. Curricular design experts can be instrumental on both counts. Many faculty members assume that because they are using presentation software or an electronic whiteboard to demonstrate a concept, they are integrating technology. Although using technology to deliver instruction can be useful, it is not true integration.

A wide range of valuable educational software products are available. Yet one is not always applying one's full potential to encourage higher-level thinking and to accommodate different learners. For instance, concept mapping products can be an amazing classroom resource. Using them to organize information is good, but using them to analyze information – for example, to compare and contrast information – is better. Another example is the use of spreadsheets. Spreadsheets are a great way to manage data and information, but a better use is to show students how to use them to make inferences and predictions, or even better, to develop new ideas.

---

## **Library Support**

The days of having to stand in line on a cold winter day in the early morning hours, waiting for the doors to be opened at a brick-and-mortar library, are long over. Of course, these libraries continue to serve an important and valuable function in meeting real-time informational needs of both students and faculty. By the same token, walk into such a traditional real-time library to see how intensively computerized it too has become.

## **Administrative Support**

Department chairs and deans must support online faculty and students in a variety of ways: recognizing and rewarding online faculty initiatives through such avenues as direct acknowledgment in retention, tenure, and promotion decisions; similarly recognizing online faculty-related professional development activities such as participation in trainings and workshops in their annual statement of expectations; and providing teaching assistant support to online faculty, particularly those with large and/or especially writing-intensive courses.

---

## **Other Critical Issues in Evaluating Online Faculty Performance**

Attendance is an issue in online programs as it is in the traditional brick-and-mortar class. However, the way that attendance is documented is very different. Instructors do not physically walk into an asynchronous online classroom. At the same time, most online classroom management systems contain specific ways to track instructor log-in days and times, duration of each log-in session and even in some cases, the specific activities the instructor engaged in while logged into their online classroom.

Instructor discretion with regard to creating their syllabus varies by rank of instructor and type of educational institution. Adjuncts, particularly those who work as needed at for-profit institutions, may have their syllabus basically handed to them. The benefit of this practice is consistency of course expectations regardless of specific instructor.

As with the syllabus, the online lessons may already be created in the form of existing web pages, supplementary links and other learning resources. Instructor discretion to modify this curriculum typically varies along the same lines as with the syllabus, discussed in the preceding point.

To quote the late New York Mayor Ed Koch who used to stop citizens in the street with this query, students naturally want to know "How am I doing?" with regard to their submitted assignments. Many schools have a requirement that an initial assessment must be graded for students within a relatively short time frame from the start

of the course. This is so they can effectively gauge their understanding and performance in the class.

There is no more daunting feeling to an online student than feeling stuck on something related to their course, and thinking, “I’m all alone, facing a cold computer screen. Is anyone out there available to help me?” Granted, the instructor response cannot be expected to be as rapid as in the face-to-face classroom, where an answer in response to a raised hand or a student approaching the instructor after class with a question is instantaneous.

Much like the live-and-in-person instructor who may precede a formal instructional session with some general announcements, regular posting of announcements in the online classroom is considered a best practice in enhancing communication with students. In addition to any late-breaking informational updates, many instructors post a start-of-week announcement that briefly recaps the learning content from the preceding week and previews the coming week’s topics.

As mentioned earlier, the amount of discretion that an online instructor may have with regard to their course content can vary. Ideally even with canned course content, there will still be room for instructors to add their own personalized tweaks to their course.

Technology itself is arguably the most rapidly changing of all disciplines. With changes in technology, there are bound to be related changes in the ways this technology is used in teaching. Most schools will likely change up their online teaching platform regularly. Sometimes this change will be an upgrade of an existing platform such as Blackboard. However, it can occasionally be a drastic shift to an entirely new platform as well.

It may seem odd to see these two items, particularly student evaluations, listed as the final evaluation criterion. Sadly, far too many evaluators of faculty performance give student evaluations the full weight, or most weight, in assessing faculty performance. Adjunct faculty at for-profit institutions, in particular, traditionally worry about their student evaluations as the make-or-break determinant in whether or not they will be offered a contract to teach again for the following term.

Online adjunct faculty, particularly those affiliated with for-profit universities, report a disturbing escalation of micromanagement of their teaching activities. This can take such forms as frequency of evaluation (e.g., the unannounced administrative drop-ins into an online classroom), exaggerating an isolated negative student evaluation comment while at the same time ignoring or underweighting positive student feedback), and ultimately employing evaluation results, particularly negative ones, in deciding whether or not to offer the adjunct faculty member a future teaching contract.

Any evaluation brings with it some inherent stress, regardless of the context. Once again, the online environment can exacerbate these stresses, particularly if they are used for nefarious purposes by the evaluator.

---

## **Evaluating the Effectiveness of Online Programs: Does Delivery Modality Affect Student Assessment Results?**

The leadership world is ever changing. Leaders are challenged to evaluate both full-time and part-time faculty, who all possess terminal degrees, and who are recognized experts in their respective fields. Additionally, challenging is the evaluation of faculty whose courses were taught in three modalities: in-person, blended, and fully online. How do you effectively evaluate faculty who taught courses in more than one modality? Are faculty expected to be equally effective teaching online courses as they were teaching in-person courses? Can online courses produce the same quality of student learning outcomes as traditionally taught in-person courses had done, and can online courses effectively prepare Educational Leaders for K-12 school leadership (which occurs predominantly in a face-to face environment) via online instruction and while never meeting leadership candidates in person?

Christensen, Aaron, and Clark (2002) argued that distance learning is disrupting traditional education: this is the theory of “disruptive innovation.” The theory of disruption can provide answers to the aforementioned questions and provide researchers, practitioners, and policy makers, with a new perspective on how increasingly effective, affordable, and accessible online opportunity has become.

The purpose of course, program, and instructor evaluation, and its resultant effect on student learning, has been studied, reviewed, discussed, debated, and researched for as long as there have been schools, programs, teachers, and students.

Regardless of teaching modality, teachers have six different identities (Magan, 1990) according to the expectations of their students. All instructors should be aware of these identities as they plan instructional objectives and student outcomes. Understanding that educators can never go back and teach the same lesson to the same students ever again, and understanding that sometimes our strategies and techniques work and sometimes they do not, is vitally important.

Evaluation instruments are all designed for a singular purpose: improve instructor performance to optimize student learning. The challenge, however, is to design evaluation instruments which provide adequate, meaningful, consistent, and reliable feedback to instructors relating to the specific course being evaluated, as well as the individual details valuable to instructors as individuals. The following is provided as an example of the philosophy behind faculty evaluation.

---

## **Sharing Results and Lessons Learned with Key Stakeholders**

Online learning has become a common feature of instructional programming from elementary school through post-secondary education. At the postsecondary level, a minimum of one online course is taken by one of every three students in their college years.

There can be little doubt that online learning provides some benefits over in-person instruction, both for the learner, and for the learning institution. For the learner, one of the great advantages of online learning is that it can be a convenient

way for working professionals to manage both a full-time job and college coursework. Its ease of access can make it possible for historically underserved areas to gain the opportunity for advanced learning. Through practices such as Universal Design for Instruction (Wynants & Dennis, 2018), differentiation for individual learning needs can, in some cases, be provided quite readily in an online setting. Institutions benefit from the fact that, in contrast to classroom-based instruction, which generally requires students to live within a reasonable distance of the classroom's location, online learning can enable institutions to offer coursework to students scattered across a geographic area as big as the earth itself. In some respects, it can be a cost-effective and efficient way to deliver instruction, potentially reducing expenditures for classroom facilities and for personnel.

There should also be little doubt that there are potential disadvantages associated with online learning. In order to ensure that the full potential for online instruction is realized, it is critical to acknowledge and address it. As school leaders consider how to go about sharing results and lessons learned from online programs, it is important to recognize that research evidence on the effectiveness of online learning programs is not consistently encouraging.

Where differences have been found in student outcomes between in-person and online coursework, it is important to attempt to understand the reasons for these differences. This does not imply that online courses should simply mimic practices that are employed in face-to-face settings. Online teaching may actually offer opportunities to innovate in ways that have not been fully explored in conventional classes, and may point the way toward improvements in both approaches.

The available evidence points to great potential for online learning to serve the needs of both individuals and institutions. As noted previously, online learning offers the potential for cost savings, increased access for underrepresented groups, differentiation of instruction, and convenience for learners who are working professionals.

---

## **Continuing to Be a Positive Change Agent in Online Instructional Initiatives and What Is Known About Leaders Who Effectively Manage Change**

While there is an extensive body of scholarly work on the topic of change in educational institutions, this section will focus on four key areas that must be influenced by leaders to effectively manage inevitable and ongoing change: trust and credibility, respect for dissent, a shared sense of purpose, and a disciplined focus.

### **Trust and Credibility**

In order to effectively manage change efforts, leaders must first earn the trust of others within their organization. Trust is not earned overnight, and once earned, it can be quickly eroded with a single misstep or careless remark. While the presence

of trust provides no guarantee of organizational success, its absence is likely to produce a host of problems. Chief among these is often a resistance to change initiatives, which can be seen in visible manifestations of suspicions toward a leader's motives.

## **Respect for Dissent**

Constant change is a fact of life for educators, particularly with respect to initiatives that involve ever-evolving technological resources. Adapting to departmental or institutional change can be time-consuming and require deep stores of patience and humility. Factors associated with change can lead faculty to speak out to express frustration, exasperation, or outright hostility to change initiatives.

The most effective change efforts engage all stakeholders early on in the planning process, not just after a solitary leader has devised a brilliant scheme to improve the organization, which he/she then shares with others, in eager anticipation of their exclamations of enthusiasm. Instances exist of leaders who created, all alone and behind closed doors, an institutional mission and vision which was subsequently delivered to stakeholders as if the document constituted sacred text.

## **A Shared Sense of Purpose**

As noted earlier, the likelihood that a given change initiative will be successful is greatly enhanced by the development of a shared and clear sense of purpose. Success is further enhanced when leaders center their actions and the actions of others on a shared mission and goals, taking steps to actively support faculty in their efforts to carry out the initiative and addressing systemic barriers that, unacknowledged and unaddressed, can efficiently derail such efforts.

---

## **Conclusions and Reflections**

Educators at all levels have witnessed countless waves of failed initiatives over the course of their careers, whether or not such initiatives have anything at all to do with online learning. Many educators have become accustomed to a somewhat cynical posture of "waiting things out" until an initiative runs out of steam and the leader who spearheaded the initiative in the first place either leaves or moves on to some more promising enterprise. Decades of education-related activism by state legislatures and the US Congress have resulted in countless top-down initiatives that spent much, achieved little, and validated the effectiveness of time-honored strategies such as pretending to care, faking implementation, and waiting until *that* person moves on so that one can go back to the way that one normally does one's job.

In the case of online initiatives, technology itself changes at a pace that is dizzying. The experience of finding that the laptop, Smartphone, router, or smart

speaker that was shiny and new not so long ago now needs (in a best-case scenario) new firmware, a new security patch, updated drivers, the most recent version of the operating system, or (in a worst-case scenario) replacement. Every closet, storeroom, and garage silently testify to the obsolescence of ideas and innovations that once seemed cutting-edge technology itself reduces the sense of reaching a point of stability or equilibrium in our lives, so it stands to reason that skeptical faculty would look at any technology-related initiative with more than a little skepticism and a sense that “this too shall pass.”

While it is unconstructive to assume that veteran faculty members are necessarily less predisposed to supporting new initiatives than newer faculty, it is constructive to recognize that there are diverse viewpoints and experiences regarding online learning in every department and college. The fact that some faculty are tenured, some not, some full-time, and some adjunct presents a host of challenges to offering effective training support. Professional development opportunities must endeavor to take into account such diversity and attempt to personalize learning for faculty, just to strive to personalize learning for our students. Although this chapter does not afford adequate space for a full exploration of the topic of faculty development for online learning, a body of current scholarly research should prove to be helpful (Carbonaro, Snart, & Goodale, 2002; Dailey-Hebert, Mandernach, Donnelly-Sallee, & Norris, 2014; Elliott, Rhoades, Jackson, & Mandernach, 2015; Hixon, Barczyk, Buckenmeyer, & Feldman, 2011; Ludwig & Taymans, 2005; Wynants & Dennis, 2018).

The bottom line should be a familiar one to most educators. Formal leaders must be viewed as the most vital of stakeholders whose support is essential to the success of a change effort such as online design and delivery in the higher education setting. While technology changes, the human element remains a constant. There are no new lessons to be learned here. There are only old lessons that have to be relearned again.

## Abstract

In the 1980s, multicultural education became one of the leading areas of discourse among educational scholars. Its development is intertwined with critical pedagogy, culturally relevant pedagogy, and social justice. Multicultural scholars are concerned with issues of equity and equality of education for historically underserved student populations. Their research explores issues of race, social class, special needs, gender, sexual orientation, and religion. While these subjects are now major areas of study within academia, it's important to remember that the

ideas about multicultural education originated in the Black activists and thinkers of the civil rights and Black power movement.

The aim of this chapter is to offer a historical overview of multicultural education by revisiting the influence of critical Black pedagogues in the curriculum discourse. It particularly explored African-centered discourse that led to the development of multicultural education, which argues that the current political climate makes it an ideal time to revisit educational discourse from an African-centered perspective. An understanding of the terms Critical Race Theory, Culturally Relevant Pedagogy, Black Critical Pedagogy, and Critical Race Theory, along with their relevance to Nikole Hannah-Jones' *The 1619 Project* is offered. The chapter concludes with a discussion of the Black Lives Matter movement as it relates to education and the preparation of educational leaders in the twenty-first century.

**The Field of Memory**

Multicultural education grew out of the African American experience (Banks, 1992), and its evolution can be traced back to the arrival of African-descended people who were brought to the Americas involuntarily. These enslaved people resisted their dehumanization, and persons like Frederick Douglass, in his 1852 speech *What to the Slave Is the Fourth of July*, offered an alternative worldview to the mainstream American narrative. Douglass disrupted the White imagination, arguing that while White Americans were rejoicing in proclaiming a new nation founded on the ideals of freedom and justice, this was not the reality for Blacks in America.

Douglass was not alone in his critique. W. E. B. Du Bois, the first person of African descent to receive a doctoral degree from Harvard University, wrote extensively about issues of racism and whiteness while also critiquing Black education (Rabaka, 2008). In his book *The Souls of Black Folks*, Du Bois (1903) discussed what it meant to be a person of African descent in American society. He raised salient points of discussion like what it means when your race is viewed as a problem. In addition, he addressed the duality of consciousness that confronts African Americans as they strive to maintain their Africanity while simultaneously trying to be American (Du Bois, 1903). Du Bois's critique of whiteness is important considering the contemporary violence toward African Americans that is reminiscent of the terrorism they experienced in the aftermath of the Civil War (Rabaka, 2008). It was after the Civil War when the old South reemerged with the birthing of the White Citizens Council, the Ku Klux Klan, and police to inflict violence upon African Americans. The violence directed toward African Americans provides a timely reminder of why it is necessary for school curricula to be more critical, truthful, and inclusive of multicultural histories and perspectives.

Du Bois's critiques were echoed by Carter G. Woodson, the founder of Black History Month, starting in the 1920s. Woodson was an early proponent of the need for diverse perspectives and strong curricula of Black history in the schools. His 1933 book *The Mis-Education of the Negro* stated his case powerfully and represented a critical Black pedagogy that was a significant forerunner of the critical pedagogy movement. Woodson wrote of the violence toward African Americans, saying "there would be no lynching if it did not start in the schoolroom" (p. 3). For Woodson, the school represented a powerful tool that could be used to eradicate inequities in the larger society. In part, it was believed that multicultural perspectives would give whites a way of deconstructing whiteness and perhaps lead them to work toward making a more socially just society.

Because of their critiques several critical Black pedagogues were placed under surveillance by the US government. For example, Carter G. Woodson's scholarship on Black history caused the US government to monitor his research (Spivey, 2003). Later J. Edgar Hoover launched a counterintelligence program against African American leaders. As the program suggest it was to *counter the intelligence* that was emerging among African Americans.

Douglass, Du Bois, and Woodson represented what Pitre (2019) coined critical Black pedagogy, which existed before the more popular critical pedagogy emanating from White scholars in the Frankfurt School of the 1930s. This critical Black pedagogy has been referred to by many names (Rabaka, 2008, calls it *Africana critical theory*), but always includes the following principles: Afrocentricity, multicultural education, and African American spirituality. The statements made in speeches and essays by the African American thought leaders who founded this school of thought have been collected in the book *A Critical Black Pedagogy Reader: The Brothers Speak* (Pitre, 2019).

In the 1960s, the efforts of these Black thinkers began to bear fruit. The Black freedom movement forged the way for curriculum changes that would include the experiences and histories of Black people. In schools and colleges across the United States students were protesting for the inclusion of Black Studies into the curriculum (Banks, 2019). At San Francisco State University, the first Department of Black Studies was founded in 1968, paving the way for Black Studies degree programs and departments in colleges and universities across the United States.

The infusion of courses around the Black experience then gave birth to ethnic and multiethnic studies. Multiethnic studies included the history and experiences of many different people of color and supported the goals of multicultural education to provide equity and equality of education (Banks, 1992). Its leading figure and founder, James Banks, defined multicultural education as "an educational reform movement whose major goal is to restructure curricula and educational institutions so that students from diverse social, racial, and ethnic groups as well as male and female students of LGBT students, teachers, parents, staff, and administrators experience equal educational opportunities" (Banks, 2019, p. 155). Nieto and Bode (2018), for their part, argued that multicultural education is critical pedagogy and social justice in general.

Over the years multicultural education has grown beyond the African-centered perspective from which it originated. Other areas such as special needs, sexual orientation, and social justice have become more visible in the multicultural discourse. Unfortunately, one result has been that, despite the groundswell of critical pedagogical and social justice research studies, African-centered perspectives have taken a back seat. Most scholars in the field of education focus their work on European thought leaders and have neglected the early critical Black pedagogues. One can easily find at national educational conferences discourse around *Marx and Education* but little on *Woodson and Education*.

### **The Field of Presence**

The curriculum is the centerpiece of the educational discourse. Pinar (2020) writes that curriculum is the heart of education because it entails what bodies of knowledge will be included in a plan of study. Apple (2019) points out that those who select the body of knowledge used in schools say something about who has the power. He also writes that the knowledge used in schools does not encompass all there is to know but nonetheless becomes *official knowledge* because it is sanctioned by those in power (Apple, 1993).

Woodson (1933) argued that the education of African Americans was controlled by those outside of their race. He described how the curriculum had been weaponized against African American students, causing them to internalize the lie that they were inferior. Thus, he argued not only for the inclusion of Black history but laid the foundation for an African-centered perspective.

The battles over what to include in the curriculum have been an ongoing site for protest and contestation since the Civil War (Anderson, 1988; Spivey, 2007; Spring, 2016; Watkins, 2001). In the aftermath of the Civil War, the White architects of Black education crafted a 75-year plan to educate the newly freed Blacks living in the South (Watkins, 2001). These architects believed that the goal of education should be to instill in the newly freed people dispositions that would make them submissive and amenable to White rule.

As time went on, African American thinkers and educators began to contest this version of education, one which Spivey (2007) called a new form of slavery. Molefi Asante's (1991) article "The Afrocentric Idea in Education" described the importance of having an African-centered perspective of the world, which required the study of African-descended people. The article also critiqued the Eurocentric curricula found in public schools across the United States.

William Watkins, in his article "Black Curriculum Orientations" (1993), identified six curriculum orientations toward the inclusion of Black history and culture. These six orientations are *functionalism*, *accommodation*, *liberalism*, *Black Nationalism*, *Afrocentrism*, and *social reconstruction*. His article highlighted the struggle that African Americans have faced to get their history and lived experiences included in the curriculum.

Pitre (2011) captured the impact of including African American studies from an African-centered perspective into the school curriculum with his study of the controversy around a Black history program that raised student consciousness of self-inflicted violence in Black communities that is a result of social engineering. Moreover, the study highlighted how an African-centered perspective can positively impact student learning.

The leading architect of multicultural education, James Banks, has also urged curriculum reform (Banks, 2019). He centers his advocacy on the importance of having students view the world from diverse perspectives – a simple example being presenting Columbus’s view of discovering the new world versus that of the Native Americans who were already there. To effectively implement multicultural education, Banks recommends four approaches that can work together to broaden students’ understanding of the world:

1. *The Contributions Approach*: This approach focuses on heroes, holidays, and discrete cultural elements.
2. *The Additive Approach*: Content, concepts, themes, and perspectives are added to the curriculum without changing its structure.
3. *The Transformation Approach*: The structure of the curriculum is changed to enable students to view concepts, issues, events, and themes from the perspective of diverse ethnic and cultural groups.
4. *The Social Action Approach*: Students make decisions on important social issues and take actions to help solve them (Banks, 2019, p. 54).

These four approaches can be a model for teachers to effectively build multicultural classrooms.

Asante’s (1991) clarion call for multicultural education set off a backlash from conservative educators. Pitre and Ray (2002) discussed the controversy around Black history in their article “The Controversy around Black History,” pointing out that scholars like Mary Leftowiz believe that the Afrocentric idea is divisive to the country. These conservative figures believe the curriculum should have a Western-centric perspective and include only textbooks that are considered Western classics. The debate over curriculum content has raged since the Civil War. The challenges to the curriculum launched by Black scholars and activists – and the subsequent defense by conservative scholars – show that these battles continue today.

### **The Field of Concomitance**

One of new frameworks that could inform the preparation of educational leaders is Critical Black Pedagogy. Critical Black Pedagogy was coined in 2008, in the book *The Struggle for Black History* (Pitre, Ray, & Pitre, 2008) but the more recent book, *A Critical Black Pedagogy Reader: The Brothers Speak* more fully articulates the framework. The book identifies four tenets of critical Black pedagogy, which includes Afrocentricity, multicultural education, critical pedagogy, and African American spirituality (Pitre, 2019). The anthology highlights selected essays and speeches from Black male thought leaders offering compelling reasons why educational leaders can learn much from Black leaders who radically transformed the lives of African Americans. For example, persons like Marcus Garvey offered an ideological perspective on Black education that could assist educators to reimagine schools for African American students. Additionally, James Baldwin in his speech, *A Talk To Teachers*, offers to educational leaders a critique of the impact that deeply entrenched racism has on the educational experiences of African American students. And Dr. King’s essay, *The Purpose of Education*, moves educators to see beyond the

scientific management approach to one that is centered on ethics and moral underpinnings (Pitre, 2019).

Educational leadership preparation programs do not explore the educational ideas of Black thought leaders, and this contributes to a form of White supremacy because it means that the official knowledge used to license educational leaders is rooted in the ideas of White scholars. Cornel West (1994) was on point when he declared the many ways that race matters in the American society. His tribute to the leadership of Malcolm X opens the door for educational leaders to study subaltern forms of education.

In the twenty-first century schools, a large number of African American youth embrace Hip Hop. Hip Hop like English as a Second Language could be explored in educational leadership programs. These artists that are conscious spit lyrics in the same spirit as their ancestors who fought to be free from oppression. These artists highlight persons like Louis Farrakhan. Farrakhan is taboo in the educational leadership discourse despite the fact that he is the voice of millions of oppressed people in the Americas and beyond.

The book, *Educational Leadership and Louis Farrakhan* departs from the scientific management discourse to one that is futuristic, multicultural, and spiritual (Pitre, 2017). Moreover, a critique of Hip-Hop and how it has been weaponized against Black youth to socially engineer their self-destruction is needed. New courses in educational leadership should include the study of Hip-Hop and how it can be used as a tool to empower educational leaders (Foust, 2021).

Lastly, there needs to be an African-centered perspective in the preparation programs for educational leaders. An African-centered perspective should begin with Africana Studies because it would help future educational leaders understand the African origins from which many of the disciplines and fields of study began (Karenga, 2002). In reading, Black Psychology educational leaders would get a chance to see how high stakes tests can be designed to support racial superiority (Akbar, 1999). In the study of Black Liberation Theology, educators would engage in the study of how the Supreme Being is on the side of the oppressed (Cone, 2010).

To effectively address the needs of African American students' preparation programs for educational leaders will need to go beyond the scientific management and social justice approach to one that embraces a critical Black pedagogy, particularly focusing on an African-centered approach for preparing educational leaders.

### **Discontinuities and Ruptures**

When teachers embed an African-centric perspective within the K-12 curriculum, they also create opportunities to emphasize current examples of Black boys and men as valuable community members. This kind of exposure is critical to the boys' development of a healthy sense of self and agency. Learning about the important discoveries and courageous acts of historians from the past and present can serve as an important reminder for today's Black boys to see themselves and their communities as vital parts of American history. It also empowers them to challenge the "troublemaker" and "bad boy" stereotypes found in typical portrayals of Black boys.

The four components of Critical Black Pedagogy: Afrocentricity, multicultural education, critical pedagogy, and African American spirituality offer the powerful agency that Black people can have over their own education. Moreover, the

curriculum must be changed to offer a multicultural perspective, which would not only liberate Black children but also White children, whose talents and character are currently distorted by the myths that support White supremacy.

Lastly, African American history is American history, and it is our responsibility, as educators, to cultivate spaces to engage with it. We must ensure that everyone has the opportunity to draw inspiration and wisdom from African American historic places.

### **Critical Assumptions**

Four critical assumptions undergird realizing the promise of Black critical pedagogy.

1. Throughout history, the struggle for educational access, equity, and social justice has been central to the educational experiences of many Black students being educated in K-12 public schools.
2. Controversy has surrounded race conscious education for a long time, with resounding proclamations of indoctrination of students. As a result, at least six US states are trying to ban the teaching of racially charged ideas about America's history, because of the supposed propensity to make American's despise their own country. A central premise of The 1619 Project seeks to illuminate the absence of key historical facts – such as slavery and its significant impact to date – that are often ignored or suppressed.
3. The current neoliberal educational reform movement has narrowed the curriculum, which often renders the historical contributions of prominent African Americans as inconsequential, irrelevant, if mentioned at all, while implementing controls including high stakes testing and the militarization and policing of schools, disproportionately resulting in the punishment and control of working-class Black youth.
4. The terms Critical Race Theory, Culturally Relevant Pedagogy, and Critical Black Pedagogy have been conflated, using poorly supported baseless information to weaponize the discussion of African American's historical contributions to America as nonexistent. Additionally, the resistance to acknowledge and utilize Black students' background and cultural experiences as tools to promote and sustain their academic success offers life-long consequences.

---

## **Introduction**

In the 1980s, multicultural education became one of the leading areas of discourse among educational scholars. Its development is intertwined with critical pedagogy, culturally relevant pedagogy, and social justice. Multicultural scholars are concerned with issues of equity and equality of education for historically underserved student populations (Banks, 2019; Gollnick & Chinn, 2017; Nieto & Bode, 2018). Their research explores issues of race, social class, special needs, gender, sexual orientation, and religion.

While these subjects are now major areas of study within academia, it's important to remember that the ideas about multicultural education originated in the Black activists and thinkers of the civil rights and Black power movement, here referred to

collectively as the Black freedom movement, and to their predecessors – especially the Black thinkers of the early and mid-twentieth century and even before. The student protests that occurred in the 1960s were the result of conscious youth who were determined to dismantle the traditional Western-centric canon that dominated educational institutions in the United States. These protests included the contestation for Black Studies in colleges and universities, which sparked new conversations around the need to include diverse perspectives into the curriculum.

The students in the Black freedom movement recognized that education is a political act (Darder, Baltodano, & Torres, 2017) and they argued that certain bodies of knowledge were being kept out of the curriculum. Scholars like Carter G. Woodson (1933) argued that the contributions that Black people made to world history were not included in the mainstream curriculum. Instead, the curriculum imposed a Eurocentric perspective grounded in White supremacy (Asante, 1991). According to Woodson (1933), African Americans were being taught that their Blackness was a curse, causing them to declare this was the worst sort of lynching.

Civil rights leaders were not protesting the Eurocentric school curriculum but instead were fighting for inclusion into the mainstream society. However, many leaders within the Black freedom movement were influenced by Malcolm X and others who argued that the school curriculum represented a form of *White power* or anti-Black racism. Moreover, the curriculum was a tool used to subjugate African Americans to an inferior position (Jenkins, 2009). Malcolm raised the following question to Blacks in America: “Who taught you to hate yourself?” It was questions like this that awakened Black youth and inspired them to protest racist school curricula that sought to relegate them to an inferior status.

The anti-Black bias of school curricula was reinforced by a Eurocentric Christianity that formed the foundation of American education. The school curricula, like Western-centric Christianity, showed the founding fathers and other White men as defenders of freedom and justice, and whites were the center of academic attention (Asante, 1991). Members of the Black freedom movement began to realize that what they were being taught in schools and universities was a form of domestication. They began to question the images of White men as being divine and argued that the European version of Christianity was instrumental in the *mis-education* of African Americans. As a result, they began to look anew at Black thought leaders such as Marcus Garvey, Martin Delaney, Harriet Tubman, Frederick Douglass, and many others as sources of learning and true education.

Scholars often point to Malcolm X as the foundational leader of the Black power movement and the emergence of Black consciousness. However, Malcolm was preceded by – and educated by – Elijah Muhammad. The wellspring of knowledge emerging from Elijah Muhammad caused him to be one of the most feared African American leaders because his teachings disrupted White supremacy as a global power. When he declared that Black people constituted the origin of humanity and were the architects of the entire universe, he began to attract attention; his influence eventually led him to be placed under surveillance by the US government (Gardell, 1996; Muhammad, 1965).

The teachings of Elijah Muhammad gave birth to a cadre of Black scholars in many diverse areas of study. Some of the most interesting were Black psychologists such as Naim Akbar (1999) and Wade Nobles (1973), who began to explore the Black self-concept. In the field of history, scholars began to look at Egypt anew, causing them to articulate that it was at one time called Kemet, the land of the Black. History became the tool to dismantle the lies that had been told, and it forged the way for a new identity among Black people. This new education even included a critique of the African American diet that was seen to be an offshoot of slavery.

The line of influence from Elijah Muhammad to Malcolm X to the leaders and students of the Black freedom movement was part of an ongoing struggle to incorporate a more multicultural curriculum in public schools. That struggle continues today and has brought positive changes to the curriculum, although it is still relegated to the shadows in some schools and universities. This chapter outlines the field of memory beginning with a historical overview of multicultural education by revisiting the influence of critical Black pedagogues in the curriculum discourse. It particularly explored African-centered discourse that led to the development of multicultural education, via the field of presence, which argues that the current political climate makes it an ideal time to revisit educational discourse from an African-centered perspective.

For African American students to realize their potential and ultimately experience academic success in the K-12 setting, an understanding of the terms Critical Race Theory and Culturally Relevant Pedagogy, along with their connection to Critical Black Pedagogy and to Nikole Hannah-Jones' *The 1619 Project*, is essential. The chapter concludes with a discussion of the Black Lives Matter movement as it relates to education and the preparation of educational leaders in the twenty-first century.

---

## The Two CRT Frameworks

The recent culture war on critical race theory and culturally relevant pedagogy (both sometimes abbreviated to CRT) have sparked fierce debates in school board meetings, caused confusion for some members of the public and educational sectors, and galvanized those who worry about how the terms are defined and reflected in the K-12 curriculum. The charge that schools are indoctrinating students is a harmful theory or political mindset. The conflation of these terms has made it virtually impossible to understand and engage both terms to improve the educational outcomes of students – particularly Black students.

### Critical Race Theory

Critical race theory is a more than 40-year-old academic framework used to understand how racism has shaped social institutions such as the criminal justice system,

education system, housing market, and health care system. It regards race as a social construction and analyzes the connections between race, racism, privilege, and power (Bell, 1995; Delgado & Stefancic, 1995). It also can help Americans to understand how oppressive policies and practices have shaped public education. According to Solórzano (1997), CRT's basic perspective includes a "premise that race and racism are endemic, permanent" (p. 6) in both small and large ways within individuals as well as institutions. CRT is conscious and unconscious, has a cumulative impact, and intersects with both gender and class discrimination. Further, CRT challenges the dominant power structure, is committed to social justice, values experiential knowledge, and uses interdisciplinary practices to put knowledge into critical historical context (Lynn, 2004; Solórzano, 1997).

Scholars who study critical race theory in education look at how policies and practices in K-12 education contribute to persistent racial inequalities in education, and advocate for ways to change them. Among the topics they've studied are: racially segregated schools, the underfunding of majority-Black and Latino school districts, disproportionate disciplining of Black students, barriers to gifted programs and selective-admission high schools, and curricula that reinforce racist ideas.

## **Culturally Relevant Teaching**

Culturally relevant teaching values and uses the characteristics, experience, and perspectives of ethnically diverse students to frame pedagogy and attitudes. It values students' lived experiences, learning styles, ethnic history, and accomplishments (Ladson-Billings, 1994). CRT emphasizes "using the cultural knowledge, prior experiences, frames of reference, and performance styles of ethnically diverse students to make learning encounters more relevant to and effective for them.

It is community-oriented both inside and outside the classroom, is grounded in caring, values personal narrative and group efforts, encourages varying perspectives, and expects achievement. Culturally relevant curriculum reflects the images and concerns of children whom it teaches, promotes critical questioning, and is committed to social justice. Students' academic achievement and engagement increases when they are taught in a culturally relevant manner (Gay, 2002; Sampson & Garrison-Wade, 2011).

Culturally responsive teaching also has critical synergies with other reform efforts in education, such as initiatives to improve school climate and implement social-emotional learning. For instance, research shows that students who develop a positive sense of racial and ethnic identity are more interested in befriending people of different backgrounds. Other studies have found that a strong racial-ethnic identity is linked to higher self-esteem, academic attitudes, well-being, and the ability to navigate discrimination. Though more rigorous, large-scale studies are needed, existing studies already support taking action to boost teachers' culturally responsive practice.

## Connecting the Dots: Understanding the Premises of Both CRTs and the 1619 Project

No other writing embodies the tenets of Critical Race Theory and Culturally Responsive Teaching more than Nikole Hannah-Jones' 2019 publication, *The 1619 Project*. The aim of this project was to reframe the country's history by placing the consequences of slavery and the contributions of African American at the center of the United States narrative. This aim faced significant criticism. The manuscript forces Americans to examine who we are as a country. Titled, *The 1619 Project*, 1619 reflected the year when approximately –20–30 Africans were captured in joint African-Portuguese raids and were brought, involuntarily, to the Virginia Colony, via the *White Lion* ship (Painter, 2006). Here begins the system of American chattel slavery – lasting for the next 250 years resulting in building the United States of America. This important linchpin in American history is all too often omitted from school curricula or, when discussed, does not provide an accurate depiction of slavery. Furthermore, conveniently omitted is how prominent individuals, industries, and institutions profited from slavery. Much like the premise of culturally responsive teaching – defined as understanding and embracing the background and culture of those different than our own – *The 1619 Project* argues that many White American students are poorly educated on and have no clue about the history of how the enslavement of Africans shaped America as we know it today. Additionally, Nikole's manuscript notes that prominent African American authors, scholars, and researchers are glaringly absent from historical discussions.

*The Project* includes 19 essays that not only explores the legacy of slavery, but also highlights the present-day struggles faced by Black Americans. Together, these essays chronicle how slavery's key tenets, can still be evidenced in just about every aspect of today's American society – including music, politics, housing, capitalism, and even religion. The systems, Hannah-Jones speaks of (e.g., education, democracy, capitalism, criminal), are the very systems explored in the framework of Critical Race Theory. Critical Race Theory denotes that systemic racism is part of American society – from education and housing to employment and healthcare. Critical Race Theory recognizes that racism is more than the result of individual bias and prejudice. It is embedded in laws, policies, and institutions that uphold and reproduce racial inequalities. To date, these systems continue to figuratively enslave millions of African Americans living in the United States.

Undoubtedly, Hannah-Jones has received some of the most prestigious awards in journalism. A recipient of the Peabody Award, along with the MacArthur genius grant for her reporting on the persistence of segregation in *This American Life*, Nikole also won a Pulitzer Prize for her essay accompanying "*The 1619 Project*." Despite being lauded for her scholarship, in 2021, Nikole faced staunch opposition to a tenured endowed professorship at The University of North Carolina at Chapel Hill. This opposition came from Walter Hussman, an alumnus, UNC Donor and Arkansas newspaper publisher whose name adorns UNC's journalism school. It should be noted that Hannah-Jones' dossier received overwhelming support from the departmental faculty, chairman, the dean, and the provost. Yet, Hussman argued his

pause with Hannah-Jones – also a UNC alumnus – was that the UNC Hussman School of Journalism and Media would become more closely associated with *The 1619 Project* than the schools' core values of objectivity, impartiality, integrity, the pursuit of truth, and the separation of news and opinion. Hussman contends his \$25 million donation was not contingent upon UNC's Board of Trustees vote to deny Hannah-Jones' application for tenure.

After lengthy deliberations, the Board of Trustees voted to grant Hannah-Jones tenure as the Knight Foundation endowed chair. However, Nikole Hannah-Jones – one who knows the value of her scholarship and who believes in academic freedom for scholars to explore ideas independent of public or political pressure – declined UNC's offer. Hussman's actions exemplify how those with power can attempt to use their privilege and financial resources to influence or even silence journalists, when the true story does not fit the narrative they want shared.

---

## Reenvisioning K-12 Education with a Critical Black Pedagogy Focus

Critical Black Pedagogy (CBP) is a philosophy of education that emphasizes teaching students how to think critically about societal and even personal problems, understanding how structures of power and racism degrade the opportunities for democracy, economic justice, and personal development. It is a cornerstone of multicultural education (Nieto & Bode, 2018). The term *Critical Black Pedagogy* first appeared in the book *The Struggle for Black History: Foundations for a Critical Black Pedagogy in Education*. In the critical pedagogy strand of CBP, the question is asked, how would schools and universities be different if Dr. Martin Luther King Jr. or Malcolm X were superintendents or presidents.

When reenvisioning this possibility, it is highly likely that teachers would have expectations for Black students, expulsion and suspension rates would be greatly reduced, special education referrals would be diminished, and students would be intrinsically motivated. Moreover, Black students would become unified community builders opposed to test takers. And while we are imagining what CBP would look like, there is a model that is open to study by way of the Nation of Islam's schools or their affiliates.

The education of students in these schools is grounded in helping students to discover their creative genius-knowledge of self (Pitre, 2015). And it is critical pedagogy because it is designed to empower and liberate Black people. Critical Black Pedagogy sits at the center of critical race theory, culturally relevant pedagogy, and *The 1619 Project* because these frameworks embody one or more of the following CBP components.

The four components of critical Black pedagogy are: Afrocentricity, multicultural education, critical pedagogy, and African American spirituality:

1. **Afrocentricity** is a frame of reference wherein phenomena are viewed from the perspective of African descended people. This approach is defined by Molefi

Asante (1991) wherein he writes, “Afrocentricity is a frame of reference wherein phenomena are viewed from the perspective of the African person. The Afrocentric approach seeks in every situation the appropriate centrality of the African person. In education this means that teachers provide students the opportunity to study the world and its people, concepts, and history from an African world view” (p. 171). It means that we must include an examination of Black leaders, scholars, students, and activists and their critique of Black education.

2. **Multicultural education** is a process of comprehensive school reform and basic education for students. It challenges and rejects racism and other forms of discrimination in schools and society and accepts and affirms pluralism (ethnic, racial, linguistic, religious, economic, and gender among others) that students, their communities, and teachers reflect (Nieto & Bode, 2018). And it offers a praxis for addressing contemporary concerns related to Black education.
3. **Critical pedagogy** asks how and why knowledge gets constructed the way it does, and how and why some constructions of reality are legitimated and celebrated by the dominant culture while others are clearly not. And it asks a central question: What would schools and universities look like if Martin Luther King Jr. or Malcolm X were in leadership roles such as superintendent, principal, university president, provost, or chancellor?
4. **African American spirituality** posits that the African concept of life and its concept of education require that the sacred and the secular should be seen as one. The African worldview does not approach the study of God as some kind of force independent of the human reason and physical reality. Instead, it sees God as an inescapable component of human life.

Each of these components is a common thread that undergirds the premise of *The 1619 Project*.

---

## Postracial Discourse

In 2008, when President Barack Obama was elected president of the United States, some thought we had now entered a so-called postracial society. For those people, the struggles of people of African descent were no longer a pressing issue. In education, the discourse became more centered on diversity and social justice to the neglect of African-centered scholarship. Lost in these shifting dynamics was the African-centered discourse that had dominated the 1960s and 1970s.

Even when exploring critical race theory, there was an emerging trend to look beyond the Black and White binary that some believed was now outdated (Delgado & Stefancic, 2017). Critical race theory, these proponents argued, should include other groups and consider religious persecution as a form of racism. The emerging trend was away from the discourse of critical Black thought leaders that offered elucidating critiques of education in a *White supremacist society*.

In this environment, too many multicultural education scholars have lost sight of those Black thinkers who laid the foundation for critical Black pedagogy. In

conferences and textbooks, prominence is given to the likes of John Dewey, Jean Piaget, B. F. Skinner, Lev Vygotsky, Michael Foucault, and other European philosophers. There is scant mention of the Black pedagogues mentioned above and of the educational ideas of prominent African American leaders such as Marcus Garvey, Elijah Muhammad, Nannie Helen Burroughs, Septima Clark, Reverend Dr. Martin Luther King Jr., and Malcolm X (Pitre, 2019).

In concert with the neglect of Black educational theorists, educators today are not pushed to include in their pedagogy any awareness of Black culture and linguistics. The language of hip hop, for example, is an offshoot of Black nationalism but is not included in educator preparation programs despite the large number of students who embrace it (Foust, 2021). This neglect simply reinforces the ideologies that contribute to the domestication of African American students. While there is an abundance of discourse around closing the achievement gap between Black and White students, there is virtually no discussion about dismantling the ideological underpinnings of White supremacy that plays out within the curriculum in numerous ways, from ignoring Black achievements to dismissing Black language as inferior or irrelevant (Perry, 1998; Pitre, 2011).

The ideas of critical Black pedagogues that gave birth to multicultural education have been placed at the margins of educational discourse in the twenty-first century. And while many of the emerging educational discourses centered on social justice continue to dominate, there is a wealth of knowledge emanating from the Afrocentric literature that could transform the educational landscape. In public schools and universities where Black Studies courses and programs have been developed, the discourse has been diluted to the degree that they are impotent to stimulate a movement that is reminiscent of the revolutionary 1960s.

---

## **Black Lives Matter in the Context of Education**

The Black Lives Matters movement has been one of the defining social movements of the 2000s. The organization was formed after the 2013 acquittal of vigilante George Zimmerman, who shot and killed teenager Trayvon Martin while he was walking alone to an acquaintance's house in 2012. The movement gathered power in the wake of several police killings of unarmed African Americans, such as Eric Garner and Freddie Gray, and most recently, Ahmaud Arbery – an unarmed jogger – and launched worldwide protests after the police killing of George Floyd in May 2020. The killing was filmed by bystanders, and the world watched in shock at the video of Derek Chauvin pressing on Floyd's neck for 8 min and 47 s, as Floyd pleaded "I can't breathe" over and over.

The Black Lives Matter movement advocates on many fronts, not just police brutality. Its efforts reach to border policy, global conflicts, and representation in the halls of power. We need also to extend this activism to schools. Black students have been muted and silenced, denied the "breathing room" that education should provide to all students. Even in schools that are predominantly African American one can find the majority of AP classes and gifted programs dominated by White students.

Joel Spring (2016) notes that many schools have second-generation segregation, which means segregation within schools. One example of second-generation segregation is tracking, a system of directing students into educational programs according to their supposed intelligence, where non-White students are routinely placed in lower tracks (Nieto & Bode, 2018).

The oppressive environment for Black students in schools begins early. In the elementary grades, Black boys are treated like adults and experience hostile teachers and administrators. Similarly, Black girls experience disproportionate discipline more than any other group of students, often outpacing the rates of most boys (Morris, 2016). Ladson-Billings (2011) writes that the school experiences of Black boys are similar to prison writing: “I could not help but notice the degree to which every aspect of the students’ activities were regulated – not just what they were taught, but also how their bodies were controlled” (p. 10).

Black lives are also being destroyed in classrooms where teachers do not acknowledge them even when their hands are raised. They receive little to no encouragement and are not given opportunities to develop leadership skills. In an observation, of one elementary school during an honors ceremony there were no non-White students with roles in the program (Personal Observation, 2018–2020). African American students over time learned to take the backdoor, causing many of them to exit the school. Louis Farrakhan once pointed out that no one wants to be in a place where one’s self-worth is diminished (Pitre, 2018). For African American students, that place is school.

Teacher preparation programs do little to discourage the dehumanizing practices of schools in regard to African American students. Too many educators still believe the vicious stereotypes about African American students being lazy, violent, and dangerous. Moreover, educator preparation programs are being forced to align with state mandates that require teacher education professors to focus on passing licensure exams required by their states, which diverts upcoming teachers from the kind of in-depth study of multicultural education that is desperately needed. There is certainly no time for the pedagogical philosophies of Black educators; a perusal of popular textbooks shows the occasional mention of Dr. Du Bois but rarely any other of the major Black thinkers. Nor is there time for the comparative study of alternative educational models like those of the Nation of Islam. It seems clear that the social justice discourse that is sweeping the educational landscape currently functions more as a pacifier designed to stop the Black exodus from mainstream society (a major goal of some Black organizations) than a true implement of liberation.

Black Lives Matter is more than a cry for equal inclusion into mainstream society. It is spiritual, rooted in the deep humanistic desire of all people to connect with their own humanity and live to their fullest potential. Education forms the center of this quest. It is knowledge that brings about a newfound consciousness that causes human beings to discover the creative self. Knowledge empowers people to become masters of their environment and it frees them to look beyond materialism. And it connects us back to our theological roots: Black lives matter because they are descendants of the originator of the universe (Muhammad, 1974; Rogers, 1995).

## Leadership Implications

While curriculum is at the center of education there is a need to explore the role of leadership in implementing multicultural curricula in the context of the Black Lives Matter Movement. The Black Lives Matter Movement is a rebirthing of past movements that sought to bring an end to atrocities that led to the untimely death of African descended people in America. Woodson argues that there would be no lynching if people were educated differently.

This implies that there is a need to explore leadership, but particularly educational leadership programs. In part, educational leaders develop policies, address curricula orientations, and they play a major role in determining how curriculum will be enacted. This section explores the role of educational leaders as it relates to the Black Lives Matter Movement.

Historical speaking the preparation of educational leaders has been shaped by a scientific management approach. Through a scientific management approach, educational leaders were prepared to oversee the operation of *things*, class schedules, bus routes, supervision of teaching, extracurricular activities as well as a host of other duties. In this context, the preparation of school leaders took on an apolitical perspective. Educational leaders were concerned with operational efficiency while not recognizing the role of culture in making the schools run efficiently.

The scientific management approach relied on quantitative research in the preparation of educational leaders. Other forms of research were not seen as authentic research. English (2002) describes it best when he says that the scientific management approach, “. . .creates a demarcation line, bestowing legitimacy on those who do their work within it while discrediting all that came before as false and trivial” (p.111). Thus, quantitative research relied on numeric data that did not explain the cultural influences that shaped the data.

Throughout the preparation programs of educational leaders there was a Eurocentric approach that began with the curriculum and expanded to the readings of predominantly White male scholars of administration theory. The preparation of educational leaders represented a form of hegemony that would support White supremacist ideology. To date, the influence of these pioneers of school administration dating back to the 1920s continues to impact the preparation of educational leaders. By and large the majority of educational leadership program continue to be rooted in a scientific management approach.

The scientific management approach does not offer a critique of the inequities that exist in schools. And it could be argued that a sizable population of those aspiring to roles such as principal or school superintendent is looking for gimmicks that bring a quick fix to a problem their schools might face. Challenges like; How to improve test scores? Or why do African American students show signs of apathy? To understand these issues, the preparation of educational leaders needs to expand beyond the scientific management approach.

The effort to expand the scientific management approach was in part a byproduct of the 1960s *Black Power Movement* that resulted in Black Studies, which gave birth to multicultural education (Banks, 1992). The introduction of multicultural

education in teacher preparation paved the way for social justice discourse in preparation programs for educational leaders.

William Foster's (1986) publication, *Paradigms and Promises: New Approaches to Educational Administration*, introduced a critical theory to the study of educational leadership. Other scholars caught on and began to focus on preparing educational leaders for social justice (Furman, 2012). Scholars in the area of social justice preparation of educational leaders while not entirely dismissing management and administration began to infuse a pedagogy of leadership around the ethic of care and moral philosophical underpinnings. New and emerging scholarships like Capper's *Organizational Theory for Equity and Diversity: Leading Integrated, Socially Just Education* expand beyond the traditional discourse found in organizational theory. In other works, like Rosemary Papa's (2020) *Handbook on Promoting Social Justice Education*, a treasure trove of information is provided that could help in raising the consciousness of educational leaders.

One result of the social justice scholarship in the preparation of educational leaders is the Carnegie Project for the Educational Doctorate. The Carnegie Project for the Educational Doctorate seeks to reenvision the Educational Doctorate (Ed.D.) for educational leaders in the twenty-first century. Its major premise is preparing social justice educational leaders. Moving away from the traditional dissertation, students seeking the Ed.D. are engaged in improvement science and complete a Dissertation of Practice or Capstone Project.

The current wave of preparing educational leaders for social justice brings us full circle back to the need for discourse around Black Lives Matter in the context of Multicultural Education. While the work on social justice leadership is laudable, this may not be enough to radically change or disrupt the inequities that African American students face.

---

## Conclusion and Reflections

The contemporary multicultural curriculum discourse has become more centered around issues of special needs, gender, and poverty; however, scholars and practitioners would do well to look at multicultural education's African-centered origins to understand how to forge a more socially just society through education. The multicultural approaches by James Banks (2019), with a particular focus on reaching the social action approach, should be revisited in the current sociopolitical climate where African Americans are bearing the brunt of both psychological and physical violence. Within the social action approach are the elements of Black consciousness that started a movement that transformed America to become more inclusive, and true to the ideals espoused in the American Constitution.

Educational scholars have asked why critical pedagogy hasn't gained traction in making wholesale changes to the educational landscape. In part, critical pedagogy is still new to the people who have been most underserved and bear the brunt of educational inequality. The paternalism in the field of education has limited powerful Black voices from being heard and as a result limited the changes that educators for

social justice claim they would like to see. Many of these educational scholars are dumbfounded when challenged by truths that go beyond their critique of the educational crises.

This has been a major factor in the lack of progress in education. To speak like James Baldwin and declare that the entire educational system is designed to destroy Black people would be heretical. Multicultural education is accepted as long as it is limited to discrete additions to the curriculum. But critical pedagogy requires a more significant transformation, addressing the structures of power, the skills needed to advocate for true democracy, the materialistic and instrumental goals of Eurocentric education, and the spiritual aspect of movements to eradicate inequities. It addresses what knowledge is taught and what knowledge is excluded, like the efforts of the Million Man March and other powerful movements that are transforming the Black world.

Critical Black pedagogy is one approach that could potentially help educators rethink policies and practices that have been detrimental to Black lives. The fear of exploring Black thought leaders from groups like the Nation of Islam should be dispelled if we are truly seeking to eradicate the inequities that exist in school and society (Pitre, 2015). In part, it was persons like Malcolm X who inspired the movement for Black Studies in schools and universities. His critiques of the dominant society sparked what are known today as critical race theory and whiteness studies.

Malcolm X raised the consciousness of people from diverse backgrounds and his “radical” teaching departed from the dominant narrative of the mainstream curriculum. His famous speech “The Ballot or the Bullet” inspired a cadre of Black activists that were determined to get justice *by any means necessary* (Breitman, 1990). And while most writings in the educational discourse refer to Malcolm X, it was Elijah Muhammad from whence he received mentorship and a *supreme wisdom* that transformed his life.

As a critical Black pedagogue, Elijah Muhammad articulated a history of Black people that predated the cosmos and he adopted Malcolm as a son, tutoring him unlike the other Ministers in the Nation of Islam, which grew him into a world leader (Haley & Malcolm X, 1964/1992). He sent Malcolm as a diplomat to African countries, and this led him to situate the Black struggle in America to people of African descent across the globe. The awakening of Malcolm X was the result of a body of knowledge that awakened the teacher within. Once awakened a metamorphosis was underway, causing Malcolm to move away from the slimy life – likened to a worm – to that of a butterfly, one of beauty and splendor that mesmerizes.

If those concerned with education are truly invested in Black lives, it will require a study of African-centered perspectives. Educator preparation programs will need to be revamped to include the ideas and philosophies of Black thought leaders. In addition, it will require that those writing the licensure exams to include African-centered perspectives. Lastly, the African-centered approach to curriculum development should be viewed as part of the multicultural curriculum reform that is inclusive of diverse perspectives and voices.

## Abstract

Studies report that most children with mental health disorders do not receive the adequate amount and type of mental health care and support they should receive to effectively guide growth and development. Often, schools are one of the only places where students and their families can receive mental health care, though

unfortunately, many school leaders do not receive sufficient training to support students in their mental health needs. Therefore, the purpose of this chapter is to present an overview of essential knowledge and skills necessary for principals and school counselors to develop collaborative relationships that better position them to support the mental health of P-12 students. The discussion is framed through the lens of relational leadership theory and highlights how the school counselor and principal roles are effectively operationalized within a collaborative, multitiered system of supports. Finally, how to move forward with collaborative pre- and in-service mental health training for principals and school counselors is discussed.

School counselor · Principal · School leader · Collaboration · Preparation · Mental health · Multitiered system of supports · Relational leadership

**The Field of Memory**

In regard to the mental health support that children receive in P-12 schools, a particular concept that is not current is that of a *vocational or guidance* counselor. In addition to fostering the academic and career developmental of students, contemporary *school counselors* also provide services which support the personal, social, and emotional needs of students. The goal of these latter services is to foster overall mental health and well-being in students. The current and comprehensive approach to school counseling focuses on academic, career, and social-emotional development. Comprehensive school counseling represents a shift from the beginnings of the profession when the focus was predominantly vocational guidance (i.e., guidance counselor to school counselor). Further, while a contemporary school counselor is trained to address the mental health needs of students, the notion that the school counselor alone bears sole responsibility for addressing the mental health needs of students is no longer valid. It has become increasingly clear that a team of individuals (e.g., parents, teachers, principals, and school counselors) is needed in order to promote mental health in students.

**The Field of Presence**

In order to effectively address students' mental health needs in schools, collaboration is essential. Unfortunately, the appropriate role and function of school counselors in the current education system often is not sufficiently understood or supported by school leaders and teachers. Thus, school counselors often are not provided with the time and resources necessary to adequately address students' social-emotional needs. Collaboration between school leaders, now more than ever, is key to a healthy school climate. This collaborative and comprehensive approach is articulated in the American School Counseling Association's (ASCA) National Model for Comprehensive School Counseling (CSC), which outlines recommended best practices for school counseling schools in the USA.

### **The Field of Concomitance**

Comprehensive school counseling draws on subject matter from related fields which include the social (e.g., psychology and sociology) and biological sciences (e.g., biology and medicine), philosophy, and social activism. Underlying school counseling and education are the principles of social justice, morality, and human behavior, as these are intertwined with one's mental health. Many of the social, emotional, and academic competencies fostered by school counselors have been grounded in the aforementioned subject areas. Further, educational leadership is connected to school counseling in that administrators and school counselors need to work together in order to achieve overall school improvement goals to most effectively meet students' needs. Comprehensive school counseling relies on successful collaboration between school counselors and principals so that both are aware of one another's roles and can support one another.

### **Discontinuities and Ruptures**

Despite the importance of addressing student mental health, there have been major ruptures in creating a school culture which supports the mental health of all students. Schools with limited resources demonstrate disproportionalities in terms of student mental health needs. At the same time, schools in low-income areas with limited funding and staffing often assign school counselors tasks (e.g., bus duty, substitute teaching, and test administration) that are not within the recommendations for best practices by ASCA in terms of job duties. This practice has been a key rupture in affording school counselors the time needed to create an environment that fosters comprehensive school programming which includes addressing students social-emotional development as recommended by the ASCA National Model for CSC. Further, schools are not always consistent in their implementation of comprehensive school counseling, even when the school counselor has been trained in the approach. Often this is due to the fact that many principals are not aware of the appropriate roles of school counselors, thus creating role confusion and inappropriate use of counselor time.

### **Critical Assumptions**

Critical assumptions in this chapter are that the social, emotional, and mental health needs of students must be addressed in addition to academic and career development. Further, collaboration between school leaders, families, stakeholders, and others is crucial in properly meeting these needs.

Since children spend much of their productive time in educational settings, schools provide a unique opportunity to identify and treat mental health conditions by serving students where they already are. (National Alliance on Mental Illness, 2020)

---

## **Introduction**

Approximately one in five children have a mental health disorder, and 80% of those children do not receive adequate or any specialized mental health care (Centers for Disease Control and Prevention, 2019). Unfortunately, disparities in access to mental

health support are more prevalent for students and families of color, low socioeconomic status, and English language learners. Often, schools may be the only place these students and families can receive support for behavioral, mental, and emotional disorders, which makes school-based mental health support an essential function of the educational environment (Kaffenberger & O'Rourke-Trigiani, 2013; Platell, Cook, & Martin, 2017).

School-based mental health support has evolved and improved over the years, growing from one or two professionals to a team of licensed individuals through the initiative of activists in the field, which benefits both underserved and general student populations as a whole (Flaherty & Osher, 2003). As having a *team* of individuals is key in promoting mental health in schools, this chapter is framed through the concept of relational leadership. Also within this chapter, a historical analysis of the development of school-based mental health is presented. An overview of the current state of mental health support in schools, with specific regard to the collaboration of school leaders and school counselors working toward the end goal of meeting students' social, emotional, academic, and mental health needs, is shared and analyzed through the lens of relational leadership. Currently, mental health in school programs is often developed and supported by a number of school personnel and leaders, with school principals and school counselors leading the focus of these programs. Therefore, it is imperative in today's society that principal and school counselor preparation programs provide candidates meaningful learning opportunities to understand and collaboratively support student mental health.

Through collaborative support, principals and school counselors effectively communicate between themselves and among school teams, parents, and community partners to determine the best route of action. It is equally important that principals and school counselors recognize when to connect students to mental health service providers with the expertise and time required to provide sufficient support. While principals and school counselors cannot provide primary mental health care for students, it is essential that they foster educational systems that facilitate access to appropriate care providers both within the school environment and outside community. This support can manifest in a variety of ways, such as enhancing the development of students' social and emotional skills (Durlak, Weissberg, Dymnicki, Taylor, & Schellinger, 2011); creating systems for school counselors to perform role-appropriate duties that include conferencing with students and listening to their needs (Dahir, Burnham, Stone, & Cobb, 2010); providing wraparound services like professional mental health services (Sanders, 2016); building a transparent and accessible network of school and community interventions and supports (Stephan, Sugai, Lever, & Connors, 2015); and developing and sustaining trauma-informed schools (Overstreet & Chafouleas, 2016). Preservice and current practitioner principals and school counselors must have knowledge of these standards of practice, as well as how to collaborate together effectively to support the implementation of school-based services and community partnerships.

Principal and school counselor collaboration to support students' emotional well-being, mental health, and equitable access to high-quality instruction and academic achievement are increasingly robust areas of research (Boyland et al., 2019; Dahir et al., 2010; Yavuz, Cayirdag, Dahir, & Gümüşeli, 2017). It is important to examine

this relationship in practice as well as the discrete skill sets of both professions so that mental health needs for P-12 students are adequately met. Furthermore, those characteristics and skills ought to inform principal and school counselor preparation programs so that candidates are able to demonstrate proficiency in this regard upon entering the workforce.

The purpose of this chapter is to first present a brief history of the developmental timeline of school-based mental health, followed by an overview of the essential knowledge and skills necessary for principals and school counselors to develop collaborative relationships so that they are better positioned to support the mental health of P-12 students through the utilization of relational leadership. The chapter also includes discussion of how that knowledge can best be incorporated into principal, counselor, and educator preparation programs. To that end, the chapter includes presentation and analysis of extant literature and current recommendations for the requisite education and professional development needed to encourage a meaningful collaboration between principals and school counselors to support student mental health. An exploration of opportunities for candidates to co-construct knowledge surrounding leadership in service of P-12 students' mental health needs within schools is also included.

## Tracing Theories and Developments

The school counseling profession developed in the context of larger educational practices, and the focus on students' personal and social development is often synonymous with supporting positive mental health. Various efforts to transform educational practices to address the mental health needs of students have been proposed for over 100 years. These education reform efforts have consistently identified ways to improve schools and transform educational practices in order to overcome the barriers to educational success encountered by many low-income and minority students. Historically, this equity-based approach to education reform was taken by educators like Julia Richman and John Dewey, as well as social workers and other activists like Jane Addams and individuals from the Hull House (Wallin, 1914).

Julia Richman experienced many roles since the start of her teaching career in 1872. Serving as a principal for 19 years, and then as a district superintendent of elementary schools in overcrowded areas of New York City, Richman was involved in many sides of the educational system, which encompassed many roles and responsibilities (Berrol, 1972). It is noted that Richman's passion for working with immigrant and lower-income populations likely arose from her friendships with other "social progressives," such as Lillian Wald and Florence Kelley (Berrol, 1972, p. 404). Richman was one of the first superintendents to form classes that aided students who experienced difficulties with learning. These classes focused on serving immigrant and children with individualized needs, in order to close the achievement gap that had developed between them and their general education peers, with the overall goal being for them to complete their elementary education by the age of 14 (Berrol, 1972). Further, Richman began to use remedial measures with students who had been disruptive or truant within

classrooms, which included approaches like increasing the amount of time spent in gymnastics, and mandating suspended students report to her on Saturday mornings (Berrol, 1972).

In contrast, John Dewey studied philosophy at the beginning of his educational career and spent time teaching at both a high school in Pennsylvania and a seminary in Vermont (Hildebrand, 2018). Dewey then continued his philosophy and psychology education at Johns Hopkins University, with these fields serving as the focus for his remaining career (Hildebrand, 2018). Much of Dewey's philosophical approach was inspired by the work of William James, as it focused on learning through the human experience (Gibbon, 2019). In 1899, Dewey published *The School and Society* – a pamphlet detailing his beliefs regarding educational reform. Dewey's approach largely focused on classrooms that included student engagement and participation, as he felt that children should be active in their learning and have hands-on experiences (Gibbon, 2019).

Interestingly, Dewey and Addams – an activist and early social worker in the early-to-mid-1900s – influenced one another's work, as both individuals understood the importance of student attendance and hands-on engagement within the classroom (Paul, 2016). Addams was instrumental in promoting immigrant, women, and children social rights. She and members of the Hull House helped to launch programs such as the Immigrants' Protective League, the Juvenile Protective Association, the National Child Labor Committee, and the Federal Children's Bureau. Additionally, Addams enacted protective legislation for children that helped create mandatory minimum education laws. This work can be seen as the basis of the promotion of healthy and inclusive school environments (Paul, 2016). Addams was influenced by the Romantics such as Thomas Carlyle and John Ruskin, social visionaries like Canon Barnett and Leo Tolstoy, and pragmatists which included Dewey and George Herbert Mead (Hamington, 2018).

As some of Addams' influences included the social visionaries Barnett and Tolstoy, the activist was dubbed as what Moldovan, Rotari, and Zagorodniuc (2016) referred to as "Tolstoy's disciple" (p. 313). Russian radical social thought developed alongside European social philosophy in the nineteenth century, resulting in the spread of Russian social and philosophical beliefs to Europe and the USA (Moldovan et al., 2016, p. 314). Addams was greatly impacted by Tolstoy's religious and philosophical works, such as *My Religion*, which aided in her adopting the philosophical approach that focused on the importance of peace, stability, democracy, and social justice (Moldovan et al., 2016). Thus, ideals like Tolstoy's began to foster a desire to fight for peace and social justice, which eventually would become the backbone of social work, and influence early school counseling practices.

School counseling began as a response to the US transition to an industrial economy during the late nineteenth and early twentieth centuries (Herr & Erford, 2011). This time period marked the start of the vocational guidance movement, which had a focus on professional- and career-based counseling, guidance, academic placement, and assessment (Gysbers & Henderson, 2001; Herr & Erford, 2011). Initially, school counselors operated under the label of guidance officers or guidance counselors and had the main responsibility of guiding students to postgraduation

employment based on their individual characteristics that included interests, abilities, intelligence, and professional aspirations (Gysbers & Henderson, 2001; Herr & Erford, 2011). Often, these guidance counselors were teachers who had been given these extra “guidance” responsibilities, but were challenged by a lack of formal training, leadership, and resources (Gysbers & Henderson, 2001).

The practice of utilizing teachers and administrators for these guidance positions changed as school counseling became a stand-alone profession that required specialized training (Gysbers & Henderson, 2001). During the 1960s and 1970s, the field wrestled with its professional identity, with the central debate surrounding whether school counselors should be classified as primarily educators or mental health professionals (Gysbers & Henderson, 2001). As a result of increasing US diversity, the Civil Rights Movement, the Women’s Rights Movement, and the Disability Movement, school counselors began serving increasingly diverse students that caused counselor education training programs to begin emphasizing multicultural counseling techniques and approaches that are designed to support the academic development and mental health needs of all students (Herr & Erford, 2011). Further, school counseling interventions became increasingly focused on measurable and developmentally appropriate interventions, as well as a range of services that include: individual and group counseling, student behavior appraisal and intervention, staff and parent consultation, and career counseling and course placement (Gysbers & Henderson, 2001). Federal legislation continued to support guidance and counseling during the 1960s, which included the passage of the 1965 Elementary and Secondary Education Act. As a result, school counseling retained a vocational focus that was seen particularly at the secondary level, while also increasing emphasis on student mental health.

The concept of comprehensive school counseling programs, along with its basis in relational leadership, was initially developed during the latter half of the twentieth century and has evolved over time. The early incarnations of comprehensive school counseling are similar to the recommendations for school counseling best practices today (Scarborough & Culbreth, 2008). Rather than primarily providing individual counseling to high-needs students, or services determined exclusively by the needs of schools, comprehensive school counseling includes a purposeful, developmentally appropriate, accountability-based school counseling framework with a range of defined components (Gysbers & Henderson, 2001). The goal of comprehensive school counseling is to promote the academic, career, and personal/social development of all students via effective partnerships and interactions between school leaders and other school and community personnel. Within a comprehensive school counseling framework, school counselors perform a myriad of tasks which include: collaboration and consultation with stakeholders that include school staff and families; serving as school leaders who advocate for systemic change; providing services which support the school’s academic mission and vision; and implementing practices which support the educational reform movement (American School Counselor Association [ASCA], 2012; Gysbers & Henderson, 2001). Further, these trends are reflected in the school counseling literature. Alexander, Kruczek, Ramirez-Chase, and Zigelbaum (2003) reviewed the school counseling literature in the ASCA

flagship journals at the outset of the National Trust's Transforming School Counseling Movement. At that time, journal articles emphasized mental health over educational and academic achievement at a ratio of two to one. Ten years later, mental health was still emphasized over educational and academic achievement, but the ratio had declined from five to three (Zagelbaum, Kruczek, Alexander, & Crethar, 2014). Further, the majority of the literature in the ASCA journal in the more recent review focused on topics unrelated to either mental health or academic achievement. The top two topics emphasized were accountability and collaboration (within schools and with outside agencies). These two topics were followed by school data and trend analyses, professional development, supervision, and coping with work stress, in that order (Zagelbaum et al., 2014).

As it stands today, school counselors provide school-based mental health services in accordance with American School Counselor Association's (ASCA) National Model for Comprehensive School Counseling programs (2019a). This model clearly defines the recommended role and responsibilities of school counselors in American school systems, and has a substantial amount of empirical evidence supporting its effectiveness for promoting student success (Dahir, Cinotti, & Feiren, 2019). Dahir et al. (2019) also notes that "comprehensive school counseling programs, driven by student data and based on standards in academic, career, and social/emotional development, promote and enhance the learning process for all students" (p. 122). This model articulates specific, empirically derived school counselor mindsets and behaviors needed for student success (ASCA, 2019a). Particularly germane to this discussion is the first mindset, which encourages the importance of mental, social, emotional, and physical well-being. Behavior standards have been established which encourage student development of learning strategies, self-management, and social skills needed for mental health and academic success (ASCA, 2019a).

---

## **Theoretical Frame: Relational Leadership**

The chapter is framed through the lens of relational leadership theory, as it illuminates the important role that traditional school leaders, like principals, and school counselors, who increasingly are expected to be leaders (Young, Dollarhide, & Baughman, 2018), have in influencing their schools to be successful. Relational leadership understands leadership "as human social constructions that emanate from the rich connections and interdependencies of organizations and their members" (Uhl-Bien, 2006, p. 655). This theory constitutes a shift from traditional views of leadership that historically focus on independent actions of one sole leader to leadership that is the result of effective relationships and interactions between many individuals (i.e., principals and school counselors).

Relational leadership theory was developed from the perspective that knowledge is socially constructed, or co-constructed between individuals as they interact with one another in their environments (Crevani, Lindgren, & Packendorff, 2010). Applied to principal-school counselor relationships, the focus is on how both parties co-construct leadership through their collaboration and interdependence,

particularly in a framework of multitiered system of supports fostered through communication and other necessary relationship-building approaches in schools (Duslak & Geier, 2018).

Some existing literature points to the importance of understanding relational leadership in the context of schools to support students beyond academic achievement. Relational leadership, in addition to an ethic of care among school principals, was found to be needed to address bullying in schools, as these factors were predictive of the nature and quality of relationships between principals, school staff, students, parents, and community stakeholders (Smit & Scherman, 2016).

We identify the discrete characteristics of leadership for principals and school counselors as separate professionals, but it is through their relational processes that mental health support will best be realized. Therefore, this chapter includes an explanation of the co-construction of knowledge and understanding within leadership and school counseling to foster collaboration to meet the complex mental health needs of all students. It is equally important to consider how preparation programs can create opportunities for principal and school counselor candidates to co-construct knowledge about students' mental health support.

---

## Literature Review

Shifting from a leader-centric approach to a relational leadership approach can both precipitate many benefits within schools and be the product of other effective approaches. As a notable example, principals and school counselors can use relational leadership to support the mental health of students. To understand this, it is vital to first understand their respective professional responsibilities. Differences and similarities among the roles of school counselors and principals in promoting student mental health in schools are reviewed in this section. Following the review of roles, this section includes ways school counselors and principals may positively collaborate to allow for more time and resources to be allocated toward mental health and social-emotional learning (SEL) in school settings, with specific examples of relational leadership fostering these collective efforts.

## School Counselors' Role in Promoting Student Mental Health

Through relational leadership, school counselors play an important role in identifying and addressing mental health needs and issues, particularly with students from economically, culturally, and linguistically diverse backgrounds through the support of educational leaders, classroom educators, and other school stakeholders (Better-Bubon, Brunner, & Kansteiner, 2016). ASCA (2019a) indicated that school counselors are often the first to recognize students' mental health needs in schools. Accordingly, they can play vital roles in supporting students with mental health needs through designing and implementing school counseling programs, if given the opportunity to lead.

The collaborations with other school staff, other educational professionals, and community services are crucial to provide education, prevention, intervention, and referral services to address mental health issues within schools (ASCA, 2019a). School counselors can develop and implement school-based prevention programs and professional development opportunities that educate teachers, staff, and leaders to enhance awareness of mental health (Goodman-Scott, Betters-Bubon, & Donohue, 2018). Additionally, school counselors can advocate, collaborate, and coordinate with stakeholders to provide appropriate referrals, resources, and accessible mental health services. Adapting the school's multitiered system of supports into a multitiered, multidomain system of supports provides a school counseling core curriculum which can meet not only the academic and career development needs of students but also their personal-social and mental health needs (Hatch, Duarte, & De Gregorio, 2019).

### **Principals' Role in Promoting Student Mental Health**

School principals are charged with operationalizing the mission and vision of the school to address students' academic, social, and emotional needs; however, principals cannot successfully accomplish this goal without forming effective partnerships and alliances within the school and community (Leithwood, Louis, Anderson, & Wahlstrom, 2004). There is a lack of research exploring the role of principals as relational leaders in partnership with school counselors to address students' mental health needs, as prior research has focused largely on the historical view of the principal in a leader-centric role. Relational leadership, on the other hand, requires a transformation in the nature of school leadership (Ospina & Uhl-Bien, 2012). In the case of principal-school counselor collaboration, relational leadership involves the forming of a partnership of equals, which results in a new type of highly cooperative and constructivist leadership that emerges due to the interactive nature of the relationship and a focus on shared goals.

Previous studies that have explored the principals' role in promoting students' mental health have primarily focused on the extent to which principals acknowledge student mental health as a priority, barriers that exist in schools to addressing student mental health needs, and effective approaches – some of which are affected by these barriers – to addressing student mental health needs.

Price, Khubchandani, Payton, and Thompson (2016) found that principals believed school violence incidents were attributable to inadequate mental health services, and peer harassment and bullying. Even so, studies have yielded varying findings with regard to the priority principals have placed on student mental health. In the wake of the 1999 Columbine High School mass shooting, a survey of Colorado school leaders revealed principals were significantly more likely than school psychologists and school social workers to indicate they were happy with current mental health services for students (Crepeau-Hobson, Filaccio, & Gottfried, 2005). However, Iachini, Pitner, Morgan, and Rhodes (2016) found that principals rated behavioral and mental health as top student needs above other categories

including extracurricular opportunities, academic considerations, attendance, technology, and discipline. Additionally, Hill, Ohmstede, and Mims (2012) found school principals, school psychologists, and school counselors were in agreement with their perceptions of the need for various mental health services.

Results of several studies have indicated that principals believe having school personnel dedicated solely or primarily to addressing student mental health, and professional development for teachers and staff, to be among the most effective approaches for promoting student mental health (Frabutt & Speech, 2012; Iachini et al., 2016; Price et al., 2016; Raphael & Burke, 2012). However, barriers exist to bringing mental health training, resources, and personnel into schools. Given that mental health personnel and professional development often directly require schools to dedicate additional financial resources, principals have identified the most significant obstacles to adequately promoting student mental health as lack of personnel and funding (Crepeau-Hobson et al., 2005; Frabutt & Speech, 2012).

In addition to hiring personnel and providing professional development, principals can support a variety of other initiatives that promote student mental health, which may or may not require the school to dedicate additional financial resources. Durlak et al. (2011) found that students in schools that implemented SEL programs not only demonstrated significantly improved social and emotional skills and academic achievement, but that these programs were effectively conducted by classroom teachers and other school staff and could be incorporated into the routine curriculum. Frabutt and Speech (2012) also found that principals saw a benefit in specific curricula and programs aimed to promote student mental health, and reported that it was important to establish and maintain high-quality, home-school relationships to prevent student mental health concerns.

Principals have also approached student mental health in ways that are closely associated with prevention and intervention of school violence. Crepeau-Hobson et al. (2005) found that following the Columbine shooting, mental health services of virtually every type were more widely implemented throughout Colorado's schools than they had been before. These services included daily check-ins with at-risk students, social skills training, group counseling, the creation of crisis teams, conflict resolution programs, and anti-bullying programs.

Assessment of the effectiveness of school-based services is an important step in promoting student mental health. Whitley (2010) noted the importance of establishing infrastructure, building capacity, partnering with the community, and developing evidence. Principals have implemented additional approaches, including suicide prevention and education (Hill et al., 2012), honing communication strategies to convey school mental health information clearly and effectively (Caparelli, 2011), and fostering positive relationships between students and teachers in classrooms and/or common planning and discussion time among teacher teams (Raphael & Burke, 2012).

Shifting away from a leader-centric model to a more relational leadership approach is also important to consider the impact of a multitiered system of supports that includes principals and school counselors, as this approach presents further opportunities for holistically supporting student mental health and fosters a

collaborative and constructivist approach to problem-solving. Through a multitiered system of supports, clear boundaries between principals, school counselors, and other participants become increasingly fluid and are contextually defined as the team focuses on the goal of helping each student meet with success. Therefore, as explained by English (► [Chap. 17, “Leader Centric Versus Leader Relational”](#)), under a leader relational model, leadership of such a team is constructivist in nature, created by human interactions, and can take on a life of its own. The interactive and relational approach of multitiered system of supports serves to blur the role boundaries between principals and school counselors as they mutually seek, create, implement, and evaluate methods of collaboratively supporting students’ mental health.

### **Multitiered System of Supports, and Comprehensive School Counseling, as a Framework for Collaboration and Relational Leadership**

Principals and school counselors play key roles in monitoring and managing school accountability as required by the No Child Left Behind Act of 2001 (No Child Left Behind [NCLB], 2002), and more recently the Every Student Succeeds Act (ESSA, 2015). A key element of the accountability movement, which fostered this legislation, was closing the achievement gap between historically marginalized minority students and their majority group counterparts. Initially, response to intervention (RTI) was developed as an alternative to the discrepancy model to identify those students in need of special education services, in the spirit of leader-centric approaches’ field of concomitance. The discrepancy model, which was originally part of the Individuals with Disabilities in Education Act (IDEA, 1975, 2004), has been criticized for overidentification of students of color and requiring students to fail before receiving services.

RTI was developed as a three-tiered approach, focused on prevention and intervention. Instructional RTI is well understood by educators, principals, and school counselors, but less awareness surrounds mental health and behavioral RTI. School-wide positive behavioral interventions and supports is a multitiered approach to prevention and intervention in the areas of social, emotional, and behavioral functioning. Some school leaders see positive behavioral interventions and supports and RTI as separate models competing for limited resources. This could be attributable to the perception that PBIS has more constrained fidelity guidelines, whereas RTI allows more freedom and flexibility in implementation (Ziomek-Daigle, Goodman-Scott, Cavin, & Donahue, 2016). However, the multitiered system of supports approach incorporates both RTI and positive behavioral interventions and supports into one comprehensive system in which RTI provides a framework for prevention and early intervention, while positive behavioral interventions and supports provide a model for consistency in behavioral expectations and incentives for positive behaviors (Sugai & Horner, 2009).

Harlacher, Sakelaris, and Kattelman (2014) described six key tenets of the multitiered system of supports framework: (a) all students are capable of grade-level learning with adequate support; (b) multitiered system of supports is rooted in proactivity and prevention; (c) the system utilizes evidence-based practices; (d) decisions and procedures are driven by school and student data; (e) the degree of support given to each student is based on their needs; and (f) implementation occurs schoolwide and requires stakeholder collaboration. Integration of a comprehensive social emotional curriculum can supplement RTI and positive behavioral interventions and support and enhance students' mental health. Specifically, social emotional theory and research suggests that the capacity to understand and regulate emotional experiences is crucial for successful academic, personal-social, and even career development (Avant & Swerdlik, 2016).

ASCA's position statement (2019b) on multitiered system of supports recommends alignment between a school's comprehensive school counseling program and multitiered system of supports in order to ensure the academic and social-emotional success of all students. By aligning a school's multitiered system of supports and comprehensive school counseling, school counselors and principals can collaborate to improve equity, and increase the efficiency and effectiveness of program delivery.

Fortunately, the elements of multitiered system of supports and comprehensive school counseling are conducive to alignment and overlap. Ziomek-Daigle et al. (2016) note that:

Similarities include utilizing collaboration and coordinated services; efficiently using the school counselors' time through tiered supports; collecting and reviewing student and school data; using evidence-based practices; developing culturally responsive interventions that close achievement gaps; promoting prevention and intervention for students through a tiered continuum; and facilitating schoolwide systemic change and a positive school climate. (p. 226–227)

This overlap manifests in each of the four components of comprehensive school counseling, including: foundation (CSC vision and goals should align with the school's multitiered system of supports priorities), delivery (CSC and multitiered system of supports can include similar prevention activities and interventions), accountability (CSC and multitiered system of supports can have similar processes for data collection/analysis and overall program evaluation), and management (CSC and multitiered system of supports can have similar organizational and administrative processes) (Ziomek-Daigle et al., 2016). For example, data systems must be designed which guide intervention planning and implementation for students not meeting grade-level academic, *and* social-emotional and behavioral benchmarks (Avant & Swerdlik, 2016). In effective comprehensive school counseling programs, school counselors lead through supporting, intervening, and facilitating (Ziomek-Daigle et al., 2016), in line with the principles of relational leadership.

RTI and positive behavioral interventions and supports within the combined auspices of multitiered system of supports provide a useful strategy to improve mental health literacy and awareness in schools. Multitiered system of supports

provides a continuum of three tiers of prevention and intervention: primary, secondary, and tertiary (Harlacher et al., 2014; Sugai & Horner, 2009). In order to develop comprehensive and integrated programs that support social, emotional, and behavioral skill development, both assessment and prevention programming must be developed for all three levels of intervention (Desrochers, 2015). Tier 1 activities that constitute primary prevention are provided universally to all students, and occur within the general education environment. Eighty percent of students receive and respond to these activities (Goodman-Scott et al., 2018; Ziomek-Daigle et al., 2016). Tier 2 activities consist of secondary prevention efforts with the goal of early identification and intervention with the approximately 15% of students who are at risk to prevent long-standing patterns of academic failure and discouragement through social and emotional functioning (Avant & Swerdlik, 2016). Finally, Tier 3 activities are those tertiary prevention efforts which are often grounded in functional behavior analyses and consist of individual behavior plans for the approximately 5% of students who are not meeting grade-level social, emotional, and behavioral benchmarks (Sugai & Horner, 2009).

In order to enhance the mental health functioning of students, it is imperative that principals invest significant effort in improving Tier 1 activities. In a recent survey, 82% of school mental health professionals reported spending very little time on Tier 1 mental health prevention programming or school-wide systems change (Avant & Swerdlik, 2016). Since schools with school-wide mental health and SEL programs have average achievement scores that are 11 points higher than schools without such programs, school principals and counselors need to collaborate to increase development of Tier 1 activities (Desrochers, 2015). Tier 1 activities should begin with those designed to create responsive classrooms, which promote positive relationships, collaborative problem-solving, cooperation, individual responsibility, self-control, and assertiveness (Rimm-Kaufman et al., 2014), eschewing the field of presence inherent in misguided leader-centric approaches.

Additionally, at Tier 1, school counselors should collaborate with principals to develop a comprehensive approach to classroom guidance which supports the development of four key social-emotional functional areas that have been linked to academic and career success (Squier, Nailor, & Carey, 2014). Those areas include: motivation, self-knowledge, self-direction, and relationship skills. Further, mechanisms should be developed whereby all students are assessed for the accomplishment of social, emotional, behavioral, and academic benchmarks (Ziomek-Daigle et al., 2016). Finally, collaboration should include universal screening for specific mental health concerns, and general emotional and behavioral risk.

Those students who are not meeting social, emotional, and behavioral benchmarks as well as those identified through the universal screenings at Tier 1 would be identified for Tier 2 prevention programming. Collaboration at this level involves school principals and school counselors working to develop and implement small group interventions using evidence-based programs. These groups can be provided

by school counselors or other school mental health personnel such as school psychologists or social workers (August, Piehler, & Miller, 2018) to better address the needs of all students in the school.

It is clear, then, that principal and school counselor collaboration is crucial in both Tier 1 and Tier 2 prevention programming. However, in order for this collaboration to be effective, there must be mutual trust and teamwork between these school leaders. Principals must support school counselors, and counselors need to be considered as leaders within their school (McConnell, Geesa, Mayes, & Elam, 2020). Doing so further fosters a culture of relational leadership and distances schools from elements of a leader-centric model, particularly the field of memory of utilizing vocational and guidance counselor-specific roles rather than school counselors who focus on social, emotional, academic, and college and career readiness needs.

Further, it is crucial that principals are trained properly in the evaluation of school counselors, as they often utilize ineffective methods and measures to determine performance (Mayes, Elam, Geesa, McConnell, & McDonald, 2020). When principals are not aware of how to properly evaluate school counselors, the counselor's role in the school could be negatively impacted, and the principal-school counselor relationship strained. Thus, it is important that principals continue to seek professional development regarding how they can support school counselors, and what their role *should* look like.

Bohanon, Gilman, Parker, Amell, and Sortino (2016) recommended a six-step implementation process for multitiered system of supports where relational leadership is evident at every step: (1) exploration and adoption fosters buy-in among staff, often through surveys and by allowing teachers to contribute to reshaping the school's mission and vision; (2) program installation calls for the formation of leadership teams, and empowering teachers through professional development related to multitiered system of supports; (3) initial implementation allows individuals or small groups to lead implementation through piloting, and involves students in event planning and schoolwide celebrations; (4) full operation involves "changing the professional roles for the entire staff" (p. 5), allowing all staff to impart some element of the program to students, and teams analyzing data at every tier to determine which students need which interventions; (5) innovation allows multitiered system of supports to serve as a springboard for developing new practices within the school; and (6) sustainability looks ahead to continue the cycle, preparing and empowering the next wave of leaders of the program.

Rowan, Correnti, Miller, and Camburn (2009) also focused on instructional leadership and teacher leadership in discussing "school improvement by design". In examining three different models of comprehensive school reform (Accelerated Schools Project, America's Choice, and Success for All), they found Accelerated Schools Project to foster the highest teacher autonomy and innovation, by focusing on culture rather than on procedural controls and routines. This aligns most closely with the principles of relational leadership, and as such is likely most conducive to implementing multitiered system of supports.

## Discussion

Training to address SEL and foster collaborative relationships among school professionals should occur before candidates enter the profession and continue through professional development in their workplace. This section discusses steps for pre- and in-service school counselors, educators, principals, and higher education faculty to take to support and promote student mental health in P-12 schools.

### Social and Emotional Learning and Pre- and In-Service Training

As discussed previously, many school leaders value SEL, though many feel that they need greater knowledge and resources to more effectively implement SEL in schools. For instance, DePaoli, Atwell, and Bridgeland (2017) found that many critical barriers to implement SEL in schools are due to the lack of pre- and in-service training. Effective SEL training for educators, school counselors, and principals is needed in preparation programs and throughout their professional careers in schools.

Regarding preservice training, Rosenthal and Gatt (2010) described a program that has been effective in teaching caregivers how to promote SEL. Although the program was initially designed for caregivers working with young children, it was adapted for teachers working with children age three to six, and thus could have important implications for teachers and other educators. The program had two parts, the first consisted of biweekly workshops and the second consisted of biweekly consultation meetings in small groups. The consultation meetings involved analyzing videos of children engaged in “challenging” behavior with a more experiential focus. Caregivers who participated in this training were more likely to offer verbal and emotional support, engage in behaviors promoting conflict resolution, and express greater warmth overall, when compared to their untrained counterparts (Rosenthal & Gatt, 2010).

A similar study by Hemmeter, Santos, and Ostrosky (2008) detailed a model, which included components of building positive relationships, implementing prevention practices in various settings, incorporating social-emotional teaching strategies, and creating individualized interventions. The researchers discussed how crucial it is to provide educators with a practicum experience that incorporates the above pieces to provide them with a more comprehensive knowledge of social-emotional development.

Rosenthal and Gatt (2010) and Hemmeter et al. (2008) emphasized the importance of experiential preservice training. Elbertson, Brackett, and Weissberg (2010) highlighted effective SEL training as providing information to in-service educators continuously, taking the form of preimplementation training, user-friendly manuals, and ongoing communication between teachers and program personnel. It would be helpful for principals to receive more preparation and training regarding the roles and responsibilities of school counselors in order to aid them in better supporting school counselors to address mental health in schools (Elam, Geesa, Mayes, & McConnell, 2019; Lowery, Quick, Boyland, Geesa, & Mayes, 2018).

Much of the research about in-service training for educators focused on its lack of use or availability, in addition to its importance (Jennings & Frank, 2015; Murano et al., 2019). For example, Murano et al. (2019) expressed that ongoing professional development regarding SEL is crucial for educators, though no states include teacher education standards that address comprehensive SEL competencies, and only 33% of state standards detail SEL competencies for students. Similarly, Jennings and Frank (2015) explained how SEL training for educators is often lacking, as SEL professional development is frequently delivered as a one-time approach.

As there is a clear lack of pre- and in-service SEL training, Chandler (2017) proposed a framework of SEL education in North Carolina. The framework incorporates social-emotional health training into preservice programs, in-service training modules to address the needs of professionals in schools, and training around North Carolina's eight SEL competencies. Additionally, Chandler (2017) found that in a study of adult professionals in various fields who had experienced several forms of SEL in-service training, participants ranked in-service training and learning through a bachelor's level program as the most effective form of preparation. These findings could apply to education professionals.

Much of the research on effective SEL training pinpoint the importance of a comprehensive approach (Bencivenga & Elias, 2003; Elbertson et al., 2010). Elbertson et al. (2010) asserted how the effectiveness of a SEL program often depends upon continuity throughout schooling (e.g., K-12), and collaboration of several individuals, from teachers to school leaders, to parents and students themselves. Further, Bencivenga and Elias (2003) detailed characteristics of visionary social-emotional leadership, a couple of these being: supporting and empowering teachers, distributing leadership roles, and actively welcoming parents and the community into schools, among other goals. Similarly, Williams and Koplow (2018) included the importance of school leaders communicating regularly with students' families in order to convey their commitment to and their cultural consideration of each student. Therefore, a comprehensive approach to pre- and in-service social-emotional training would likely be helpful in fostering strong social-emotional development in schools for educators, school counselors, and principals.

## **Course Content for Pre- and In-Service Principals and School Counselors**

As discussed, to build the capacity for principals and counselors to collaboratively promote school-wide mental health awareness and support, a comprehensive training approach is recommended which should promote the engagement of teachers, families, and other stakeholders in advancing school mental health (Bencivenga & Elias, 2003). The content of pre- and in-service training for principals and school counselors should focus on collaborative leadership for implementing research-based programs and strategies that address school mental health needs, while also developing principals' and counselors' awareness of appropriate role division in these efforts per the relevant professional standards for their respective fields

(Boyland et al., 2019; Carnes-Holt, Range, & Cisler, 2012; Dahir et al., 2010). Therefore, the course content for principal and counselor trainings should be aligned with their leading national standards, the National Educational Leadership Preparation (NELP) standards for building-level leaders (National Policy Board for Educational Administration [NPBEA], 2018), and the ASCA professional standards and competencies for school counselors (2019a). This standards-based, collaborative training of principals and school counselors should begin early in candidates' university preparation programs and then continue with ongoing professional development opportunities provided after graduates have become practitioners. Through the lens of relational leadership theory, education preparation faculty would focus on creating opportunities for candidates to examine the nature of their collaboration and understanding of leadership actions to support students (Crevani et al., 2010).

Specific course content areas that have been identified as crucial for pre- and in-service training of principals and school counselors for collaborative SEL leadership include, but are not limited to: understanding each other's professional standards; effective integration of research-based multitiered system of supports and SEL programs; appropriate role and resource alignment; effective communication; family and community engagement strategies; and collaborative social justice leadership for school improvement and opportunity equity (Carnes-Holt et al., 2012; Lowery et al., 2019; Stephan et al., 2015). Delivery of course content should begin with an overview of the principal and school counselor national standards, and the research bases supporting these standards (Boyland et al., 2019; Geesa, Elam, Mayes, McConnell, & McDonald, 2019). Understanding the professional expectations from both fields lays the groundwork for principals and counselors to then learn about the appropriate roles and responsibilities of each position (Carnes-Holt et al., 2012), suitable allocations of the counselor's time in supporting students through direct and indirect services, and the importance of effective communication between principals and school counselors (Duslak & Geier, 2018).

Content for pre- and in-service training for principals and school counselors should include detailed information on collaborative management of an effective student services program. This includes appropriate financial and human resource supports for implementing research-based strategies to address school-wide SEL efforts, incorporation of culturally responsive practices, as well as methods of working with families and community resources to support students' mental health needs (Lowery et al., 2019; Stephan et al., 2015). Principals and counselors should also learn how to partner in leading school crisis prevention, intervention, and safety planning, including dealing with emergency situations such as child abuse, suicide, bullying, harassment, and threatening behaviors (Cowan, Vaillancourt, Rossen, & Pollitt, 2013). In sum, course content for pre- and in-service training should focus on the standards-aligned teamwork that is needed between principals and school counselors in leading SEL efforts, while effectively engaging teachers, families, and community resources to assess and address school mental health needs to integrate research-based strategies, appropriate preventative and intervention programs, and ongoing supports.

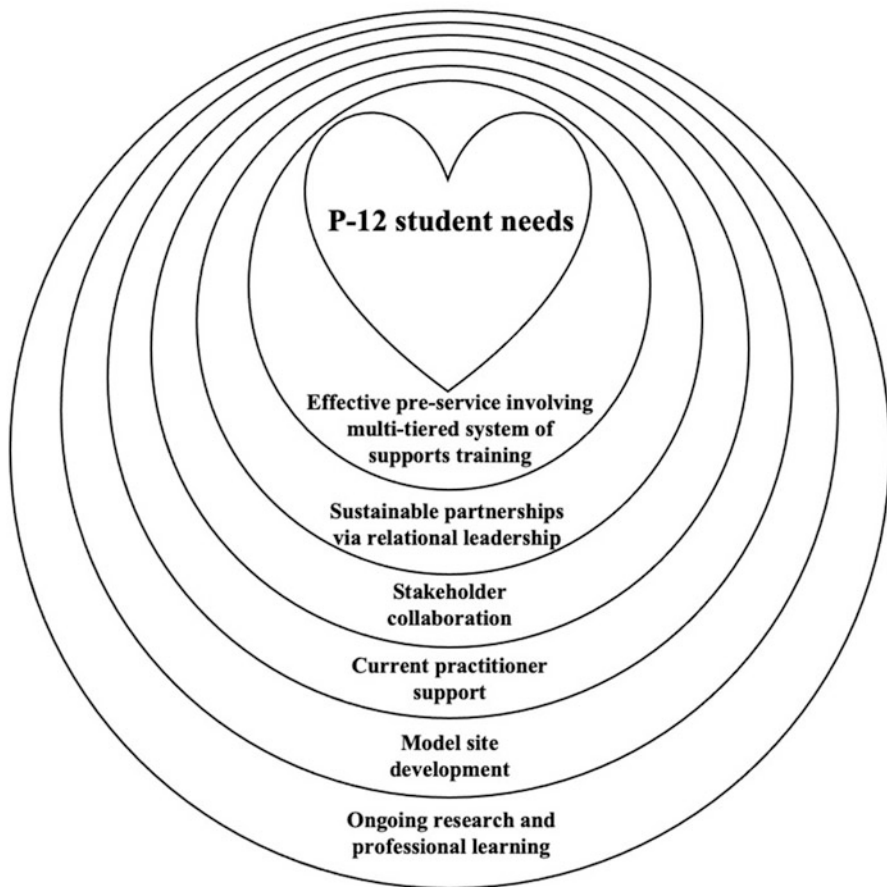

## Training to Support Collaboration for Multitiered System of Supports and Comprehensive School Counseling

Successful collaborative implementation of multitiered system of supports and comprehensive school counseling to support the mental health and social-emotional functioning of students may require changes to curriculum and pedagogy. Specifically, it is important for school principals and school counselors to recognize the significant degree of commonality their respective professions have in terms of being part of a leadership team, fostering collaborative relationships within schools, supporting data-informed decision-making, ensuring equity and cultural responsiveness, supporting evidence-based prevention and intervention, promoting systemic change and advocacy, and ensuring a positive school climate (Ziomiek-Daigle et al., 2016). Toward that end, Splett, Fowler, Weist, McDaniel, and Dvorsky (2013) recommend adding multidisciplinary team-taught courses into the curriculum of both professions that model collaboration and integration. The goal of these courses would be to increase collaboration and school-wide systems of support, improve effective interventions, and situate school leaders and counselors as co-managers of data management teams (Avant & Swerdlik, 2016). These courses present the opportunity for the co-construction of knowledge surrounding schools and students' mental health as discussed in relational leadership theory (Uhl-Bien, 2006). For example, candidates could explore case studies and role plays from their respective vantage points, and collaborate around problem-solving. This could also take place within in-service professional development opportunities.

As part of ongoing learning critical for successful implementation of multitiered system of supports, school counselors and principals should collaborate to provide professional development activities for school faculty and staff. These activities should result in the implementation of evidence-based, school-wide classroom management systems that are clear and consistent across grades, reflect the principles of responsive classrooms, are sensitive to the mental health needs of students, and are trauma informed. These systems should include strategies for assessing and monitoring social and emotional learning that go beyond the typical attendance and discipline data that are commonly utilized as proxies for SEL. Attendance and discipline referrals alone do not provide the causal information needed to develop meaningful intervention strategies. In the real-life context of their work, education professionals would have the opportunity to construct, reflect upon, and interrogate their practices.

### Call to Action

The *Collaborative Training Framework* (see Fig. 1) provides educators, leaders, and school counselors a structure to promote active leadership and collaboration in schools toward the betterment of students' mental health. This framework is altered from the original framework for collaborative school principal and school counselor preparation and support by Geesa et al. (2020). The purpose of this chapter is to

**Fig. 1** Collaborative training framework. (Note. An earlier version of this figure was published in “Increasing Partnerships in Educational Leadership and School Counseling: A Framework for Collaborative School Principal and School Counselor Preparation and Support,” by R. L. Geesa, R. D. Mayes, K. P. Lowery, L. G. Boyland, M. M. Quick, J. Kim, N. P. Elam, & K. M. McDonald, 2020, *International Journal of Leadership in Education*, p. 10 (<https://doi.org/10.1080/13603124.2020.1787525>). It has been revised and updated to suit the needs of the contents of this handbook entry)

make a call to action to pre- and in-service educators, school counselors, and school leaders, as there are many ways that they can help create a healthier school climate that support student needs. For instance, effective preservice preparation might mean implementing an exemplar program that integrates training in multitiered system of supports with training in effective collaboration between preservice administrators and preservice school counselors. Building sustainable partnerships, specifically between educational leadership and school counseling programs, is another example of an action that would better prepare preservice candidates to effectively meet

students' needs. This also would demonstrate relational leadership, which is one of the ultimate goals of sustainable partnerships both in the school and outside of it. Similarly, active collaboration with community and business stakeholders can open opportunities for students that they may not have had otherwise, and can provide an additional level of support to students and their families.

Current practitioner support can also be instrumental in learning how to meet student mental health needs, as ongoing, in-service training can provide practitioners with newer and more relevant information on social-emotional learning as it evolves. This in-service training could also serve to keep practitioners updated on new developments related to best practice in multitiered system of supports. Next, creating, participating in, or visiting a model site of an exemplary program can give both pre- and in-service practitioners the chance to observe an effective principal-school counselor working relationship that is rooted in collaboration. Last but certainly not least, ongoing research and professional development are critical where collaborative school counseling and relational leadership are concerned, as contributing to the research base can aid practitioners in better understanding this collaboration, and how it can benefit students.

---

## Conclusions and Reflections

A relational leadership approach should extend beyond the principal and school counselor role, as expanded school mental health includes a multilayered approach to addressing student mental health that should involve school-community-family collaboration (Weist, Ambrose, & Lewis, 2006). Partnerships with community agencies, connections with students' caregivers and families, and resources and supports for all school stakeholders to better identify and support the mental health needs of PK-12 students are needed.

Principals and school counselors are essential leaders in school-community-family collaboration with efforts to improve mental health well-being. This chapter includes several learning opportunities for preservice candidates and new and veteran educators (e.g., teachers, school counselors, and principals) to collaboratively construct meaning of the school environment to provide the best mental health care for students within multitiered system of supports. Multitiered system of supports provide a structure for school leaders, student support specialists, and other stakeholders to improve student support services and provide the proper type of social-emotional learning assistance to individuals and groups of students.

### Abstract

Although education is understood to be a caring endeavor, explorations of caring leadership have often taken caring as either a taken-for-granted background condition or a means to an end. Caring, though, is complex, and well-intended efforts to care often fall short or, worse, have the opposite of their intended effect. Recent scholarship has increasingly sought to move understanding of caring from an empty buzzword to a meaningfully defined and bounded idea. Over the past decade, an increasing number of studies have placed caring leadership at the front and center (see Bass L, *Int J Qual Stud Educ* 25:73–87, 2012; Bass LR, *Educ Adm Q* 56:353–395, 2020; Louis KS, Murphy J, *J Educ Adm*, 2017; Louis KS, Murphy J, Smylie M, *Educ Adm Q*, 52(2), 310–348, 2016; Lumby J, Azaola

MC, *Br Educ Res J* 40:30–44, 2014; Sanzo KL, Sherman WH, Clayton J, *J Educ Adm*, 2011; Smylie MA, Murphy J, Louis KS, *Am J Educ* 123(1):1–35, 2016; Rivera-McCutchen RL, *Educ Adm Q*, 2020; Tichnor-Wagner A, Allen D, *Leadersh Policy Schools* 15:406–447, 2016; van der Vyver CP, van der Westhuizen PC, Meyer LW, *Educ Manage Adm Leadersh* 42(1):61–74, 2014). Most of this scholarship responds to a sense that the research and practice of educational leadership had become too focused on administrative emphasis on academic press (that is, expectations to maintain or raise academic standards of performance), to the detriment of the way that leader-affective support influences the organizational environment and relationships in the school. These strands of scholarship emphasize that, despite a policy environment heavily focused on accountability and narrow measures of student success, social support for adults and the creation of a caring school environment are important functions of school leadership as such, and not merely as an instrumental approach to improved student achievement. The purpose of this chapter is to ground scholarship in caring leadership in past and ongoing discussions about leadership, examine cleavages and disconnections within current conceptualizations of caring leadership, and explore potential future directions and avenues of inquiry in caring school leadership.

Caring · Support · Relationships · School culture · Care ethics · Equity · Social justice · Radical care · Principal-teacher relationship · Principal-student relationship · School organization

**The Field of Memory**

At first glance, caring may appear to be a “trait” of a leader (Mann, 1959; Stogdill, 1948). Caring leadership, however, does not align with trait theories of leadership because caring is a way of being in a relationship, not a resource or benefit offered from a leader to others. Consequently, trait-based understandings of caring leadership are firmly in the field of memory.

**The Field of Presence**

More immediate predecessors in leadership theory on which conceptions of caring leadership draw include transformational leadership and leadership for social justice. Transformational leadership emphasizes both the importance of alignment between leader’s goals and follower’s needs, and the way that leaders work to produce emotionally supportive organizational climates (Gunter, 2016; Hoy, Tarter, & Hoy, 2006; Leithwood & Jantzi, 1999; Leithwood & Sun, 2012; Marks & Printy, 2003). Leadership for social justice emphasizes the ways that educational leaders work to redress historical marginalization and inequity, and specifically, the way that leaders’ critical consciousness shapes their actions and interactions (Capper, Theoharis, & Sebastian, 2006; Horsford, 2010; Horsford & Tillman, 2012; Theoharis, 2007). These two theoretical approaches straddle the border between the field of memory

and the field of presence: although both remain fertile spaces for inquiry in educational leadership, and offer foundational concepts to inquiry into caring school leadership, much of the scholarship of caring school leadership no longer explicitly situates itself within these frames – though this is more true of transformational leadership than leadership for social justice.

Caring is a broad concept that is frequently used as a colloquial descriptor even when it is not a major focus of study. Consequently, one focus of empirical and theoretical work on caring leadership has focused on understanding and defining the leader's role in fostering informally described caring conditions (e.g., a caring school climate).

### **The Field of Concomitance**

Caring school leadership borrows not only from work on care ethics in education more broadly (Gilligan, 1993; Noddings, 2005; Noddings, 2013), but also work on caring from other fields such as nursing (Gadow, 1985; Watson, 2008) and ministry (Doehring, 2014; Gerkin, 1997). Caring is understood to be an essential component of what it means to be human, and so philosophers, political scientists, and anthropologists have all explored caring relations, along with scholars from human service professions. Each of these perspectives offers something to caring school leadership as well.

### **Discontinuities and Ruptures**

As noted above, the emphasis on caring school leadership is a response, in part, to overemphasis on academic press to the exclusion of social and affective support in schools. However, the primary misalignments within caring leadership mirror the misalignments in the scholarship of caring in education more generally. Nel Noddings (2005, 2013) is the most widely cited ethicist of caring in education. Noddings' vision of good care in schools is similar to the care that a mother offers to her child. However, other scholars have critiqued this conceptualization on several grounds. First, some scholars suggest that Noddings' way of thinking does not admit of the variety of ways of caring that may be shaped by culture or social position and argue that Noddings' vision of care is essentially a white, middle-class approach to caring (Thompson, 1998; Valenzuela, 1999). These debates about the cultural specificity of caring are also reflected in the ways that different scholars describe caring school leadership.

### **Critical Assumptions in Defining Caring School Leadership**

Although there are some disagreements in the definition of caring school leadership, several assumptions are widely agreed upon and have to do with the phenomenology of caring itself. First, caring is an intersubjective way of being in a relationship. This means that caring cannot be a "one-way street": Both the person intending to care and the would-be recipient of caring must recognize what is occurring as care. Consequently, actions cannot be described as caring or uncaring from the outside – what matters is how the people in the relationship intended and received those actions. Furthermore, caring necessarily has the potential for mutuality: The person

caring in one instance may be the person cared for in another instance. One final implication of this understanding is that describing a school climate as caring is not strictly appropriate. Because caring is a characteristic of a relationship between individuals, it makes more sense to describe school climates that are *conducive to* or *facilitative of* caring.

Second, caring must respond to needs. These needs may be expressed by the one cared for or inferred by the one caring. This means that caring involves a particular kind of attentiveness and action – one must detect and respond to the needs of another. Additionally, caring cannot simply be a felt state – it involves action on behalf of another. The mutuality, attentiveness, and emphasis on action make caring leadership subtly different than other forms of leadership that emphasize general social support. For example, transformational leadership theory focuses on inspiration and leader behavior as ways to increase follower motivation and improve organizational climate; however, the locus of action for transformational leadership is more focused on organizational improvement than meeting needs.

---

## Introduction

Despite the current policy emphasis on accountability in schools, and heavy focus in practice and research on the ways that leaders facilitate high levels of academic press and improved student learning outcomes, there has been renewed interest in how school leaders develop caring relationships with members of the school community and support a caring school climate. These examinations simultaneously acknowledge that schools that achieve both academic success and high levels of social and emotional flourishing are characterized by a balance between academic press and social support that has become tilted too far in the direction of the former, while also emphasizing that relations of care are a good and worthwhile goal unto themselves.

The purpose of this chapter is to place inquiry caring school leadership in context. The initial section of the chapter explores caring school leadership's outgrowth from existing leadership frameworks. Then, it describes and appraises the two currently dominant conceptions of caring leadership – one rooted in an organizational leadership perspective and another, based on notions of critical care, that is broadly rooted in leadership for social justice. The concluding section explores the possibilities for additional symmetry and synthesis between these two perspectives and describes potential fruitful directions for research at the interstices between care ethics and school organization.

---

## Caring School Leadership

Broadly speaking, there are two approaches to understanding caring educational leadership that typify scholarly discourse at present. One approach to caring leadership focuses on how leaders' interpersonal caring and/or vision and pursuit of a caring school climate influences teacher beliefs and actions and thereby broader

organizational outcomes. The other approach emphasizes the ways that leaders' positionality and experiences around caring shape their beliefs and actions with respect to equity and social justice in education. This section briefly traces the origins of each way of thinking about caring school leadership, before exploring the particulars of each way of thinking in greater depth.

## Origin Stories of Approaches to Caring Leadership

Although both approaches to caring school leadership described above find their basis in how leaders approach and realize care ethics in schools, they nonetheless stem from somewhat different intellectual traditions. This section refers to the two approaches as an *organizational approach* and a *social justice approach*. Although this shorthand does elide some of the strands of thinking both between and within each approach, it is also a convenient way to distinguish between the two.

As noted above, the organizational approach to caring school leadership was borne in part out of increasing concern that an emphasis on educational leadership for academic press was crowding out schools' role in offering social support to students (and that social support is important both for its own sake and because it is associated with improved academic outcomes). Although the empirical and theoretical bases of work around caring leadership have deepened considerably over the past decade, it is important to note that concerns with caring in educational administration are not new (Beck, 1994; Enomoto, 1997; Marshall, Patterson, Rogers, & Steele, 1996; Sernak, 1998). These earlier works argued that a renewed emphasis on caring in educational administration was needed to improve the ethical focus of schools (Beck, 1994; Sernak, 1998), respond to overly rational, mechanistic, and transactional models of leadership (Marshall et al., 1996), and balance care ethics with other potentially competing ethics such as justice (Enomoto, 1997; Sernak, 1998). The importance of developing leaders with emotional literacy (Roffey, 2006) and with a strong sense of the ethical aims of education (Noddings, 2006) has also been a topic of inquiry. In general, these earlier works had a relatively more deontological emphasis, whereas more recent scholarship has had a more teleological, consequentialist emphasis. Besides these earlier works, which take caring school leadership as their direct topic of inquiry, a great many works reference care or caring in leadership in general as a worthy aim.

Recent scholarship in the organizational approach to caring school leadership also draws on extant frameworks for leadership, including servant leadership, authentic leadership, and transformation leadership. Specifically, caring leaders are proposed to be servant leaders in the sense that they highly prize meeting the needs of others as a way of creating a positive and productive climate (Greenleaf, 2002). Caring leaders are understood to be authentic leaders in that their leadership stems from a strong ethical base and is characterized by openness in professional relationships (Avolio & Gardner, 2005). Finally, caring leaders are understood to be transformational to the extent that such leaders focus on producing emotionally supportive climates, and increasing awareness of moral standards (Bass, 1985; Burns, 1978; Gunter, 2016;

Hoy et al., 2006; Leithwood & Jantzi, 1999; Leithwood & Sun, 2012; Marks & Printy, 2003). These leadership frameworks and accompanying examinations of how such leadership influences relationships and organizational outcomes form some of the basis for recent scholarship in caring leadership.

The social justice approach to caring leadership finds its origins in a combination of womanism/black feminist caring, critical care, and notions of mothering as care. Womanism is a social theory first advanced by Alice Walker (1983) as a response to feminism. Womanism advances the values and experiences of women of color to challenge traditional hierarchies of race, class, and gender (Williams, 1993). Like womanism, black feminist caring is grounded in the experiences of black women. Thompson (1998, 2004) argued that traditional feminist theories of care ethics are grounded in a colorblind, essentially white vision of what constitutes good caring. However, Thompson (1998, 2004) suggests that caring is both culturally and experientially grounded: Good caring may look differently in contexts characterized by oppression or marginalization such as those frequently experienced by black women and families. In educational terms, this means that caring must often be characterized by advocacy and resistance. The concept of critical care also emphasizes advocacy. Critical care stems in part from Valenzuela's (1999) finding that minoritized students often find caring to be inauthentic and contingent (e.g., teachers care about students who care about school). For such students, caring that is both authentic and directly responsive to both culturally grounded notions of care and to racial and ethnic discrimination is important (Antrop-González & De Jesús, 2006; Curry, 2016; Rolón-Dow, 2005). Wilson notes, "Critical care involves embracing and exhibiting values, dispositions and behaviors related to empathy, compassion, advocacy, systemic critique, perseverance and calculated risk-taking for the sake of justly serving students and improving schools" (2016, p. 557). Finally, although the bulk of the research that takes a social justice approach to caring leadership has taken place in the USA, some international scholarship draws on theories of mothering and how mothering is related to social context. Specifically, mothering often constitutes a shared activity that involves delivering everyday care to those in need (Hollway, 2001). The concepts of womanism, black feminist caring, critical care, and mothering are all closely related – in many cases, they are directly intertwined. The implications of these theories for caring school leadership are explored in greater depth below, but, unsurprisingly, they emphasize advocacy and resistance of injustice.

## **Caring Leadership and Organizational Perspectives**

The most complete current formulation of the organizational perspective on caring leadership comes from Smylie, Murphy, and Louis (2016, 2020). Their model is broken down into three components: antecedents to caring school leadership, practices of caring school leadership, and outcomes of caring leadership. For the present examination, the antecedents and practices of caring leadership are most important, both because this chapter focuses on caring leadership as a phenomenon, and

because the effects of caring leadership on student outcomes are only beginning to emerge in empirical studies (although adult outcomes are better understood).

The antecedents of caring leadership implicate the aims, virtues, and competencies of the leader (Smylie et al., 2016, 2020). In the first place, leaders must intend to care – to purposefully meet the needs of others. Because caring is a quality of a relationship, the aims underlying a leader’s actions are important; efforts at “caring” that are merely instrumental or transactional are unlikely to achieve the intended results and may backfire (Noddings, 2006; Smylie et al., 2016, 2020). Similarly, caring leadership must be grounded in moral virtues (e.g., kindness, empathy, and respect); caring relationships are characterized by the one caring genuinely intending to do good on behalf of another. Finally, caring involves knowledge and action that can be held and done with greater or lesser efficacy. Although caring is grounded in intention and feeling, it progresses to specific knowledge of another’s needs, and action on behalf of those needs. Caring that is done with good intentions, but that does not actually address a need, is referred to as *virtue caring* (Noddings, 2001). Because caring is an intersubjective way of being in relation, a caring leaders’ aims, virtues, and competencies must all align in order for that leader to be truly caring (Smylie et al., 2016, 2020).

Following the antecedents of caring leadership is the practice of caring leadership itself. As one might expect, the first component in the practice of caring school leadership is leader’s interpersonal and relational caring with members of the school community (Smylie et al., 2016, 2020). These relationships can serve as a form of modeling or a template for the desired tenor of interpersonal interactions in the school (Noddings, 2012). The second broad practice of caring leadership is cultivating caring communities within the school (Smylie et al., 2016, 2020). One aspect of building caring communities within the school is building the capacity of others to care. This may involve not only modeling caring practice (as described above), but also explicitly teaching others how to care in certain context, or emphasizing caring as a prized organizational attribute. The last way that Smylie and coauthors (2016, 2020) suggest that caring school leadership can cultivate caring school communities is via influence on organizational conditions. Although caring is understood to be a quality of a relationship between individuals, past research has found that an organizational emphasis on caring and the common good can create organizational policies and practices that promote caring relationships (Cassidy & Bates, 2005; Siddle-Walker, 1993). The final way that caring leadership is practiced is in contexts beyond the school. Specifically, caring school leaders may engage families and the broader school community to build webs of care and support that rebound to support students in school as well (Smylie et al., 2016). Caring school leaders may also engage in both boundary spanning (e.g., with the district office) to advocate for care resources and buffering (e.g., with respect to policy initiatives) that may prove adverse to caring in schools (Rallis & Goldring, 2000; Smylie et al., 2016). Leaders’ interpersonal caring, cultivation of caring school communities, and caring engagement in contexts beyond schools form the crux of practice for caring leadership.

Although the ultimate outcome of caring school leadership is presumed to be social, emotional, and academic benefits to students, most of the recent empirical

literature on caring leadership has focused on its effects on adults or on the broader climate of the school. For example, caring school leadership appears to have the largest effect on the climate of the school when it is accompanied by a strong culture of professional collaboration (Louis, Murphy, & Smylie, 2016; Sanzo, Sherman, & Clayton, 2011). Furthermore, the schools that most successfully operationalize a caring climate not only have leaders who infuse caring into the vision of the school, but also have school-wide structures (e.g., a surfeit of extracurricular activity options) that create opportunities for a greater density of caring relationships (Tichnor-Wagner & Allen, 2016). Several recent studies have specifically examined the way that perceived principal caring is related to professional climate and organizational outcomes. Principal caring for teachers is associated with both greater teacher academic support for students and greater sense of collective responsibility among teachers (Louis et al., 2016). Furthermore, teachers find principals to be more caring when principals hold higher levels of trust in teachers' professional capacities and judgments; greater principal caring is in turn associated with higher levels of organizational learning (Louis & Murphy, 2017). Finally, principals tend to believe that they are more caring than teachers find them to be, especially with respect to their personal interest in the well-being of teachers (Van der Vyver et al., 2016). Although a deep understanding of caring leadership influences on students and teachers is only emerging, there is nonetheless growing evidence that caring school leadership has considerable organizational benefits.

### **Critical Caring: Leadership for Social Justice Perspectives**

Examinations of caring school leadership that proceed from a leadership for social justice premise often focus somewhat more on the direct actions and intentions of leaders compared to studies of caring leadership that proceed from a more organizational perspective. Specifically, these studies often invoke a counterstorying framework that centers questions of racism and oppression, and how leaders resist and combat these problems (Rivera-McCutchen, 2020; Wilson, 2015, 2016). For example, caring school leaders often prioritize an ethic of care over an ethic of justice by resisting or ignoring zero tolerance policies (Bass, 2009, 2012). This approach emphasizes relational reciprocity (i.e., the golden rule) rather than fixed and principled notions of right and wrong. Caring leaders also take actions on behalf of students and the broader school community to resist marginalization and advocate for school and community needs (Wilson, 2015, 2016). For example, Wilson (2016) examined the way that African American women leaders operating from a critical care approach resisted school failure and deficit framings of their community and advocated for community needs in policy arenas. Similarly, caring school leaders seek to subvert deficit framings of their school and students and restore these deficits as sources of strength and resilience (Witherspoon & Arnold, 2010). Scholars writing from this perspective emphasize that caring school leadership involves "activist risk taking" (Bass, 2012, p. 73) on behalf of students, and "tweaking,"

(Witherspoon & Arnold, 2010, p. 228) resisting, ignoring, or subverting policies that are disadvantageous in order to prioritize an ethic of care.

The ethic of care is a feminine ethic (Gilligan, 1982, Noddings, 2012; Tronto, 2010), so it is perhaps unsurprising that scholars writing of caring leadership from a social justice perspective have emphasized *mothering* and *othermothering* as dimensions of caring leadership. Because this perspective primarily originated in womanist and black feminist thought, mothering is a natural approach to frame caring actions. These scholars highlight that a mothering perspective emphasizes practical skills and needs and is a way to grapple with local context and frame social problems in challenges humanely (Lumby & Azaola, 2014). Mothering is often seen as distinct from leadership, or not leaderly, but this approach “troubles gender” by repositioning motherhood as a leadership asset and pushes back against gendered visions of leadership as dominant or aggressive (Lumby & Azaola, 2014, p. 36). Othermothering as it relates to caring leadership emphasizes that mothering can be an act or expression rather than a familial relationship, and direct maternal care and service to others is an essential quality of mothering that can also promote reciprocal caring relations (Bass, 2009, 2012, 2020). Scholars writing from this perspective also emphasize that there is often a religio-spiritual dimension to caring school leadership (Bass, 2009; Witherspoon & Arnold, 2010). Caring leadership often stems from leaders’ own experiences of discrimination and marginalization, and adopting a spiritual perspective on overcoming obstacles is often a symbolic source of strength and hope for such leaders. For example, Witherspoon and Arnold locate the spiritual influence of the black female principals in their study in the Black Church which is “the heart of hope in the Black community’s experience of oppression, survival struggle and historic efforts toward complete liberation” (Williams, 1993, p. 205).

One recent framework in this approach to caring school leadership is the idea of *Radical Care* (Rivera-McCutchen, 2020). This approach to caring school leadership has five elements. First, radically caring leaders adopt an antiracist, social justice stance. This involves highlighting and redressing inequitable distributions of resources and organizing students to resist racism and oppression within the community (Rivera-McCutchen, 2020). Second, radically caring leaders cultivate authentic relationships. This means, above all, not treating relationships with students or staff as a mechanism for instrumental exchange, but for deeply felt expressions and actions of support. Third, radically caring leaders believe in students’ and teachers’ capacity for growth and excellence. This generally means taking an expansive view of what is possible in students’ education and encouraging students and staff to be similarly expansive and creative in their efforts. Fourth, radically caring leaders skillfully navigate the sociopolitical and policy climate. Leaders are adept at recognizing areas where they can advocate on behalf of students and families, and the extent to which they can reimagine policy expectations in ways that better support the students in their schools. Finally, radically caring leaders also embrace a spirit of radical hope (Duncan-Andrade, 2009). This radical hope simultaneously recognizes the serious shortcomings faced by many minoritized students

in schools while maintaining optimism that it is worthwhile to envision and vigorously pursue a better, more humane approach to education.

Overall, the caring leadership that stems from a leadership for social justice approach simultaneously not only recognizes the oppression that is endemic for many students and communities, but also holds that an ethic of care can elevate marginalized voices and produce more humane conditions in schools (Rivera-McCutchen, 2020; Wilson, 2015, 2016).

---

## Conclusion and Reflections

The above sections proposed that there are, in some sense, two related but distinct approaches to conceptualizing caring leadership: one that focuses primarily on organizational theory and the organizational effects of leadership, and another that grounds itself in leadership for social justice. This distinction is, to a certain extent, stylized. Certainly, the scholars identified as writing within each approach cite one another. However, the distinction is nonetheless useful because these scholars are operating from somewhat different epistemological stances and exploring the borderlands between these stances is a useful way of understanding how future work in caring school leadership may proceed. This section explores three avenues that may both expose some tensions across the two ways of thinking and offer potential for synthesis of ideas.

### Joining Conceptions

One obvious avenue for additional work in caring school leadership is in efforts to better join organizational conceptions of caring leadership with those that draw on leadership for social justice perspectives. Current scholarship has found that the benefits of caring leadership may be amplified in schools that serve large proportions of marginalized students (Louis et al., 2016). However, while there is evidence of this relationship, and a fairly extensive normative literature about how leaders operating from an ethic of care may combat marginalization and minoritization (Rivera-McCutchen, 2020; Witherspoon & Arnold, 2010), there is not much insight into the *process* of how caring leadership alters the organizational grammar of the school in ways that promote social justice (see Khalifa, 2018, for one process-oriented exploration). Two avenues of inquiry may be especially fruitful. First, examinations of caring leaders exercising power and engaging in conflict and negotiation to achieve equitable ends would help to clarify how ethically caring leadership influences organizational commitments to social justice (Walls, 2020a). Second, Smylie and coauthors (2017) have noted that caring leadership often involves building webs of caring that not only begin in school but also reach beyond it. Understanding how leaders' caring practices face outward into the broader community will offer insight into the process by which caring leadership might produce social justice (Khalifa, 2018).

## Caring as an Ethical Stance

Earlier works on caring leadership tended to focus more narrowly on the deontological *and* teleological dimensions of leading through an ethic of care (see Beck, 1994; Enomoto, 1997; Sernak, 1998). The ethical position of caring in more recent works has been positioned as a response to concerns: an overemphasis on academic press and achievement for scholars writing from an organizational perspective, and oppressive and marginalizing social forces for those writing from the perspective of leadership for social justice. By its nature, caring is focused on doing what is right in the context of particular relationships, e.g., when might failing a student or enacting a zero-tolerance discipline policy be a careless response? However, given that many of the concerns that caring leadership responds to are codified as national or state policies (i.e., high-stakes standardized testing) or local prescribed practices (i.e., one-size-fits-all discipline policies), there is room to examine caring leaders' local ethical responses. For example, how do caring leaders support teachers experiencing stress and pressure to show positive "results" in narrowly defined ways (Walls, 2020b).

## Interpersonal Relationships: Foundations of Care

Interpersonal relationships are primarily how care is manifest in schools and, thus, should be a central focus for school leaders who desire to promote care in their schools. Smylie et al. (2020) noted, "the outcomes of caring should be understood systematically, that is, as a totality of caring relationships that a person may experience" (p. 24). Starratt (1991) stated that school administrators committed to an ethic of caring must "be grounded in the belief that the integrity of human relationships should be held sacred" (p. 195). While there is ample evidence pointing to significant outcomes resulting from positive, caring teacher-student relationships, there is less empirical evidence pointing to outcomes of principal-teacher relationships, and even less detailing the effects of principal-student relationships. What *is* known about leader-involved relationships, however, suggests that they are also critically important, affecting both student and school-wide outcomes in ways similar to the teacher-student relationship.

While the teacher-student relationship is a well-studied, important phenomenon in schools, shown to have a broad and deep impact on a variety of outcomes (Bernstein-Yamashiro & Noam, 2013; Crosnoe, Johnson, & Elder, 2004; Freiberg, 2014; Landrum, 2014; Murray, 2014; Poplin & Weeres, 1993), less is understood about leaders' relationships – especially with students. What is known, however, implies that leader relationships are similarly impactful and important. A principal's professional relationships are integral to their ability to effectively perform many of their job responsibilities, and these relationships can contribute to improved outcomes in schools (Marzano, Waters, & McNulty, 2005). But while the vast majority of leadership effectiveness research indeed acknowledges a substantial relationship between leadership and student outcomes, most appear to discuss the various

mechanisms, mediating factors, and pathways through which the effects on student outcomes are manifest. For example, several authors have documented the power and responsibility of principals to influence school culture, which in turn impacts outcomes (Fink & Resnick, 2001; Hallinger & Heck, 1996; Leithwood & Jantzi, 1997; MacNeil, Prater, & Busch, 2009). Principal-teacher relationships, specifically, impact principals' and teachers' satisfaction, cohesion, and commitment levels, thereby influencing school climate (Price, 2012; Price & Moolenaar, 2015).

But a growing body of scholarship is revealing that direct principal-student relationships may also have profound effects on individual as well as school-wide outcomes. Presented in greater detail in Chapter XX of this volume, direct principal-student relationships have led to increased motivation and perceptions of achievement in students (Gentilucci & Muto, 2007; Silva, White, & Yoshida, 2011), as well as a better ability to feel the pulse of the school (Kudlats & Brown, 2020; Lavery & Hine, 2013; Ryan, 1999). Deeply meaningful and personally profound relationships have also formed between principals and students (Cranston, 2012; Hawkes, 2010; Janson, Parikh, Young, & Fudge, 2011; Kudlats & Brown, 2020), and direct student relationships have contributed to students' feelings of fairness and belonging, promoting more culturally responsive leadership (Khalifa, 2018). Given the underexplored and undertheorized nature of leader relationships, caring school leadership may provide the most fitting framework on which to base further study of these relationships and better reveal their impact on a variety of student and school outcomes.

Although schools are presumed to be sites of caring, there is evidence that most American students feel that caring is crowded out by an emphasis on success and achievement (Weissbourd & Jones, 2014). Caring has sometimes been a taken-for-granted concept in educational research as well, but achieving true interpersonal care, and realizing a climate of care, often proves to be quite complex in practice. This chapter has examined the growing scholarship on caring school leadership. Thus far, this scholarship has largely split into two broad areas: one focused on how caring leadership influences school organizations, and the other focused on caring leadership as a means to produce greater social justice in education. Both of these approaches have generated insight into what caring leaders believe and do, and how this influences other adults and students in the school. Future efforts should focus on bridging conceptual gaps between the two approaches, zeroing in more narrowly on caring as an *ethical* approach to leadership, and, perhaps most importantly, examining the particulars of leaders' interpersonal relationships as a model for how caring is realized throughout the school.

## Abstract

This chapter begins with a Western perspective on education administration, management, and leadership preparation in backdrop to understand the present international field which has been greatly shaped over the last 20 years through exportation of standards and assessments in administrator preparation worldwide. The drumming of economic efficiency and scalability led to the neoliberal rise of standard measurements through testing is examined with the Western lens to recent international studies performed with the best of intentions. The final section represents our imagining of a world shaped by localized and contextualized realities in rejection of political and economic levers guiding the creative world of schooling in search of quality and fairness as sought by Educational Leaders Without Borders.

**Field of Memory: Points of Western Origin**

In order to understand the impact of Western development on school leadership, the US history is described beginning with the science of management in the 1880s to 1980s. In excerpt (Excerpt from Papa, 2005):

In the ways of knowing Education Administration, one must acknowledge that knowing where you are requires you to understand where you have been. To assimilate our rich legacy enables each of us to understand our role in preparing leaders in all educational settings.

*Science of School Management 1881–1930.* The first course designed to train principals was taught in 1881 by William T. Payne, a former superintendent and later an education professor at the University of Michigan. Over 100 years ago, in 1904, Cubberley and Strayer became the first professors of education administration in this country (Willower & Culbertson, 1964). Cubberley wrote in 1927, “We have an organized body of knowledge and established principles of action” (p. ix), based on the ideas of William Payne and William Harris who stressed the need for scientific approaches to be used in school administration (Papalewis, 2004). In 1905, Teacher’s College Columbia awarded eight doctorates in educational administration and two of the recipients, Ellwood Cubberley and George Strayer, became professors at Stanford University and Teachers’ College, Columbia, respectively (Culbertson, 1988). Later in his career Cubberley (1927) was convinced that educational administration had a knowledge base to solve the problems of managing city school districts when he stated, “. . . We have had an organized body of knowledge and established principles of action which have been taught generally for some time” (p. 8). In 1920 the number of college courses in school administration had multiplied to supply the demand for administrators for America’s schools (Hoyle, 1991). Cubberley believed that from a state perspective more unique interests, “. . . Called for a more thoroughly sound policy and a firm grasp of economic policy and political theory” (p. 14). The knowledge base at that time consisted of school management, teacher supervision and practical field-based experiences, “war stories” for students to emulate from former school administrators (Hoyle, 1991).

*The Giants Theory [1960s].* Willower and Culbertson wrote that emphasis in our field must move in the direction of theory, research and content differentiation (Papalewis, 2004). Campbell (1964) wrote more specifically to the kind of professors sought in education administration, “In seeking talent for the professorship. . . we should look for men who are bright, who are young, who have dealt with the major ideas of Western culture, who have exhibited some independence and creativity, and who have a commitment to education” (p. 19). In seeking these ideal professors of education administration, the American Association of School Administration (AASA) in their 1960 Yearbook listed (Griffiths, 1964) the ideal staffing for our departments. Possibly, this was an early precursor to their role in the standardization of our field: “3 senior faculty members; 5 associate faculty members; 2 assistant faculty members; 10 graduate assistants; and 7 secretaries” (p. 30).

The great man theory meant employ “giants” in our field for university and departmental fame. These giants were not to be expected to become team players. The scientific journal theory was meant to harness the intellectual activity of the department. Create a scientific refereed journal and the intellectual activity would increase among the faculty and bring esteem to the department. In the 1960s, theories relating to practice focused on the administrator as practitioner and was viewed as an outcome of a complex marriage of practice and theory enlivened by the tension between them. “It was believed that practice brought two

gifts: The wit to bring theory to its matter. . . make sense of ideas; and the wit to bridge what theory must become coherent” (Willower & Culbertson, 1964, p. 64). Consequently, “Theory brought three gifts: Depth and breadth of coherent knowledge beyond experience; Breaching walls of personal and social class prejudice; and Expansion and refreshment to experience” (p. 64).

Reller (1962) in the early 1960s argued that field studies in a foreign country were an effective way to provide better understanding of educational changes in the U.S. Over the next [50] years, this became the purview of the research institutions, often leaving the local community and state education initiatives in the hands of regional comprehensive institutions. As a field of study, we claim more than a 140 years of knowledge development. We anchored our discipline in the medical model of theory and practice. Joseph Schwab (1964) pointedly argued that the theory movement reflected a false model both for inquiry and training. He stated that medicine’s ‘theory of practice’ with the study of biological science and medicine – what diseases and pathologies there are, their symptoms, etiology, causes and treatment is equivalent in education administration. He suggested that the study of the school – the missions it undertakes, and patterns it has used, its strengths and weaknesses, needs and problems is parallel more to the medicine model (Papalewis, 2004).

**Theory Movement 1970s.** Since the 1970s, the theory of practice and the practice of theory debate has long been a strong topic for the education administration professorate. Culbertson wrote (1988) that NCEA [National Council of Professors of Education Administration now called the International Council of Professors of Educational Leadership] helped nurture the new movement by providing forums where scholars could challenge existing research and advocate theory-based norms to professors in attendance from across the nation. To the study of education administration, the theory movement promised to deliver a solid knowledge base (Hoyle, 1991). Today most still believe that our future depends on the theory development. Hoy and Miskel (1991) stated, “The road to generalized knowledge can lie only in tough minded empirical research, not introspection and subjective experience” (p. 25).

In opposition to the theory driven field of study, Greenfield in 1975 stated, “Academics who assume that social-scientific secrets can explain how organizations work or how policy should be made, indulge at best in premature hope and at worst in a delusion” (Culbertson, 1988, p. 20). Greenfield commented that researchers in education administration wrote of organizations as if they were real. Greenfield espoused that there should be no single paradigms, only theories of education administration that should be limited to specific types of organizations which exist in carefully defined contexts (Papalewis, 2004). Culbertson (1988) wrote that both Greenfield and William Harris stressed that organizations cannot be equated with objective phenomena, “That organizations do not think, choose, or act as theories claim; rather individuals do” (p. 20). The theory movement has attracted critics who maintain that organizational theory portends that people drive organizations and therefore are too unpredictable to follow hard mathematical and scientific principles (Foster, 1980; Greenfield, 1975; Murphy & Hallinger, 1987; Schwab, 1964). Jack Culbertson (1988) suggested that the theory movement has failed to live up to its billing. Few final answers through theory have been found focused on precise practice applications.

**Pluralism and Libertarian Drivers 1990–2020.** Beginning with the 1980s we began to diversify the field both by faculties and school administrators. This began the movement that would produce more voices into the field and better reflect the growing diversity of our schools. Role modeling and mentoring became the vehicles for moving our field forward. Practice in the schools became more inclusive of women and people of color. Research on gender and race discrimination became a focus to education administration human resource courses with an attempt to be inclusive of “all voices” to enrich the field of leadership research (Leonard & Papalewis, 1987; Papalewis & Yerkes, 1995; Shakeshaft, 1988). In 1989 the National Policy Board for Educational Administration was created by UCEA [University Council of Educational Administration] to foster reform in the field and develop

policy positions for its Agenda for Reform. This report contained seven recommendations for programs to deliver: 1. Societal and cultural influences in education; 2. Teaching and learning processes and school improvement; 3. Organizational theory 4. Methodologies of organizational studies and policy analysis; 5. Leadership and management processes and functions. 6. Policy studies and politics of education; and, 7. Moral and ethical dimensions of schooling.

Papalewis (1995) wrote that traditional writings in education administration have tended to disregard the existence of different types of leadership leading to a uniform “typically male” way of perceiving and relating. Moral and ethical leadership allowed diversity and inclusion into education administration. Previous models that were applicable to a single gender were still the “realm of the coin” in most education administration textbooks well into the mid-1990s. The need to allow more voices, different voices was beginning to take hold. The professional organizations – NCEA and UCEA – were no longer single gender nor single race based.<sup>1</sup>

### **Field of Presence**

Global response to preparation of school leaders has followed a similar trend as the USA experience with a focus for schools on assessments and standards, and a narrowed curriculum to fit business needs.

Inherent with this new era of business and privatization, the hopeful move into diversity of school administrators was met with eventually a standardized and in the USA a nationalized curriculum that many in the field of education administration actively sought. By increasing credentialing and certification requirements, standards were forcefully supported with many research funds going into a bifurcation of the field through private career degrees, and master’s versus doctoral programs. The harshness of federal initiatives 1983 – United States National Commission on Excellence in Education *A Nation at Risk*, the 2001 – *No Child Left Behind*, and the 2009 *Race to the Top* continued to narrow school leadership curriculum, as well the curriculum offered students. During this austere time and guided less by the contextualized reality of child and family poverty and the continued lack of funding for public education eroded schools in the USA.

The international arena moved its focus on overcoming poverty in the world with a view that quality education would achieve the economic goals set primarily by Western voices. In 2000, the United Nations created Millennium Development Goals which had 8 goals, 21 targets, and 63 indicators which by the 2015 United Nations Sustainable Development Goals grew to 17 Sustainable Development Goals and 169 targets. This universal agenda is intended to leave no one behind. The United Nations Sustainable Development Goals are described as:

The Sustainable Development Goals (SDGs), also known as the Global Goals, were adopted by all United Nations Member States in 2015 as a universal call to action to end poverty, protect the planet and ensure that all people enjoy peace and prosperity by 2030. (United Nations Sustainable Development Goals, 2015, para. 1)

By flipping the narrative, standards could be imposed with measurements to be met. The field of educational leadership preparation expanded over the last two decades to research and influence on international principal preparation standards.

### **Field of Concomitance**

International educational leadership preparation has been heavily influenced in recent decades by the colonizing influence of the professional standards movement in the USA and UK. The standards movement, in turn, borrowed extensively from fields including medicine, law, psychology, and engineering, which have long pursued professionalization through an established and highly regulated approach to professional standards (Hackmann, 2016). This movement has also been based on a belief, borrowed from business, that market competition would produce, through a process of creative destruction, a state of unparalleled educational entrepreneurship (Moore, 2019).

### **Discontinuities and Ruptures Which Form the Different Viewpoints of This Field**

As has been asserted thus far, the influence of the standards movements, both those focused on professional standards and those focused on academic standards, has shaped the field of international leadership preparation for the last 30 years. In addition, the acceleration of efforts to move toward greater privatization, marketization, and individualization of schooling (Moore, 2019) has been quite pronounced during the last two decades. In answer to efforts to either homogenize schooling through standards or to incentivize competition through privatization, there is emerging interest in asserting indigenous, local, and context-based reforms that reject mindsets founded in colonization. Much work, however, remains to be done in this area. Notes Mullen, “Tribal justice for Indigenous populations has yet to appear as an ethical framework in the preparation of graduate students for the principalship, superintendency, and other leadership roles” (2020, p. 18).

### **Critical Assumptions**

Schooling has been unduly influenced by “prescriptive educational transactions and programming” (Mullen, 2020, p. 22) imposed on others. Examples can be found in the standards and accountability pressures described in this chapter. These pressures and their underlying assumptions are today being increasingly challenged by grassroots leaders. Mullen argues that a nascent decolonization movement “is growing, fueled by the desire for Indigenous rights and freedoms, systemic change, and sustainable ecologies” (2020, p. 23). The present chapter envisions systems of schooling that are shaped by localized and context-based circumstances and realities and led by leaders whose primary motivations are social justice and culturally responsive leadership.

---

## **Standards 1990s–2020**

The original ISLLC standards from 1996 were revised by the Council of Chief State School Officers in 2008 provoked sometimes heated debate among scholars in the years following their adoption. These standards and their later version (Council of Chief State School Officers, 2008) provoked sometimes heated debate among scholars in the years following their adoption. Proponents of such standards never

fully overcame concerns that their efforts actually lowered leadership-preparation standards (English, 2006) that these efforts rested on a flawed assumption that their implementation would solve the challenges of schooling America's children (English & Papa, 2010), and that, at their core, they relied on a premise that employees could be controlled through "a policy regime and a culture of performativity" (Gronn, 2002, p. 553).

Although significant questions regarding the 1996 and 2008 versions of the ISLLC standards were not fully addressed (English, 2006, 2012), groups that were supportive of the idea of professional standards pressed ahead with a revision of the standards, in the form of the Professional Standards for Educational Leaders (National Policy Board for Educational Administration, 2015) and the National Educational Leadership Preparation standards (National Policy Board for Educational Administration, 2018). The next generation of standards was adopted in 2015 by the National Policy Board for Educational Administration to replace the ISLLC standards. The updated National Educational Leadership Preparation ("NELP") standards (National Policy Board for Educational Administration, 2018) were developed to align with the PSEL standards.

The movement toward leadership standards in the USA has been influential in promoting similar efforts internationally. In 2008, the OECD cited efforts by a number of countries to replicate the leadership standards movement in the USA and to incorporate such standards in the regulatory framework of schooling (Pont, Nusche, Moorman, & Hopkins, 2008, pp. 62–63). Their proliferation in the USA and the UK has been attributed to a kindred market-oriented neoliberal ideology (English, 2012).

If the roughly 500 leadership preparation programs in existence in the USA have successfully endeavored to align their programs and course offerings with professional standards, legitimate questions remain as to whether these efforts have produced better leaders or better outcomes for students. Young and colleagues acknowledge there is "a significant difference between merely adopting a set of standards and using or putting them to work" (2016, p. 21). Some have concluded that sound evidence of such effects does not exist. McCarthy and Forsyth wrote,

There appears to be universal agreement that empirical documentation of the merits of leadership preparation is lacking and that much written about this topic cannot be considered research. In short, we do not have credible evidence to counter the allegations that the current preparation of school leaders is wrongheaded or that the significant costs associated with graduate education for school leaders could be better spent elsewhere. (McCarthy & Forsyth, 2009, p. 117)

Elsewhere, these authors argue that "Although educational leadership programs are purported to have become standards based and even document which standards each course addresses, it is debatable whether the actual substance of most courses has changed substantially" (McCarthy & Forsyth, 2009, p. 95). Elaborating on this point, these authors point out that "The state of educational leadership preparation is never what academics think it should be, and it never perfectly meets the perceived needs of practitioners and the public" (McCarthy & Forsyth, 2009, p. 87).

Given the fact that the ISLLC standards were ultimately adopted by 45 states, it should come as no surprise that they influenced licensure requirements in every state (Baker et al., 2007; Young, Mawhinney, & Reed, 2016). Although there is little research on the relationship between state licensure examinations and leader quality (Browne-Ferrigno & Fusarelli, 2005; Fuller, Young, & Baker, 2011; Hackmann, 2016), the majority of the states now require successful completion of an examination in order to receive licensure (Young et al., 2016). State licensure is predicated on the assumption that passing a standards-derived assessment signals that an individual is qualified to lead a school or a school district. Hackmann reported that, as of 2008, 43 states required some form of the ISLLC standards in licensing requirements and leadership preparation coursework, and that 35 states required applicants to pass an examination in order to receive licensure (2016). Research has failed to establish verification of a relationship between licensing criteria and leader effectiveness (McCarthy & Forsyth, 2009).

Although the existence of professional standards is purportedly intended to ensure that all school leaders demonstrate certain core competencies, the US federal government effectively incentivized a back door to certification. The federal Race to the Top grant (U.S. Department of Education, 2009) required applicant states to create alternative paths to certification, which have become prevalent over the last decade. Consequently, as many states increased requirements for leadership-preparation programs and administrative licensure through traditional routes, they simultaneously promulgated alternative pathways and preparation routes to circumvent such requirements. As a result, "In some states, individuals can become school principals or superintendents with no administrative training, having no educator experiences, and possessing only a bachelor's degree" (Hackmann, 2016, p. 58).

The later part of the twentieth and early decades of the twenty-first century embraced cultural pluralism on the one hand and privatization to narrow the education administration curriculum to a very prescribed path, on the other. Achilles in many writings (1991, 1994, 2000) believed, "If practitioners do not know what improves schools, this reflects upon the EDAD professorate" (2000, p.11). Context matters for school leadership. The early twentieth century was focused on the science of school management. The mid-twentieth century was characterized by administration as a science. The business model of management gave way to the medical model of theory building. Societal impacts expecting more and more of public education while withdrawing funds to enforce private collaborations have earmarked the first two decades of the twenty-first century.

In support of a narrowed curriculum and privatization, continuous assaults from professional educational organizations continued. Fuller et al. (2011) found an association "between principals who attended principal preparation programs housed at research and doctoral institutions and improvements in the qualifications of the team of teachers. . . Thus, we believe the results suggest some type of programmatic or resource availability effect of the preparation programs housed by research and doctoral institutions" (p. 208). As a field, using this lens, the research done by esteemed journals in the field supported this with accepting research that fit

this discourse. Perrone and Tucker (2019) research focused on ed. admin degree production from 2000 to 2014. Three findings:

1. The number of institutions granting degrees in ed. admin increased by 72% this century.
2. The total number of leadership degrees granted doubled over this time period and is substantially larger at all award levels (postbaccalaureate, master's, specialist, doctorate) in 2014 than 2000.
3. The types of institutions offering ed. leadership degrees and their production rates have changed dramatically over this period. (p. 253)

Implications include that “the supply of principal candidates far exceeds the number annual principal openings offering school systems greater choice among candidates” (p. 253). The assault within the USA feeds the narrative that data presented are data that should be considered without context. Likewise, Grissom, Mitani, and Woo (2019) studied how principal preparation programs (PPP) lead to measuring principal outcomes. “This study establishes that PPPs vary systematically based on their graduates’ licensure examination results, labor market outcomes, and job performance” (p. 106).

---

## International and the West

International research speaks to the spread of standards outcome based promoted through research found in the dominant journals (such as EAQ, Sage Journal of Research on Leadership Education) in research often funded by conservatively based philanthropies (e.g., Wallace Foundation, Heritage) all in the name of reform.

The International Study of Principal Preparation network (Slater, Garcia Garduno, & Mentz, 2018), created in 2008 by members of UCEA, has been focused on novice principals for their ongoing mixed-methods research in 15 countries across five continents. Their focus was to understand how principal preparation was useful. In a three stage study, (1) case study, interviews, (2) followed by principal narratives, and (3) a survey on their challenges, they found “in spite of cultural differences and economic development of the countries, the challenges faced by novice principals had more commonalities than differences” (p. 126). The commonalities found are: feelings of professional isolation, loneliness, management of time through multiple tasks, prioritizing budget items, handling state/nation requirements, reckoning with the previous principal’s style, ineffective staff, and operational and maintenance problems with buildings. Context over standardization is emphasized through two ISPP frameworks that emerged from this research: “Principals need to be in a position to help teachers guide students to learn to be critical of the status quo and become agents of change for a more just community” (p. 126). This can be difficult to do when preparation of school leadership in the US model is exported worldwide.

Slater et al. (2018) believed these findings support an expansion for both developed and developing countries for formal principal preparation, while emphasizing that the programs should not be standardized. The new principals, their study showed, the “need for clear instruction on budget, paperwork related to accountability, and the implementation of government mandates” (p. 131). They believe these are the first needs new principals have.

Webber and Scott (2013) in their international research established five elements for principal preparation. These include: (1) principal as a professional; (2) establish relationships with stakeholders and learn to navigate them; (3) understanding of the formal and informal characteristics; (4) balancing skills of power and accountability; and (5) preparing for a clear understanding of the stresses and need to take good self-care. Ensuring excellent preparation for school administrators is at the heart of preparation programs.

According to Bysik et al. (2015) a new era of accountability in Russia set the stage for national standards for principal preparation. In a study of 300 principals across four regions in Russia, these principals identified their expectations for their training as seeking “personal professional growth (36%), new knowledge (15%), improving the quality of schooling (13%), and getting the certificate completed (1%)” (p. 336). Responses from the survey “highlighted organizational and communication skills, intuition, ability to handle stress, ability to work hard as being essential to becoming successful principal” (p. 336), though these are characteristics “not explicitly taught or developed within the training they had experienced” (p. 336). Bysik et al. found that Russian principal preparation mainly focused on “issues of educational law (53%), management (51%), and finance (48%)” (p. 337). Items these principals felt were not covered, but were nonetheless important, included

Leading the management team, developing leadership skills and ability to communicate with people, handling professional relationships at school, especially working in a team, modern ways to manage a team, building relationships from a vertical to a horizontal system of professional collaboration, and ways to stimulate teaching staff to improve the quality of services. (p. 337)

Other findings include how these principals feel the tensions between how they were trained and their personal feelings about the role of serving as principal. The principals want to work more collaboratively with their teachers in building professional communities; however, the principal standards are managerial in nature and fail to focus sufficiently on themes such as professional relationships and collaborative work.

Research on how Malaysia prepares principals is also tied to the reform movement. “The findings from this study would indicate that the contemporary leadership practices of principals in Malaysia are rapidly changing and this shift is consistent with the transformational aspirations and reform agenda within the country” (Jones et al., 2015, p. 362).

Sumintono, Elsee, Sheyoputri, Misbach, and Jumintono (2015) described in a study of 18 principals, chosen since 2001, that “in a new era of educational reform, as

part of changing state administration” (p. 344) new polices were ushered in to redefine education with some colonial roots. A variety of selection methods were found along with preparation and appointment procedures. For example, some were appointed without principal training or known qualifications, appointed by a major. The politics in this process feature those that are in favor, though many teachers have received training in principal preparation. “The competition to become a principal in any public secondary school in Indonesia is tight and it has been argued that this has resulted in practices that bypass the formal system of selection” (p. 348). Increased scrutiny from the central government has challenged principals with accountability concerns. Further data suggests that unintentional appointing of principals is “not solely based on merit or qualifications but rather is a matter of political expedience” (p. 350).

Five programs (Canada, Australia, Hong Kong, Singapore, and the USA) were reviewed from three continents: Asia, North America, and Australia in research performed by Walker, Bryant, and Lee (2013). They identified: (1) the top performers in the PISA (Programme for International Student Assessment); (2) recognition in reports (testing and performance cultures); (3) all with accredited credentialing (degree and non-degree programs); and (4) qualification required for principal appointment (universities, professional organizations, not-for-profit). Participants in this study were: Canada (Ontario): Principals Qualification Programme (PQP); Australia (Victoria): Master of School Leadership (MSL); Singapore: Leaders in Education Programme (LEP); Hong Kong: Certification for Principalship (CFP); and USA (New York City): Aspiring Principals Programme (APP). Findings by Walker et al. (2013) identified major commonalities of a framework:

1. Frameworks are based in empirically grounded research or theory.
2. Frameworks are derived from research syntheses or widely respected international sources.
3. Frameworks provide the potential of a common leadership language across the respective jurisdiction; frameworks are adjusted to suit jurisdictional needs.

Major variations identified by Walker et al. (2013) are:

1. Explicitly articulated to program structure to implicitly applied in instructional tools
2. Derived from a synthesis of research to derived from a singular theoretical construct
3. Mandated from the top (Ontario, Hong Kong, and Victoria) or framed by program developers (Singapore and New York)

Walker et al. (2013) with respect to content (instructional and transformational), major commonalities include:

1. Established frameworks drive overarching content
2. Provider expertise determines specific foci
3. Practitioner involvement supports contextualization of content

Major content variations include:

1. Specific program foci are dictated by local concerns as mediated by the expertise of academic and/or practitioners.
2. Content ranges from addressing “national” priorities such as globalization and the knowledge society (Hong Kong and Singapore) to more pragmatic concerns of the “local” context (e.g., NYC on closing the achievement).

Major commonalities in terms of operational features include:

1. Programs accept aspiring and potential principals.
2. Programs have admission requirements (e.g., experience and professional qualification).
3. Successful completion of a program results in formal licensure/certification – this is required by the system although some provide credit toward formal degrees.
4. Programs are offered by multiple providers who are centrally selected/regulated (except Singapore).
5. Practitioners’ roles in programs are expanding as programs emphasize contextualized knowledge and skills.

The variations of operational features are:

1. Some programs (e.g., the cases of Singapore and New York City) involve a limited number of fully funded places to attract a wider range of talent. Walker et al.
2. Other programs (e.g., the cases of Hong Kong and Ontario) focus more on wider access to potential leaders and so an expanded pool of future principals. (In Ontario’s case, completion rates now exceed principal positions.)

They found that these programs through offering part-time access greatly broadened access (Ontario, Melbourne-Victoria, Hong Kong) while highly selective programs (New York City and Singapore) were offered on a full-time basis only. With all stakeholders (universities, practitioners, and governments) involvement requires partnership to aid in shaping by the key providers’ determining what they choose to emphasize.

According to Gurmu (2018) the development of Ethiopian school leadership courts self-dependence as noted in its historical evolution as a country. “An attempt to understand the existing practices of the leadership of any nation and an effort to formulate its future policies are revealed from its historical discourses” (p. 343). Historical evolution of Ethiopian education is described in three phases: (1) indigenous education; (2) “inscriptions carved on stones” prior to Christianity (p. 344) and involved primarily “leadership of the church and mosque education” (p. 345); and, the introduction of Western education. Seven phases formed school leadership from the turn of the twentieth century to currently: (1) the school principalship evolved into a separate position; (2) Ethiopians replaced expatriate staffs;

(3) Ethiopian principals' preparation commenced; (4) principals' tasks escalated while their preparation reduced; (5) principal deprofessionalized; (6) principals' preparation reemphasized; and (7) postgraduate diploma in school leadership (PGDSL) training started. "Educational leadership is an integral part of Ethiopian traditional education . . . transition through the twentieth century was one of international and national forces" (p. 359). "An effort to reinvent policies as well as practices of the school leadership of a nation must be conversant with lessons from its past since exertion for its systematization without counting on such information becomes baseless" (p. 360).

---

### Where Has the Creative and Imaginative Leader Gone in Research?

If the artfulness of leadership cannot be measured, then it is understandable that it has been left off the table of preparing school leaders. Barakat, Reames, and Kensler (2019) presented research on how educational leaders are prepared culturally to ensure better competency. They found that ". . . few programs access their student's cultural competence" (p. 212). These authors stated that culture has complex roots in anthropology, sociology, intercultural communication, and cross-cultural psychology.

Within *Pedagogy of the Oppressed*, the "banking" concept of education Freire described a setting where the student was viewed as an empty account to be filled by the teacher. He explained the result of such an environment wherein the teacher-student relationship controlled the thinking of the student and inhibited his or her creativity (Freire, 1996). Freire's (1996) pedagogy is an "education as the practice of freedom – as opposed to the education as the practice of domination" (p. 62). Freire's proposed pedagogy is a "problem-posing education" that is a "humanist and liberating praxis" which "posits as fundamental that the people subjected to domination must fight for their emancipation" (p. 67). Freire (1996) concluded that his problem-posing education "does not and cannot serve the interests of the oppressor" (p. 67) as underprivileged students of color "develop their power to perceive critically the way they exist and the world with which and in which they find themselves" (Freire, 1996, p. 64).

Leadership preparation supports teachers to understand what Freire (1998) calls for hope and optimism. Those who think pessimistically "have lost their place in history" (Freire, 1998, p. 26). Montessori schools began in the early twentieth century focused on inner-city Roman children unable to learn elsewhere. The Montessori techniques emphasized collaboration, independence, and discovery (American Montessori Society, 2016). Dewey believed that (Dewey, 1997) education "would lead to the liberation of a greater diversity of personal capacities which characterize a democracy" (p. 87). Dewey (1997) asserted "our instruction in history and geography and our social studies should be intellectually more honest, they should bring students into gradual contact with the actual realities of contemporary life" (p. 156).

These are lessons that we espouse as good practices are not applied to principal preparation. Bush (2018) identifies five arguments that preparing for a principalship (headship) requires:

1. Expansion of the role of school principal
  2. The devolution of powers to school level
  3. The increasing complexity of school contexts
  4. Recognition that preparation is a moral obligation
  5. Recognition that effective preparation and development make a difference.
- (p. 67)

Bush (2018) stated

Patterns of leadership preparation and development are highly variable across national contexts, ranging from prescriptive mandatory programmes, as in Singapore, to ad hoc “on the job” learning in many countries. There is growing recognition of the need for specialized leadership preparation, but programme content and processes differ significantly. In centralized systems, such as China, France and Singapore, the learning model is standardized, providing consistency, but allowing limited scope for role mentoring, would enable participants to customize their learning to their personal needs and those of their school. In decentralized systems, for example in England, the challenge is how to judge the value of optional national professional qualifications, offered by different licenses, and to compare them with university master’s level programmes. (pp. 69–70)

Specialized, imaginative, and creative should enter the jargon of educational preparation of school leaders (Papa & English, 2014). Educational Leaders Without Borders believes that education should be “universal, enlightening, and liberating...[it] should draw out of humans the potentialities of a progressive humanity which is inclusive and respectful of difference” (Papa, 2016, p. 4). School leaders must be prepared to be culturally proficient while understanding the inherent bias the school has. Educational Leaders Without Borders work to create a socially just school leader that recognizes the impacts of poverty within the contextualized fabric of communities throughout the world. ELWBers question and stand outside while working inside at how schools work to “perpetuate injustice, social division, and reinforce social hierarchy” (Papa, 2016, p. 5). ELWB views leadership for schools as “a leveraging institutional force for greater equality and opportunity than...are found in many of the wealthier more privileged Western nations”.

---

## Conclusions and Recommendations

Many scholars (Jensen, Downing, & Clark, 2017; LaPointe, Davis, & Cohen, 2007; Levine, 2005) have concluded that leadership preparation programs do an inadequate job of preparing leaders for the complex work of leading a school. Acknowledging findings supporting such conclusions, Skousen argues that leadership development should be construed as a process that continues throughout one’s

career, as “there is no assurance that the participants who leave [a] program will be successful school leaders and enact effective practices” (2020, p. 1097). The pandemic COVID-2019 has brought the USA world of measurements, assessments, and testings to an abrupt halt, for now. Most schools will begin the Fall of 2020 in a virtual environment. Universities structure of admission once driven by such tests as the SAT (Jaschik, 2020) and other test scores are soundly confronted with the realization of #BlackLivesMatter and the obvious bias and lack of social supports for those in low-paying high poverty jobs. The folly to the road we have been on in preparation of school leaders through measurement and testing standards is exposed by the very nature that starved public schools following edicts of measurement is not the right road to be on. A recent report from the CDC found data collected in 14 states March to July 2020 that while

most pediatric cases of covid-19, the disease caused by the novel coronavirus, are asymptomatic or mild and that hospitalization rates among children remain relatively low. [But like covid-19 in adults](#), Black and Hispanic children are far more likely to experience symptoms warranting hospitalization. The report calls for improved understanding of the broader social forces that affect health so that racial and ethnic disparities in pediatric hospitalization rates can be mitigated. (Janes, 2020, paras. 2–3)

Our hope is now found in the opportunities the pandemic has bestowed upon us: the lack of public supports through social services to improve lives, and in the USA the unrelenting racial bias that has undergirded many of the supposed good educational initiatives. Clearly, the standards movement has not yielded unbiased schools. Humanity through the educational leaders’ eyes must be fairness to all: is fairness in opportunity, is fairness in funding supports, and is a leader prepared to understand hope and happiness as the higher calling. Preparation programs for school leader able to emphasize that social justice “isms” (racial, gender, LGBTQ+, age, special needs, etc.) are at the core of contextualized schools, thus found in preparation programs that support human agency. These are complex, not easily measured qualities in preparation programs for the school leader. Humanity in all its labyrinth of messiness holds a future that school leaders characterizes more than the ability to check measurement boxes. We ask you to imagine preparation of school leaders in a contextual, resource rich, respected, and respectful of the children, families, and communities they serve globally.

## Abstract

Despite decades of school reform initiatives focused on closing the racialized achievement gap, Black, Latinx, and Indigenous students continue to experience systemic barriers to a high quality education. Research indicates that the academic and social-emotional well-being of students from minoritized groups greatly improves when they are taught by a teacher who shares their racial identity. Unfortunately, teachers of color are underrepresented in education.

They enter the profession at much lower rates than their white counterparts, and they exit the profession at much higher rates. To improve student outcomes, more school principals of color are needed; principals of color have proven to recruit and retain more teachers of color, who, in turn, positively influence student outcomes. This chapter provides the context and support for the need to diversify leadership in education by providing teachers and principals of color with new pathways to career attainment. Cultivating effective high-quality school leaders of color has the potential to shift the demographics of the teaching profession to better align with the increasingly diverse student body. More importantly, these future leaders possess the capacity to improve the academic and life outcomes for all students, in particular students of color.

Educational leadership · Black principals · Black teachers · Desegregation · Career pathways · Black education history · Brown versus Board of Education

**The Field of Memory**

The disproportionately low number of Black principals relative to today's increasingly diverse student body can be traced back to the landmark case *Brown v. Board of Education of Topeka*. In 1954 when the Supreme Court of the United States ruled that school segregation was unconstitutional, it marked progress toward racial equality at the expense of Black educators, especially principals. School integration was a slow arduous process that mostly forced small groups of Black students to attend schools outside of their communities, environments that were riddled with hostility and, at times, violence. School integration rarely included the integration of *staff*. After the ruling, Black principals, especially in the southern states, were fired or pressured to resign. Others maintained employment as principals but with little authority, or they were demoted. The alleged progress toward racial justice and equality in education as a result of *Brown* had an unforeseen, detrimental impact on Black principals for decades to come.

**The Field of Presence**

Second to teachers, school principals can have a significant impact on student learning, engagement, and academic achievement. In particular, schools with highly qualified principals of color have reported positive academic and social-emotional outcomes for students and staff. Principals of color can combat deficient ideologies about students, especially those students of color who are disproportionately placed in special education programs, denied access to advanced placement courses, and disciplined at higher rates than their white counterparts. They can advocate for policies and practices that will increase opportunities and create sustainable systems to improve the school experience for students of color. They typically recruit, hire, and retain more teachers of color at rates much higher than White principals. When

students are taught by teachers who share their racial identities, this can positively influence their academic and social-emotional well-being; thus, the ripple effect of a principal of color can possibly shift power dynamics and minimize the oppressive structures that have historically suppressed opportunity, hope, and agency for generations of students.

### **The Field of Concomitance**

While student populations continue to become more racially, ethnically, and linguistically diverse, the demographics of principals have not followed this shift. Principals of color represent roughly 10% of all principals, while the percentage of students of color continues to climb toward 60% across the nation. Other industries with perpetual shortages of underrepresented groups understand the need to diversify their workforces to both innovate internal processes and improve external outputs to clients. In examining methods of addressing this challenge, the approach taken by science, technology, engineering, and mathematics (STEM) industries has been to strengthen their “pipelines” of potential candidates. Similarly, educational systems have begun to recruit and prepare students and educators of color situated at various points in the educational pipeline. These districts and organizations have created new pathways to teaching and leading that have the potential to close achievement gaps and improve the academic and life outcomes for all students.

### **Discontinuities and Ruptures**

The educational experiences of generations of Black children have been afflicted by systemic oppressive ideologies, policies, and practices. Black children are overrepresented in special education programs, experience disproportionately high suspension rates, and are forced to learn White supremacy culture through racially biased curricula and assessments. The reorientation of schools toward educational equity begins with creating innovative approaches to recruiting and retaining staff that exhibit the cultural values of the communities in which they serve.

### **Critical Assumptions**

Cultivating more Black principals to advance the well-being and academic success of Black students surfaces several critical suppositions. First, Black principals must possess the capacity to build inclusive and supportive school climates; secure appropriate personnel and resources; manage district requirements and expectations; comply with school, district, and federal mandates; and develop the competencies of an instructional leader. Next, they must be proficient in facilitating collaboration among key stakeholders, e.g., parents, philanthropic organizations, district personnel, community organizations, and local colleges and universities. In addition, they must build a dexterity of skills that allow them to be instructional leaders, data managers, community liaisons, and business developers. Last, Black principals possess the authority and influence to change school and district policies to continue to advance the well-being of students and staff, especially those intentionally or unintentionally the target of racially charged practices.

## Introduction

The 1896 ruling from the Supreme Court in *Plessy v. Ferguson* legalized “separate but equal” public facilities. This case sanctioned laws that prohibited people of color from using the same hospitals, buses, water fountains, building entrances, cemeteries, schools, and any public facility as White people. During this time, Jim Crow laws established a plethora of complex, irrational, and dehumanizing rules and customs that further exacerbated the *Plessy* ruling. The laws spanned from etiquette norms that asserted, “Blacks were not allowed to show public affection toward one another in public, especially kissing, because it offended whites” to require Black voters to pass literacy tests and pay poll taxes before they were permitted to vote (Pilgrim, 2012). This era of racial apartheid in the United States lasted well into the middle of the twentieth century.

Beginning with its founding in 1909, the National Association for the Advancement of Colored People (NAACP) advocated for an integrated education system. At that time, the resources allocated to schools for children of color were far less than equal to those granted to White schools. Especially in southern states, the segregated schools for Black children were located in old, dilapidated buildings (Spring, 2001). Children were often given worn, outdated textbooks after years of use from White students. The curriculum given to Black teachers was limited and unparalleled to the course of study afforded to White students (Fairclough, 2004). In addition, Black teachers and principals were paid less than their white counterparts with far more responsibilities. It was common practice for Black teachers to use their own money to buy classroom supplies. Black principals, especially in rural schools, typically both led and taught classes at their schools.

Because of these inequalities, the NAACP fought for decades with a network of other organizations and state level teacher associations to prepare the profession and general public for school integration. Nevertheless, when the Supreme Court ruled that racially segregated schools were unconstitutional in the landmark case *Brown v. The Board of Education of Topeka*, neither the field of education nor the general public were truly ready for this decision. While this historic ruling marked significant progress toward racial equality and arguably provided the impetus for the Civil Rights Movement, it came at the expense of thousands of Black educators. The NAACP and its constituents assumed during the initial phases of the desegregation of schools, some Black educators would lose their positions. They thought unemployment would be temporary; however, in the decades to follow, racism and discrimination eroded the presence and power of Black educators (Karpinski, 2006).

---

## The Consequences of *Brown* on Black Teachers

Prior to *Brown*, the field of education was one of the only professions that offered upward mobility for Black college graduates. Accordingly, 60% of these graduates became teachers, most of which were employed in Black schools in the south

(Tillman, 2004b). Black teachers embodied excellence, competence, skill, and perseverance. Black teachers lived in the communities in which they worked. They attended the same church as their students and often visited their homes (Randolph, 2004). They acted as surrogate parents, social workers, counselors, and role models; advocated for the academic, social-emotional, and cultural development of children; and championed for racial uplift (Fairclough, 2004; King, 1993). Despite the marginal resources allotted to their schools, they strived to provide Black children with a superior education and prepare students for the racially charged world that awaited them.

Since Black teachers were integral to the success of Black students and a vital part of the community, the NAACP worked with Black teacher associations to convince its members that school integration was necessary for racial advancement, justice, and equality; therefore, any encumbrance endured would be for the greater good of current and future generations of black children. The organization projected that unemployment due to Black and White schools merging would be minimal. In addition, employment termination would most severely impact incompetent, unskilled teachers, not the majority of high-effective skilled Black educators (Fairclough, 2004). Unfortunately, this sentiment was far from reality.

One year before the *Brown* ruling, a superintendent sent the following letter to all Black teachers which bluntly foreshadowed their fate for the foreseeable future.

Due to the present uncertainty about enrollment next year in schools for negro children, it is not possible at this time to offer you employment for next year. If the Supreme Court should rule that segregation in the elementary grades is unconstitutional our Board will proceed on the assumption that the majority of people in Topeka will not want negro teachers next year for White children. . . It is necessary for me to notify you now that your services will not be needed next year. (Tillman, 2004b, p. 280)

The 10 years immediately following the *Brown* ruling represented the most devastating for Black educators. Districts almost immediately devised racist policies and practices that victimized Black teachers. Hiring managers began to evaluate applicants based on their scores on standardized assessments such as the Graduate Record Exam (GRE) and National Teacher Examination. This subjective evaluation only applied to Black applicants, not White, and eliminated them from the candidate pool. In numerous southern states, Black teachers were fired for being members of so-called radical organizations such as the Urban League, NAACP, and even Black teacher associations. The Board of Education in Georgia adopted a resolution that prohibited teachers from even joining the NAACP. Other states dismissed Black teachers for registering to vote, participating in voter registration campaigns, and/or exercising their right to vote (Tillman, 2004b). In other instances, state organizations simply revoked their teaching licenses without just cause. These tactics evolved from fear of Black teachers taking the jobs of White teachers and even worse teaching White children. In total, nearly 38,000 Black teachers were fired between 1954 and 1965 (Ethridge, 1979), causing such severe declines in some states that by 1975, Black teachers were faintly existent (Hudson & Holmes, 1994).

White school administrators selected the most highly effective Black teachers to be transferred to their schools, environments where they confronted hostility, degradation, and, at times, violence on a daily basis (Milner & Howard, 2004). For others, colorism played a major role in their employment at the newly integrated schools (Lash & Ratcliffe, 2014; Mabokela & Madsen, 2003; Milner & Howard, 2004). Deeply rooted deficit ideologies about skin color stemming from slavery still dominated this time period. White administrators viewed lighter-skinned Black female teachers as “more closely connected to the White students and teachers, and consequently there was less of a threat for the White teachers, White community members, and White students” (Milner & Howard, 2004, p. 289). The darker-skinned teachers were perceived to be too far from Whiteness, i.e., less employable in the integrated school.

The massive resistance to desegregation permeated higher education. Specifically, teacher education programs also suffered from the wrath of racism (Tillman, 2004b). In one notable case, the governor of South Carolina accused three professors at Allen University of promoting communism and demanded that the university terminate their contracts. The three professors, two White and one Black, were all Northerners and outspoken opponents of segregation, discrimination, and bias (Hoffman, 1998). All three were highly credentialed and well-qualified educators; therefore, the Board of Trustees failed to comply with the governor’s mandate. To retaliate, the State Board of Education headed by the governor withheld state certification of the university’s teacher education program (“Fourth Annual Message,” 1958). Without state teaching certification, Allen University graduates were virtually unemployable. Black students who tried to enroll at the University of South Carolina to complete their degrees and earn certification were flatly denied admission. The battle continued until the university succumbed to pressure and terminated the professors. Unfortunately, records do not indicate when/if the state board reinstated Allen University’s certification of the education program.

The majority of Black students remained in schools stripped of culturally competent, dedicated, and highly skilled teachers. Hawkins (1994) deemed the post-*Brown* era as the beginning of Black children experiencing higher rates of school-induced trauma; decreased career and life aspirations; increased academic tracking in low-level courses; and disproportionate placement in Special Education programs. The sudden decrease of Black teachers warranted equally severe dismissals of Black principals.

---

## **The Consequences of *Brown* on Black Principals**

Black principals were integral figures in the Black schools and communities (Randolph, 2004). They recruited, hired, and maintained talented Black teachers to their schools and supported teachers. As instructional leaders, Black principals provided schools with a vision of excellence in education. They were role models for teachers, students, and other members of their staff. They worked with parents to obtain necessary school resources by asking for direct donations, organizing fundraisers,

and supporting their petitions to an all-White school board for additional funding. They challenged the deficit ideologies about Black students held by their White counterparts and advocated for an educated class of Black children. In direct opposition to White supremacist ideals of Black inferiority, Black principals radiated self-efficacy, self-respect, and racial pride (Tillman, 2004a). They acted not just as principals, but as financial advisors, politicians, civil rights activists, superintendents, family counselors, and community organizers (Tillman, 2004b).

The unintended consequences of *Brown* also impacted Black principals. Tillman (2008) argued that black principals experienced the most disadvantage of all Black educators. The fear of White children being taught by Black teachers was only trumped by the fear of White schools being led by Black principals. As with Black teachers, the “best” principals were transferred to the newly integrated schools, but they were demoted to assistant principals. In direct opposition to their previous roles as community leaders and role models, they were limited to being disciplinarians to the Black students, especially the Black males (Milner & Howard, 2004). The remainder of principals were dismissed at an expedient tempo and pace (Fultz, 2004). If a Black school closed, the principal lost his or her position. If enrollment in a Black school declined because of integration, the principal was oftentimes terminated and replaced with an unqualified or reluctant White principal. Other Black principals were denied employment contracts, and some were terminated for insignificant matters, such as failure to administer the routine fire drill or report a parking violation. The most unfortunate were fired without notice and without reason (Karpinski, 2006).

In the 10 years immediately following the *Brown* decision, Delaware, West Virginia, Kentucky, Missouri, and Oklahoma closed the majority of all Black schools; those same five states terminated over 50% of their Black principals (Tillman, 2004a). In Maryland between 1954 and 1968, the employment of Black principals decreased by 27% as the number of White principals increased by 167%. North Carolina experienced a 95% decline in the employment of Black principals, the largest of all southern states (Karpinski, 2006). The number of Black principals decreased from 226 to 15 in this state between 1963 and 1973 (Karpinski, 2006); other sources report a more severe decline from 620 to 40 (Tillman, 2004a). Inconsistent and inaccurate data collection methods conceal the actual impact of desegregation on Black principals. Once official records finally surfaced in the 1970s, Black principals were at the brink of extinction.

---

## The Current State of Black Principals and Teachers

The decimation of Black principals ebbed and flowed for the next four decades. Currently, only 11% of principals are Black (Taie & Goldring, 2019). Despite the small representation of Black principals, their impact of Black teachers and students is fairly immense (Grissom, Egalite, & Lindsay, 2021). The historic tradition of supporting Black teachers continued with contemporary leaders. Black principals hire more Black teachers at a higher rate than their White counterparts. This stems

partly from Black principals' ability to hire from within their diverse professional network (Bartanen & Grissom, 2019). In addition, Black principals are more likely to be placed in urban schools, schools in which the demographics of the staff are typically incongruent with the student population. Thus, diversifying the staff to better meet the needs of students of color becomes a priority. Once hired, Black teachers with race-congruent principals report higher levels of support, autonomy, and appreciation. This also increases their tenure in the profession longer than Black teachers supervised by White principals (Grissom & Keiser, 2011).

The increased attrition and increased job satisfaction of Black teachers because of Black principals directly translates to student outcomes (Hansen & Quintero, 2018). Continuing the legacy of their predecessors, Black teachers hold significantly higher expectations for Black students in comparison to nonblack teachers (Bristol & Martin-Fernandez, 2019; Dilworth & Coleman, 2014; Gershenson, Holt, & Papageorge, 2016; Gershenson & Papageorge, 2018). One study revealed that math and reading achievement significantly increased when students have a race-congruent teacher (Dee, 2004). Evidence from national data indicates that Black students have a higher likelihood of placement in gifted programs if their teacher is Black; this increases substantially when both the teacher and principal are Black (Grissom, Rodriguez, & Kern, 2017).

Black teachers are more likely to seize opportunities in class to discuss issues of race, bias, and discrimination and redesign eurocentric curriculum to be more culturally responsive (Ahmad & Boser, 2014). In their classrooms, Black students feel emotionally and physically safe. Black teachers are more likely to address behavioral infractions rather than refer students to the principal's office (Bristol & Martin-Fernandez, 2019). One study analyzed discipline and demographic data of elementary school students and teachers. Over a 5-year period, they compared disciplinary rates of students in years with versus without race-congruent teachers. The results were consistent with similar studies; Black students, especially males, were less vulnerable to detentions, suspensions, or expulsions from school when the teacher was Black (Williams, Davis, & Butler, 2020).

Recent findings are beginning to reveal the impact of a race-congruent teacher beyond the time in which students spend with the teacher. Black students hold affirmative aspirations for postsecondary degree attainment at higher rates in classrooms with same-race teachers (Bristol & Martin-Fernandez, 2019). Utilizing data from a statewide initiative on the impact of class size in elementary schools, Gershenson et al. (2021) uncovered if a Black student experiences at least one Black teacher between kindergarten and third grade, it increases the likelihood of the student graduating from high school by 13% and enrolling in college by 19%.

---

## The Complex Road to the Principalship

Despite the overwhelming evidence that supports the impact of Black principals on Black teachers and students, pathways to the principalship are complex. Those Black teachers and other educators (e.g., school counselors) who aspire to be principals face a host of obstacles that hinder, delay, or completely halt their advancement

(Mc Cray, Wright, & Beachum, 2007). First, most Black educators are not encouraged to pursue administrative careers; school leaders tend to encourage those who share their gender and race exclusively (Fuller, Hollingworth, & An, 2019). Considering that most administrations are White, they are the ones who typically are encouraged to apply to principal preparation programs. For those Black educators that persist and earn their administrative credentials, they are more likely to be assistant principals for a longer period of time than their White colleagues. Specifically, Bailes and Guthrey (2020) found that 5 years after earning certification, Black administrators were more likely to still be assistant principals, while their White male counterparts have transitioned into being principals.

For all women of all races, the road to higher level administrative positions is much less linear than White males. Women are most often granted positions as principals in elementary schools. While this represents an accomplishment, it also comes with many consequences. In the implicit hierarchy of school leadership positions, the elementary school principal is much less prestigious. Most school districts have more elementary schools than secondary, making these positions more plentiful. The school's geographic reach is relatively small, and budgetary needs are less demanding than those of secondary schools. Also, administrators have to manage very little extracurricular and/or after school activities. Last, elementary school principals are typically paid less than secondary principals. These and other factors have limited women's access to higher level positions (Bailes & Guthrey, 2020). The position of high school principal is often viewed as the gateway to superintendency and other higher level central office positions (Mc Cray et al., 2007). Unlike their male counterparts, career advancement is delayed by 5–6 years, as they move from elementary school principal to mid-level central office position.

Wilkerson and Wilson (2017) declared that aspiring Black principals have an “infinitesimal chance” of leading a majority White school (p. 777). Typically, they inherit segregated schools with majority Black and Brown students who reside in communities highly impacted by poverty. These schools are challenged by high staff turnover rates, high concentrations of beginning teachers, and low student achievement on standardized assessments (Wilkerson & Wilson, 2017). They must balance the contradictory demands from students, staff, parents, and superintendents while internally battling feelings of isolation and marginalization (Poland, 1997).

---

## Shifting from Pipelines to Pathways

The “pipeline” metaphor is often used to explain the low representation of people of color and women in certain high-demand fields (Jacobs, 2010; Tippet & Stanford, 2019). The metaphor is based on the premise that having an *output* of college graduates for a particular occupation requires an *input* of students interested in that field during their formative years. Their interest is maintained throughout the pipeline from elementary school to college graduation and beyond. As individuals move along the metaphorical pipeline, success is assessed by their ability to progress through critical preparatory checkpoints.

Decades of research on participation and achievement in science, technology, engineering, and mathematics (STEM) have popularized this metaphor. The STEM pipeline follows a linear projection. Typically, it begins in middle school, the quintessential time when students, especially girls, must develop and maintain an interest in STEM (Modi, Schoenberg, & Salmond, 2012). In high school, they need to complete upper-level STEM classes to best prepare themselves for rigorous college coursework (Lancaster & Xu, 2020). While in college, students must participate in a series of internships and other work-related experiences before they earn their degrees in STEM (Lyon, Jafri, & St. Louis, 2012). The next steps along this pipeline include earning advanced degrees and securing employment. The metaphor explains that women and underrepresented racial groups in STEM “leak” out of the pipeline at multiple points, e.g., lack of advanced math courses in high school (Green & Sanderson, 2018) and discriminatory hiring practices (Sheltz & Smith, 2014). The leaks in the pipeline explain their low representation in STEM fields.

The pipeline metaphor has been a framework frequently used to describe the lack of racial diversity among teachers and principals (Ahmad & Boser, 2014; Turball, Riley, Arcaira, Anderson, & MacFarlane, 2013). In an examination of the Massachusetts teacher workforce, Rucinski and Goodman (2019) disaggregated by race the potential candidate pool of teachers at each stage of the pipeline: (1) public school students, (2) 4-year college graduates, (3) completed teacher certification exam, (4) passed exam, (5) earned license, (6) hired as a teacher, and (7) taught for 3 or more years. The report identified areas of improvement along the teacher pipeline to include closing gaps in high school and college enrollment for Black and Latinx students in addition to targeted interventions for teacher candidates from diverse backgrounds who do not initially pass the state teacher licensure test. After analyzing 12 years of employment data, Williams et al. (2020) looked further down the pipeline for opportunities to increase racial diversity. Findings revealed that the percentage of Black teacher assistants (52–58%) far extended the percentage of Black teachers (25–29%). Their study suggested the recruitment of currently employed teacher assistants could lead to more teachers of color.

Emerging studies advocate for shifting the framework away from a pipeline to pathways (Fealing & Myers, 2012; White, 2005). Inherent in the pipeline metaphor is the assumption that when people “leak out” of the pipeline, they have exited completely. This metaphor leaves no time, space, or opportunity for an individual to rejoin the career progression (Garbee, 2017). Second, the pipeline metaphor ignores the experiences of those who never traveled through the pipeline, yet still acquired positions within their desired profession. In studying female scientists and engineers, this dominant framework failed to explain the experiences of approximately half of these STEM professionals (Cannady, Greenwald, & Harris, 2014). Last, the metaphor assumes there is one linear path to career attainment. This exemplifies a dominant cultural frame of reference based on White male privilege and discounts the variances in career trajectories for women and people of color (Atman et al., 2008). Specifically, the linear metaphor ignores the extent to which pervasive gender and/or racial discrimination derail their career aspirations.

More recent studies support a pathway metaphor to better illuminate the complexities of career development, especially for women and people of color. This metaphor is less dependent on a linear progression from one checkpoint to the next; instead, the pathway provides multiple entry points throughout time. School districts across the nation have recognized the need to create pathways targeted at diversifying their workforce.

## **Edgecombe County High School Scholars Program**

High school teacher cadet programs date back to 1984 when one of the first was created by Lehman High School and Walton College in Bronx, NY. These programs focus on rigorous coursework, work-based experiences, and professional learning for aspiring teachers. The programs offer students 1 year of introductory experience (Center for Teaching Quality, 2009). More recently, programs have expanded in scope and sequence. Edgecombe County, a rural district in North Carolina, developed a 3-year program. The Edgecombe County High School Scholars Program recruits a racially and ethnically diverse cohort of rising juniors interested in careers in teaching. The impetus for the program emerged from a need to stabilize their workforce. At the time of its inception, 20% of teachers left the county every year; high teacher turnover has a negative impact on student learning and engagement. The purpose of this program was to attract, prepare, and empower local students to pursue careers in teaching in Edgecombe County.

Often referred to as the grow-your-own-program, the curriculum focuses on social justice, career exploration, service learning, and power of place, i.e., knowing the needs of the local community. The scholars complete both high school and community college courses while participating in internships at local elementary and middle schools. Through working with mentor teachers, they gain exposure to the knowledge, competencies, and skills needed to be a highly effective, culturally competent teacher. The hope is for the scholars to return to the district to complete their student-teaching and eventually secure full-time employment. It is too early to determine the impact of the program; however, the majority of scholars have majored in education and plan to return to Edgecombe upon graduation.

## **Call Me MiSTER**

Call Me MiSTER (Mentors Instructing Students Toward Effective Role Models) is another example of a grow-your-own program. It originated in South Carolina at Clemson University, a state challenged by perpetual teacher shortages, nearly half of students attending schools in rural areas, and higher than average levels of poverty in those rural areas. Call Me MiSTER is designed to address the need for more dedicated and highly qualified teachers in high-need elementary schools by investing in male college students. It attracts and recruits mostly Black males pursuing majors in elementary, middle, or special education. The program provides them with

financial, academic, social-cultural support and a mentor to promote their personal and professional growth. The tenets of Call Me MiSTER are ambassadorship, brother's keeper, personal growth, teacher efficacy, and servant leadership.

The program officers utilize both traditional methods to recruit candidates (e.g., providing information to school counselors) and more community-based informal means by seeking young pastors, local barbers, community organizations, or volunteers at the local YMCA. The vast majority of Call Me MiSTER graduates secure teaching positions in the targeted rural, high-need areas; several have earned advanced degrees and became assistant principals and principals. In South Carolina, over 90% of the 211 program graduates have remained in education at the elementary, secondary, or postsecondary level (Jones, Holton, & Joseph, 2019). Call Me MiSTER is now a nationally recognized program for cultivating the next generation of Black male teachers with affiliates in North Carolina, Tennessee, Mississippi, and Illinois.

### **The Aspiring Principals Program**

The Leadership Academy's research-based Aspiring Principals Program represents another pathway designed to attract and prepare teachers to school leadership positions. The program started in New York City to cultivate a cohort of leaders prepared to dismantle systemic inequities in school through exposure to culturally responsive leadership. It is a yearlong residency program that includes expert mentors, multiweek summer-intensive, and skill-based training. From 2003 to 2017, the program trained nearly 600 principals to serve high-need schools throughout the city. In 2019, 67% are still working in the New York City school system and improving student outcomes, currently operating as the majority of participants were women and people of color. With its success in New York City, the program has been adopted by more than 200 education systems in 37 states and Washington D.C. (Leadership Academy's History, 2021).

### **Guilford Aspiring Leaders Academy**

Other leadership preparation programs borrow tenets from the grow-your-own framework. Guilford County in North Carolina designed GALA, Guilford Aspiring Leaders Academy, to prepare future leaders to advance the district's culture for equity, deeper learning, and high performance. Similar to Call Me MiSTER, the academy welcomes all candidates with an emphasis on Black and Latino male assistant principals. The 18-month program builds on research that Black and Latino boys experience greater academic outcomes, lower suspension rates, and higher graduation rates in schools with more male educators of color. The participants learn about the complexities of leadership, school culture, data-informed decisions, leading for equity, cross-racial and cross-cultural community, and instructional leadership (Contreras, 2018). The program shows promising results; some of the newly

appointed principals assigned to high-need schools, with a majority of students of color, reported notable improvements to academic performance and growth (Contreras, 2021).

---

## Conclusions and Reflections

The unintended consequences of *Brown* versus *the Board of Education* reverberate throughout today's educational systems. As student populations increasingly become richer with racial, ethnic, and linguistic diversity, the divergence between principal and student demographics becomes greater and greater. Throughout elementary, middle, and high schools, students deserve to see leaders who look like them, who share their cultural values. Leaders who are empowered to critically identify and examine inequities permeating their schools and districts dismantle systemic obstacles that inhibit learning and engagement and create innovative policies, practices, and procedures to improve the academic and life outcomes for all students, especially those experiencing marginalization. To ensure academic excellence for Black students, these leaders strive to retain more black teachers. With the support of the Black principal, Black teachers design classroom learning environments that foster community, safety, and agency. This translates into greater academic and life outcomes.

The realities of the current educational system reveal the rarity of these experiences for Black children. State and national programs have emerged that pave viable pathways to teaching and leadership for people of color, but even more are needed to mitigate the impact of *Brown*. A new program could uniquely situate itself between initiatives that strive to professionalize career pathways for teachers and those that aim to diversify leadership licensure programs. It serves as a means of retaining teachers of color, especially those who may not have considered a position in leadership as a viable career option, while simultaneously preparing more educators to better serve the needs of students from minoritized groups. The curriculum would need to dive deeply into aspects of critical self-reflection, historical root causes of racism in education, current institutional factors that inhibit student success, and approaches used by transformative leaders to ensure more equitable outcomes. With more exposure and preparedness for school leadership, program graduates are best positioned to increase the diversity of the principalship and facilitate individual and collective approaches to teaching and learning. By tracing our roots, i.e., examining the history of education – both successes and challenges, educational systems can create new pathways to transform the role of Black principals and improve long-term outcomes for black students.

### Abstract

The New DEEL (Democratic Ethical Educational Leadership) was formed in 2004 when two senior educational leadership faculty members from Temple University's College of Education partnered in response to two dynamic challenges. The first was a neoliberal policy environment that focused on high stakes testing that included draconian sanctions along with a robust pursuit of privatization. The second was the ill-founded belief that if the testing regime led to improved scores, social problems such as poverty among marginalized groups would be greatly reduced if not eliminated.

Central to this organization's scholarship, course development, conferences, and work with practitioners in the United States and around the world are five visions for educational leadership statements. Each of these is contrasted to behaviors of conventional leaders to form a continuum. This chapter examines each vision statement vis-à-vis Foucault's fields of memory, presence, and concomitance. The chapter concludes with an appraisal of the combined impact of these statements in guiding and sustaining the New DEEL organization, especially as it moves into an ever more challenging yet potentially constructive era in educational leadership due to the impact of a global pandemic and the crisis of racial injustice found in the United States.

### Keywords

Democracy · Ethics · Educational reform · Equity · Turbulence theory · Leadership · Social justice and social responsibility

### The Field of Memory

That education is siloed from the rest of society into a nondemocratic hierarchy typified by neoliberalism, essentialism, and scientific management theories. That micro-managed accountability practices will lead to higher test scores which will lead in turn into a more equitable society. That ethical reasoning is largely a matter of an ethic of justice and that careers in education can be viewed as a climb up a corporatist ladder.

### The Field of Presence

That guiding social development both near and far is part of educational leadership. Redefining leadership to include all participants and community members. That democracy, authentic educational reform, and social responsibility are dynamically reinforcing and integrally connected. That working with turbulence

to protect and promote innovation is critical as is working from a multiple ethical paradigm when faced with inevitable ethical dilemmas. Seeing one's career as a calling.

### **The Field of Concomitance**

These include democratic theory, feminist critique, critical race theory, Desmond Tutu's use of unbuntu, Deweyan progressive philosophy, democratic administration theory, turbulence training for pilots, action research, Alfred North Whitehead's notion of the utilization of knowledge, FDR's Second Bill of Rights, and the United Nations Declaration of Human Rights.

### **Discontinuities and Ruptures**

The New DEEL approach rejects the stance of neoliberalism's reprise of scientific management in education. Specifically, it rejects the position that schools alone bear the weight of social and economic transformation toward equity and that equity can be achieved when schools produce sufficiently high scores on standardized tests. Further, it rejects the concept that educational leadership is restricted to a single individual at the top of an organizational chart and that educational leaders are not to act as democratic ethical leaders in the wider community.

### **Critical Assumptions or Presupposition**

The current policy that predicts testing and punishment will lead to middle-class lives for those families now entrenched in poverty is exactly backwards. It is the very supports that middle-class families have that account for most of the difference in educational performance in our society. Since we have not seen signs of a reversal in this wayward policy direction, educational leaders at every level who seek social justice and social responsibility must redefine their jobs and share leadership with all related groups (faculty, staff, students, families, and the wider community). Beyond new attitudes and expanded definitions of the job of democratic ethical leadership, new skills including community organizing, alliance forging, sophisticated ethical reasoning, and understanding the nature of organizational turbulence are required.

---

## **Introduction**

The New DEEL (Democratic Ethical Educational Leadership) was formed in 2004 when two senior educational leadership faculty members from Temple University's College of Education partnered in response to two dynamic challenges. The first was a neoliberal policy environment that focused on high stakes testing that included draconian sanctions along with a robust pursuit of privatization. The second, allied with this emphasis, was the ill-founded belief that if the testing regime led to improved test scores, social problems such as poverty among marginalized groups would be greatly reduced, if not eliminated.

The two founders believed that the first priority of a public education system was to raise the next generation of young people to be able to sustain and improve upon a democratic ethical society. Given the vast gulf between this goal and the then current situation facing educational leaders at every level, they decided to create a new movement. They shared their concerns and aspirations with colleagues around the world asking for support and involvement. They achieved this through the Consortium for the Study of Leadership and Ethics in Education (CSLEE) and the University Council for Educational Administration (UCEA).

After two Winter Strategy Sessions in 2004 and 2005, the New DEEL colleagues drafted a mission statement and adopted a set of five beliefs that they felt would define the parameters of a new kind of educational leader. They refer to these five beliefs as the New DEEL Vision for Leaders. Significantly, these are a series of interdependent continua rather than dichotomous extremes. They are also dynamic and are influenced by such external conditions as security, economics, the environment and technology, and their combined impacts on educational leaders. As such the New DEEL vision for leadership statements are meant to be both aspirational and practical in nature. All New DEEL initiatives, including articles, books, course development, international conferences, and consultations with practitioners, have used these statements as foundational elements.

New DEEL colleagues believe that these five vision statements are at the heart of that organization and its ability to evolve over an extended period of time and through dynamically changing circumstances. Each of the five vision statements represents a critical facet of a socially just and socially responsible movement to reclaim educational reform. Therefore, each of the five statements will be explicated in order in this chapter and considered in light of the Fields of Memory, Presence and Concomitance. Their unified impact will be described at the chapter’s conclusion.

**Vision Statement 1**

New DEEL Leader	Conventional Leader
Guided by an inner sense of responsibility to students, faculty, staff, families, the community and social development on a world scale.	Driven by an exterior pressure to those above in the organizational/political hierarchy.

The first vision statement for the New DEEL vision for educational leadership describes the continuum between a New DEEL leader who is driven by an inner responsibility to stakeholders whom they serve, and a conventional leader who primarily responds to a narrow understanding of responsibility to the leaders occupying roles with positional power. Conventional leaders often define their success through outputs created by exterior pressures, such as performance on high-stakes testing, affirmation from those in leadership positions above them, and opportunities to “climb the ladder.” Comparatively, the New DEEL leader is energized by “building community and a wider sense of us” in all facets of the school community (Gross & Shapiro, 2016). In short, while conventional leaders operate with a concentration on compliance, New DEEL leaders recognize the cornerstone to their approach is sensing the connection and adhering to a commitment to others outside of themselves (Gross, 2020).

Yet, school leaders grapple with this tension between accountability and responsibility. One fundamental question centers around what exactly it means to be driven by an inner sense of responsibility in the wake of accountability pressure, which is often experienced by school systems in economically disadvantaged areas disproportionately. In these school systems, how do school leaders work for vulnerable students and families while complying with narrow, rigorous accountability systems?

Thus, educational leadership responses have not always been designed with equity in mind. One such widespread response resulting from the accountability-based reform approach that highlights the difference between New DEEL leaders and conventional leaders is the focus on the “bubble groups” in instructional and strategic leadership and decision-making. Commonly employed in low performing school districts, conventional leaders commit additional resources and time to only those students whose score was near proficiency cut score (Greer, 2018), to the exclusion of the students performing below the cut score level. Concerned with expedient compliance and narrow ideas of improving student achievement, school leaders endeavor to move the students deemed most viable to the next higher performance level with a result of an increased overall rating for schools and districts, often to the detriment of all ready under-resourced groups of students at the tail end of the continuum (Ladd & Lauen, 2010). In this way, conventional leaders believe that closing the achievement gap required by the accountability-based reform approach can simply be reduced to analyzing the data of student performance on the high-stakes testing (Feuerstein, 2013) and selecting the student groups whose test scores seem easiest to elevate. As has been noted, while this practice grew in popularity during the onset of high stakes testing, the practice misses the boat when it comes to broader concerns for the whole school community.

Moreover, leaders who react to the pressures of accountability-based reform and rely on increasing student achievement to comply with those mandates fail to abandon traditional educational approaches and beliefs even when they may recognize social inequities exist (Newcomer & Cowin, 2018). Conversely, New DEEL leaders recognize this narrow approach contributes to greater educational inequities and social injustices. Moreover, they believe students are more than just sets of data. Fei Wang states, “Educators who seek solutions to social injustice look to address the root causes of problems, not just their symptoms” (2017, p. 396). Shifting focus away from narrow responses to accountability measures, school leaders, driven by a broad sense of social justice and equity, remain committed to, for instance, traditionally under-resourced student groups, even if it means not expediently achieving the required accountability targets.

---

## Field of Memory

Foucault’s concept of the field of memory challenges one to identify what components of ideas, theories, and practices are no longer viable, and may have evolved into dysfunction. Although the accountability-based reform approach has morphed over time from the narrow focus of No Child Left Behind (NCLB) to the more flexible Every Student Succeeds Act (ESSA), there are still components that stymie

the progress of maintaining educational equity. While some educational leaders and policymakers assert that the focus on accountability is an important part of school reform, others point out how some so-called reform efforts have spurred unethical practices (Lauen & Gaddis, 2012). One example of the narrow focus on accountability is the widespread practice of reorganizing instructional time to emphasize the tested subject areas. This practice has led school districts to support this additional instructional time in tested areas by cutting recess, emphasizing “teaching to the test,” and decreasing, or in some cases, eliminating, instructional time for non-tested content areas such as social studies, art, or music (Groen, 2012). Altogether, this practice is both short sighted and neglects the broader focus that an inner sense of responsibility to students elicits.

At the heart of the overreliance on leadership practices that amount to accountability compliance over a shared sense of responsibility are conventional, commonly held assumptions and conceptions about the value of high stakes testing. These assumptions can also be seen in the very policies that shape the use of testing across school systems itself. Yet, how useful are test scores in the advancement of students?

In response to the strong call for exemplary schools on an international level, Levin (2012) traced the increasingly narrow focus on test performance to the exclusion of other critical skills, contending that noncognitive and socio-emotional skill acquisition were arguably more important to strengthening labor force readiness than test performance was. Likewise, responding to the broader question of the field’s overreliance on educational testing and the oversimplification of test interpretation in school settings across the country, Koretz (2008) cautioned that test scores fall short in attempting to capture the full picture of a student’s achievement or a school’s effectiveness, suggesting that school leaders and policymakers narrowly focusing on test scores were missing the bigger picture.

The accountability-based reform movement has not only led to educational inequities for students, it also has created unforeseen challenges for teachers. In work investigating the effects of accountability pressure on teachers, several factors relating to the reform movement such as a lack of time, imposed curriculum changes, and testing of special education populations contributed to an increase in job-related stress for educators (Gonzalez, Peters, Orange, & Grigsby, 2017). Additionally, recent work has identified that the massive workload associated with accountability is a critical factor that contributes to qualified teachers leaving the profession in the first 5 years (Perryman & Calvert, 2020). As can be seen, accountability exerts a toll on teachers and their school systems.

Perhaps, instead of becoming engrossed in reducing the pressure, leaders should invest their time sharing in the responsibility of addressing the root of the problem that is much deeper than not meeting the required accountability targets. Although more demanding, the work of democratic and ethical leadership is manifested through efforts such as uniting the school community, supporting the self-efficacy of stakeholders, and advocating for the underrepresented groups most detrimentally impacted by unresponsive policies.

---

## Field of Presence

Analyzing what is truthful and necessary about a practice is the foundation of Foucault's field of presence. New DEEL leaders confront the inequities of the accountability-based reform movement by connecting educational reform to democracy and social responsibility. They understand and even appreciate the "out of touch" and "incompetent" labels some place on them because they are focused on deeper educational reform outcomes than what accountability-based reform can produce (Feuerstein, 2013).

One concept that has become validated in the field of presence is cultural competency as a standard in educational leadership. Accordingly, possessing a high degree of cultural competence necessary to understand and meet the needs of stakeholders and communities is now considered an integral component to a sense of social responsibility. As schools and classrooms become more culturally and linguistically diverse (Keengwe, 2010), the New DEEL leader confirms the values and beliefs of stakeholders through actions, decisions, and communication. What this requires leaders to do is "recognize the hugeness and complexity of what (culturally competent) educators on the frontline are up against: the status quo which has built-in reinforcements to protect itself" (Boutte, Kelly-Jackson, & Johnson, 2010, n.p.).

Yet, accountability pressure continues to be at the foreground for many school leaders. Many school districts moved to a focus on "teaching to the test" and overloading students with assessments, such as benchmark, diagnostic, and assessments created just to practice taking the standardized assessments (Groen, 2012, p. 14). With all this time committed to preparing for the test operationally, in addition to the focus on teaching tested content like math and language arts, less attention can be given to the "educational, social, and political implications of our role as educators" (Boutte et al., 2010, p. 15) necessary to provide culturally relevant learning opportunities for students.

In the continuum of beliefs about school reform, New DEEL leaders are committed to being agents of social justice, and as such, understand the needs of diverse learners and support teaching so that all can achieve (Ayers, Quinn, & Stovall, 2009). They also believe that their inner responsibility stretches beyond the commitment to stakeholders of one organization. Their inner drive is grounded in a social responsibility and transcends the organization because "it considers the community and social development around the world" (Gross, 2020, p. 91).

---

## Field of Concomitance

Thinking about the ideas that also belong to or concern different types of discourses (Foucault, 1972), social responsibility and cultural competency are not unique to the New DEEL leader nor K-12 education. These values also have a deep root in politics and public administration. Giving attention to the "racial hierarchy that impacts modern issues of wealth and power" is a necessary part of public administration

(Carrizales, 2019, p. 30). Beyond politics and public administration, they are an established feature of social work education and practice, a main objective of engineering programs, and connected to business practices and corporate policies (Brodeur, 2013; Fitzpatrick, 2013; Vincent, 2012). As educational leadership continues to evolve, contemporary concepts such as anti-blackness, intersectional oppression, cross-cultural concepts of motivation from the fields of public policy, sociology, and psychology continue to imprint on educational leaders, as they continue to grapple within the continuum between accountability and responsibility, pressure to comply as a leader on the rise and a deeply held commitment to share responsibility for and with the humanity widely experienced by all.

### Vision Statement 2

New DEEL Leader	Conventional Leader
Leads from an expansive community-building perspective. A democratic actor who understands when and how to shield the school from turbulence and when and how to use turbulence to facilitate change	Bound by the system and the physical building. A small part of a monolithic, more corporate structure.

Inherently, there is a dynamic tension between the New DEEL Vision for educational leaders and the corresponding behavior of conventional school leaders. The conventional leader is often “bound by the system and the physical building, seeing themselves as a “small part of a monolithic, more corporate structure” (Shapiro & Gross, 2013, p. 7). On the other hand, the New DEEL leader “leads from an expansive community building perspective.” Connected to a concern for the community, the New DEEL leader “is a democratic actor who understands when and how to shield a school from turbulence and perhaps most importantly, when and how to use turbulence to facilitate change” (Shapiro & Gross, 2013, p. 7). With attention to a mutually beneficial and democratic vision for the future, the New DEEL leader has the ability to work with emerging turbulence and create more opportunities for discussion, innovation in terms of policy and programming, and representation from those who have typically been silenced (Gross, 2020).

One compelling and ongoing illustration of this vision of leadership can be seen in the recent development of the school closures during the COVID 19 pandemic. As turbulence levels hit an all-time high in school districts throughout the United States, the landscape of education continued to change, sometimes on a daily basis. Among other needs, school leaders were required to expediently assess and resolve a myriad of unprecedented operational and instructional concerns. It is precisely this ability to gauge evolving needs that drives adaptation and new democratic and ethical possibilities for the organization. Shapiro, Gross, and Shapiro (2008) described how the process of gauging the level of turbulence in any given situation supports the organization moving forward in increasingly just ways:

Under turbulence theory, individuals have an enhanced ability to calibrate the severity of the issue at hand. It further aids them in their attempt to contextualize a given problem as they construct strategies to move to less troubled waters. (p. 18)

A tool for understanding and transforming problematic conditions, gauging turbulence and understanding the complex balance of driving forces within the context and culture are invaluable strategies for the democracy minded school leader.

As has been noted, schools are facing an unprecedented crisis requiring transformational leadership. On its surface, the central challenge has been for leaders to pivot from conventional notions of how to educate young people who cannot go to physical schools because of the pandemic. However, the community minded, NEW DEEL leader goes beyond reflective thinking, advancing toward a more reflexive process to grapple with the “thinking about the thinking” (English, 2015, p. 40) that undergirds complex decision-making during turbulent times. Thus, a New DEEL leader must be able to think through the turbulence, working with stakeholders in democratic ways, in order to make certain that learning takes place in the most equitable way possible, sometimes using the turbulence to innovate and make more democratic existing processes.

By the same token, a New DEEL leader must think well beyond the walls and constraints of the building and consider all possibilities. As an illustration, for many school systems prior to the emergence of COVID-19, online learning existed at the periphery of services offered for students. While some school districts had previously and successfully implemented cyber course options for their secondary students, other school districts had constrained online learning to the occasional infusion within the conventional, face to face curriculum or as ancillary course options designed to recover credit or enrich learning, often limited to specific students in need of these options at the secondary level.

In an instant, however, online and hybrid learning has become more than an important tool in this new educational world; it has surprisingly become the very foundation of learning, albeit newly established and perhaps temporal in its dominance. Indeed, in the age of COVID-19, for many school systems, online learning has become the primary platform for learning for all students, PK – 12.

Predictably, heightened turbulence around evolving guidance from an array of community agencies and stakeholders has also become the new normal. A New DEEL leader, though, relies on a community building perspective, and thus, is better prepared than a traditional, individualistic leader to think well beyond even the local community to make certain that his or her students learn not only the required curriculum but are supported with the tools, both emotionally and logistically, during this time and beyond.

---

## Field of Memory

When applying Foucault’s field of memory (1972) to educational leadership, the reasonable premise involves the traditional school leader as the figure responsible for carrying out the wishes of the state or district. These leaders were bound by rules from the past, spending time enforcing the dictates of others. This principle often entailed enforcing state testing or abiding by mandates that lacked flexibility from the federal government. This perspective limits educational leaders to be essentially little more than middlemen who are bound by rigid rules, trapped within the confines of the building, making decisions in the vacuum of the building itself. These leaders

may lack the flexibility to respond to unprecedented changes in a new era. These leaders may have problems dealing with students who are diverse and who require new forms of pedagogy. They may not understand the needs of diverse communities.

---

## Field of Presence

Today's leaders must intimately know the citizens beyond the four walls of their school buildings in order to effectively serve the different communities of which they are a part of, and who comprise the school community. Thus, the impact of the coronavirus highlights how dysfunctional conventional ideas of leadership can be in this new landscape. As the COVID-19 pandemic hit, most American schools were forced to close their doors and move to an online format. This required that leaders act swiftly and dynamically, responding to the needs of their individual community at an unprecedented pace. Rather than narrowly setting their sights on compliance, these leaders needed to tailor the dictates of the state and district to their communities' unique needs. Factors like size of the district, income level, existing technological resources, and level of tech literacy were among the factors that laid the foundation for early operational, strategic, and instructional decision-making. Understanding the unique barriers that students and families face in terms of access to Wi-Fi, adequate devices, and proficiency with online learning systems had the potential to make the difference between the children in their schools receiving an education or falling by the wayside.

Responding to the heightened turbulence that COVID-19 closures have specifically had on low income, racially and ethnically diverse, and classified students, school leaders, and policy makers have begun to respond. With equitable access to high school graduation in mind, multiple states waived their graduation assessment requirements for Class of 2020 senior students (Ed Week, 2020), with discussion in progress on a similar waiving or adapting of requirements for the Class of 2021, as well. Without specific, supplemental instruction on portfolio or substitute assessment, and other similar supports, for instance, the turbulence caused to vulnerable students and families pursuing high school graduation in those final months would have been severe to extreme, as described by the turbulence gauge (Shapiro & Gross, 2013). Thus, on the local level, school and district leaders have responded with adapting existing policies such as waiving their end of year or end of course test and credit requirements (Ed Week, 2020), and scrutinizing and reducing the use of grade retention as a practice, particularly for students whose performance diminished primarily during the time when schools were closed (Schwartz, 2020).

As with anything else, a continuum exists for the presence of an ethical and democratic emphasis in school leadership responses. By using the turbulence to create new possibilities for vulnerable students, some school systems have begun to innovate existing systems of intervention for students and families. One widespread area that school leaders have used the force of turbulence to improve upon is that of credit recovery which, at its best, can counter the practices of retention, course

repetition, and dropout and pushout responses (Franco & Patel, 2011; Heppen et al., 2017).

In addition to the heightened needs of students and families, teachers, too, are also experiencing turbulence. Thus, for school leaders, responding to the emerging needs of the teachers has also become critical. Certainly, there is a widespread, timely need to provide expedient professional development and technological support to help prepare those educators with inadequate or outdated technical skills. Additionally, teachers require further pedagogical support to create new content, innovate processes, and successfully deliver it through unfamiliar, online or hybrid formats. While recent work has begun to explore best practices for online learning and teaching (Bowser, Davis, Singleton, & Small, 2017; Keengwe & Schnellert, 2012; Yang, 2017), more attention to this is needed, especially for the educators thrown for a loop, during times of heightened turbulence.

In the final analysis, this unique situation requires leaders to act wisely under turbulent conditions and to envision the expansive needs of the community rather than constrain one's leadership actions to a small piece of the bigger picture. Committed to finding viable benefits and opportunities for flexibility, the New DEEL leader aims to work with the flow of a given situation and come through periods of turbulence with improved and more just practices.

---

## Field of Concomitance

Interestingly, the COVID 19 pandemic has necessitated school leaders to concern themselves with the discourse of different domains including the health science and public health policy, illustrating the utility of the field of concomitance (Foucault, 1972). Now more than ever, school leaders must endeavor to be community advocates who understand evidence-based results. They need to have some knowledge of and respect for science to educate their students and their parents regarding the coronavirus and its after-effects.

New DEEL leaders will continue to face severe levels of turbulence as they wrestle with the fallout from COVID-19. But a skilled leader will use the turbulence to advocate for needed resources for their schools. They will know which students need crisis counselors, as children in the hardest-hit areas wrestle with trauma. They will be aware of which children require remedial help as they catch up on work that they could not complete due to lack of resources. Knowing the community and being able to respond beyond the confines of a building will play a huge part in the educational recovery that will have to occur in school systems across the world. It will take many years to recover not just educationally but emotionally from the impact of COVID-19 on schools, communities, families, and students. Leaders will be responsible not just to the community within the building but toward a more expansive community beyond the school doors. By knowing their population and advocating for the unique needs of diverse communities, it is believed that responsive New DEEL leaders will be able to negotiate the changing landscape of education in these turbulent times.

### Vision Statement 3

New DEEL Leader	Conventional Leader
Integrates the concepts of democracy, social justice, and school reform through scholarship, dialogue, and action.	Separates democracy and social justice from guiding vision and accepts school improvement (a subset of school reform) as the dominant perspective.

Throughout educational leadership circles, social justice and democracy have been key concepts emphasized in the scholarship and dialogue associated with the field, and the concept of school reform goes back even further. Taught in leadership programs, integrated into the leadership standards, highlighted within district and school mission statements, social justice and school reform purports to be at the center of the beliefs, decisions, and actions of educational leaders. Furthermore, as Gross and Shapiro (2015) suggest, educational reform has had an array of theoretical and philosophical influences and has evolved into a narrowed emphasis of accountability (e.g., limited curriculum; high stakes tests and policies) and what is stressed by market forces. Left out of the contemporary definition of school reform, often, are the concepts of democracy and a shared commitment to equity, one of the five New DEEL visions for a more inclusive and progressive brand of educational reform.

Not surprisingly, in practice, leaders often struggle between what is optimal for reform and acting upon what is deliverable, resulting in the phenomenon of school leaders modifying reform efforts, as opposed to reform efforts transforming schools (Tyack & Cuban, 1996). The reasons for this are complex. Too often, the more difficult notion of leadership that brings about social justice is chiseled down to reflect a school improvement perspective over a broader concept of school reform: the democratic, ethical educational leadership perspective (Gross & Shapiro, 2015). While conventional leaders advance a mechanistic vision that narrowly ties school reform to singular accountability measures or initiatives, a democratic educational leader sees a bigger, more complex picture – that school reform cannot be annexed from a democratic perspective.

To understand this continuous, iterative tension between conventional leadership and democratic educational leadership, consider one current focus of school reform, the improvement of chronic absenteeism rates. As of 2020, 36 states and the District of Columbia have approved Every Student Succeed Act (ESSA) plans with school level chronic absenteeism as an indicator for school quality, and leader effectiveness. Research has supported its utility as a predictor of pivotal educational and quality of life outcomes (Gottfried, 2009; Balfanz & Byrnes, 2012). Like many other accountability measures, though, it has the potential to become the single focus for improvement-minded school leaders, overwhelm other reform efforts, and at worst, be used to manipulate educational outcomes for vulnerable students. Indeed, student attendance, deceptively simple to measure in practice, has utility to operate both as an accountability measure for school leaders and a “backstage” lever to buffer school leaders and educators from the most difficult to educate students (Tropea, 1987).

To further investigate the ways conventional and New DEEL leaders respond to accountability pressure related to chronic absenteeism, it is important, as Creswell (2013) noted, to set knowledge in the conditions of the world today, deconstructing this knowledge in terms of the different discourses and universals that hold true regardless of social conditions. Foucault's framework organizes this knowledge and helps us understand it in terms of the coexistence of the field of statements.

---

## Field of Memory

A ubiquitous measure, attendance collection as a practice dates back to the very first public schools of the 1800s, but became intertwined with another early accountability measure, the city-wide test examination (Tyack, 1974). As early as the 1870s, cities across the country began to publish test results for the public's review – striking examples of the early testing programs as tools to hold schools and teachers accountable. At the same time, these early state tests garnered almost immediate criticism and a variety of subsequent responses from actors operating in the school system's organizational environment including ceasing the publication of test scores (e.g., Thomas Crawford, Portland) and publicly decrying the comparison of school systems and teachers based on test scores (e.g., Emerson E. White, Cincinnati). While these responses may have represented some concern for the way teachers and students alike were represented and impacted by negative public perceptions, other leadership responses went even further to buffer school systems from accountability pressure. One example of this manipulation of student attendance involved school leaders coaxing low performing students – often poor, diverse students forced to school by public officials, to discontinue attendance to school.

The problem of educating students who teachers and leaders of the time referred to as “incorrigible” (Tyack, 1974, p. 70) and “defective” (Tropea, 1987, p. 11) was complex, as can be seen in the cases of large urban school districts of the late 1800s. In the 1890s, important legislation such as child labor and compulsory education laws began to influence how school leaders and their practices were governed. While school leaders could easily defy these compulsory attendance laws by continuing to expel the difficult to educate and vulnerable as young as 11, some of the forces that would change the continuity of school leadership practices. Specifically, these laws “rearranged, reduced, effaced” the continuity (Foucault, 1972, p. 9) of events that led to thinking about students attending school in a different way.

Yet, it would take many decades for leadership practices around exclusion to improve. Tropea (1987, 2005) documents that with the advent of compulsory education laws, school leaders introduced the special class, often ungraded, for the management of low performing, behaviorally challenging schools, and with this, a period of significant segregation and lowered standards. Hence, the identification of special children in a special class allowed both compliance with mandates about compulsory attendance that were very much a part of the field of presence at that

point and met the needs of the teachers who were challenged by these students. The practice of the ungraded special class enrolled with difficult, special students that school leaders were forced to educate illustrates what Foucault (1972) termed as the document: existing in memory but containing relevance and holding relation to other important events.

The unfettered leadership practice of segregating students in their special, basic classes began to be reformed through important court decision such as *Hobson v Hansen* (Tropea, 2005). As a result of this rupture, school leaders needed a new strategy. Thus, by the 1960s, the use of the disciplinary suspension, a younger descendent of the practice used during the common school days (Tyack, 1974), re-emerged and was applied for lengthy periods of time in the cases of difficult students and implemented at the school, not district, level in many cases (Tropea, 1995). Additionally, leaders also dispensed suspensions to problematic students to avoid the accountability associated with the testing of these students perceived to be difficult to educate (Tropea, 1987). This history of gaming the accountability associated with attendance continued to evolve, as countermeasures developed.

Indeed, using suspensions to control the impact of low achieving students continued as a practice into the 1970s. All things considered, there could be no greater demonstration of nondemocratic, leadership practice than that of excluding students from their education to buffer the system from their performance; those families and students had no representation in those decisions. Thus, accountability measures connected to emerging compulsory schooling laws provided a necessary check to exclusionary practices. This increased accountability, however, did not effectively reform the rationale that fueled the manipulative leadership practices in the first place, as Tropea argued (2005), but it did change the strategic way school leaders approached vulnerable students.

Fortunately, the idea of sending low performing students home now represents a practice that contributed to the reproduction of inequities in the school system. Illustrating Foucault's notion of discontinuity (1972), this widespread practice of excluding students from education to buffer accountability-minded school leaders and educators was cut off from the original intention and brought into a new time. Subsequently, a new tension was born, one between the accountability associated with improving absenteeism rates, and one concerned with the larger question of democratic, equitable access to a high-quality education for all students, even the difficult to educate.

---

## Field of Presence

In recent years, the scope of accountability systems has broadened under Every Student Succeeds Act (ESSA) of 2015. As such, chronic absenteeism has emerged as a popular metric chosen by many states as a newer component of their statewide accountability system (Rafa, 2017; Bauer, et al. 2018), undergirded by the widespread assumption by school leaders and policymakers that student attendance is integral to key educational outcomes (Chang & Romero, 2008; Gottfried & Kirksey, 2017; Gottfried, 2010; Mac Iver & Messel, 2013; Neild, Balfanz, & Herzog, 2007;

Henry, et al. 2012). As a result, conventional school leaders have taken to encouraging, pressuring, and even punishing students and families to achieve acceptable levels of school attendance, in spite of the barriers that exist for students living in poverty. Leaving behind the old practices of exclusion through unfettered expulsion and suspension in the field of memory, school leaders have adapted and developed new practices that reflect the continuity of the well-established need to manage difficult students.

Recent scholarship demonstrates the use of these kinds of leadership practices in the field of presence. Mireles-Rios, Rios, and Reyes (2020) explored the use of punitive truancy responses to students experiencing a myriad of challenges including health, transportation and school avoidance issues, finding that this type of policy supported a pushing out effect on vulnerable students at risk for dropping out. Similarly, in a mixed methods study exploring the educational experiences of Latino youth who chose to leave high school before attaining a diploma, Lukes (2014) found that both local and federal policy constrained school leaders attempting to serve students with limited English proficiency and chronic absenteeism. Not surprisingly, when the path became checkered with barriers and hurdles too high to surmount, students chose high school equivalency programs to advance their aspirations for jobs, training, or higher education (Lukes, 2014). These findings suggest that leadership practices developed in response to absenteeism policies still manage to use attendance as a lever to manage and steer difficult and vulnerable students.

As has been noted, the importance of sound student attendance has been established in the field of presence, supported by methods explicated by Foucault (1972), such as logical validation, repetition, and acceptance justified by authority. However, as has been noted, leadership practices can vary significantly when considering that continuum between conventional and democratic, ethical responses. In the final analysis, intended as a school quality measure, the use of student attendance in policy and practice has the real potential to be designed and implemented narrowly, punitively, and subsequently, can be used to replicate, rather than eradicate, inequity.

Interestingly, both the set of knowledge developed by conventional school leaders with their flawed, narrowed visions of school reform and the knowledge associated with their progressive counterparts, endeavoring to lead with broad visions of democratic, equitable leadership, have a place in the field of presence. School reform is a well-established goal in the field, and democratic leadership, served by practices such as engaging families in culturally responsive ways and endeavoring to represent every group's traditions and perspectives in leadership decisions, is a necessary proposition. Yet, so are narrow school improvement strategies such as punishing chronically tardy and absent students with consequences that take them away from critical instruction.

---

## Field of Concomitance

Lastly, applying the field of concomitance to reform efforts focused on absenteeism, the use of data systems for purposes of improving educational outcomes originates from other disciplines. Fueled by advances in computing power and development of

data analysis techniques for large amounts of data, school systems across the country now utilize longitudinal data systems like New Jersey's Standards Measurement and Resource for Teaching (NJ SMART). Instituted in response to the need for larger quantities and types of data generated by the passage of No Child Left Behind (NCLB) and later, ESSA, NJ SMART collects demographic and student achievement information on students across the state. Data submitted by districts through NJ Smart generates the District Report which includes information about an array of accountability measures such as chronic absenteeism and 4-year graduation rates, complete with graphical representations of these measures. While openly accessible to important stakeholders such as families, community members, and students, this kind of reporting narrowly focuses on the aforementioned measures, and in the case of New Jersey, simplistically places the district in the red, yellow, or green of a gauge, depending on the reported percentages. Do such representations hurt or help the efficacy of parents, students, teachers, and leaders? Alternately, do they advance a sense of shared responsibility amongst our educational communities or do they narrow and crystallize the gazes of decision makers? Too often, the reporting outputs of longitudinal data systems serve as both a reflection and an endorsement of conventional notions of school reform and can encourage leadership actions that favor a limited vision of school reform.

A second reform effort that reflects the field of concomitance is the applicability of various technological teaching and learning applications, which on their face, provide at-risk students more options for educational attainment. Two examples of this type of innovation are learning management systems and online tutorial platforms, which range in both cost and cost effectiveness to school systems and families. At their best, these systems allow vulnerable, chronically absent, highly mobile students to achieve higher levels of engagement with their studies, and perhaps more importantly, connection with caring, concerned leaders (i.e., teachers, counselors, and administrators). At their worst, these innovations reflect existing achievement and opportunity gaps and subject vulnerable student groups to further inequity in achievement and resource allocation. In recent research exploring the disparities in remote learning since schools closed rapidly due to COVID-19, an Ed Week study found that the percentage of educators in the lowest income schools who reported that they were engaging in instruction was significantly lower than their higher income counterparts. Likewise, students from low-income schools were truant, or essentially unreachable, throughout distance learning in far greater numbers than their counterparts in higher income schools (Ed Week, 2020). While peer-reviewed research on the impact of COVID-19 on learning outcomes is still a ways off, initial reports may sound a critical alarm for school leaders and policy makers regarding access and equity to learning (Dorn, Hancock, Sarakatsannis, & Viruleg, 2020; Ed Week, 2020).

While online learning is achievable due to knowledge existing from other technological disciplines and perpetuated through the field of concomitance, in the final analysis, it is where the leader falls on the continuum of ethical and equitable practice that ultimately determines the degree to which these innovations can help to level the playing field for students at risk of disengagement, absenteeism, and drop out.

### Vision Statement 4

New DEEL Leader	Conventional Leader
Operates from a deep understanding of ethical decision-making in the context of a dynamic, inclusive, democratic vision.	Operates largely from perspective of the ethic of justice wherein obedience to authority and current regulations is largely unquestioned despite one's own misgivings.

The fourth vision statement of the New DEEL vision for educational leadership indicates that leaders should operate from a deep understanding of ethical decision-making, using a multidimensional paradigm approach that is inclusive and diverse in nature (Gross, 2006; Gross & Shapiro, 2016). This exists in stark contrast to the behavior of conventional school leaders who rely predominantly on the ethic of justice when making complex decisions. Conventional leaders are concerned with obeying authority and often will not question current regulations, despite their own misgivings (Gross, 2006). The New DEEL leader understands the importance of the ethic of justice in decision-making because it informs leaders on what laws, rules, and rights have to say about a given situation. However, New DEEL leaders also recognize an approach to decision-making that includes other ethics is needed, as well. Thus, in addition to the ethic of justice, New DEEL leaders utilize the ethics of critique, care, and profession when making decisions.

Certainly, there are times in which educational leaders can be pulled away from using a multidimensional approach to ethical decision-making and lean more toward making decisions based solely on the ethic of justice. For example, when leaders work in an organization with a controlling culture rather than a supporting one, they are more likely to defer to their superiors on decision-making (Langlois & Lapointe, 2014). In such a case, leaders subscribe to the policies of the organization rather than utilizing their own judgment when making a decision. Using Foucault's concepts of presence, memory, and concomitance (1972) help to illustrate how the behavior and practices of conventional school leaders circulate and evolve.

---

### Field of Memory

Foucault's concept of the field of memory encourages people to consider what about a particular practice is no longer viable. Most commonly, school leaders draw from an overreliance on the ethic of justice. Not surprisingly, leadership practices that only include the ethic of justice in decision-making are limited. Based on two different schools of thought; one grounded in anthropology and the other in epistemology (Starratt, 1994), the ethic of justice is at the foundation of thinking for many conventional school leaders. Starratt's first concept of justice (1994) is based on the works of Hobbes, Rawls, and Kohlberg and places the individual as the central figure, separate from social relationships. Individuals make decisions based on their own self-interests and, through human reasoning, determine how much freedom they are willing to give up for the betterment of society or social justice. Conversely,

Staratt's second concept of justice (1994) puts community at the forefront of just governance and is based on the works of Aristotle, Rousseau, Hegel, Marx, and Dewey. Through participation in community and relationships, individuals learn how to think about their behaviors and the impact they have on the society in which they live (Starratt, 1994).

Building on these two different schools of thought, the ethic of justice attempts to use a similar standard that is applied to all situations in the same manner (Starratt, 1994). In doing this, leaders neglect important considerations for each decision they make. For example, the ethic of justice does not take into account if the rules, laws, and policies in place benefit certain groups of people over others. Correspondingly, leaders who work solely from an ethic of justice may not consider how the outcomes of their decisions will impact others. Specifically, the ethic of justice is not focused primarily on what is in the best interest of the student (Shapiro & Stefkovich, 2016). All of these are necessary considerations that the ethic of justice alone does not address.

Alternately, the ethic of critique, as described by Starratt (1994), is based on critical theory and the idea that issues in society can be problematic as various groups and individuals have competing wants and needs. Foster (1986) explains that critical theory "critiques and examines" the ways in which our lives are organized and "probes foundational assumptions that are normally taken for granted and seen as natural outgrowths of historical process" (p. 72). While some studies (Arar, Haj, Abramovitz, & Oplatka, 2016; Eyal, Berkovich, & Schwartz, 2011) suggest that aspiring educational leaders rely heavily on the ethic of critique when making ethical decisions, Langlois and Lapointe (2007) argue differently. Langlois and Lapointe (2007) assert that new principals used one ethic only (i.e., justice) in ethical decision-making, whereas more seasoned leaders approached dilemmas using a "consolidated ethical framework which includes the ethic of care and the ethic of critique" (p. 247), along with an "emerging professional ethic" (p. 247). This suggests that there is a link between educational leaders' years of experience and their use of a more comprehensive ethical framework for decision-making (Langlois & Lapointe, 2007).

---

## Field of Presence

As Foucault (1972) asserted, existing concepts change in emphasis or structure and new concepts are introduced. This can be seen in the way the "general arrangement" of ethics expanded to encompass new forms (Foucault, 1972, p. 63). Foucault's concept of the field of presence asks individuals to consider what about a particular practice is truthful and necessary. When educational leaders use a multidimensional approach to ethical decision-making, they are engaging in exemplary practices substantiated in reasoning (Starratt, 1994). Thus, educational leaders should strive to move themselves and their school communities toward operating from a position that considers the ethics of justice, critique, care, and profession when making decisions. The fourth vision statement in the New DEEL vision for educational leaders urges leaders and their school communities to consider more than just what

laws, rules, and policies have to say about a particular situation when making decisions. Educational leaders expand the ways in which they think about ethical dilemmas by incorporating the ethics of critique, care, and profession into their decision-making, as well.

The ethics of critique, care, and profession ask leaders to consider important questions in their decision-making process. For example, the ethic of critique requires leaders to question current laws and policies to ask such questions as: Who created the laws and policies and who do the laws and policies benefit (Gross & Shapiro, 2016)? The ethic of care, on the other hand, calls for leaders to ask themselves: Who benefits and who is harmed by the outcomes of their decisions? Finally, the ethic of the profession requires leaders to consider the professional ethics from different organizations, as well as their own personal and professional codes of ethics, when making decisions. Taking into account the multiple codes of this ethic, it is not surprising that, at times, educational leaders' codes may clash. Shapiro and Stefkovich (2016) state that leaders' codes can clash in the following four ways:

clashes between an individual's personal and professional codes of ethics; clashes within professional codes; clashes of professional codes among educational leaders; clashes between a leader's personal and professional code of ethics and custom and practices set forth by the community (either the professional community, the school community, or the community where the educational leader works). (pp. 24–25)

To address clashes that arise, Shapiro and Stefkovich (2016) urge leaders to stay focused on their central mission: to make decisions in the best interests of the student, while still considering the community as a whole. Approaching ethical decision-making in this way proves to be both inclusive and democratic in nature.

---

## Field of Concomitance

Foucault's concept of the field of concomitance entails considering the ideas and theories that have come from other disciplines and have been transferred to the field of educational leadership. Philosophers such as Socrates and Aristotle first proposed theories related to the ethical behaviors of human beings. These theories set the stage for engagement in ethical decision-making in a number of different disciplines. In the field of psychology, for example, Rest (1994), drawing from the work of Lawrence Kohlberg, proposed a model for ethical decision-making that includes four processes: moral awareness, moral judgment, moral intention, and moral action. Likewise, ethical decision-making models can also be found in both the business world (De George, 2010) and the medical profession (Self & Baldwin, 1994). De George (2010) traced ethics in business back to Plato's discussions on justice, and notes the rise of a business ethics movement in the 1970s that was modeled after a medical ethics model adopted a decade prior.

As elements of ethics originating in these other fields are transferred to educational leadership, one can see how the concept grows and changes. The approach to ethical decision-making offered by the New DEEL vision for educational leadership illustrates the practical ways leaders can approach decision-making in their organizations. Leaders can now work from a multidimensional paradigm composed of four ethics to consider when faced with ethical dilemmas. For example, the multidimensional approach to ethical decision-making guided one principal at an adult secondary education setting in responding to and supporting his school community after the death of a student (Yelman, 2019). Considering each ethic helped guide the principal on what steps to take after the student's death, such as when and how to inform members of the school community, how much personal information to share about the deceased, and how to develop a protocol that could guide leaders in the future through similar circumstances (Yelman, 2019). Finally, the New DEEL does not suggest that this form of decision-making is specific to educational leaders only. Instead, the New DEEL urges educational leaders to encourage and support the various members of their school communities to think and act in this ethical way, as well, endeavoring to include and connect everyone to the shared vision.

### Vision Statement 5

New DEEL Leader	Conventional Leader
Sees one's career as a calling and has a well-developed sense of mission toward democratic social improvement that cuts across political, national, class, gender, racial, ethnic, and religious boundaries.	Sees one's career in terms of specific job titles with an aim to move to ever greater positions of perceived power within the current system's structure.

What does it mean to have found one's calling? Some believe that phrase has become, perhaps most recently, a jargon-y cliché used to persuade employees to work increasingly harder for ever stagnating wages. But is that always the case, or can seeing one's career as a calling positively influence the way in which one practices his or her craft? In school systems, this tension can be seen in the way school leaders envision their mission. On the one hand are the traditional school leaders who do not view their career as a calling. Pulled by political and economic forces toward positions of perceived prestige for the sake of increased pay and elaborate titles, these leaders often operate without a greater sense of purpose, seeing the position as their purpose, and nothing more. On the other end of the spectrum are the New DEEL leaders who see their role as transcending the traditional role of school leadership. Driven by a commitment grounded in democratic social improvement for all people, the New DEEL leader uniquely aspires to a mission that is larger than just the self.

Convincingly explored by Mattingly (1975), the lengthy tradition of career as a calling has been connected to supernatural, spiritual, or religious beliefs. A more recent body of literature indicates that those who see career as a calling operate differently than those who see career as a sliding scale of pay and responsibility (Dik & Duffy, 2009; Wrzesniewski, 2010). Additional literature suggests that those who see their profession as answering a calling are likelier to feel satisfied and fulfilled

(Bunderson & Thompson, 2009; Davidson & Caddell, 1994; Peterson, Park, Hall, & Seligman, 2009; Wrzesniewski, McCauley, Rozin, & Schwartz, 1997).

Traditionally, the position of school principal has been considered prestigious and desirable to those looking to use it as a stepping stone on the way toward more executive power at the district or state levels. Meanwhile, these school leaders are regularly asked to take on new responsibilities in increasingly challenging circumstances. This ends in roughly half of new principals leaving their schools by the third year, despite the allure of the title and the perceived power of the office (School Leaders Network, 2014). This grim statistic is made even more tragic by the fact that principal turnover continues to disproportionately affect students of color, students with disabilities and low-income, urban schools (Béteille, Kalogrides, & Loeb, 2012; Simon & Johnson, 2015). This unsustainable practice continues to drive a wedge between our most accomplished schools and those most in need of support.

---

## Field of Memory

The power of school leadership lying in a single office with a sole stakeholder is an idea that has entered the field of memory. A series of complex pressures have made it nearly impossible for any school leader to sustain progress while centralizing power (Spillane & Anderson, 2014; Spillane & Lee, 2014). As such, the idea of the school leader being siloed within an office and making decisions from on high no longer inhabits the standards that define the profession. Such conventional ideas of school leadership have also been rendered obsolete by changes in technology, the economy, and family structure. Increasingly, the idea that a principal might serve a particular type of student or a particular group of people has largely disappeared aside from select private or religious schools. While this notion of leadership is no longer discussed or accepted in the field, its association with the field of leadership can still be identified and thus, according to Foucault (1972), comprises the field of memory.

The idea of school principal as chief and harsh disciplinarian has also entered the field of memory. In 1952, Leland March so eloquently wrote “It used to be thought that the sterner and harsher the principal was, the better disciplinarian he was. Fortunately, that point of view is changing” (p. 49). A more comprehensive understanding of the position, and its relationship to the New DEEL vision statement is manifested by the school principal’s focus on school culture and sustained transformation in the lives of students. Several studies have established that teacher retention is correlated with working conditions and teacher perceptions of their school principals (Burkhauser, 2016; Ladd, 2011). It is, therefore, unsurprising that school principals are becoming increasingly focused on equity and community connectedness at the expense of their role as chief disciplinarian. The National Association of Elementary School Principals established that the role of the principal has been changing for some time, suggesting that “Traditional leaders may have considered their jobs to be solely the managers of schools.” They contrast this sharply with what they see as the new role of the principal: “supporting social, physical and emotional

needs of children,” in a way that “the vision, courage and skill to lead and advocate for effective learning communities. . .” (2012, p. 2).

Applying to principal and other school leadership roles, the New DEEL vision statement for school leadership challenges educators to increase their awareness to the interconnectedness of all of us, with a deeply felt regard for all groups of people, guided by the belief in “democratic social improvement for everyone” (Gross & Shapiro, 2016, p. 122). Yet, this mission has still not fully been realized. As indicated by the turnover rates of novice principals, something about the current system of external pressures toward conformity and accountability is, largely, not working to support this aspiration for lifelong leadership that transcends racial, socioeconomic, national, ethnic or religious boundaries.

---

## Field of Presence

Understanding how school leaders can develop a mission toward democratic self-improvement and helping them see career as a calling that is disconnected from positional power is critical in the current context. School leaders often face anger, unhappiness, and disengagement from their work when their beliefs or character do not coincide with the realities of the career (Schabram & Maitlis, 2017a). Significant research on turnover among novice leaders suggests that their ability to cope with some of the first experiences in schools is directly related to their ability to persevere in their positions in meaningful ways (Louis, 1980). If the research is to be believed, a new type of leadership preparation needs to enter the field of presence. This type of preparation *must* focus on the development of a meaningful mission in a way that underscores career as a calling.

In contrast, this New DEEL vision statement goes beyond understanding a personal philosophy of education and touches on a more profound truth that is ingrained in the heart of many educators: the work goes beyond the self. In order to sustain school leadership through trying circumstances and a myriad of reform movements, the career has to be a calling.

Career as a calling has been explored more extensively by Duffy and Sedlacek (2010) who assert that career as a calling is not found in any major texts on career choice. Their work found that nearly 70% of surveyed college students either saw their future career as a calling or were seeking a career that called to them. This relatively new entry to the literature highlights the value of the 5th New DEEL vision statement. Duffy and Sedlacek also found that students pursuing “advanced professional degrees” were further predisposed to seeing their career as a calling. Considering that the principalship, specialized school leadership positions and an increasing number of teaching positions require advanced degrees, there is certainly room for discussion on the relationship between continuing education, career calling, and perceived overqualification.

Lobene and Meade (2013) discuss the relationship between teachers’ perceived overqualification, their commitment to the school organization, and their orientation toward career calling. Their work found that those with higher levels of calling were more likely to stay in teaching positions even though they perceived themselves to be

overqualified, while those with low calling and a high sense of overqualification were more likely to leave or want to leave the position. This finding seems to suggest that it is the more complex, less definable, commitment to the work than a specific educational trajectory that seems to support the feelings of having calling in the educational field.

---

## Field of Concomitance

Concepts from human resource management, economics, and the business sector have steadily crept into education and permeated the way that school leaders conceptualize their work. A prominent example is the focus on labor-market outcomes, resulting in the ubiquitous push for college and career readiness for all students. This push was largely initiated by *A Nation at Risk*, the 1983 report of the US National Commission on Excellence in Education, and further amplified by the passing of the No Child Left Behind Act in 2004. Anyon and Greene (2007) have convincingly argued that this bill was a thinly veiled stand-in for a comprehensive jobs policy. Since then, the national focus has shifted from teaching and leading as callings for democratic social improvement to a push to improve the national economy (Anyon & Kiersten, 2007). Where does this push leave school leaders aspiring to tend to the care and welfare of others through the educational system?

Thomas Friedman (2014) proudly exclaimed that “average is officially over,” at the Society for Human Resource Management Annual Conference & Exposition. He argued that current economic systems are pushing routine workers out due to automation, and that the real *value* has to come from “your unique value contribution that justifies why you should be hired, why you should be promoted and why you should be advanced every year.” This rhetoric is indicative of the tension between conventional school leadership values, now represented by the tension experienced between the trademark values of a market-based economy and a New DEEL leader. On the one hand is the concept of a career as an ever-escalating set of titles and pay raises with the hope of preparing others for the same circumstances. On the other hand is the idea of career as a calling, marked by humility and a quieter understanding of power, focused on improving the lives of other people, regardless of their desire to participate in a predatory economic system.

The intrusion of nonprofit and for-profit organizations into the school space has raised significant concerns about the future of public education. School choice and voucher systems have dominated headlines and court dockets in recent years. One thing is for sure: K-12 and higher education are being increasingly driven by market forces rather than a progress toward improved teaching and learning.

---

## Conclusion and Reflections

The five vision statements describe a more inclusive, less hierarchical profession with organic connections to potential allies and colleagues in the wider universe beyond the typical boundaries of organization and the narrow confines of machine

metaphor thought. The disharmony now existing between traditional forms of education and the deeper needs of young people is itself a central rupture. Each of the five vision statements lays a part of the foundation needed to reposition, redefine, and thereby reclaim education toward social justice, social responsibility, and a vigorous democratic society.

Vision Statement 1 encourages leaders at all levels to change their perspective and focus from relying on external rewards such as achievement measures and approval of others to an intrinsic motivation that is built on the foundation of their inner responsibility to stakeholders, the profession, and a global push for social justice and democracy. The pressures to move into the approach held by conventional leaders will continue and may even increase. When leaders ground themselves in their inner responsibility and surround themselves with others who approach leadership from a New DEEL lens, they will be able to move beyond the pressures and simple expectations of mere compliance.

Vision Statement 2 pushes educators to go beyond reflexive thinking. Those seeking to become authentic democratic actors must refuse to behave in a reactive, fear motivated fashion when confronting the inevitable turbulence that all educators at all levels and those they serve face as a simple fact of their work in communities. There is a new requirement to be flexible enough to respond to the dynamic challenges and opportunities of heightened turbulence by seeing turbulence itself as a critical source of energy rather than a threat. This requires a new set of skills and habits of mind.

Vision Statement 3 reveals important shifts that include leadership responses to early twentieth century calls for compulsory school attendance, and later, reform through high stakes testing and other similarly narrow, limiting conceptions of school quality. Likewise, there is a promising possibility that current conditions simultaneously disrupt the historic grip of this idea while giving way to its alternative. These include culturally responsive, democratic leadership practices such as two-way communication with students and parents. It also means increasing access to better quality of life outcomes for underrepresented students through stronger policies and programs such as schools as sanctuaries for immigrant origin students and school-based health centers.

Vision Statement 4 moves leaders beyond considering ethical dilemmas from the sole vantage point of what rules, laws, and policies have to say about a given situation. Instead, New DEEL leaders approach ethical decision-making using a comprehensive model that includes the ethics of justice, critique, care, and profession. The questions each of these ethics ask of us as leaders elevates our work by providing practical ways to address ethical dilemmas. Further, it engages the entire school community to think and act in this same manner.

Vision statement 5 alerts us to the fact that major shifts are coming in the way that schools determine student success and prioritize social-emotional health over college and career readiness. Yet, the recent global pandemic has demonstrated that the greatest disruptions will affect the school communities that already demonstrate the greatest need, with a shift to remote work pushing some students and teachers even further behind. This opens a very real possibility for the continued intrusion of big

business values into public education, focusing on the outsourcing of teaching work to for-profit entities that can provide remote instruction at a discounted rate. So, what will be dominant, the mission of the democratic ethical educational leader or the machine of the organization that too often traps and confines her/him to its rigid dimensions?

The New DEEL colleagues have used these vision statements to organize, inspire, and guide their work for the past 16 years. Times and challenges have changed. Their thinking and scholarship has evolved in each of these areas. Currently, the leadership of this group has moved to an emphasis of connecting the existing scholarship, course work, and conference presentations to concrete problems of practice in the field, particularly in the area of mentoring leaders at all levels in democratic ethical practices so that they in turn can mentor others.

In the macro sense, this project has been challenged first by the current COVID-19 pandemic crisis sweeping the world, thereby shutting off the group from field practitioners, at least for the time being. Just as critical, the May 2020 murder of George Floyd at the hands of police along with similar murders of other African American men and women has created a simultaneous challenge to all educators. This challenge may disrupt the business-as-usual mentality, pushing large elements of the system to recalibrate their priorities in a direction more in keeping with these vision statements and the decade and a half of scholarship, practice and community building that they represent.
